For information with respect to executive compensation, see the sections entitled "Governance — Non-Employee Director Compensation" and "Executive Compensation — Compensation Discussion and Analysis, — Compensation Committee Report and — Compensation Tables" in our definitive Proxy Statement to be filed with the Securities and Exchange Commission and delivered to shareholders in connection with our 2020 Annual Meeting of Shareholders, which are incorporated by reference herein. There were no relationships to be disclosed under paragraph (e)(4) of Item 407 of Regulation S-K.

Item 12. Security Ownership of Certain Beneficial Owners and Management and Related Stockholder Matters

For information with respect to the security ownership of the Directors and Executive Officers, see the section entitled "Stock Ownership —Security Ownership of Certain Beneficial Owners and Management" in our definitive Proxy Statement to be filed with the SEC and delivered to shareholders in connection with our 2020 Annual Meeting of Shareholders, which is incorporated herein by reference. In addition, the following table provides other equity compensation plan information:

The following table provides information as of December 31, 2019 for (i) all equity compensation plans previously approved by the Company's shareholders, and (ii) all equity compensation plans not previously approved by the Company's shareholders. From May 9, 2009 until May 4, 2017, the Company only issued awards under the 2009 Verizon Communications Inc. Long-Term Incentive Plan and, after May 4, 2017, the Company only issued awards under the 2017 Verizon Communications. Inc. Long-Term Incentive Plan (2017 LTIP). Each of these plans provides for awards of stock options, restricted stock, restricted stock units, performance stock units and other equity-based hypothetical stock units to employees of Verizon and its subsidiaries. No new awards are permitted to be issued under any equity compensation plan other than the 2017 LTIP. In accordance with SEC rules, the table does not include outstanding awards that are payable solely in cash by the terms of the award, and such awards do not reduce the number of shares remaining for issuance under the 2017 LTIP.

Plan Category	Number of securities to be issued upon exercise of outstanding options, warrants and rights (a)	Weighted-average exercise price of outstanding options, warrants and rights (b)	Number of securities remaining available for future issuance under equity compensation plans (excluding securities reflected in column (a)) (c)
Equity compensation plans approved by security holders	7,259,237 [1]	$ — [2]	88,717,670 [3]
Equity compensation plans not approved by security holders	120,272 [4]	—	—
Total	**7,379,509**	**$ —**	**88,717,670**

[1] This amount includes: 7,259,237 of common stock subject to outstanding restricted stock units and performance stock units, including dividend equivalents accrued on such awards through December 31, 2019. This does not include performance stock units, deferred stock units and deferred share equivalents payable solely in cash.

[2] Verizon's outstanding restricted stock units, performance stock units and deferred stock units do not have exercise prices associated with the settlement of these awards.

[3] This number reflects the number of shares of common stock that remained available for future issuance under the 2017 LTIP.

[4] This number reflects shares subject to deferred stock units credited to the Verizon Income Deferral Plan, which were awarded in 2002 under the Verizon Communications Broad-Based Incentive Plan. No new awards are permitted to be issued under this plan.

Item 13. Certain Relationships and Related Transactions, and Director Independence

For information with respect to certain relationships and related transactions and Director independence, see the sections entitled "Governance — Our Approach to Governance — Our Approach to Strategy and Risk Oversight — Other Risk-Related Matters — Related Person Transactions and — Our Board Composition and Structure — Our Board's Independence" in our definitive Proxy Statement to be filed with the Securities and Exchange Commission and delivered to shareholders in connection with our 2020 Annual Meeting of Shareholders, which are incorporated by reference.

Item 14. Principal Accounting Fees and Services

For information with respect to principal accounting fees and services, see the section entitled "Audit Matters — Item 3: Ratification of Appointment of Independent Registered Public Accounting Firm" in our definitive Proxy Statement to be filed with the Securities and Exchange Commission and delivered to shareholders in connection with our 2020 Annual Meeting of Shareholders, which are incorporated by reference.

EXHIBIT 4f

DESCRIPTION OF VERIZON'S SECURITIES
REGISTERED PURSUANT TO SECTION 12 OF
THE SECURITIES EXCHANGE ACT OF 1934

As of December 31, 2019, Verizon Communications Inc. had the following twenty-one classes of securities registered under Section 12 of the Securities Exchange Act of 1934, as amended: (i) common stock, $.0.10 par value per share ("Common Stock"), (ii) 2.375% Notes due 2022 (the "2.375% 2022 Notes"), (iii) 0.500% Notes due 2022 (the "0.500% 2022 Notes"), (iv) 1.625% Notes due 2024 (the "1.625% 2024 Notes"), (v) 4.073% Notes due 2024 (the "4.073% 2024 Notes"), (vi) 0.875% Notes due 2025 (the "2025 Notes"), (vii) 3.250% Notes due 2026 (the "3.250% 2026 Notes"), (viii) 1.375% Notes due 2026 (the "1.375% 2026 Notes"), (ix) 0.875% Notes due 2027 (the "2027 Notes"), (x) 1.375% Notes due 2028 (the "2028 Notes"), (xi) 1.875% Notes due 2029 (the "2029 Notes"), (xii) 1.250% Notes due 2030 (the "1.250% 2030 Notes"), (xiii)1.875% Notes due 2030 (the "1.875% 2030 Notes"), (xiv) 2.625% Notes due 2031 (the "2.625% 2031 Notes"), (xv) 2.500% Notes due 2031 (the "2.500% 2031 Notes"), (xvi) 0.875% Notes due 2032 (the "2032 Notes"), (xvii) 4.750% Notes due 2034 (the "2034 Notes"), (xviii) 3.125% Notes due 2035 (the "2035 Notes"), (xix) 3.375% Notes due 2036 (the "2036 Notes"), (xx) 2.875% Notes due 2038 (the "2038 Notes") and (xxi) 1.500% Notes due 2039 (the "2039 Notes," and together with the 2.375% 2022 Notes, the 0.500% 2022 Notes, the 1.625% 2024 Notes, the 4.073% 2024 Notes, the 2025 Notes, the 3.250% 2026 Notes, the 1.375% 2026 Notes, the 2027 Notes, the 2028 Notes, the 2029 Notes, the 1.250% 2030 Notes, the 1.875% 2030 Notes, the 2.625% 2031 Notes, the 2.500% 2031 Notes, the 2032 Notes, the 2034 Notes, the 2035 Notes, the 2036 Notes and the 2038 Notes, the "Notes"). In this exhibit, "we," "our," "us" and "Verizon Communications" refer to Verizon Communications Inc.

COMMON STOCK

Our restated certificate of incorporation provides authority to issue up to 6,500,000,000 shares of stock of all classes, of which 6,250,000,000 are shares of Common Stock, and 250,000,000 are shares of preferred stock, $0.10 par value per share.

Subject to any preferential rights of the preferred stock, holders of shares of our Common Stock are entitled to receive dividends on that stock out of assets legally available for distribution when, as and if authorized and declared by the board of directors and to share ratably in assets legally available for distribution to our shareholders in the event of our liquidation, dissolution or winding-up. We may not pay any dividend or make any distribution of assets on shares of Common Stock until cumulative dividends on shares of preferred stock then outstanding, if any, having dividend or distribution rights senior to the Common Stock have been paid.

Holders of Common Stock are entitled to one vote per share on all matters voted on generally by the shareholders, including the election of directors. In addition, the holders of Common Stock possess all voting power except as otherwise required by law or except as provided for by any series of preferred stock. Our restated certificate of incorporation does not provide for cumulative voting for the election of directors.

No holder of any shares of Common Stock has any preemptive or preferential right to acquire or subscribe for any unissued shares of any class of stock or any authorized securities convertible into or carrying any right, option or warrant to subscribe for or acquire shares of any class of stock.

The Common Stock is listed on the New York Stock Exchange and the NASDAQ Global Select Market under the symbol "VZ."

Our board of directors is authorized at any time to provide for the issuance of all or any shares of our preferred stock in one or more classes or series, and to fix for each class or series voting powers, full or limited, or no voting powers, and distinctive designations, preferences and relative, participating, optional or other special rights and any qualifications, limitations or restrictions, as shall be stated and expressed in the resolution or resolutions adopted by the board of directors providing for the issuance of the preferred stock and to the fullest extent as may be permitted by Delaware law. This authority includes, but is not limited to, the authority to provide that any class or series be:

- subject to redemption at a specified time or times and at a specified price or prices;
- entitled to receive dividends (which may be cumulative or non-cumulative) at specified rates, on specified conditions and at specified times, and payable in preference to, or in relation to, the dividends payable on any other class or classes or any other series;
- entitled to rights upon the dissolution of, or upon any distribution of the assets of, Verizon Communications; or
- convertible into, or exchangeable for, shares of any class or classes of our stock, or our other securities or property, at a specified price or prices or at specified rates of exchange and with any specified adjustments.

Although no shares of preferred stock are outstanding as of December 31, 2019, in the event of the issuance of any shares of preferred stock, the rights evidenced by, or amounts payable with respect to, the Common Stock may be materially limited or qualified by the terms of such preferred stock.

NOTES

The following description of the Notes is a summary and does not purport to be complete. This description is qualified in its entirety by reference to the indenture between the Company and U.S. Bank National Association (as successor to Wachovia Bank, National Association,

formerly known as First Union National Bank), as trustee, dated as of December 1, 2000, as amended (the "Indenture") and the terms of the global securities representing the Notes.

Principal Amount, Maturity, Interest and Listing

The following table sets forth for each series of Notes the applicable date of initial issuance, principal amount initially issued, principal amount outstanding as of December 31, 2019, maturity date, interest rate per annum, interest payment and record dates, and New York Stock Exchange listing symbol:

Notes	Date of Initial Issuance	Principal Amount Initially Issued	Principal Amount Outstanding as of 12/31/2019	Maturity Date	Interest Rate Per Annum	Interest Payment Date	Record Date	NYSE Listing Symbol
2.375% 2022 Notes	February 12, 2014	€1,750,000,000	€935,347,000	February 17, 2022	2.375%	February 17	February 3	VZ22A
0.500% 2022 Notes	November 2, 2016	€1,000,000,000	€453,963,000	June 2, 2022	0.500%	June 2	May 19	VZ22B
1.625% 2024 Notes	December 1, 2014	€1,400,000,000	€684,827,000	March 1, 2024	1.625%	March 1	February 15	VZ24B
4.073% 2024 Notes	June 18, 2014	£694,804,000	£412,534,000	June 18, 2024	4.073%	June 18	June 4	VZ24C
2025 Notes	November 2, 2016	€1,000,000,000	€1,000,000,000	April 2, 2025	0.875%	April 2	March 19	VZ25

Interest on each series of Notes is payable annually in arrears and will be computed on the basis of the actual number of days in the period for which interest is being calculated and the actual number of days from and including the last date on which interest was paid on such series (or the date of initial issuance of such series, if no interest has been paid on such series), to but excluding the next scheduled interest payment date. This payment convention is referred to as ACTUAL/ACTUAL (ICMA) as defined by the rulebook of the International Capital Market Association.

If interest or principal on any of the 2.375% 2022 Notes, 0.500% 2022 Notes, 1.625% 2024 Notes, 2025 Notes, 3.250% 2026 Notes, 1.375% 2026 Notes, 2027 Notes, 2028 Notes, 2029 Notes, 1.250% 2030 Notes, 2.625% 2031 Notes, 2032 Notes, 2038 Notes and 2039 Notes (collectively, the "Euro Notes") is payable on a Saturday, Sunday or any other day when commercial banks are not open for business in The City of New York or London or any day on which the Trans- European Automated Real-time Gross settlement Express Transfer payment system or any successor thereto is not open for transfer of payments, we will make the payment on the next succeeding business day in such locations, and no additional interest will accrue as a result of the delay in payment. If interest or principal on any of the 4.073% 2024 Notes, 1.875% 2030 Notes, 2.500% 2031 Notes, 2034 Notes, 2035 Notes and 2036 Notes (collectively, the "Sterling Notes") is payable on a Saturday, Sunday or any other day when commercial banks are not open for business in The City of New York or London, we will make the payment on the next business day in such locations, and no additional interest will accrue as a result of the delay in payment.

We may issue additional Notes of any series in the future.

Ranking

Each series of Notes is unsecured and ranks equally with all of our unsecured and unsubordinated indebtedness.

Currency Conversion

All payments of principal, interest and additional amounts, if any, including any payments made upon any redemption, on the Euro Notes will be payable in euro.

All payments of principal, interest and additional amounts, if any, including any payments made upon any redemption, on the Sterling Notes will be payable in GBP.

If either euro or GBP, as applicable, is unavailable to us due to the imposition of exchange controls or other circumstances beyond our control (including the dissolution of the euro), then all payments in respect of the relevant Notes will be made in U.S. dollars until euro or GBP, as the case may be, is again available to us. The amount payable on any date in euro or GBP, as applicable, will be converted into U.S. dollars at a rate mandated by the U.S. Federal Reserve Board as of the close of business on the second business day prior to the relevant payment date or, in the event the U.S. Federal Reserve Board has not mandated a rate of conversion, on the basis of the latest U.S. dollar/euro exchange rate or U.S. dollar/GBP exchange rate, as applicable, available on or prior to the second business day prior to the relevant payment date as determined by us in our sole discretion. Any payment in respect of the Notes alternatively made in U.S. dollars will not constitute an event of default under the Notes or the Indenture.

Optional Redemption

2.375% 2022 Notes, 0.500% 2022 Notes, 1.625% 2024 Notes, 4.073% 2024 Notes, 2025 Notes, 3.250% 2026 Notes, 1.375% 2026 Notes, 2028 Notes, 2029 Notes, 2.625% 2031 Notes, 2034 Notes, 2035 Notes, 2036 Notes and 2038 Notes

We have the option to redeem each of the 2.375% 2022 Notes, 0.500% 2022 Notes, 1.625% 2024 Notes, 4.073% 2024 Notes, 2025 Notes, 3.250% 2026 Notes, 1.375% 2026 Notes, 2028 Notes, 2029 Notes, 2.625% 2031 Notes, 2034 Notes, 2035 Notes, 2036 Notes and 2038 Notes on not less than 30 nor more than 60 days' notice, in whole or in part, at any time prior to maturity, at a redemption price equal to the greater of:

(i) 100% of the principal amount of the Notes of such series being redeemed, or

(ii) the sum of the present values of the remaining scheduled payments of principal and interest on the Notes of such series being redeemed (exclusive of interest accrued to the date of redemption), as the case may be, discounted to the date of redemption on an annual basis (ACTUAL/ACTUAL (ICMA)) at (A) the Comparable Government Bond Rate plus 20 basis points for the 2.375% due 2022 Notes, (B) the Comparable Government Bond Rate plus 15 basis points for the 0.500% 2022 Notes, (C) the Comparable Government Bond Rate plus 15 basis points for the 1.625% 2024 Notes, (D) the Comparable Government Bond Rate plus 25 basis points for the 4.073% 2024 Notes, (E) the Comparable Government Bond Rate plus 20 basis points for the 2025 Notes, (F) the Comparable Government Bond Rate plus 25 basis points for the 3.250% 2026 Notes, (G) the Comparable Government Bond Rate plus 20 basis points for the 1.375% 2026 Notes, (H) the Comparable Government Bond Rate plus 20 basis points for the 2028 Notes, (I) the Comparable Government Bond Rate plus 25 basis points for the 2029 Notes, (J) the Comparable Government Bond Rate plus 25 basis points for the 2.625% 2031 Notes, (K) the Comparable Government Bond Rate plus 25 basis points for the 2034 Notes, (L) the Comparable Government Bond Rate plus 25 basis points for the 2035 Notes, (M) the Comparable Government Bond Rate plus 25 basis points for the 2036 Notes and (N) the Comparable Government Bond Rate plus 30 basis points for the 2038 Notes,

plus, in each case, accrued and unpaid interest on the principal amount being redeemed to, but excluding, the date of redemption.

2027 Notes, 1.250% 2030 Notes, 1.875% 2030 Notes, 2.500% 2031 Notes, 2032 Notes and 2039 Notes

We have the option to redeem the 2027 Notes, 1.250% 2030 Notes, 1.875% 2030 Notes, 2.500% 2031 Notes, 2032 Notes and 2039 Notes on not less than 10 nor more than 60 days' notice, in whole or in part,

(i) at any time prior to (A) January 8, 2027 (three months prior to the maturity date of the 2027 Notes) (the "2027 Notes par call date") with respect to the 2027 Notes, (B) January 8, 2030 (three months prior to the maturity date of the 1.250% 2030 Notes) (the "1.250% 2030 Notes par call date") with respect to the 1.250% 2030 Notes (C) June 19, 2030 (three months prior to the maturity date of the 1.875% 2030 Notes) (the "1.875% 2030 Notes par call date") with respect to the 1.875% 2030 Notes (D) January 8, 2031 (three months prior to the maturity date of the 2.500% 2031 Notes) (the "2.500% 2031

Notes par call date") with respect to the 2.500% 2031 Notes, (E) December 19, 2031 (three months prior to the maturity date of the 2032 Notes) (the "2032 Notes par call date") with respect to the 2032 Notes and (F) March 19, 2039 (six months prior to the maturity date of the 2039 Notes) (the "2039 Notes par call date") with respect to the 2039 Notes, at a redemption price equal to the greater of:

(a) 100% of the principal amount of the Notes of such series being redeemed, or

(b) the sum of the present values of the remaining scheduled payments of principal and interest on the Notes of such series being redeemed (exclusive of interest accrued to the date of redemption), assuming for such purpose that the (A) 2027 Notes matured on the 2027 Notes par call date, (B) 1.250% 2030 Notes matured on the 1.250% 2030 Notes par call date, (C) 1.875% 2030 Notes matured on the 1.875% 2030 Notes par call date, (D) 2.500% 2031 Notes matured on the 2.500% 2031 par call date, (E) 2032 Notes matured on the 2032 Notes par call date and (F) 2039 Notes matured on the 2039 Notes par call date, discounted to the date of redemption on an annual basis (ACTUAL/ACTUAL (ICMA)) at (AA) the Comparable Government Bond Rate plus 20 basis points for the 2027 Notes, (BB) the Comparable Government Bond Rate plus 25 basis points for the 1.250% 2030 Notes, (CC) the Comparable Government Bond Rate plus 25 basis points for the 1.875% 2030 Notes, (DD) the Comparable Government Bond Rate plus 25 basis points for the 2.500% 2031 Notes, (EE) at the Comparable Government Bond Rate plus 25 basis points for the 2032 Notes and (FF) the Comparable Government Bond Rate plus 30 basis points for the 2039 Notes; and

(ii) at any time on or after (A) the 2027 Notes par call date with respect to the 2027 Notes, (B) the 1.250% 2030 Notes par call date with respect to the 1.250% 2030 Notes, (C) the 1.875% 2030 Notes par call date with respect to the 1.875% 2030 Notes, (D) the 2.500% 2031 Notes par call date with respect to the 2.500% 2031 Notes (E) the 2032 Notes par call date with respect to the 2032 Notes and (F) the 2039 Notes par call date with respect to the 2039 Notes, at a redemption price equal to 100% of the principal amount of the Notes of such series being redeemed,

plus, in each case, accrued and unpaid interest on the principal amount of such series being redeemed to, but excluding, the date of redemption.

Defined Terms

The "Comparable Government Bond Rate" will be determined on the third business day preceding the redemption date and means, with respect to any date of redemption, the rate per annum equal to the yield to maturity calculated in accordance with customary financial practice in pricing new issues of comparable corporate debt securities paying interest on an annual basis (ACTUAL/ACTUAL (ICMA)) of the applicable Comparable Government Bond, assuming a price for the applicable Comparable Government Bond (expressed as a percentage of its principal amount) equal to the applicable Comparable Government Bond Price for such date of redemption.

"Calculation Agent" means an independent investment banking or commercial banking institution of international standing appointed by us.

"Comparable Government Bond" means (i) with respect to any series of Euro Notes, the Federal Republic of Germany government security or securities selected by one of the Reference Government Bond Dealers appointed by us as having an actual or interpolated maturity comparable with the remaining term of such series of Euro Notes that would be utilized, at the time of selection and in accordance with customary financial practice, in pricing new issues of euro-denominated corporate debt securities of a maturity comparable to the remaining term of such series of Euro Notes and (ii) with respect to any series of Sterling Notes, the United Kingdom government security or securities selected by one of the Reference Government Bond Dealers appointed by us as having an actual or interpolated maturity comparable with the remaining term of such series of Sterling Notes that would be utilized, at the time of selection and in accordance with customary financial practice, in pricing new issues of sterling-denominated corporate debt securities of a maturity comparable to the remaining term of such series of Sterling Notes.

"Comparable Government Bond Price" means, with respect to any redemption date, (A) the arithmetic average of the Reference Government Bond Dealer Quotations for such redemption date, after excluding the highest and lowest such Reference Government Bond Dealer Quotations, or (B) if the Calculation Agent obtains fewer than four such Reference Government Bond Dealer Quotations, the arithmetic average of all such quotations.

"Reference Government Bond Dealer" means each of five banks selected by us, which are (A) primary European government securities dealers, and their respective successors, or (B) market makers in pricing corporate bond issues.

"Reference Government Bond Dealer Quotations" means, with respect to each Reference Government Bond Dealer and any redemption date, the arithmetic average, as determined by the Calculation Agent, of the bid and offered prices for the applicable Comparable Government Bond (expressed in each case as a percentage of its principal amount) at 11:00 a.m., Central European Time (or in the case of the 4.073% 2024 Notes, London Time), on the third business day preceding such date for redemption quoted in writing to the Calculation Agent by such Reference Government Bond Dealer.

Tax Redemption

2.375% 2022 Notes, 1.625% 2024 Notes, 4.073% 2024 Notes, 3.250% 2026 Notes, 2.625% 2031 Notes and 2034 Notes

Each of the 2.375% 2022 Notes, 1.625% 2024 Notes, 4.073% 2024 Notes, 3.250% 2026 Notes, 2.625% 2031 Notes and 2034 Notes may be redeemed at our option, in whole but not in part, at any time on giving not less than 30 nor more than 60 days' notice to the noteholders (which notice shall be irrevocable), at their principal amount, together with interest accrued to, but excluding, the date fixed for redemption, if:

(i) we have or will become obliged to pay additional amounts with respect to such series of Notes as provided or referred to under "-Withholding Taxes-*2.375% 2022 Notes, 4.073% 2024 Notes, 3.250% 2026 Notes and 2034 Notes*" below in the case of the 2.375% 2022 Notes, 1.625% 2024 Notes, 4.073% 2024 Notes, 3.250% 2026 Notes, 2.625% 2031 Notes and 2034 Notes, or under "-Withholding Taxes-*1.625% 2024 Notes and 2.625% 2031 Notes*" below in the case of the 1.625% 2024 Notes and 2.625% 2031 Notes, as a result of any change in, or amendment to, the laws, treaties, or rulings of the United States or any political subdivision or any authority thereof or therein having the power to tax, or any change in the application or official interpretation of such laws or regulations or rulings (including a holding by a court of competent jurisdiction in the United States), which change or amendment is enacted or adopted on or after the issue date of such series of Notes; provided that, prior to the publication of any notice of redemption pursuant to this paragraph, we have delivered to the trustee a certificate signed by one of our officers stating that we are entitled to effect such redemption and setting forth a statement of facts showing that the conditions precedent to our right so to redeem have occurred; or

(ii) on or after the issue date of such series of Notes, any action is taken by a taxing authority of, or any decision has been rendered by a court of competent jurisdiction in, the United States or any political subdivision of or in the United States or any authority thereof or therein having the power to tax, including any of those actions specified in clause (i) above, whether or not such action was taken or decision was rendered with respect to us, or any change, amendment, application or interpretation is officially proposed, which, in any such case, in the written opinion of independent tax counsel of nationally recognized standing, will result in a material probability that we will become obliged to pay additional amounts with respect to such series of Notes; provided that, prior to the publication of any notice of redemption pursuant to this paragraph, we have delivered to the trustee a certificate signed by one of our officers stating that we are entitled to effect such redemption and setting forth a statement of facts showing that the conditions precedent to our right so to redeem have occurred. However, no such notice of redemption shall be given less than 30 or more than 90 days prior to the earliest date on which we would be obliged to pay such additional amounts if a payment in respect of such series of Notes were then due.

0.500% 2022 Notes, 2025 Notes, 1.375% 2026 Notes, 2027 Notes, 2028 Notes, 2029 Notes, 1.250% 2030 Notes, 1.875% 2030 Notes, 2.500% 2031 Notes, 2032 Notes, 2035 Notes, 2036 Notes, 2038 Notes and 2039 Notes

Each of the 0.500% 2022 Notes, 2025 Notes, 1.375% 2026 Notes, 2027 Notes, 2028 Notes, 2029 Notes, 1.250% 2030 Notes, 1.875% 2030 Notes, 2.500% 2031 Notes, 2032 Notes, 2035 Notes, 2036 Notes, 2038 Notes and 2039 Notes may be redeemed at our option, in whole but not in part, at any time on giving not less than 30 nor more than 90 days' notice to the noteholders (which notice shall be irrevocable), at their principal amount, together with interest accrued to the date fixed for redemption, if:

(i) we have or will become obliged to pay additional amounts with respect to such series of Notes as provided or referred to under "-Withholding Taxes-*0.500% 2022 Notes, 2025 Notes, 1.375% 2026 Notes, 2027 Notes, 2028 Notes, 2029 Notes, 1.250% 2030 Notes, 1.875% 2030 Notes, 2.500% 2031 Notes, 2032 Notes, 2035 Notes, 2036 Notes, 2038 Notes and 2039 Notes*" below as a result of any change in, or amendment to, the laws, treaties, or rulings of the United States or any political subdivision or any authority thereof or therein having the power to tax, or any change in the application or official interpretation of such laws or regulations or rulings (including a holding by a court of competent jurisdiction in the United States), which change or amendment is enacted or adopted on or after the issue date of such series of Notes; or

(ii) on or after the issue date of such series of Notes, any action is taken by a taxing authority of, or any decision has been rendered by a court of competent jurisdiction in, the United States or any political subdivision of or in the United States or any authority thereof or therein having the power to tax, including any of those actions specified in clause (i) above, whether or not such action was taken or decision was rendered with respect to us, or any change, amendment, application or interpretation is officially proposed, which, in any such case, will result in a material probability that we will become obliged to pay additional amounts with respect to such series of Notes; provided that, prior to the publication of any notice of redemption pursuant to this paragraph, we have delivered to the trustee a certificate signed by one of our officers stating that we are entitled to effect such redemption and setting forth a statement of facts showing that the conditions precedent to our right so to redeem have occurred and a copy of an opinion of a reputable independent counsel of our choosing to that effect based on that statement of facts. However no such notice of redemption shall be given less than 30 nor more than 90 days prior to the earliest date on which we would be obliged to pay such additional amounts if a payment in respect of such series of Notes were then due.

Withholding Taxes

For purposes of all clauses described under "-Withholding Taxes", references to the holder or beneficial owner of a Note include a fiduciary, settlor, beneficiary or person holding power over such holder or beneficial owner, if such holder or beneficial owner is an estate or trust, or a partner, member or shareholder of such holder or beneficial owner, if such holder or beneficial owner is a partnership, limited liability company or corporation. In addition, we will not pay additional amounts to the holder of a Note if such holder or the beneficial owner of such Note is a fiduciary, partnership, limited liability company or other fiscally transparent entity, or if the holder of such Note is not the sole beneficial owner of such Note, as the case may be, to the extent that a beneficiary or settlor with respect to the fiduciary, or a beneficiary, partner or member of the partnership, limited liability company or other fiscally transparent entity, or a beneficial owner would not have been entitled to the payment of an additional amount had the beneficiary, settlor, beneficial owner, partner or member received directly its beneficial or distributive share of the payment. For purposes of "-Withholding Taxes," the term "Non-U.S. Person" means any person that is, for U.S. federal income tax purposes, a foreign corporation, nonresident alien individual, a nonresident fiduciary of a foreign estate or foreign trust or a foreign partnership one or more of the partners of which is such a foreign corporation, nonresident alien individual or nonresident fiduciary.

Any additional amounts paid pursuant to any clause described under "-Withholding Taxes" on the Euro Notes or the Sterling Notes will be paid in euro or GBP, respectively.

2.375% 2022 Notes, 4.073% 2024 Notes, 3.250% 2026 Notes and 2034 Notes

All payments of principal, interest and premium (if any) in respect of the 2.375% 2022 Notes, 4.073% 2024 Notes, 3.250% 2026 Notes and 2034 Notes by us or a paying agent on our behalf shall be made without withholding or deduction for or on account of any present or future taxes, duties, assessments or other governmental charges ("Taxes") imposed by or on behalf of the United States or any political subdivision thereof or any authority therein or thereof having the power to tax, unless the withholding or deduction of such Taxes is required by law. In that event, we shall pay to a holder that is a Non-U.S. Person such additional amounts as may be necessary to ensure that the net amount received by such holder, after withholding or deduction for or on account of such Taxes, will be equal to the amount such holder would have received in the absence of such withholding or deduction. However, no additional amounts shall be payable with respect to any Note if the beneficial owner is subject to taxation solely for reasons other than its ownership of Notes, nor shall additional amounts be payable for or on account of:

(i) any Tax that would not have been imposed, withheld or deducted but for any present or former connection (other than the mere fact of being a holder or beneficial owner of such Note) between the holder or the beneficial owner of such Note and the United States or the applicable political subdivision or authority, including, without limitation, such holder or beneficial owner being or having been a citizen or resident of the United States or the applicable political subdivision or authority or treated as being or having been a resident thereof;

(ii) any Tax that would not have been imposed, withheld or deducted but for the holder or beneficial owner of such Note being or having been with respect to the United States a personal holding company, a controlled foreign corporation, a passive foreign investment company, a foreign private foundation or other foreign tax-exempt organization, or a corporation that accumulates earnings to avoid U.S. federal income tax;

(iii) any Tax that is payable other than by withholding or deduction by us or a paying agent from payments in respect of such Note;

(iv) any gift, estate, inheritance, sales, transfer, personal property, excise or similar Tax;

(v) any Tax that would not have been imposed, withheld or deducted but for a change in any law, treaty, regulation, or administrative or judicial interpretation that becomes effective after the applicable payment becomes due or is duly provided for, whichever occurs later, to the extent such change in law, treaty, regulation or administrative interpretation would apply retroactively to such payment;

(vi) any Tax that would not have been imposed, withheld or deducted but for the presentation of such Note more than 30 days after the applicable payment becomes due or is duly provided for, whichever occurs later, except to the extent that such holder would have been entitled to such additional amounts on presenting such Note for payment on the last date of such period of 30 days;

(vii) any Tax that would not have been imposed, withheld or deducted but for the failure of a direct or indirect holder or beneficial owner of such Note to comply with applicable certification, information, documentation or other reporting requirements concerning the nationality, residence, identity or connection with the United States of such holder or beneficial owner;

(viii) any Tax that would not have been imposed, withheld or deducted but for the failure of the holder or beneficial owner of such Note to meet the requirements (including the statement requirements) of Section 871(h) or Section 881(c) of the Internal Revenue Code of 1986, as amended (the "Code"); or

(ix) any combination of items (i)-(viii).

1.625% 2024 Notes and 2.625% 2031 Notes

All payments of principal, interest and premium (if any) in respect of the 1.625% 2024 Notes and 2.625% 2031 Notes by us or a paying agent on our behalf shall be made without withholding or deduction for or on account of any Taxes imposed by or on behalf of the United States or any political subdivision thereof or any authority therein or thereof having the power to tax, unless the withholding or deduction of such Taxes is required by law. In that event, we shall pay to a holder that is a Non-U.S. Person such additional amounts as may be necessary to ensure that the net amount received by such holder, after withholding or deduction for or on account of such Taxes, will be equal to the amount such holder would have received in the absence of such withholding or deduction. However, no additional amounts shall be payable with respect to any Note if the beneficial owner is subject to taxation solely for reasons other than its ownership of Notes, nor shall additional amounts be payable for or on account of:

(i) any Tax that would not have been imposed, withheld or deducted but for any present or former connection (other than the mere fact of being a holder or beneficial owner of such Note) between the holder or the beneficial owner of such Note and the United States or the applicable political subdivision or authority, including, without limitation, such holder or beneficial owner being or having been a citizen or resident of the United States or the applicable political subdivision or authority or treated as being or having been a resident thereof;

(ii) any Tax that would not have been imposed, withheld or deducted but for the holder or beneficial owner of such Note being or having been with respect to the United States a personal holding company, a controlled foreign corporation, a passive

foreign investment company, a foreign private foundation or other foreign tax-exempt organization, or a corporation that accumulates earnings to avoid U.S. federal income tax;

(iii) any Tax that is payable other than by withholding or deduction by us or a paying agent from payments in respect of such Note;

(iv) any gift, estate, inheritance, sales, transfer, personal property, excise or similar Tax;

(v) any Tax that would not have been imposed, withheld or deducted but for a change in any law, treaty, regulation, or administrative or judicial interpretation that becomes effective after the applicable payment becomes due or is duly provided for, whichever occurs later, to the extent such change in law, treaty, regulation or administrative interpretation would apply retroactively to such payment;

(vi) any Tax that would not have been imposed, withheld or deducted but for the presentation of such Note more than 30 days after the applicable payment becomes due or is duly provided for, whichever occurs later, except to the extent that such holder would have been entitled to such additional amounts on presenting such Note for payment on the last date of such period of 30 days;

(vii) any Tax that would not have been imposed, withheld or deducted but for the failure of a direct or indirect holder or beneficial owner of such Note to comply with applicable certification, information, documentation or other reporting requirements concerning the nationality, residence, identity or connection with the United States of such holder or beneficial owner;

(viii) any Tax that would not have been imposed, withheld or deducted but for the failure of the holder or beneficial owner of such Note to meet the requirements (including the statement requirements) of Section 871(h) or Section 881(c) of the Code; or

(ix) any Tax imposed pursuant to Sections 1471 through 1474 of the Code, any current or future regulations or official interpretations thereof, any agreements entered pursuant to Section 1471(b) of the Code and any intergovernmental agreements (and related legislation or official administrative guidance) implementing the foregoing; or

(x) any combination of items (i)-(ix).

0.500% 2022 Notes, 2025 Notes, 1.375% 2026 Notes, 2027 Notes, 2028 Notes, 2029 Notes, 1.250% 2030 Notes, 1.875% 2030 Notes, 2.500% 2031 Notes, 2032 Notes, 2035 Notes, 2036 Notes, 2038 Notes and 2039 Notes

All payments of principal, interest and premium (if any) in respect of the 0.500% 2022 Notes, 2025 Notes, 1.375% 2026 Notes, 2027 Notes, 2028 Notes, 2029 Notes, 1.250% 2030 Notes, 1.875% 2030 Notes, 2.500% 2031 Notes, 2032 Notes, 2035 Notes, 2036 Notes, 2038 Notes and 2039 Notes by us or a paying agent on our behalf shall be made without withholding or deduction for or on account of any Taxes imposed by or on behalf of the United States or any political subdivision thereof or any authority therein or thereof having the power to tax, unless the withholding or deduction of such Taxes is required by law. In that event, we shall pay to a holder that is a Non-U.S. Person such additional amounts as may be necessary to ensure that the net amount received by such holder, after withholding or deduction for or on account of such Taxes, will be equal to the amount such holder would have received in the absence of such withholding or deduction. However, no additional amounts shall be payable with respect to any Note if the beneficial owner is subject to taxation solely for reasons other than its ownership of Notes, nor shall additional amounts be payable for or on account of:

(i) any Tax that would not have been imposed, withheld or deducted but for any present or former connection (other than the mere fact of being a holder or beneficial owner of such Note) between the holder or the beneficial owner of such Note and the United States or the applicable political subdivision or authority, including, without limitation, such holder or beneficial owner being or having been a citizen or resident of the United States or the applicable political subdivision or authority or treated as being or having been a resident thereof;

(ii) any Tax that would not have been imposed, withheld or deducted but for the holder or beneficial owner of such Note being or having been with respect to the United States a personal holding company, a controlled foreign corporation, a passive foreign investment company, a foreign private foundation or other foreign tax-exempt organization, or a corporation that accumulates earnings to avoid U.S. federal income tax;

(iii) any Tax that is payable other than by withholding or deduction by us or a paying agent from payments in respect of such Note;

(iv) any gift, estate, inheritance, sales, transfer, value added, personal property, excise or similar Tax;

(v) any Tax that would not have been imposed, withheld or deducted but for a change in any law, treaty, regulation, or administrative or judicial interpretation that becomes effective after the applicable payment becomes due or is duly provided for, whichever occurs later;

(vi) any Tax that would not have been imposed, withheld or deducted but for the presentation of such Note for payment more than 30 days after the applicable payment becomes due or is duly provided for, whichever occurs later, except to the extent

that such holder would have been entitled to such additional amounts on presenting such Note for payment on the last date of such period of 30 days;

(vii) any Tax that would not have been imposed, withheld or deducted but for the failure of the holder or beneficial owner of such Note to comply with applicable certification, information, documentation or other reporting requirements concerning the nationality, residence, identity or connection with the United States of such holder or beneficial owner;

(viii) any Tax that would not have been imposed, withheld or deducted but for the failure of the holder or beneficial owner (or any financial institution or other person through which the holder or beneficial owner holds any Notes) to comply with any certification, information, identification, documentation or other reporting requirements with respect to itself or any beneficial owner or account holders thereof;

(ix) any Tax that would not have been imposed, withheld or deducted but for the failure of the holder or beneficial owner of such Note to meet the requirements (including the statement requirements) of Section 871(h) or Section 881(c) of the Code;

(x) any Tax imposed by the Foreign Account Tax Compliance Act pursuant to Sections 1471 through 1474 of the Code, any current or future regulations or official interpretations thereof, any agreements entered into pursuant to Section 1471(b) of the Code and any intergovernmental agreements (and related legislation or official administrative guidance) implementing the foregoing; or

(xi) any combination of items (i)-(x).

Book-Entry Only Form

Each series of Notes was issued in book-entry only form, which means that it is represented by one or more permanent global securities registered in the name of The Depository Trust Company, New York, New York ("DTC"), or its nominee. We refer to this form as "book-entry only."

For debt securities issued in book-entry only form, DTC keeps a computerized record of its participants (for example, a broker) whose clients have purchased the securities. Each participant then keeps a record of its clients who purchased the securities. A global security may not be transferred, except that DTC, its nominees and their successors may transfer an entire global security to one another.

For book-entry only debt securities, we wire principal and interest payments to DTC's nominee. We and the trustee treat DTC's nominee as the owner of the global securities for all purposes. Accordingly, neither we nor the trustee have any direct responsibility or liability to pay amounts due on the debt securities issued under the Indenture to owners of beneficial interests in the global securities.

Under book-entry only form, we have not issued physical certificates representing beneficial interests in the global securities to individual holders of the debt securities. Beneficial interests in global securities will be shown on, and transfers of global securities will be made only through, records maintained by DTC and its participants and will be exchangeable for debt securities in certificated form with the same terms in authorized denominations only if:

- DTC notifies us that it is unwilling or unable to continue as depository;
- DTC ceases to be a clearing agency registered under applicable law and a successor depository is not appointed by us within 90 days; or
- We instruct the trustee that the global security is exchangeable for debt securities in certificated form.

Defeasance

The Indenture permits us to discharge or defease certain of our obligations on any series of debt securities issued under the Indenture at any time. We may defease such obligations relating to a series of debt securities by depositing with the trustee sufficient cash or government securities to pay all sums due on that series of debt securities.

Liens on Assets

The Notes and other debt securities will not be secured. However, if at any time we mortgage, pledge or subject to any lien any of our property or assets, the Indenture requires us to secure the Notes and other debt securities issued under the Indenture equally and ratably with the debt or obligations secured by such mortgage, pledge or lien for as long as such debt or obligations remain secured. Exceptions to this requirement include the following:

- purchase-money mortgages or liens;
- liens on any property or asset that existed at the time when we acquired that property or asset;
- any deposit or pledge to secure public or statutory obligations;
- any deposit or pledge with any governmental agency required to qualify us to conduct any part of our business, to entitle us to maintain self-insurance or to obtain the benefits of any law relating to workmen's compensation, unemployment insurance, old age pensions or other social security; or

- any deposit or pledge with any court, board, commission or governmental agency as security for the proper conduct of any proceeding before it.

The Indenture does not prevent any of our affiliates from mortgaging, pledging or subjecting to any lien, any property or asset, even if the affiliate acquired that property or asset from us.

We may issue or assume an unlimited amount of debt under the Indenture.

Changes to the Indenture

The Indenture may be changed with the consent of holders owning more than 50% of the principal amount of the outstanding debt securities of each series affected by the change. However, we may not change principal or interest payment terms of the Notes or the percentage required to change other terms of the Indenture without consent of the holders of the Notes and the consent of others similarly affected.

We may enter into supplemental indentures for other specified purposes, including the creation of any new series of debt securities, without the consent of any holder of debt securities issued under the Indenture.

Consolidation, Merger or Sale

The Indenture provides that we may not merge with another company or sell, transfer or lease all or substantially all of our property to another company unless:

- the successor corporation expressly assumes:
- payment of principal, interest and any premium on the debt securities issued under the Indenture; and
- performance and observance of all covenants and conditions in the Indenture;
- after giving effect to the transaction, there is no default under the Indenture;
- we have delivered to the trustee an officers' certificate and opinion of counsel stating that such transaction complies with the conditions set forth in the Indenture; and
- if as a result of the transaction, our property would become subject to a lien that would not be permitted by the asset lien restriction, we secure the debt securities Issued under the Indenture equally and ratably with, or prior to, all indebtedness secured by that lien.

Events of Default

An event of default means, for any series of debt securities issued under the Indenture, any of the following:

- failure to pay interest on that series of debt securities for 90 days after payment is due;
- failure to pay principal or any premium on that series of debt securities when due;
- failure to perform any other covenant relating to that series of debt securities for 90 days after notice to us;
- certain events of bankruptcy, insolvency and reorganization; and
- any other event of default provided for in the supplement to the Indenture, board resolution or officers' certificate designating the specific terms of such series of debt securities.

An event of default for a particular series of debt securities does not necessarily impact any other series of debt securities issued under the Indenture.

If an event of default for any series of debt securities occurs and continues, the trustee or the holders of at least 25% of the outstanding principal amount of the debt securities of such series may declare the entire principal of all the debt securities of that series to be due and payable immediately. If this happens, subject to certain conditions, the holders of a majority of the outstanding principal amount of the debt securities of that series can rescind the declaration if there has been deposited with the trustee a sum sufficient to pay all matured installments of interest, principal and any premium.

The holders of more than 50% of the outstanding principal amount of any series of the debt securities, may, on behalf of the holders of all of the debt securities of that series, control any proceedings resulting from an event of default or waive any past default except a default in the payment of principal, interest or any premium. We are required to file an annual certificate with the trustee stating whether we are in compliance with all of the conditions and covenants under the Indenture.

Concerning the Trustee

Within 90 days after a default occurs with respect to a particular series of Notes, the trustee must notify the holders of such series of Notes of all defaults known to the trustee if we have not remedied them (default is defined to mean any event which is, or after notice or lapse of time or both would become, an event of default with respect to such series of Notes as specified above under "-Events of Default"). If a default described in the third bullet point under "-Events of Default" occurs, the trustee will not give notice to the holders of the series until at

least 60 days after the occurrence of that default. The trustee may withhold notice to the holders of the Notes of any default (except in the payment of principal, interest or any premium) if it in good faith believes that withholding this notice is in the interest of the holders.

Prior to an event of default, the trustee is required to perform only the specific duties stated in the Indenture, and after an event of default, must exercise the same degree of care as a prudent individual would exercise in the conduct of his or her own affairs. The trustee is not required to take any action permitted by the Indenture at the request of holders of the debt securities, unless those holders protect the trustee against costs, expenses and liabilities. The trustee is not required to spend its own funds or become financially liable when performing its duties if it reasonably believes that it will not be adequately protected financially.

U.S. Bank National Association, the trustee for the Notes, and its affiliates have commercial banking relationships with us and some of our affiliates and serves as trustee or paying agent under indentures relating to debt securities issued by us and some of our affiliates.

The graph compares the cumulative total returns of Verizon, the S&P 500 Stock Index and the S&P 500 Telecommunications Services Index over a five-year period. It assumes $100 was invested on December 31, 2014 with dividends being reinvested.

Management's Discussion and Analysis of Financial Condition and Results of Operations

Overview

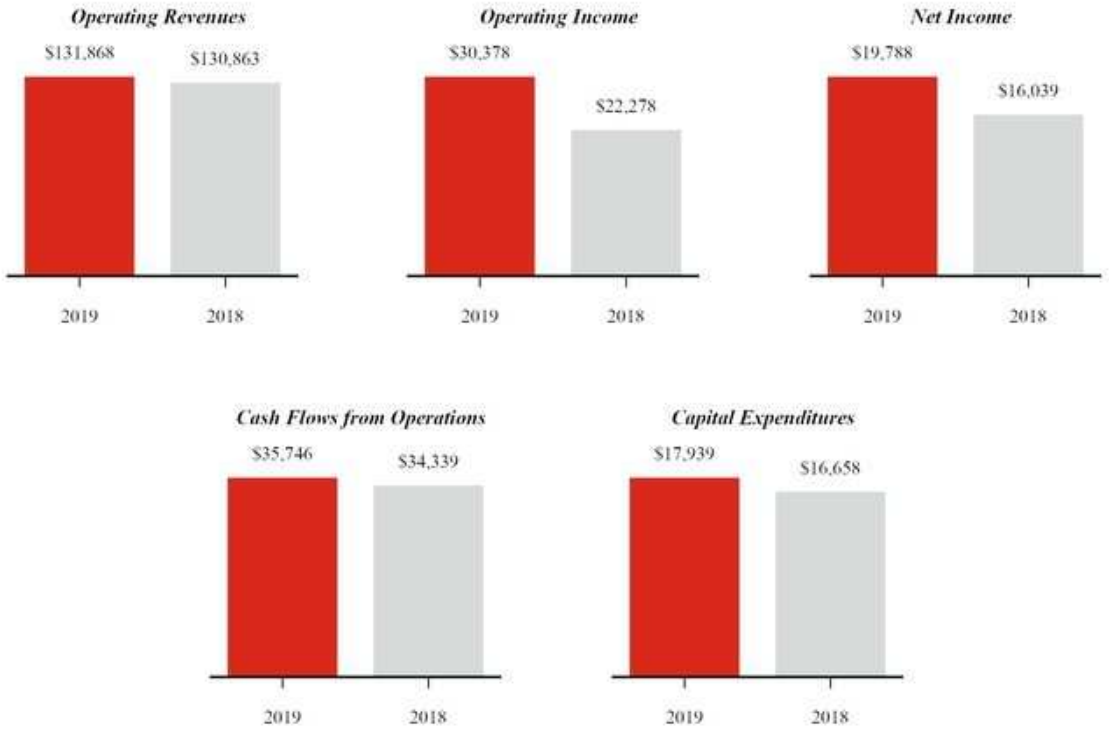
Verizon Communications Inc. (Verizon or the Company) is a holding company that, acting through its subsidiaries, is one of the world's leading providers of communications, information and entertainment products and services to consumers, businesses and government entities. With a presence around the world, we offer voice, data and video services and solutions on our networks that are designed to meet customers' demand for mobility, reliable network connectivity, security and control. We have a highly diverse workforce of approximately 135,000 employees as of December 31, 2019.

To compete effectively in today's dynamic marketplace, we are focused on the capabilities of our high-performing networks to drive growth based on delivering what customers want and need in the new digital world. During 2019, we focused on leveraging our network leadership; retaining and growing our high-quality customer base while balancing profitability; enhancing ecosystems in growth businesses; and driving monetization of our networks and solutions. We are creating business value by earning customers', employees' and shareholders' trust, limiting our environmental impact and continuing our customer growth while creating social benefit through our products and services. Our strategy requires significant capital investments primarily to acquire wireless spectrum, put the spectrum into service, provide additional capacity for growth in our networks, invest in the fiber that supports our businesses, evolve and maintain our networks and develop and maintain significant advanced information technology systems and data system capabilities. We believe that steady and consistent investments in our networks and platforms will drive innovative products and services and fuel our growth.

We are consistently deploying new network architecture and technologies to extend our leadership in both fourth-generation (4G) and fifth-generation (5G) wireless networks. We expect that our next-generation multi-use platform, which we call the Intelligent Edge Network, will simplify operations by eliminating legacy network elements, improve 4G Long-Term Evolution (LTE) wireless coverage, speed the deployment of 5G wireless technology and create new opportunities in the business market. Our network leadership is the hallmark of our brand and the foundation for the connectivity, platform and solutions upon which we build our competitive advantage.

Highlights of Our 2019 Financial Results

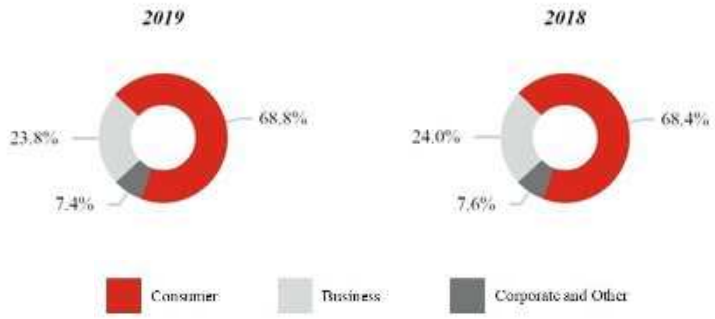
(dollars in millions)



Business Overview

In November 2018, we announced a strategic reorganization of our business. Under the new structure, effective April 1, 2019, there are two reportable segments that we operate and manage as strategic business units - Verizon Consumer Group (Consumer) and Verizon Business Group (Business).

Revenue by Segment



Note: Excludes eliminations.

Verizon Consumer Group

Our Consumer segment provides consumer-focused wireless and wireline communications services and products. Our wireless services are provided across one of the most extensive wireless networks in the United States (U.S.) under the Verizon brand and through wholesale and other arrangements. Our wireline services are provided in nine states in the Mid-Atlantic and Northeastern U.S., as well as Washington D.C., over our 100% fiber-optic network under the Fios brand and over a traditional copper-based network to customers who are not served by Fios. Our Consumer segment's wireless and wireline products and services are available to our retail customers, as well as resellers that purchase wireless network access from us on a wholesale basis.

Customers can obtain our wireless services on a postpaid or prepaid basis. A retail postpaid connection represents an individual line of service for a wireless device for which a customer is generally billed one month in advance for a monthly access charge in return for access to and usage of network services. Our prepaid service is offered only to Consumer customers and enables individuals to obtain wireless services without credit verification by paying for all services in advance. The Consumer segment also offers several categories of wireless equipment to customers, including a variety of smartphones and other handsets, wireless-enabled Internet devices, such as tablets, laptop computers and netbooks, and other wireless-enabled connected devices, such as smart watches and other wearables.

In addition to the wireless services and equipment discussed above, Consumer sells residential fixed connectivity solutions, including Internet, video and voice services, and wireless network access to resellers on a wholesale basis. The Consumer segment's operating revenues for the year ended December 31, 2019 totaled $91.1 billion, an increase of $1.3 billion, or 1.4%, compared to the year ended December 31, 2018. As of December 31, 2019, Consumer had approximately 95 million wireless retail connections, 6 million broadband connections and 4 million Fios video connections.

Verizon Business Group

Our Business segment provides wireless and wireline communications services and products, video and data services, corporate networking solutions, security and managed network services, local and long distance voice services and network access to deliver various Internet of Things (IoT) services and products, including solutions that support fleet tracking management, compliance management, field service management, asset tracking and other types of mobile resource management. We provide these products and services to businesses, government customers and wireless and wireline carriers across the U.S. and select products and services to customers around the world. The Business segment's operating revenues for the year ended December 31, 2019 totaled $31.4 billion, a decrease of $91 million, or 0.3%, compared to the year ended December 31, 2018. As of December 31, 2019, Business had approximately 25 million wireless retail postpaid connections and 489 thousand broadband connections.

Corporate and Other

Corporate and other includes the results of our media business, Verizon Media, and other businesses, investments in unconsolidated businesses, insurance captives, unallocated corporate expenses, certain pension and other employee benefit related costs and interest and financing expenses. Corporate and other also includes the historical results of divested businesses and other adjustments and gains and losses that are not allocated in assessing segment performance due to their nature. Although such transactions are excluded from the business segment results, they are included in reported consolidated earnings. Gains and losses from transactions that are not individually significant are included in segment results as these items are included in the chief operating decision maker’s assessment of segment performance.

Verizon Media includes diverse media and technology brands that serve both consumers and businesses. Verizon Media provides consumers with owned and operated and third-party search properties as well as mail, news, finance, sports and entertainment offerings, and provides other businesses and partners access to consumers through digital advertising, content delivery and video streaming platforms. Verizon Media's total operating revenues were $7.5 billion for the year ended December 31, 2019. This was a decrease of 3.0% from the year ended December 31, 2018.

Capital Expenditures and Investments

We continue to invest in our wireless networks, high-speed fiber and other advanced technologies to position ourselves at the center of growth trends for the future. During the year ended December 31, 2019, these investments included $17.9 billion for capital expenditures. See "Cash Flows Used in Investing Activities" and "Operating Environment and Trends" for additional information. We believe that our investments aimed at expanding our portfolio of products and services will provide our customers with an efficient, reliable infrastructure for competing in the information economy.

Global Network and Technology

We are focusing our capital spending on adding capacity and density to our 4G LTE network, while also building our next generation 5G network. We are densifying our network by utilizing small cell technology, in-building solutions and distributed antenna systems. Network densification enables us to add capacity to address increasing mobile video consumption and the growing demand for IoT products and services on our 4G LTE and 5G networks. Over the past several years, we have been leading the development of 5G wireless technology industry standards and the ecosystems for fixed and mobile 5G wireless services. We believe 5G technology will be able to provide users with eight capabilities, or currencies. The eight currencies are peak data rates, mobile data volumes, mobility, number of connected devices, energy efficiency of connected devices, service deployment, reduced latency and improved reliability. We expect that 5G technology will provide higher throughput and lower latency than the current 4G LTE technology and enable our networks to handle more traffic as the number of Internet-connected devices grows. During 2018, we commercially launched 5G Home on proprietary standards in four U.S. markets and on global standards in a fifth U.S. market in 2019. We also launched our 5G Ultra Wideband Network in 31 U.S. markets in 2019, as well as several 5G-compatible smartphones.

To compensate for the shrinking market for traditional copper-based products, we continue to build our wireline business around fiber-based networks supporting data, video and advanced business services - areas where demand for reliable high-speed connections is growing. We are evolving the architecture of our networks to a next-generation multi-use platform, providing improved efficiency and virtualization, increased automation and opportunities for edge computing services that will support both our fiber-based and radio access network technologies. We call this the Intelligent Edge Network. We expect that this new architecture will simplify operations by eliminating legacy network elements, improve our 4G LTE wireless coverage, speed the deployment of 5G wireless technology and create new opportunities in the business market.

Recent Developments

In 2019, the Federal Communications Commission (FCC) completed two millimeter wave spectrum license auctions. Verizon participated in these auctions and was the high bidder on 9 and 1,066 licenses, respectively, in the 24 Gigahertz (GHz) and 28 GHz bands. We submitted an application to the FCC and paid cash of approximately $521 million for the licenses. We received the licenses during the fourth quarter of 2019.

In December 2019, the FCC incentive auction for spectrum licenses in the upper 37 GHz, 39 GHz, and 47 GHz bands commenced. As an incumbent licensee, Verizon received vouchers related to our existing 39 GHz licenses. These vouchers can be converted into cash, the amount of which will not be known until the conclusion of the auction, or applied toward the purchase price of spectrum in the auction. At the conclusion of the auction, all existing licenses will be cancelled and new reconfigured licenses or cash will be distributed depending on the results of the auction. Due to the FCC's rules restricting communications regarding the auction, we will not disclose our financial plans for the auction during the quiet period for this auction unless legally required. In addition, as of this time, until the completion of the auction process, we cannot determine the resulting financial outcome, including a potential gain or loss. Such gain or loss, if any, may be material.

Consolidated Results of Operations

In this section, we discuss our overall results of operations and highlight special items that are not included in our segment results. In "Segment Results of Operations," we review the performance of our two reportable segments in more detail. A detailed discussion of 2017 items and year-over-year comparisons between 2018 and 2017 that are not included in this Form 10-K can be found in the "Management's Discussion and Analysis of Financial Condition and Results of Operations" for the year ended December 31, 2018 filed with our most recent financial statements and included in the Company's Current Report on Form 8-K dated August 8, 2019.

Consolidated Revenues

(dollars in millions)

			Increase/(Decrease)	
Years Ended December 31,	**2019**	2018	**2019 vs. 2018**	
Consumer	**$ 91,056**	$ 89,762	$ 1,294	1.4 %
Business	**31,443**	31,534	(91)	(0.3)
Corporate and other	**9,812**	9,936	(124)	(1.2)
Eliminations	**(443)**	(369)	(74)	20.1
Consolidated Revenues	**$ 131,868**	$ 130,863	$ 1,005	0.8

Consolidated revenues increased $1.0 billion, or 0.8%, during 2019 compared to 2018, primarily due to an increase in revenues at our Consumer segment, partially offset by decreases in revenues at our Business segment and Corporate and other.

Revenues for our segments are discussed separately below under the heading "Segment Results of Operations."

Corporate and other revenues decreased $124 million, or 1.2%, during 2019 compared to 2018, primarily due to a decrease of $232 million in revenues within Verizon Media.

Consolidated Operating Expenses

(dollars in millions)

Years Ended December 31,	2019	2018	Increase/(Decrease) 2019 vs. 2018	
Cost of services	**$ 31,772**	$ 32,185	$ (413)	(1.3)%
Cost of wireless equipment	**22,954**	23,323	(369)	(1.6)
Selling, general and administrative expense	**29,896**	31,083	(1,187)	(3.8)
Depreciation and amortization expense	**16,682**	17,403	(721)	(4.1)
Media goodwill impairment	**186**	4,591	(4,405)	(95.9)
Consolidated Operating Expenses	**$ 101,490**	$ 108,585	$ (7,095)	(6.5)

Operating expenses for our segments are discussed separately below under the heading "Segment Results of Operations."

Cost of Services

Cost of services includes the following costs directly attributable to a service: salaries and wages, benefits, materials and supplies, content costs, contracted services, network access and transport costs, customer provisioning costs, computer systems support, and costs to support our outsourcing contracts and technical facilities. Aggregate customer care costs, which include billing and service provisioning, are allocated between Cost of services and Selling, general and administrative expense.

Cost of services decreased $413 million, or 1.3%, during 2019 compared to 2018, primarily due to decreases in network access costs, a product realignment charge in 2018 (see "Special Items"), decreases in employee-related costs resulting from the Voluntary Separation Program and decreases in digital content costs. These decreases were partially offset by increases in rent expense as a result of adding capacity to the networks to support demand and the adoption of the new lease accounting standard in 2019, regulatory fees, and costs related to the device protection package offered to our wireless retail postpaid customers.

Cost of Wireless Equipment

Cost of wireless equipment decreased $369 million, or 1.6%, during 2019 compared to 2018, primarily as a result of declines in the number of wireless devices sold as a result of an elongation of the handset upgrade cycle, partially offset by a shift to higher priced devices in the mix of wireless devices sold.

Selling, General and Administrative Expense

Selling, general and administrative expense includes salaries and wages and benefits not directly attributable to a service or product, bad debt charges, taxes other than income taxes, advertising and sales commission costs, call center and information technology costs, regulatory fees, professional service fees, and rent and utilities for administrative space. Also included is a portion of the aggregate customer care costs as discussed above in "Cost of Services."

Selling, general and administrative expense decreased $1.2 billion, or 3.8%, during 2019 compared to 2018, primarily due to decreases in employee-related costs primarily due to the Voluntary Separation Program, a decrease in severance, pension and benefits charges (see "Special Items"), the acquisition and integration related charges in 2018 primarily related to the acquisition of Yahoo's operating business (see "Special Items") and a net gain from dispositions of assets and businesses in 2019 (see "Special Items"), partially offset by increases in advertising expenses, sales commission and bad debt expense. The increase in sales commission expense during 2019 compared to 2018, was primarily due to a lower net deferral of commission costs as a result of the adoption of Topic 606 on January 1, 2018, using a modified retrospective approach.

Depreciation and Amortization Expense

Depreciation and amortization expense decreased $721 million, or 4.1%, during 2019 compared to 2018, primarily due to the change in the mix of net depreciable assets.

Media Goodwill Impairment

The goodwill impairment charges recorded in 2019 and 2018 for Verizon Media were a result of the Company's annual impairment test performed in the fourth quarter (see "Critical Accounting Estimates").

Other Consolidated Results

Other Income (Expense), Net

Additional information relating to Other income (expense), net is as follows:

(dollars in millions)

Years Ended December 31,	2019	2018	Increase/(Decrease) 2019 vs. 2018	
Interest income	**$ 121**	$ 94	$ 27	28.7 %
Other components of net periodic benefit cost	**627**	3,068	(2,441)	(79.6)
Early debt extinguishment costs	**(3,604)**	(725)	(2,879)	nm
Other, net	**(44)**	(73)	29	39.7
Total	**$ (2,900)**	$ 2,364	$ (5,264)	nm

nm - not meaningful

The change in Other income (expense), net during the year ended December 31, 2019, compared to the similar period in 2018, was primarily driven by early debt redemption costs of $3.6 billion recorded during 2019, compared to $725 million recorded during 2018 (see "Special Items") as well as pension and benefit charges of $126 million recorded in 2019, compared with pension and benefit credits of $2.1 billion recorded in 2018 (see "Special Items").

Interest Expense

(dollars in millions)

Years Ended December 31,	2019	2018	Increase/(Decrease) 2019 vs. 2018	
Total interest costs on debt balances	**$ 5,386**	$ 5,573	$ (187)	(3.4)%
Less capitalized interest costs	**656**	740	(84)	(11.4)
Total	**$ 4,730**	$ 4,833	$ (103)	(2.1)
Average debt outstanding	**$ 112,901**	$ 115,858		
Effective interest rate	**4.8%**	4.8%		

Total interest costs on debt balances decreased during 2019 primarily due to lower average debt balances.

Provision for Income Taxes

(dollars in millions)

Years Ended December 31,	2019	2018	Increase/(Decrease) 2019 vs. 2018	
Provision for income taxes	**$ 2,945**	$ 3,584	$ (639)	(17.8)%
Effective income tax rate	**13.0%**	18.3%		

The effective income tax rate is calculated by dividing the provision for income taxes by income before income taxes. The effective income tax rate for 2019 was 13.0% compared to 18.3% for 2018. The decrease in the effective income tax rate and the provision for income taxes was primarily due to the recognition of approximately $2.2 billion of a non-recurring tax benefit in connection with the disposition of preferred stock, representing a minority interest in a foreign affiliate in 2019 compared to the non-recurring deferred tax benefit of approximately $2.1 billion as a result of an internal reorganization of legal entities within the historical Wireless business, which was offset by a goodwill charge that is not deductible for tax purposes in 2018.

A reconciliation of the statutory federal income tax rate to the effective income tax rate for each period is included in Note 12 to the consolidated financial statements.

Consolidated Net Income, Consolidated EBITDA and Consolidated Adjusted EBITDA

Consolidated earnings before interest, taxes, depreciation and amortization expenses (Consolidated EBITDA) and Consolidated Adjusted EBITDA, which are presented below, are non-generally accepted accounting principles (GAAP) measures that we believe are useful to management, investors and other users of our financial information in evaluating operating profitability on a more variable cost basis as they exclude the depreciation and amortization expense related primarily to capital expenditures and acquisitions that occurred in prior years, as well as in evaluating operating performance in relation to Verizon's competitors. Consolidated EBITDA is calculated by adding back interest, taxes, and depreciation and amortization expenses to net income.

Consolidated Adjusted EBITDA is calculated by excluding from Consolidated EBITDA the effect of the following non-operational items: equity in losses of unconsolidated businesses and other income and expense, net, as well as the effect of special items. We believe that this measure is useful to management, investors and other users of our financial information in evaluating the effectiveness of our operations and underlying business trends in a manner that is consistent with management's evaluation of business performance. We believe that Consolidated Adjusted EBITDA is widely used by investors to compare a company's operating performance to its competitors by minimizing impacts caused by differences in capital structure, taxes and depreciation policies. Further, the exclusion of non-operational items and special items enables comparability to prior period performance and trend analysis. See "Special Items" for additional information.

It is management's intent to provide non-GAAP financial information to enhance the understanding of Verizon's GAAP financial information, and it should be considered by the reader in addition to, but not instead of, the financial statements prepared in accordance with GAAP. Each non-GAAP financial measure is presented along with the corresponding GAAP measure so as not to imply that more emphasis should be placed on the non-GAAP measure. We believe that non-GAAP measures provide relevant and useful information, which is used by management, investors and other users of our financial information, as well as by our management in assessing both consolidated and segment performance. The non-GAAP financial information presented may be determined or calculated differently by other companies and may not be directly comparable to that of other companies.

(dollars in millions)

Years Ended December 31,		**2019**		2018
Consolidated Net Income	**$**	**19,788**	$	16,039

Acquisition and integration related charges§		**—**		531
Product realignment charges§		**—**		450
Impairment charges		**186**		4,591
Net gain from dispositions of assets and businesses		**(261)**		—
Consolidated Adjusted EBITDA	**$**	**47,189**	$	47,410

† Includes Pension and benefits mark-to-market adjustments and early debt redemption costs, where applicable.
‡ Includes Product realignment charges and impairment charges, where applicable.
§ Excludes depreciation and amortization expense.

The changes in Consolidated Net Income, Consolidated EBITDA and Consolidated Adjusted EBITDA in the table above were primarily a result of the factors described in connection with operating revenues and operating expenses.

Segment Results of Operations

We have two reportable segments that we operate and manage as strategic business units, Consumer and Business. We measure and evaluate our reportable segments based on segment operating income. The use of segment operating income is consistent with the chief operating decision maker's assessment of segment performance.

To aid in the understanding of segment performance as it relates to segment operating income, we use the following operating statistics to evaluate the overall effectiveness of our segments:

Wireless retail connections are retail customer device postpaid and prepaid connections. Retail connections under an account may include those from smartphones and basic phones (collectively, phones) as well as tablets and other Internet devices, including wearables and retail IoT devices.

Wireless retail postpaid connections are retail postpaid customer device connections. Retail connections under an account may include those from phones, as well as tablets and other Internet devices, including wearables and retail IoT devices.

Fios Internet connections are the total number of connections to the Internet using Fios Internet services.

Fios video connections are the total number of connections to traditional linear video programming using Fios video services.

Broadband connections are the total number of connections to the Internet using Digital Subscriber Line (DSL) and Fios Internet services.

Voice connections are the total number of traditional switched access lines in service and Fios digital voice connections.

Wireless retail connections, net additions are the total number of additional retail customer device postpaid and prepaid connections, less the number of device disconnects within the current period.

Wireless retail postpaid connections, net additions are the total number of additional retail customer device postpaid connections, less the number of device disconnects within the current period.

Churn is the rate at which service to either retail or postpaid retail connections is terminated on a monthly basis.

Wireless retail postpaid ARPA is the calculated average service revenue per account (ARPA) from retail postpaid accounts, which does not include recurring device payment plan billings related to the Verizon device payment program, plan billings related to total mobile protection packages or regulatory fees.

Wireless retail postpaid accounts are retail customers that are directly served and managed under the Verizon brand and use its services. Accounts include unlimited plans, shared data plans and corporate accounts, as well as legacy single connection plans and family plans. A single account may include monthly wireless services for a variety of connected devices.

Wireless retail postpaid connections per account is calculated by dividing the total number of retail postpaid connections by the number of retail postpaid accounts as of the end of the period.

Segment earnings before interest, taxes, depreciation and amortization (Segment EBITDA), which is presented below, is a non-GAAP measure and does not purport to be an alternative to operating income as a measure of operating performance. We believe this measure is useful to management, investors and other users of our financial information in evaluating operating profitability on a more variable cost basis as it excludes the depreciation and amortization expenses related primarily to capital expenditures and acquisitions that occurred in prior years, as well as in evaluating operating performance in relation to our competitors. Segment EBITDA is calculated by adding back depreciation and amortization expense to segment operating income. Segment EBITDA margin is calculated by dividing Segment EBITDA by total segment operating revenues. You can find additional information about our segments in Note 13 to the consolidated financial statements.

Verizon Consumer Group

Our Consumer segment provides consumer-focused wireless and wireline communications services and products. Our wireless services are provided across one of the most extensive wireless networks in the United States under the Verizon brand and through wholesale and other arrangements. Our wireline services are provided in nine states in the Mid-Atlantic and Northeastern U.S., as well as Washington D.C., over our 100% fiber-optic network under the Fios brand and over a traditional copper-based network to customers who are not served by Fios.

Operating Revenues and Selected Operating Statistics

(dollars in millions, except ARPA)

Years Ended December 31,	2019	2018	Increase/(Decrease) 2019 vs. 2018	
Service	**$ 65,383**	$ 64,223	$ 1,160	1.8 %

Wireless retail postpaid connections per account[1]	**2.67**	2.64	0.03	1.1

[1] As of end of period
[2] Excluding acquisitions and adjustments

Consumer's total operating revenues increased $1.3 billion, or 1.4%, during 2019 compared to 2018, primarily as a result of increases in Service and Other revenues, partially offset by a decrease in Wireless equipment revenue.

Service Revenue

Service revenue increased $1.2 billion, or 1.8%, during 2019 compared to 2018, primarily due to increases in wireless service and Fios revenues, partially offset by decreases in wireline voice and DSL services.

Wireless service revenue increased $1.3 billion, or 2.5%, during 2019 compared to 2018, due to increases in wireless access revenue, driven by customers shifting to higher access plans including unlimited plans and increases in the number of devices per account, the declining fixed-term subsidized plan base and growth from reseller accounts. Wireless retail postpaid ARPA increased 2.3%.

For the year ended December 31, 2019, Fios revenues totaled $10.4 billion and increased $92 million, or 0.9%, compared to 2018. This increase was due to a 2.5% increase in Fios Internet connections, reflecting increased demand in higher broadband speeds, partially offset by a 5.1% decrease in Fios video connections, reflecting the ongoing shift from traditional linear video to over-the-top (OTT) offerings.

Service revenue attributable to wireline voice and DSL broadband services declined during 2019, compared to 2018. The declines are primarily due to a decrease of 9.1% in voice connections resulting primarily from competition and technology substitution with wireless and competing Voice over Internet Protocol (VoIP) and cable telephony services.

Wireless Equipment Revenue

Wireless equipment revenue decreased $827 million, or 4.4%, during 2019 compared to 2018, as a result of declines in wireless device sales primarily due to an elongation of the handset upgrade cycle and increased promotions. These decreases were partially offset by a shift to higher priced units in the mix of wireless devices sold.

Other Revenue

Other revenue includes non-service revenues such as regulatory fees, cost recovery surcharges, revenues associated with our device protection package, leasing and interest on equipment financed under a device payment plan agreement when sold to the customer by an authorized agent.

Other revenue increased $1.0 billion, or 14.4%, during 2019 compared to 2018, primarily due to pricing increases related to our wireless device protection plans, as well as regulatory fees.

Operating Expenses

(dollars in millions)

				Increase/(Decrease)	
Years Ended December 31,	**2019**	2018		**2019 vs. 2018**	
Cost of services	**$ 15,884**	$ 15,335	$	549	3.6 %
Cost of wireless equipment	**18,219**	18,763		(544)	(2.9)
Selling, general and administrative expense	**16,639**	15,701		938	6.0
Depreciation and amortization expense	**11,353**	11,952		(599)	(5.0)
Total Operating Expenses	**$ 62,095**	$ 61,751	$	344	0.6

Cost of Services

Cost of services increased $549 million, or 3.6%, during 2019 compared to 2018, primarily due to increases in rent expense as a result of adding capacity to the networks to support demand as well as an increase due to the adoption of the new lease accounting standard in 2019, increases in costs related to the device protection package offered to our wireless retail postpaid customers, as well as regulatory fees. These increases were partially offset by decreases in employee-related costs primarily due to the Voluntary Separation Program, as well as decreases in access costs and roaming.

Cost of Wireless Equipment

Cost of wireless equipment decreased $544 million, or 2.9%, during 2019 compared to 2018, primarily as a result of declines in the number of wireless devices sold as a result of an elongation of the handset upgrade cycle. These decrease were partially offset by a shift to higher priced devices in the mix of wireless devices sold.

Selling, General and Administrative Expense

Selling, general and administrative expense increased $938 million, or 6.0%, during 2019 compared to 2018, primarily due to increases in sales commission and bad debt expense, and an increase in advertising costs. The increase in sales commission expense during 2019 compared to 2018 was primarily due to a lower net deferral of commission costs as a result of the adoption of Topic 606 on January 1, 2018 using a modified retrospective approach. These increases were partially offset by decreases in employee-related costs primarily due to the Voluntary Separation Program.

Depreciation and Amortization Expense

Depreciation and amortization expense decreased $599 million, or 5.0%, during 2019 compared to 2018, driven by the change in the mix of total Verizon depreciable assets and Consumer's usage of those assets.

Segment Operating Income and EBITDA

(dollars in millions)

				Increase/(Decrease)	
Years Ended December 31,	**2019**	2018		**2019 vs. 2018**	
Segment Operating Income	**$ 28,961**	$ 28,011	$	950	3.4 %
Add Depreciation and amortization expense	**11,353**	11,952		(599)	(5.0)
Segment EBITDA	**$ 40,314**	$ 39,963	$	351	0.9
Segment operating income margin	**31.8%**	31.2%			
Segment EBITDA margin	**44.3%**	44.5%			

The changes in the table above during the periods presented were primarily a result of the factors described in connection with operating revenues and operating expenses.

Verizon Business Group

Our Business segment provides wireless and wireline communications services and products, video and data services, corporate networking solutions, security and managed network services, local and long distance voice services and network access to deliver various IoT services and products. We provide these products and services to businesses, government customers and wireless and wireline carriers across the U.S. and select products and services to customers around the world. The Business segment is organized in four customer groups: Global Enterprise, Small and Medium Business, Public Sector and Other, and Wholesale.

Operating Revenues and Selected Operating Statistics

(dollars in millions)

			Increase/(Decrease)	
Years Ended December 31,	**2019**	2018	**2019 vs. 2018**	
Global Enterprise	**$ 10,818**	$ 11,201	$ (383)	(3.4)%

Wireless retail postpaid phones	**0.99%**	0.98%		

[1] Service and other revenues included in our Business segment amounted to approximately $27.9 billion and $28.1 billion for the years ended December 31, 2019 and 2018, respectively. Wireless equipment revenues included in our Business segment amounted to approximately $3.5 billion and $3.4 billion for the years ended December 31, 2019 and 2018, respectively.
[2] As of end of period
[3] Includes certain adjustments

Business revenues decreased $91 million, or 0.3%, during 2019 compared to 2018, primarily due to decreases in Global Enterprise and Wholesale revenues, partially offset by increases in Small and Medium Business and Public Sector and Other revenues.

Global Enterprise

Global Enterprise offers services to large businesses, which are identified based on their size and volume of business with Verizon, as well as non-U.S. public sector customers.

Global Enterprise revenues decreased $383 million, or 3.4%, during 2019 compared to 2018, primarily due to declines in traditional data and voice communication services as a result of competitive price pressures. These revenue decreases were partially offset by increases in wireless service revenue.

Small and Medium Business

Small and Medium Business offers wireless services and equipment, tailored voice and networking products, Fios services, IP networking, advanced voice solutions, security and managed information technology services to our U.S.-based customers that do not meet the requirements to be categorized as Global Enterprise.

Small and Medium Business revenues increased $712 million, or 6.6%, during 2019 compared to 2018, primarily due to an increase in wireless postpaid service revenue of 11.7% as a result of increases in the amount of wireless retail postpaid connections. These increases were further driven by increased wireless equipment revenue resulting from a shift to higher priced units in the mix of wireless devices sold and increases in

the number of wireless devices sold, increased revenue related to our wireless device protection package, as well as increased revenue related to Fios services. These revenue increases were partially offset by revenue declines related to the loss of voice and DSL service connections.

Small and Medium Business Fios revenues totaled $915 million and increased $110 million, or 13.7%, during 2019 compared to 2018, reflecting the increase in total connections, as well as increased demand for higher broadband speeds.

Public Sector and Other

Public Sector and Other offers wireless products and services as well as wireline connectivity and managed solutions to U.S. federal, state and local governments and educational institutions. These services include the business services and connectivity similar to the products and services offered by Global Enterprise, in each case, with features and pricing designed to address the needs of governments and educational institutions.

Public Sector and Other revenues increased $89 million, or 1.5%, during 2019 compared to 2018, driven by increases in networking and wireless postpaid service revenue as a result of an increase in wireless retail postpaid connections.

Wholesale

Wholesale offers wireline communications services including data, voice, local dial tone and broadband services primarily to local, long distance, and wireless carriers that use our facilities to provide services to their customers.

Wholesale revenues decreased $509 million, or 13.6%, during 2019 compared to 2018, primarily due to declines in core data and traditional voice services resulting from the effect of technology substitution and continuing contraction of market rates due to competition.

Operating Expenses

(dollars in millions)

			Increase/(Decrease)	
Years Ended December 31,	**2019**	2018	**2019 vs. 2018**	
Cost of services	**$ 10,655**	$ 10,859	$ (204)	(1.9)%
Cost of wireless equipment	**4,733**	4,560	173	3.8
Selling, general and administrative expense	**8,188**	7,689	499	6.5
Depreciation and amortization expense	**4,105**	4,258	(153)	(3.6)
Total Operating Expenses	**$ 27,681**	$ 27,366	$ 315	1.2

Cost of Services

Cost of services decreased $204 million, or 1.9%, during 2019 compared to 2018, primarily due to lower access costs resulting from a decline in voice connections, as well as lower employee-related costs associated with the lower headcount resulting from the Voluntary Separation Program, offset by an increase in regulatory fees.

Cost of Wireless Equipment

Cost of wireless equipment increased $173 million, or 3.8%, during 2019 compared to 2018, primarily driven by a shift to higher priced units in the mix of wireless devices sold and an increase in the number of wireless devices sold.

Selling, General and Administrative Expense

Selling, general and administrative expense increased $499 million, or 6.5%, during 2019 compared to 2018, due to increases in advertising expenses and sales commission expense, which were partially offset by decreases in employee-related costs resulting from the Voluntary Separation Program. The increase in sales commission expense was primarily due to a lower net deferral of commission costs in 2019 as compared to 2018 as a result of the adoption of Topic 606 on January 1, 2018 using a modified retrospective approach.

Depreciation and Amortization Expense

Depreciation and amortization expense decreased $153 million, or 3.6%, during 2019 compared to 2018, driven by the change in the mix of total Verizon depreciable assets and Business's usage of those assets.

Segment Operating Income and EBITDA

(dollars in millions)

Years Ended December 31,	2019	2018	Increase/(Decrease) 2019 vs. 2018	
Segment Operating Income	**$ 3,762**	$ 4,168	$ (406)	(9.7)%
Add Depreciation and amortization expense	**4,105**	4,258	(153)	(3.6)
Segment EBITDA	**$ 7,867**	$ 8,426	$ (559)	(6.6)
Segment operating income margin	**12.0%**	13.2%		
Segment EBITDA margin	**25.0%**	26.7%		

The changes in the table above during the periods presented were primarily a result of the factors described in connection with operating revenues and operating expenses.

Special Items

Special items included in Income Before (Provision) Benefit For Income Taxes were as follows:

(dollars in millions)

Years Ended December 31,	2019	2018
Severance, pension and benefits charges (credits)		
Selling, general and administrative expense	**$ 204**	$ 2,157
Other income (expense), net	**126**	(2,107)
Acquisition and integration related charges		
Selling, general and administrative expense	**—**	531
Depreciation and amortization expense	**—**	22
Product realignment charges		
Cost of services	**—**	303
Selling, general and administrative expense	**—**	147
Equity in losses of unconsolidated businesses	**—**	207
Depreciation and amortization expense	**—**	1
Impairment charges		
Media goodwill impairment	**186**	4,591
Equity in losses of unconsolidated businesses	**50**	—
Early debt redemption costs		
Other income (expense), net	**3,604**	725
Net gain from dispositions of assets and businesses		
Selling, general and administrative expense	**(261)**	—
Total	**$ 3,909**	$ 6,577

The Consolidated Adjusted EBITDA non-GAAP measure presented in the Consolidated Net Income, Consolidated EBITDA and Consolidated Adjusted EBITDA discussion (see "Consolidated Results of Operations") excludes all of the amounts included above, as described below.

The income and expenses related to special items included in our consolidated results of operations were as follows:

(dollars in millions)

Years Ended December 31,	2019	2018
Within Total Operating Expenses	**$ 129**	$ 7,752
Within Equity in losses of unconsolidated businesses	**50**	207
Within Other income (expense), net	**3,730**	(1,382)
Total	**$ 3,909**	$ 6,577

Severance, Pension and Benefits Charges (Credits)

During 2019, in accordance with our accounting policy to recognize actuarial gains and losses in the period in which they occur, we recorded net pre-tax pension and benefits charges of $126 million in our pension and postretirement benefit plans. The charges were recorded in Other income (expense), net in our consolidated statements of income and were primarily driven by a decrease in our discount rate assumption used to determine the current year liabilities of our pension plans and postretirement benefit plans from a weighted-average of 4.4% at December 31, 2018 to a weighted-average of 3.3% at December 31, 2019 ($4.3 billion), partially offset by the difference between our estimated return on assets and our actual return on assets ($2.3 billion) and other assumption adjustments of $1.9 billion, of which $1.6 billion related to healthcare claims experience. During 2019, we also recorded net pre-tax severance charges of $204 million in Selling, general and administrative expense in our consolidated statements of income.

During 2018, we recorded net pre-tax pension and benefits credits of $2.1 billion in accordance with our accounting policy to recognize actuarial gains and losses in the period in which they occur. The pension and benefits remeasurement credits of $2.3 billion, which were recorded in Other income (expense), net in our consolidated statements of income, were primarily driven by an increase in our discount rate assumption used to determine the current year liabilities of our pension plans and postretirement benefit plans from a weighted-average of 3.7% at December 31, 2017 to a weighted-average of 4.4% at December 31, 2018 ($2.6 billion), and mortality and other assumption adjustments of $1.7 billion, $1.6 billion of which related to healthcare claims and trend adjustments, offset by the difference between our estimated return on assets of 7.0% and our actual return on assets of (2.7)% ($1.9 billion). The credits were partially offset by $177 million due to the effects of participants retiring under the Voluntary Separation Program. During 2018, we also recorded net pre-tax severance charges of $2.2 billion in Selling, general and administrative expense, primarily driven by the Voluntary Separation Program for select U.S.-based management employees and other headcount reduction initiatives, which resulted in a severance charge of $1.8 billion ($1.4 billion after-tax), and $339 million in severance costs recorded under other existing separation plans.

Due to the presentation of the other components of net periodic benefit cost, we recognize a portion of the pension and benefits charges (credits) in Other income (expense), net in our consolidated statements of income.

See Note 11 to the consolidated financial statements for additional information related to severance, pension and benefits charges (credits).

Acquisition and Integration Related Charges

Acquisition and integration related charges of $553 million recorded during the year ended December 31, 2018 primarily related to the acquisition of Yahoo's operating business in June 2017.

Product Realignment Charges

Product realignment charges of $658 million recorded during the year ended December 31, 2018 primarily related to the discontinuation of the go90 platform and associated content during the second quarter of 2018.

Impairment Charges

The impairment charges consist of write-downs of goodwill and other investments or assets. The goodwill impairment charges of $186 million and $4.6 billion recorded during the years ended December 31, 2019 and 2018, respectively, for Verizon Media were a result of the Company's annual impairment test performed in the fourth quarter (see "Critical Accounting Estimates"). In addition, we recorded an impairment charge of $50 million in Equity in losses of unconsolidated businesses related to a media joint venture investment.

Early Debt Redemption Costs

During 2019 and 2018, we recorded early debt redemptions costs of $3.6 billion and $725 million, respectively.

We recognize early debt redemptions costs in Other income (expense), net in our consolidated statements of income. See Note 7 to the consolidated financial statements for additional information related to our early debt redemptions.

Net Gain from Dispositions of Assets and Businesses

During 2019, we recorded a pre-tax net gain from dispositions of assets and businesses of $261 million in connection with the sale of various real estate properties and businesses.

Operating Environment and Trends

The telecommunications industry is highly competitive. We expect competition to remain intense as traditional and non-traditional participants seek increased market share. Our high-quality customer base and networks differentiate us from our competitors and give us the ability to plan and manage through changing economic and competitive conditions. We remain focused on executing on the fundamentals of the business: maintaining a high-quality customer base, delivering strong financial and operating results and strengthening our balance sheet. We will continue to invest for growth, which we believe is the key to creating value for our shareholders. We continue to lead in 4G LTE performance while building momentum for our 5G network. Our strategy lays the foundation for the future through investments in our Intelligent Edge Network that enable efficiencies throughout our core infrastructure and deliver flexibility to meet customer requirements.

The U.S. wireless market has achieved a high penetration of smartphones, which reduces the opportunity for new phone connection growth for the industry. We expect future revenue growth in the industry to be driven by expanding existing customer relationships, increasing the number of ways customers can connect with wireless networks and services and increasing the penetration of other connected devices including wearables, tablets and IoT devices. We expect 5G technology will provide a significant opportunity for growth in the industry in 2021 and beyond. With respect to our wireless connectivity products and services, we compete against other national wireless service providers, including AT&T Inc., Sprint Corporation and T-Mobile USA, Inc., as well as various regional wireless service providers. We also compete for retail activations with resellers that buy bulk wholesale service from wireless service providers, including Verizon, and resell it to their customers. Resellers may include cable companies. We face competition from other communications and technology companies seeking to increase their brand recognition and capture customer revenue with respect to the provision of wireless products and services, in addition to non-traditional offerings in mobile data. For example, Microsoft Corporation, Alphabet Inc., Apple Inc. and others are offering alternative means for making wireless voice calls that, in certain cases, can be used in lieu of the wireless provider's voice service, as well as alternative means of accessing video content.

With respect to wireless services and equipment, pricing plays an important role in the wireless competitive landscape. We compete in this area by offering our customers services and devices that we believe they will regard as the best available value for the price. As the demand for wireless services continues to grow, wireless service providers are offering a range of service plans at competitive prices. These service offerings will vary from time to time based on customer needs, technology changes and market conditions and may be provided as standard plans or as part of limited time promotional offers.

We expect future service revenue growth opportunities to arise from increased access revenue as customers shift to higher access plans, as well as from increased connections per account. Future service revenue growth opportunities will be dependent on expanding the penetration of our services, increasing the number of ways that our customers can connect with our networks and services and the development of new ecosystems.We and other wireless service providers, as well as equipment manufacturers, offer device payment options, which provide customers with the ability to pay for their device over a period of time, and some providers offer device leasing arrangements.

Current and potential competitors in the wireline service market include cable companies, wireless service providers, domestic and foreign telecommunications providers, satellite television companies, Internet service providers, over-the-top providers and other companies that offer network services and managed enterprise solutions.

In addition, companies with a global presence are increasingly competing with us in our wireline services. A relatively small number of telecommunications and integrated service providers with global operations serve customers in the global enterprise market and, to a lesser extent, the global wholesale market. We compete with these providers for large contracts to provide integrated solutions to global enterprises. Many of these companies have strong market presence, brand recognition and existing customer relationships, all of which contribute to intensifying competition that may affect our future revenue growth.

Despite this challenging environment, we expect that we will be able to grow key aspects of our wireline services. We continue to provide network reliability and offer products, which include fiber-optic Internet access, several video services, and voice services. Further, we will continue to offer our business and government customers more robust IP products and services, and advance our IoT strategies by leveraging business models that monetize usage on our networks at the connectivity, platform and solution layers.

The online advertising market continues to evolve as online users are migrating from traditional desktop to mobile and multiple-device usage. Also, there is a continued shift towards programmatic advertising which presents opportunities to connect online advertisers with the appropriate online users in a rapid environment. Our Media business competes with other online search engines, advertising platforms, digital video services and social networks. We are experiencing pressure from search and desktop usage and believe the pressure in these sectors will continue. We are implementing initiatives to realize synergies across all of our media assets and build services around our core content pillars to diversify revenue and return to growth.

We will also continue to focus on cost efficiencies to ensure we have the maximum flexibility to adjust to changes in the competitive and economic environments and maximize returns to shareholders.

2020 Connection Trends

In our Consumer segment, we expect to continue to attract new customers and maintain high-quality retail postpaid customers, capitalizing on demand for data services and providing our customers new ways of using wireless services in their daily lives. We expect that future connection growth will be driven by smartphones, tablets and other connected devices such as wearables. We believe the combination of our wireless network performance and Mix & Match unlimited plans provides a superior customer experience, supporting increased penetration of data services and the continued attraction and retention of higher valued retail postpaid connections. We expect to manage churn by providing a consistent, reliable experience on our wireless service and focusing on improving the customer experience through simplified pricing and continued focus in our distribution channels. We expect to continue to grow our Fios Internet connections as we seek to increase our penetration rates within our Fios service areas, further supported by the demand for higher speed internet connections. In Fios video, the business continues to face ongoing pressure as observed throughout the linear television market. We expect to manage market pressure by offering customers a choice of video service, including options such as Mix & Match on Fios and other offerings. We have experienced continuing access line and DSL losses as customers have disconnected both primary and secondary lines and switched to alternative technologies such as wireless, VoIP and cable for voice and data services.

In our Business segment, we offer wireless products and services to business and government customers across the U.S. We continue to grow our retail connections while facing a competitive environment. We expect to maintain connection growth in part by adding capacity and density

to our 4G LTE network, in addition to leading the build-out of 5G technology. We expect this connection growth, combined with our industry-leading network assets, will provide additional opportunities to sell solutions, such as those around security, advanced communications and professional services. We expect to expand our existing services offered to business customers through our Intelligent Edge Network, our multi-use platform.

2020 Operating Revenue Trends

In our Consumer segment, we expect to see a continuation of the service revenue trends from 2019 as customers shift to higher access plans with additional services and increase the number of devices they connect with our networks and services. Equipment revenues are largely dependent on wireless device sales volumes, the mix of devices, promotions and upgrades, which are subject to device lifecycles, iconic device launches and competition within the wireless industry. We anticipate an increase in wireless device upgrades in the second half of the year as we expand the availability and reach of our 5G network.

In our Business segment, we expect overall revenue growth in 2020 as wireless services and our high-quality fiber-based products will offset secular declines from legacy technologies and pressure from competition. We expect wireless revenue to expand, driven by connection growth led by Small and Medium Business. We expect our Fios products, through increased penetration, will also contribute to revenue growth. Legacy traditional wireline services continue to face secular pressures.

Our Media Business, Verizon Media, is primarily made up of digital advertising products. We are experiencing revenue pressure from search and desktop usage, which started to improve throughout 2019 and believe the pressure in those sectors will continue. We are focused on returning to revenue growth by implementing initiatives to realize synergies across all of our media assets and building services around our core content pillars. We expect positive growth in mobile services and products.

2020 Operating Expense and Cash Flow from Operations Trends

We expect our consolidated operating income margin and adjusted consolidated EBITDA margin to remain strong as we continue to undertake initiatives to reduce our overall cost structure by improving productivity and gaining efficiencies in our operations throughout the business in 2020 and beyond. Business Excellence initiatives include the adoption of the zero-based budgeting methodology, driving capital efficiencies from the architecture of the networks, evolving our Information Technology strategy and the continuing benefit from the Voluntary Separation Program. We believe our additional investments in our Business segment in both product simplification and continued focus on process improvements and new work tools will drive cost savings and create incremental growth opportunities in areas such as 5G and One Fiber. The goal of the Business Excellence initiative is to take $10 billion of cumulative cash outflows out of the business over four years, beginning with 2018. As part of this initiative, we are focusing on both operating expenses and capital expenditures. Our Business Excellence initiatives produced cumulative cash savings of $5.7 billion through the end of 2019 from a mix of capital and operational expenditure activities. The program remains on track to achieve our goal. Expenses related to programs funded through the reinvestment of program savings are expected to apply offsetting pressures to our margins.

The implementation of Topic 606 resulted in the deferral of commission expense in both our Consumer and Business segments. In 2020, we expect a smaller year-over-year benefit from the adoption of the standard due to the deferral of commission costs as compared to 2018 and 2019. The reduction in benefit creates a year-over-year headwind to operating income.

We create value for our shareholders by investing the cash flows generated by our business in opportunities and transactions that support continued profitable growth, thereby increasing customer satisfaction and usage of our products and services. In addition, we have used our cash flows to maintain and grow our dividend payout to shareholders. Verizon's Board of Directors increased the Company's quarterly dividend by 2.1% during 2019, making this the thirteenth consecutive year in which we have raised our dividend.

Our goal is to use our cash to create long-term value for our shareholders. We will continue to look for investment opportunities that will help us to grow the business, strengthen our balance sheet, acquire spectrum licenses (see "Cash Flows from Investing Activities"), pay dividends to our shareholders and, when appropriate, buy back shares of our outstanding common stock (see "Cash Flows from Financing Activities").

Capital Expenditures

Our 2020 capital program includes capital to fund advanced networks and services, including expanding our core networks, adding capacity and density to our 4G LTE network in order to stay ahead of our customers' increasing data demands and deploying our 5G network, transforming our structure to deploy the Intelligent Edge Network while reducing the cost to deliver services to our customers, and pursuing other opportunities to drive operating efficiencies. We expect that the new network architecture will simplify operations by eliminating legacy network elements, improve our 4G LTE coverage, speed the deployment of 5G technology, and create new enterprise opportunities in the business market. The level and the timing of the Company's capital expenditures within these broad categories can vary significantly as a result of a variety of factors outside of our control, such as material weather events, equipment availability from vendors and permits from local governments. Capital expenditures for 2020 are expected to be in the range of $17.0 billion to $18.0 billion, including the continued investment in our 5G network. Capital expenditures were $17.9 billion in 2019 and $16.7 billion in 2018. We believe that we have significant discretion over the amount and timing of our capital expenditures on a Company-wide basis as we are not subject to any agreement that would require significant capital expenditures on a designated schedule or upon the occurrence of designated events.

Consolidated Financial Condition

(dollars in millions)

Years Ended December 31,		2019		2018
Cash flows provided by (used in)				
Operating activities	**$**	**35,746**	$	34,339
Investing activities		**(17,581)**		(17,934)
Financing activities		**(18,164)**		(15,377)
Increase in cash, cash equivalents and restricted cash	**$**	**1**	$	1,028

We use the net cash generated from our operations to fund expansion and modernization of our networks, service and repay external financing, pay dividends, invest in new businesses and spectrum and, when appropriate, buy back shares of our outstanding common stock. Our sources of funds, primarily from operations and, to the extent necessary, from external financing arrangements, are sufficient to meet ongoing operating and investing requirements. We expect that our capital spending requirements will continue to be financed primarily through internally generated funds. Debt or equity financing may be needed to fund additional investments or development activities or to maintain an appropriate capital structure to ensure our financial flexibility. Our cash and cash equivalents are held both domestically and internationally, and are invested to maintain principal and provide liquidity. See "Market Risk" for additional information regarding our foreign currency risk management strategies.

Our available external financing arrangements include an active commercial paper program, credit available under credit facilities and other bank lines of credit, vendor financing arrangements, issuances of registered debt or equity securities, U.S. retail medium-term notes and other capital market securities that are privately-placed or offered overseas. In addition, we monetize our device payment plan agreement receivables through asset-backed debt transactions.

Cash Flows Provided By Operating Activities

Our primary source of funds continues to be cash generated from operations. Net cash provided by operating activities increased by $1.4 billion during 2019, compared to the similar period in 2018, primarily due to an increase in earnings and a decrease in discretionary contributions to qualified employee benefit plans, offset by changes in working capital, which includes an increase in cash income taxes as well as severance payments as a result of the Voluntary Separation Program. We made $300 million and $1.7 billion in discretionary employee benefits contributions to our defined benefit pension plan during 2019 and 2018, respectively. As a result of the discretionary pension contributions, we expect that there will be no required pension funding until 2026, which will continue to benefit future cash flows. These contributions also improved the funded status of our qualified pension plan.

Cash Flows Used In Investing Activities

Capital Expenditures

Capital expenditures continue to relate primarily to the use of capital resources to facilitate the introduction of new products and services, enhance responsiveness to competitive challenges, maintain our existing infrastructure and increase the operating efficiency and productivity of our networks.

Capital expenditures, including capitalized software, were as follows:

(dollars in millions)

Years Ended December 31,		2019		2018
Capital expenditures (including capitalized software)	**$**	**17,939**	$	16,658
Total as a percentage of revenue		**13.6%**		12.7%

Capital expenditures increased in 2019 primarily due to an increase in investments to support multi-use fiber assets, which support the densification of our 4G LTE network and our 5G technology deployment. Our investments are primarily related to network infrastructure to support the business.

Acquisitions

During 2019 and 2018, we invested $898 million and $1.4 billion, respectively, in acquisitions of wireless licenses. During 2019 and 2018, we also invested an insignificant amount and $230 million, respectively, in acquisitions of businesses, net of cash acquired.

In 2019, the FCC completed two millimeter wave spectrum license auctions. We paid approximately $521 million for spectrum licenses in connection with these auctions. See Note 3 to the consolidated financial statements for additional information.

In January 2018, Verizon acquired NextLink Wireless LLC (NextLink) from a wholly-owned subsidiary of XO Holdings for approximately $493 million, subject to certain adjustments, of which $320 million (an option exercise price to acquire NextLink) was prepaid in the first quarter of 2017. The option exercise price represented the fair value of the option. The remaining cash consideration was paid at the closing of the transaction. The spectrum acquired as part of the transaction is being used for our 5G technology deployment.

In February 2018, Verizon acquired Straight Path Communications Inc. (Straight Path), a holder of millimeter wave spectrum configured for 5G wireless services for total consideration reflecting an enterprise value of approximately $3.1 billion, which was primarily settled with Verizon shares but also included transaction costs payable in cash of approximately $736 million, consisting primarily of a fee paid to the FCC. The spectrum acquired as part of the transaction is being used for our 5G technology deployment.

During 2019 and 2018, we completed various other acquisitions for an insignificant amount of cash consideration.

See "Acquisitions and Divestitures" for information on our acquisitions.

Dispositions

During 2019, we received gross proceeds of approximately $1.0 billion for a sale-leaseback transaction for buildings and real estate. See Note 6 to the consolidated financial statements for additional information.

Cash Flows Used In Financing Activities

We seek to maintain a mix of fixed and variable rate debt to lower borrowing costs within reasonable risk parameters and to protect against earnings and cash flow volatility resulting from changes in market conditions. During 2019 and 2018, net cash used in financing activities was $18.2 billion and $15.4 billion, respectively.

2019

During 2019, our net cash used in financing activities of $18.2 billion was primarily driven by:

- $23.9 billion used for repayments, redemptions and repurchases of long-term borrowings and finance lease obligations, which included $6.3 billion used for prepayments and repayments of asset-backed long-term borrowings;
- $10.0 billion used for dividend payments; and
- $1.8 billion used for net debt related costs.

These uses of cash were partially offset by proceeds from long-term borrowings of $18.7 billion, which included $8.6 billion of proceeds from our asset-backed debt transactions.

Proceeds from and Repayments, Redemptions, and Repurchases of Long-Term Borrowings

At December 31, 2019, our total debt decreased to $111.5 billion as compared to $113.1 billion at December 31, 2018. During both the years ended December 31, 2019 and 2018, our effective interest rate was 4.8%. The substantial majority of our total debt portfolio consists of fixed rate indebtedness, therefore, changes in interest rates do not have a material effect on our interest payments. See also "Market Risk" and Note 7 to the consolidated financial statements for additional information.

At December 31, 2019, approximately $23.5 billion, or 21.1%, of the aggregate principal amount of our total debt portfolio consisted of foreign denominated debt, primarily the Euro and British Pound Sterling. We have entered into cross currency swaps on substantially all of our foreign denominated debt in order to fix our future interest and principal payments in U.S. dollars and mitigate the impact of foreign currency transaction gains or losses. See "Market Risk" for additional information.

Verizon may continue to repurchase debt securities issued by Verizon and its affiliates in the future through open market purchases, privately negotiated transactions, tender offers, exchange offers, or otherwise, upon such terms and at such prices as Verizon may from time to time determine for cash or other consideration.

Other, net

Other, net financing activities during 2019 includes early redemption costs, see "Special Items" for additional information, as well as cash paid on debt exchanges and derivative-related transactions. See Note 15 to the consolidated financial statements for additional information.

Dividends

The Verizon Board of Directors assesses the level of our dividend payments on a periodic basis taking into account such factors as long-term growth opportunities, internal cash requirements and the expectations of our shareholders. During the third quarter of 2019, the Board increased our quarterly dividend payment by 2.1% to $0.6150 from $0.6025 per share from the previous quarter. This is the thirteenth consecutive year that Verizon's Board of Directors has approved a quarterly dividend increase.

As in prior periods, dividend payments were a significant use of capital resources. During 2019, we paid $10.0 billion in dividends.

2018

During 2018, our net cash used in financing activities of $15.4 billion was primarily driven by:

- $14.6 billion used for repayments, redemptions and repurchases of long-term borrowings and finance lease obligations, which included $3.6 billion used for prepayments of asset-backed long-term borrowings; and
- $9.8 billion used for dividend payments.

These uses of cash were partially offset by proceeds from long-term borrowings of $10.8 billion, which included $4.8 billion of proceeds from our asset-backed debt transactions.

Proceeds from and Repayments, Redemptions, and Repurchases of Long-Term Borrowings

At December 31, 2018, our total debt was $113.1 billion, and during the year ended December 31, 2018, our effective interest rate was 4.8%. The substantial majority of our total debt portfolio consisted of fixed rate indebtedness, therefore, changes in interest rates did not have a material effect on our interest payments. See "Market Risk" and Note 7 to the consolidated financial statements for additional information.

At December 31, 2018, approximately $17.1 billion, or 15.1%, of the aggregate principal amount of our total debt portfolio consisted of foreign denominated debt, primarily the Euro and British Pound Sterling. We have entered into cross currency swaps on a majority of our foreign denominated debt in order to fix our future interest and principal payments in U.S. dollars and mitigate the impact of foreign currency transaction gains or losses. See "Market Risk" for additional information.

Other, net

Other, net financing activities during 2018, included early debt redemption costs. See "Special Items" for additional information, as well as cash paid on debt exchanges and derivative-related transactions.

Dividends

During the third quarter of 2018, the Board increased our quarterly dividend payment by 2.1% to $0.6025 per share.

As in prior periods, dividend payments were a significant use of capital resources. During 2018, we paid $9.8 billion in dividends.

Asset-Backed Debt

As of December 31, 2019, the carrying value of our asset-backed debt was $12.4 billion. Our asset-backed debt includes Asset-Backed Notes (ABS Notes) issued to third-party investors (Investors) and loans (ABS Financing Facilities) received from banks and their conduit facilities (collectively, the Banks). Our consolidated asset-backed debt bankruptcy remote legal entities (each, an ABS Entity or collectively, the ABS Entities) issue the debt or are otherwise party to the transaction documentation in connection with our asset-backed debt transactions. Under the terms of our asset-backed debt, Cellco Partnership (Cellco) and certain other affiliates of Verizon (collectively, the Originators) transfer device payment plan agreement receivables to one of the ABS Entities, which in turn transfers such receivables to another ABS Entity that issues the debt. Verizon entities retain the equity interests in the ABS Entities, which represent the rights to all funds not needed to make required payments on the asset-backed debt and other related payments and expenses.

Our asset-backed debt is secured by the transferred device payment plan agreement receivables and future collections on such receivables. The device payment plan agreement receivables transferred to the ABS Entities and related assets, consisting primarily of restricted cash, will only be available for payment of asset-backed debt and expenses related thereto, payments to the Originators in respect of additional transfers of device payment plan agreement receivables, and other obligations arising from our asset-backed debt transactions, and will not be available to pay other obligations or claims of Verizon's creditors until the associated asset-backed debt and other obligations are satisfied. The Investors or Banks, as applicable, which hold our asset-backed debt have legal recourse to the assets securing the debt, but do not have any recourse to Verizon with respect to the payment of principal and interest on the debt. Under a parent support agreement, Verizon has agreed to guarantee certain of the payment obligations of Cellco and the Originators to the ABS Entities.

Cash collections on the device payment plan agreement receivables collateralizing our asset-backed debt securities are required at certain specified times to be placed into segregated accounts. Deposits to the segregated accounts are considered restricted cash and are included in Prepaid expenses and other, and Other assets in our consolidated balance sheets.

Proceeds from our asset-backed debt transactions are reflected in Cash flows from financing activities in our consolidated statements of cash flows. The asset-backed debt issued and the assets securing this debt are included in our consolidated balance sheets. See Note 7 to the consolidated financial statements for additional information.

In May 2018, we entered into an ABS financing facility with a number of financial institutions (2018 ABS Financing Facility). One loan agreement was entered into in connection with the 2018 ABS Financing Facility. In May 2019, the $540 million outstanding under the loan agreement was prepaid, and the loan agreement was terminated.

In September 2016, we entered into an ABS financing facility with a number of financial institutions (2016 ABS Financing Facility). Two loan agreements were entered into in connection with the 2016 ABS Financing Facility in September 2016 and May 2017. In April and May 2019, we paid off both the 2016 and 2017 loans for an aggregate of $671 million, and the loan agreements were terminated.

In May 2019, the 2016 ABS Financing Facility was amended and restated (2019 ABS Financing Facility). One loan agreement was entered into in connection with the 2019 ABS Financing Facility. Under the 2019 loan agreement, we have the right to prepay all or a portion of the advances at any time without penalty, but in certain cases, with breakage costs. During 2019, we received $4.8 billion of borrowings and prepaid $1.5 billion under the 2019 loan agreement.

Long-Term Credit Facilities

		At December 31, 2019		
(dollars in millions)	Maturities	Facility Capacity	Unused Capacity	Principal Amount Outstanding
Verizon revolving credit facility [1]	2022	$ 9,500	$ 9,390	N/A
Various export credit facilities [2]	2022-2027	5,500	—	4,471
Total		$ 15,000	$ 9,390	$ 4,471

[1] The revolving credit facility does not require us to comply with financial covenants or maintain specified credit ratings, and it permits us to borrow even if our business has incurred a material adverse change. The revolving credit facility provides for the issuance of letters of credit.
[2] During 2019 and 2018, we drew down $1.5 billion and $3.0 billion from these facilities, respectively. We use these credit facilities to finance equipment-related purchases.

Common Stock

Common stock has been used from time to time to satisfy some of the funding requirements of employee and shareholder plans. During the years ended December 31, 2019 and 2018, we issued 3.8 million and 3.5 million common shares from Treasury stock, respectively, which had an insignificant aggregate value.

In February 2020, the Verizon Board of Directors authorized a share buyback program to repurchase up to 100 million shares of the Company's common stock. The program will terminate when the aggregate number of shares purchased reaches 100 million, or a new share repurchase plan superseding the current plan is authorized, whichever is sooner. The program permits Verizon to repurchase shares over time, with the amount and timing of repurchases depending on market conditions and corporate needs. There were no repurchases of common stock during 2019 or 2018 under our previously authorized share buyback program.

Credit Ratings

Verizon's credit ratings did not change in 2019 or 2018.

Securities ratings assigned by rating organizations are expressions of opinion and are not recommendations to buy, sell or hold securities. A securities rating is subject to revision or withdrawal at any time by the assigning rating organization. Each rating should be evaluated independently of any other rating.

Covenants

Our credit agreements contain covenants that are typical for large, investment grade companies. These covenants include requirements to pay interest and principal in a timely fashion, pay taxes, maintain insurance with responsible and reputable insurance companies, preserve our corporate existence, keep appropriate books and records of financial transactions, maintain our properties, provide financial and other reports to our lenders, limit pledging and disposition of assets and mergers and consolidations, and other similar covenants.

We and our consolidated subsidiaries are in compliance with all of our restrictive covenants in our debt agreements.

Change In Cash, Cash Equivalents and Restricted Cash

Our Cash and cash equivalents at December 31, 2019 totaled $2.6 billion, a $151 million decrease compared to Cash and cash equivalents at December 31, 2018, primarily as a result of the factors discussed above.

Restricted cash at December 31, 2019 totaled $1.3 billion, a $152 million increase compared to restricted cash at December 31, 2018, primarily due to cash collections on the device payment plan agreement receivables that are required at certain specified times to be placed into segregated accounts.

Free Cash Flow

Free cash flow is a non-GAAP financial measure that reflects an additional way of viewing our liquidity that, when viewed with our GAAP results, provides a more complete understanding of factors and trends affecting our cash flows. Free cash flow is calculated by subtracting capital expenditures from net cash provided by operating activities. We believe it is a more conservative measure of cash flow since purchases of fixed assets are necessary for ongoing operations. Free cash flow has limitations due to the fact that it does not represent the residual cash flow available for discretionary expenditures. For example, free cash flow does not incorporate payments made on finance lease obligations or cash payments for business acquisitions or wireless licenses. Therefore, we believe it is important to view free cash flow as a complement to our entire consolidated statements of cash flows.

The following table reconciles net cash provided by operating activities to Free cash flow:

				(dollars in millions)
Years Ended December 31,		**2019**		2018
Net cash provided by operating activities	**$**	**35,746**	$	34,339
Less Capital expenditures (including capitalized software)		**17,939**		16,658
Free cash flow	**$**	**17,807**	$	17,681

The increase in free cash flow during 2019 is a reflection of the increase in operating cash flows, partially offset by the increase in capital expenditures discussed above.

Employee Benefit Plans Funded Status and Contributions

Employer Contributions

We operate numerous qualified and nonqualified pension plans and other postretirement benefit plans. These plans primarily relate to our domestic business units. During 2019 and 2018, contributions to our qualified pension plans were $300 million and $1.0 billion, respectively. We made contributions of $71 million in 2019 to our nonqualified pension plans.

The Company's overall investment strategy is to achieve a mix of assets that allows us to meet projected benefit payments while taking into consideration risk and return. In an effort to reduce the risk of our portfolio strategy and better align assets with liabilities, we have adopted a liability driven pension strategy that seeks to better match cash flows from investments with projected benefit payments. We expect that the strategy will reduce the likelihood that assets will decline at a time when liabilities increase (referred to as liability hedging), with the goal to reduce the risk of underfunding to the plan and its participants and beneficiaries; however, we also expect the strategy to result in lower asset returns. Nonqualified pension contributions are estimated to be approximately $70 million in 2020.

Contributions to our other postretirement benefit plans generally relate to payments for benefits on an as-incurred basis since these other postretirement benefit plans do not have funding requirements similar to the pension plans. We contributed $449 million to our other postretirement benefit plans in 2019 and $1.2 billion, including $679 million discretionary contributions, in 2018. Contributions to our other postretirement benefit plans are estimated to be approximately $700 million in 2020.

Leasing Arrangements

See Note 6 to the consolidated financial statements for a discussion of leasing arrangements.

Contractual Obligations

The following table provides a summary of our contractual obligations and commercial commitments at December 31, 2019. Additional detail about these items is included in the notes to the consolidated financial statements.

(dollars in millions)

	Payments Due By Period				
Contractual Obligations	Total	Less than 1 year	1 to 3 years	3 to 5 years	More than 5 years
Long-term debt[1]	$ 110,865	$ 10,470	$ 16,431	$ 9,803	$ 74,161
Finance lease obligations[2]	1,213	366	479	244	124
Total long-term debt, including current maturities	112,078	10,836	16,910	10,047	74,285
Interest on long-term debt[1]	62,450	4,578	8,383	7,426	42,063
Operating leases[2]	25,968	4,099	7,127	5,485	9,257
Purchase obligations[3]	18,769	8,384	7,448	1,441	1,496
Other long-term liabilities[4]	4,135	694	1,692	1,749	—
Finance obligations[5]	1,539	281	579	603	76
Total contractual obligations	$ 224,939	$ 28,872	$ 42,139	$ 26,751	$ 127,177

[1] Items included in long-term debt with variable coupon rates exclude unamortized debt issuance costs, and are described in Note 7 to the consolidated financial statements.

[2] See Note 6 to the consolidated financial statements for additional information.

[3] Items included in purchase obligations are primarily commitments to purchase content and network services, equipment, software and marketing services, which will be used or sold in the ordinary course of business. These amounts do not represent our entire anticipated purchases in the future, but represent only those items that are the subject of contractual obligations. We also purchase products and services as needed with no firm commitment. For this reason, the amounts presented in this table alone do not provide a reliable indicator of our expected future cash outflows or changes in our expected cash position. See Note 16 to the consolidated financial statements for additional information.

[4] Other long-term liabilities represent estimated postretirement benefit and qualified pension plan contributions. Estimated qualified pension plan contributions include expected minimum funding contributions, which commence in 2026 based on the plan's current funded status. Estimated postretirement benefit payments include expected future postretirement benefit payments. These estimated amounts: (1) are subject to change based on changes to assumptions and future plan performance, which could impact the timing or amounts of these payments; and (2) exclude expectations beyond 5 years due to uncertainty of the timing and amounts. See Note 11 to the consolidated financial statements for additional information.

[5] Represents future minimum payments under the sublease arrangement for our tower transaction. See Note 6 to the consolidated financial statements for additional information.

We are not able to make a reasonable estimate of when the unrecognized tax benefits balance of $2.9 billion and related interest and penalties will be settled with the respective taxing authorities until issues or examinations are further developed. See Note 12 to the consolidated financial statements for additional information.

Guarantees

We guarantee the debentures of our operating telephone company subsidiaries as well as the debt obligations of GTE LLC, as successor in interest to GTE Corporation, that were issued and outstanding prior to July 1, 2003. See Note 7 to the consolidated financial statements for additional information.

In connection with the execution of agreements for the sale of businesses and investments, Verizon ordinarily provides representations and warranties to the purchasers pertaining to a variety of nonfinancial matters, such as ownership of the securities being sold, as well as financial losses. See Note 16 to the consolidated financial statements for additional information.

As of December 31, 2019, letters of credit totaling approximately $632 million, which were executed in the normal course of business and support several financing arrangements and payment obligations to third parties, were outstanding. See Note 16 to the consolidated financial statements for additional information.

Market Risk

We are exposed to various types of market risk in the normal course of business, including the impact of interest rate changes, foreign currency exchange rate fluctuations, changes in investment, equity and commodity prices and changes in corporate tax rates. We employ risk management strategies, which may include the use of a variety of derivatives including cross currency swaps, forward starting interest rate swaps, interest rate swaps, interest rate caps and foreign exchange forwards. We do not hold derivatives for trading purposes.

It is our general policy to enter into interest rate, foreign currency and other derivative transactions only to the extent necessary to achieve our desired objectives in optimizing exposure to various market risks. Our objectives include maintaining a mix of fixed and variable rate debt to lower borrowing costs within reasonable risk parameters and to protect against earnings and cash flow volatility resulting from changes in market conditions. We do not hedge our market risk exposure in a manner that would completely eliminate the effect of changes in interest rates and foreign exchange rates on our earnings.

Counterparties to our derivative contracts are major financial institutions with whom we have negotiated derivatives agreements (ISDA master agreements) and credit support annex (CSA) agreements which provide rules for collateral exchange. Negotiations and executions of new ISDA master agreements and CSA agreements with our counterparties continued during 2018. The CSA agreements contain rating based thresholds such that we or our counterparties may be required to hold or post collateral based upon changes in outstanding positions as compared to established thresholds and changes in credit ratings. At December 31, 2019, we held an insignificant amount and at December 31, 2018, we posted approximately $0.1 billion of collateral related to derivative contracts under collateral exchange arrangements, which were recorded as Other current liabilities and Prepaid expenses and other, respectively, in our consolidated balance sheets. While we may be exposed to credit losses due to the nonperformance of our counterparties, we consider the risk remote and do not expect that any such nonperformance would result in a significant effect on our results of operations or financial condition due to our diversified pool of counterparties. See Note 9 to the consolidated financial statements for additional information regarding the derivative portfolio.

Interest Rate Risk

We are exposed to changes in interest rates, primarily on our short-term debt and the portion of long-term debt that carries floating interest rates. As of December 31, 2019, approximately 79% of the aggregate principal amount of our total debt portfolio consisted of fixed rate indebtedness, including the effect of interest rate swap agreements designated as hedges. The impact of a 100-basis-point change in interest rates affecting our floating rate debt would result in a change in annual interest expense, including our interest rate swap agreements that are designated as hedges, of approximately $248 million. The interest rates on our existing long-term debt obligations are unaffected by changes to our credit ratings.

Certain of our floating rate debt and our interest rate derivative transactions utilize interest rates that are linked to the London Inter-Bank Offered Rate (LIBOR) as the benchmark rate. LIBOR is the subject of recent U.S. and international regulatory guidance and proposals for reform. These reforms and other pressures may cause LIBOR to become unavailable or to perform or be reported differently than in the past. The consequences of these developments cannot be entirely predicted but could include an increase in the cost of our floating rate debt or exposure under our interest rate derivative transactions. We do not anticipate a significant impact to our financial position given our current mix of variable and fixed-rate debt, taking into account the impact of our interest rate hedging.

The table that follows summarizes the fair values of our long-term debt, including current maturities, and interest rate swap derivatives as of December 31, 2019 and 2018. The table also provides a sensitivity analysis of the estimated fair values of these financial instruments assuming 100-basis-point upward and downward shifts in the yield curve. Our sensitivity analysis does not include the fair values of our commercial paper and bank loans, if any, because they are not significantly affected by changes in market interest rates.

(dollars in millions)

Long-term debt and related derivatives	Fair Value	Fair Value assuming + 100 basis point shift	Fair Value assuming - 100 basis point shift
At December 31, 2019	**$ 128,633**	**$ 119,288**	**$ 139,980**
At December 31, 2018	119,195	111,250	128,957

Interest Rate Swaps

We enter into interest rate swaps to achieve a targeted mix of fixed and variable rate debt. We principally receive fixed rates and pay variable rates that are currently based on LIBOR, resulting in a net increase or decrease to Interest expense. These swaps are designated as fair value hedges and hedge against interest rate risk exposure of designated debt issuances. At December 31, 2019, the fair value of the asset and liability of these contracts were $568 million and $173 million, respectively. At December 31, 2018, the fair value of the asset and liability of these contracts were insignificant and $813 million, respectively. At December 31, 2019 and 2018, the total notional amount of the interest rate swaps was $17.0 billion and $19.8 billion, respectively.

Forward Starting Interest Rate Swaps

We have entered into forward starting interest rate swaps designated as cash flow hedges in order to manage our exposure to interest rate changes on future forecasted transactions. At December 31, 2019 and 2018, the fair value of the liability of these contracts was $604 million and $60 million, respectively. At December 31, 2019 and 2018, the total notional amount of the forward starting interest rate swaps was $3.0 billion and $4.0 billion, respectively.

Interest Rate Caps

We also have interest rate caps which we use as an economic hedge but for which we have elected not to apply hedge accounting. We enter into interest rate caps to mitigate our interest exposure to interest rate increases on our ABS Financing Facility and ABS Notes. The fair value of the asset and liability of these contracts was insignificant at both December 31, 2019 and 2018. At December 31, 2019 and 2018, the total notional value of these contracts was $679 million and $2.2 billion, respectively.

Foreign Currency Translation

The functional currency for our foreign operations is primarily the local currency. The translation of income statement and balance sheet amounts of our foreign operations into U.S. dollars is recorded as cumulative translation adjustments, which are included in Accumulated other comprehensive income in our consolidated balance sheets. Gains and losses on foreign currency transactions are recorded in the consolidated statements of income in Other income (expense), net. At December 31, 2019, our primary translation exposure was to the British Pound Sterling, Euro, Australian Dollar and Japanese Yen.

Cross Currency Swaps

We have entered into cross currency swaps designated as cash flow hedges to exchange our British Pound Sterling, Euro, Swiss Franc and Australian Dollar-denominated cash flows into U.S. dollars and to fix our cash payments in U.S. dollars, as well as to mitigate the impact of foreign currency transaction gains or losses. The fair value of the asset of these contracts was $211 million and $220 million at December 31, 2019 and 2018, respectively. At December 31, 2019 and 2018, the fair value of the liability of these contracts was $912 million and $536 million, respectively. At December 31, 2019 and 2018, the total notional amount of the cross currency swaps was $23.1 billion and $16.6 billion, respectively.

Foreign Exchange Forwards

We also have foreign exchange forwards which we use as an economic hedge but for which we have elected not to apply hedge accounting. We enter into British Pound Sterling and Euro foreign exchange forwards to mitigate our foreign exchange rate risk related to non-functional currency denominated monetary assets and liabilities of international subsidiaries. At December 31, 2019, the fair value of the asset of these contracts was insignificant. At December 31, 2019 and 2018, the total notional amount of the foreign exchange forwards was $1.1 billion and $600 million, respectively.

Critical Accounting Estimates and Recently Issued Accounting Standards

Critical Accounting Estimates

A summary of the critical accounting estimates used in preparing our financial statements is as follows:

Wireless Licenses and Goodwill

Wireless licenses and Goodwill are a significant component of our consolidated assets. Both our wireless licenses and goodwill are treated as indefinite-lived intangible assets and, therefore are not amortized, but rather are tested for impairment annually in the fourth fiscal quarter, unless there are events requiring an earlier assessment or changes in circumstances during an interim period providing impairment indicators are present. We believe our estimates and assumptions are reasonable and represent appropriate marketplace considerations as of the valuation date. Although we use consistent methodologies in developing the assumptions and estimates underlying the fair value calculations used in our impairment tests, these estimates and assumptions are uncertain by nature, may change over time and can vary from actual results. It is possible that in the future there may be changes in our estimates and assumptions, including the timing and amount of future cash flows, margins, growth rates, market participant assumptions, comparable benchmark companies and related multiples and discount rates, which could result in different fair value estimates. Significant and adverse changes to any one or more of the above-noted estimates and assumptions could result in a goodwill impairment for one or more of our reporting units.

Wireless Licenses

The carrying value of our wireless licenses was approximately $95.1 billion as of December 31, 2019. We aggregate our wireless licenses into one single unit of accounting, as we utilize our wireless licenses on an integrated basis as part of our nationwide wireless network. Our wireless licenses provide us with the exclusive right to utilize certain radio frequency spectrum to provide wireless communication services. There are currently no legal, regulatory, contractual, competitive, economic or other factors that limit the useful life of our wireless licenses.

In 2019, we performed a qualitative impairment assessment to determine whether it is more likely than not that the fair value of our wireless licenses was less than the carrying amount. As part of our assessment we considered several qualitative factors including the historical business enterprise value of our wireless business, macroeconomic conditions (including changes in interest rates and discount rates), industry and market considerations (including industry revenue and EBITDA margin projections), the recent and projected financial performance of our wireless business as a whole, as well as other factors.

In 2018, our quantitative impairment test consisted of comparing the estimated fair value of our aggregate wireless licenses to the aggregated carrying amount as of the test date.

Our impairment test in 2019 indicated that it is more likely than not that the fair value of our wireless licenses remained above their carrying value and, therefore, did not result in an impairment. Our impairment test in 2018 indicated that the fair value of our wireless licenses significantly exceeded their carrying value and, therefore, did not result in an impairment.

Under our quantitative assessment, we estimated the fair value of our wireless licenses using the Greenfield approach. The Greenfield approach is an income-based valuation approach that values the wireless licenses by calculating the cash flow generating potential of a hypothetical start-up company that goes into business with no assets except the wireless licenses to be valued. A discounted cash flow analysis is used to estimate what a marketplace participant would be willing to pay to purchase the aggregated wireless licenses as of the valuation date. As a result, we

were required to make significant estimates about future cash flows specifically associated with our wireless licenses, an appropriate discount rate based on the risk associated with those estimated cash flows and assumed terminal value and growth rates. We considered current and expected future economic conditions, current and expected availability of wireless network technology and infrastructure and related equipment and the costs thereof as well as other relevant factors in estimating future cash flows. The discount rate represented our estimate of the weighted-average cost of capital (WACC), or expected return, that a marketplace participant would have required as of the valuation date. We developed the discount rate based on our consideration of the cost of debt and equity of a group of guideline companies as of the valuation date. Accordingly, our discount rate incorporated our estimate of the expected return a marketplace participant would have required as of the valuation date, including the risk premium associated with the current and expected economic conditions as of the valuation date. The terminal value growth rate represented our estimate of the marketplace's long-term growth rate.

Goodwill

In November 2018, we announced a strategic reorganization of our business. The Company began reporting externally under the new structure as of April 1, 2019 which resulted in certain changes to our operating segments and reporting units. Upon the date of reorganization, the goodwill of our historical Wireless reporting unit, historical Wireline reporting unit and historical Verizon Connect reporting unit were reallocated to our new Consumer and Business reporting units using a relative fair value approach. At December 31, 2019, the balance of our goodwill was approximately $24.4 billion, of which $17.1 billion was in our Consumer reporting unit and $7.3 billion was in our Business reporting unit. To determine if goodwill is potentially impaired, we have the option to perform a qualitative assessment to determine whether it is more likely than not that the fair value of a reporting unit is less than its carrying value. If we elect not to conduct the qualitative assessment or if indications of a potential impairment exist, the determination of whether an impairment has occurred requires the determination of the fair value of each the reporting unit being assessed.

Under the qualitative assessment, we consider several qualitative factors, including the business enterprise value of the reporting unit from the last quantitative test and the excess of fair value over carrying value from this test, macroeconomic conditions (including changes in interest rates and discount rates), industry and market considerations (including industry revenue and EBITDA margin projections), the recent and projected financial performance of the reporting unit, as well as other factors.

Under our quantitative assessment, the fair value of the reporting unit is calculated using a market approach and a discounted cash flow method. The market approach includes the use of comparative multiples to corroborate discounted cash flow results. The discounted cash flow method is based on the present value of two components-projected cash flows and a terminal value. The terminal value represents the expected normalized future cash flows of the reporting unit beyond the cash flows from the discrete projection period. The fair value of the reporting unit is calculated based on the sum of the present value of the cash flows from the discrete period and the present value of the terminal value. The discount rate represented our estimate of the WACC, or expected return, that a marketplace participant would have required as of the valuation date. The application of our goodwill impairment test required key assumptions underlying our valuation model. The discounted cash flow analysis factored in assumptions on discount rates and terminal growth rates to reflect risk profiles of key strategic revenue and cost initiatives, as well as revenue and EBITDA growth relative to history and market trends and expectations. The market multiples approach incorporated significant judgment involved in the selection comparable public company multiples and benchmarks. The selection of companies was influenced by differences in growth and profitability, and volatility in market prices of peer companies. These valuation inputs are inherently uncertain, and an adverse change in one or a combination of these inputs could trigger a goodwill impairment loss in the future.

A projected sustained decline in a reporting unit's revenues and earnings could have a significant negative impact on its fair value and may result in impairment charges. Such a decline could be driven by, among other things: (1) further anticipated decreases in service pricing, sales volumes and long-term growth rate as a result of competitive pressures or other factors; or (2) the inability to achieve or delays in achieving the goals in strategic initiatives. Also, adverse changes to macroeconomic factors, such as increases to long-term interest rates, would also negatively impact the fair value of the reporting unit.

We performed impairment assessments of the impacted reporting units, specifically our historical Wireless, historical Wireline and historical Connect reporting units on March 31, 2019, immediately before our strategic reorganization became effective. Our impairment assessments indicated that the fair value for each of our historical Wireless, historical Wireline and historical Connect reporting units exceeded their respective carrying values, and therefore did not result in a goodwill impairment. We then performed quantitative assessments of our Consumer and Business reporting units on April 1, 2019, immediately following our strategic reorganization. Our impairment assessments indicated that the fair value for each of our Consumer and Business reporting units exceeded their respective carrying values and therefore, did not result in a goodwill impairment. Our Media reporting unit was not impacted by the strategic reorganization and there was no indicator of impairment as of the reorganization date.

We performed qualitative impairment assessments for our Consumer and Business reporting units during the fourth quarter of 2019. Our qualitative assessments indicated that it was more likely than not that the fair values for our Consumer and Business reporting units exceeded their respective carrying values and, therefore, did not result in an impairment. We performed quantitative impairment assessments for our Media reporting unit in 2019 and 2018. For details on our Media reporting unit, refer to the discussion below.

Our Media business, Verizon Media, experienced increased competitive and market pressures throughout 2018 that resulted in lower than expected revenues and earnings. These pressures were expected to continue and have resulted in a loss of market positioning to our competitors in the digital advertising business. Our Media business also achieved lower than expected benefits from the integration of the Yahoo Inc. and AOL Inc. (AOL) businesses.

As of August 2018, Hans Vestberg became Chief Executive Officer of Verizon, and as of October 2018, K. Guru Gowrappan was appointed Chief Executive Officer of our Media business. In connection with Verizon's annual budget process during the fourth quarter of 2019 and 2018, the leadership at both Verizon Media and Verizon completed a comprehensive five-year strategic planning review of Verizon Media's business prospects resulting in unfavorable adjustments to Verizon Media's financial projections. These revised projections were used as a key input into Verizon Media's annual goodwill impairment tests performed in the fourth quarter of 2019 and 2018.

During the fourth quarter of 2019 and 2018, consistent with our accounting policy, we applied a combination of a market approach and a discounted cash flow method reflecting current assumptions and inputs, including our revised projections, discount rate and expected growth rates, which resulted in the determination that the fair value of the Media reporting unit was less than its carrying amount. As a result, we recorded a non-cash goodwill impairment charge of approximately $186 million ($176 million after-tax) in the fourth quarter of 2019 and a charge of $4.6 billion ($4.5 billion after-tax) in the fourth quarter of 2018 in our consolidated statements of income. The goodwill balance of the Media reporting unit has been fully written off as a result of these impairment charges.

We performed a quantitative impairment assessment for all of the other reporting units in 2018. Our impairment tests indicated that the fair value for each of our historical Wireless, historical Wireline and historical Connect reporting units exceeded their respective carrying value and, therefore, did not result in an impairment.

Pension and Other Postretirement Benefit Plans

We maintain benefit plans for most of our employees, including, for certain employees, pension and other postretirement benefit plans. At December 31, 2019, in the aggregate, pension plan benefit obligations exceeded the fair value of pension plan assets, which will result in future pension plan expense. Other postretirement benefit plans have larger benefit obligations than plan assets, resulting in expense. Significant benefit plan assumptions, including the discount rate used, the long-term rate of return on plan assets, the determination of the substantive plan and health care trend rates are periodically updated and impact the amount of benefit plan income, expense, assets and obligations. Changes to one or more of these assumptions could significantly impact our accounting for pension and other postretirement benefits. A sensitivity analysis of the impact of changes in these assumptions on the benefit obligations and expense (income) recorded, as well as on the funded status due to an increase or a decrease in the actual versus expected return on plan assets as of December 31, 2019 and for the year then ended pertaining to Verizon's pension and postretirement benefit plans, is provided in the table below.

(dollars in millions)	Percentage point change	Increase/(decrease) at December 31, 2019*
Pension plans discount rate	+0.50 $	(1,137)
	-0.50	1,266
Rate of return on pension plan assets	+1.00	(167)
	-1.00	167
Postretirement plans discount rate	+0.50	(858)
	-0.50	948
Rate of return on postretirement plan assets	+1.00	(9)
	-1.00	9
Health care trend rates	+1.00	626
	-1.00	(696)

* In determining its pension and other postretirement obligation, the Company used a weighted-average discount rate of 3.3%. The rate was selected to approximate the composite interest rates available on a selection of high-quality bonds available in the market at December 31, 2019. The bonds selected had maturities that coincided with the time periods during which benefits payments are expected to occur, were non-callable and available in sufficient quantities to ensure marketability (at least $300 million par outstanding).

The annual measurement date for both our pension and other postretirement benefits is December 31. We use the full yield curve approach to estimate the interest cost component of net periodic benefit cost for pension and other postretirement benefits. The full yield curve approach refines our estimate of interest cost by applying the individual spot rates from a yield curve composed of the rates of return on several hundred high-quality fixed income corporate bonds available at the measurement date. These individual spot rates align with the timing of each future cash outflow for benefit payments and therefore provide a more precise estimate of interest cost.

Income Taxes

Our current and deferred income taxes and associated valuation allowances are impacted by events and transactions arising in the normal course of business as well as in connection with the adoption of new accounting standards, changes in tax laws and rates, acquisitions and dispositions of businesses and non-recurring items. As a global commercial enterprise, our income tax rate and the classification of income taxes can be affected by many factors, including estimates of the timing and realization of deferred income tax assets and the timing and amount of income tax payments. We account for tax benefits taken or expected to be taken in our tax returns in accordance with the accounting standard relating to the uncertainty in income taxes, which requires the use of a two-step approach for recognizing and measuring tax benefits taken or expected to be taken in a tax return. We review and adjust our liability for unrecognized tax benefits based on our best judgment given the facts, circumstances and information available at each reporting date. To the extent that the final outcome of these tax positions is different than the amounts recorded, such differences may impact income tax expense and actual tax payments. We recognize any interest and penalties accrued related to unrecognized tax benefits in income tax expense. Actual tax payments may materially differ from estimated liabilities as a result of changes in tax laws as well

as unanticipated transactions impacting related income tax balances. See Note 12 to the consolidated financial statements for additional information.

Property, Plant and Equipment

Our Property, plant and equipment balance represents a significant component of our consolidated assets. We record Property, plant and equipment at cost. We depreciate Property, plant and equipment on a straight-line basis over the estimated useful life of the assets. We expect that a one year increase in estimated useful lives of our Property, plant and equipment would result in a decrease to our 2019 depreciation expense of $2.7 billion and that a one year decrease would result in an increase of approximately $4.7 billion in our 2019 depreciation expense.

Accounts Receivable

We maintain allowances for uncollectible accounts receivable, including our direct-channel device payment plan agreement receivables, for estimated losses resulting from the failure or inability of our customers to make required payments. Indirect-channel device payment loans are considered financial instruments and are initially recorded at fair value net of imputed interest, and credit losses are recorded as incurred. However, loan balances are assessed quarterly for impairment and an allowance is recorded if the loan is considered impaired. Our allowance for uncollectible accounts receivable is based on management's assessment of the collectability of specific customer accounts and includes consideration of the credit worthiness and financial condition of those customers. We record an allowance to reduce the receivables to the amount that is reasonably believed to be collectible. We also record an allowance for all other receivables based on multiple factors including historical experience with bad debts, the general economic environment and the aging of such receivables. Similar to traditional service revenue, we record direct device payment plan agreement bad debt expense based on an estimate of the percentage of equipment revenue that will not be collected. This estimate is based on a number of factors including historical write-off experience, credit quality of the customer base and other factors such as macroeconomic conditions. If there is a deterioration of our customers' financial condition or if future actual default rates on receivables in general differ from those currently anticipated, we may have to adjust our allowance for doubtful accounts, which would affect earnings in the period the adjustments are made.

Recently Issued Accounting Standards

See Note 1 to the consolidated financial statements for a discussion of recently issued accounting standard updates not yet adopted as of December 31, 2019.

Acquisitions and Divestitures

Acquisition of AOL Inc.

In May 2015, we entered into an Agreement and Plan of Merger with AOL Inc. pursuant to which we commenced a tender offer to acquire all of the outstanding shares of common stock of AOL at a price of $50.00 per share, net to the seller in cash, without interest and less any applicable withholding taxes.

On June 23, 2015, we completed the tender offer and merger, and AOL became a wholly-owned subsidiary of Verizon. The aggregate cash consideration paid by Verizon at the closing of these transactions was approximately $3.8 billion. Holders of approximately 6.6 million shares exercised appraisal rights under Delaware law. In September 2018, we obtained court approval to settle this matter for total cash consideration of $219 million, of which an insignificant amount relates to interest, resulting in an insignificant gain. We paid the cash consideration in October 2018.

XO Holdings

In February 2016, we entered into a purchase agreement to acquire XO Holdings' wireline business (XO), which owned and operated one of the largest fiber-based IP and Ethernet networks in the U.S. Concurrently, we entered into a separate agreement to utilize certain wireless spectrum from a wholly-owned subsidiary of XO Holdings, NextLink, that held XO's millimeter-wave wireless spectrum. The agreement included an option, subject to certain conditions, to acquire NextLink. In February 2017, we completed our acquisition of XO for total cash consideration of approximately $1.5 billion, of which $100 million was paid in 2015, and we prepaid $320 million in connection with the NextLink option which represented the fair value of the option.

In April 2017, we exercised our option to buy NextLink for approximately $493 million, subject to certain adjustments, of which $320 million was prepaid in the first quarter of 2017. The transaction closed in January 2018. The acquisition of NextLink was accounted for as an asset acquisition, as substantially all of the value related to the acquired spectrum. Upon closing, we recorded approximately $657 million of wireless licenses, $110 million of a deferred tax liability and $58 million of other liabilities. See Note 3 to the consolidated financial statements for additional information.

Straight Path

In May 2017, we entered into a purchase agreement to acquire Straight Path, a holder of millimeter wave spectrum configured for 5G wireless services, for total consideration reflecting an enterprise value of approximately $3.1 billion. Under the terms of the purchase agreement, we agreed to pay: (1) Straight Path shareholders $184.00 per share, payable in Verizon shares; and (2) certain transaction costs payable in cash of approximately $736 million, consisting primarily of a fee to be paid to the FCC. The transaction closed in February 2018 at which time we issued

approximately 49 million shares of Verizon common stock, valued at approximately $2.4 billion, and paid the associated cash consideration. See Note 3 to the consolidated financial statements for additional information.

Spectrum License Transactions

From time to time, we enter into agreements to buy, sell or exchange spectrum licenses. We believe these spectrum license transactions have allowed us to continue to enhance the reliability of our wireless network while also resulting in a more efficient use of spectrum. See Note 3 to the consolidated financial statements for additional information regarding our spectrum license transactions.

Other

From time to time, we enter into strategic agreements to acquire various other businesses and investments. See Note 3 to the consolidated financial statements for additional information.

Cautionary Statement Concerning Forward-Looking Statements

In this report we have made forward-looking statements. These statements are based on our estimates and assumptions and are subject to risks and uncertainties. Forward-looking statements include the information concerning our possible or assumed future results of operations. Forward-looking statements also include those preceded or followed by the words "anticipates," "believes," "estimates," "expects," "hopes" or similar expressions. For those statements, we claim the protection of the safe harbor for forward-looking statements contained in the Private Securities Litigation Reform Act of 1995. We undertake no obligation to revise or publicly release the results of any revision to these forward-looking statements, except as required by law. Given these risks and uncertainties, readers are cautioned not to place undue reliance on such forward-looking statements.

The following important factors, along with those discussed elsewhere in this report and in other filings with the SEC, could affect future results and could cause those results to differ materially from those expressed in the forward-looking statements:

- cyber attacks impacting our networks or systems and any resulting financial or reputational impact;
- natural disasters, terrorist attacks or acts of war or significant litigation and any resulting financial or reputational impact;
- disruption of our key suppliers' or vendors' provisioning of products or services;
- material adverse changes in labor matters and any resulting financial or operational impact;
- the effects of competition in the markets in which we operate;
- failure to take advantage of developments in technology and address changes in consumer demand;
- performance issues or delays in the deployment of our 5G network resulting in significant costs or a reduction in the anticipated benefits of the enhancement to our networks;
- the inability to implement our business strategy;
- adverse conditions in the U.S. and international economies;
- changes in the regulatory environment in which we operate, including any increase in restrictions on our ability to operate our networks;
- our high level of indebtedness;
- an adverse change in the ratings afforded our debt securities by nationally accredited ratings organizations or adverse conditions in the credit markets affecting the cost, including interest rates, and/or availability of further financing;
- significant increases in benefit plan costs or lower investment returns on plan assets;
- changes in tax laws or treaties, or in their interpretation; and
- changes in accounting assumptions that regulatory agencies, including the SEC, may require or that result from changes in the accounting rules or their application, which could result in an impact on earnings.

Report of Management on Internal Control Over Financial Reporting

We, the management of Verizon Communications Inc., are responsible for establishing and maintaining adequate internal control over financial reporting of the company. Management has evaluated internal control over financial reporting of the company using the criteria for effective internal control established in Internal Control–Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission in 2013.

Management has assessed the effectiveness of the company's internal control over financial reporting as of December 31, 2019. Based on this assessment, we believe that the internal control over financial reporting of the company is effective as of December 31, 2019. In connection with this assessment, there were no material weaknesses in the company's internal control over financial reporting identified by management.
The company's financial statements included in this Annual Report have been audited by Ernst & Young LLP, independent registered public accounting firm. Ernst & Young LLP has also provided an attestation report on the company's internal control over financial reporting.

Report of Independent Registered Public Accounting Firm

To the Shareholders and the Board of Directors of Verizon Communications Inc.:

Opinion on Internal Control Over Financial Reporting

We have audited Verizon Communications Inc. and subsidiaries' (Verizon) internal control over financial reporting as of December 31, 2019, based on criteria established in Internal Control-Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (2013 framework) (the COSO criteria). In our opinion, Verizon maintained, in all material respects, effective internal control over financial reporting as of December 31, 2019, based on the COSO criteria.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States) (PCAOB), the consolidated balance sheets of Verizon as of December 31, 2019 and 2018, the related consolidated statements of income, comprehensive income, cash flows, and changes in equity for each of the three years in the period ended December 31, 2019, and the related notes and our report dated February 21, 2020 expressed an unqualified opinion thereon.

Basis for Opinion

Verizon's management is responsible for maintaining effective internal control over financial reporting and for its assessment of the effectiveness of internal control over financial reporting included in the accompanying Report of Management on Internal Control Over Financial Reporting. Our responsibility is to express an opinion on Verizon's internal control over financial reporting based on our audit. We are a public accounting firm registered with the PCAOB and are required to be independent with respect to Verizon in accordance with the U.S. federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audit in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether effective internal control over financial reporting was maintained in all material respects.

Our audit included obtaining an understanding of internal control over financial reporting, assessing the risk that a material weakness exists, testing and evaluating the design and operating effectiveness of internal control based on the assessed risk, and performing such other procedures as we considered necessary in the circumstances. We believe that our audit provides a reasonable basis for our opinion.

Definition and Limitations of Internal Control Over Financial Reporting

A company's internal control over financial reporting is a process designed to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles. A company's internal control over financial reporting includes those policies and procedures that (1) pertain to the maintenance of records that, in reasonable detail, accurately and fairly reflect the transactions and dispositions of the assets of the company; (2) provide reasonable assurance that transactions are recorded as necessary to permit preparation of financial statements in accordance with generally accepted accounting principles, and that receipts and expenditures of the company are being made only in accordance with authorizations of management and directors of the company; and (3) provide reasonable assurance regarding prevention or timely detection of unauthorized acquisition, use, or disposition of the company's assets that could have a material effect on the financial statements.

Because of its inherent limitations, internal control over financial reporting may not prevent or detect misstatements. Also, projections of any evaluation of effectiveness to future periods are subject to the risk that controls may become inadequate because of changes in conditions, or that the degree of compliance with the policies or procedures may deteriorate.

February 21, 2020

Report of Independent Registered Public Accounting Firm

To the Shareholders and the Board of Directors of Verizon Communications Inc.:

Opinion on the Financial Statements

We have audited the accompanying consolidated balance sheets of Verizon Communications Inc. and subsidiaries (Verizon) as of December 31, 2019 and 2018, the related consolidated statements of income, comprehensive income, cash flows, and changes in equity for each of the three years in the period ended December 31, 2019, and the related notes (collectively referred to as the "consolidated financial statements"). In our opinion, the consolidated financial statements present fairly, in all material respects, the financial position of Verizon at December 31, 2019 and 2018, and the results of its operations and its cash flows for each of the three years in the period ended December 31, 2019, in conformity with U.S. generally accepted accounting principles.

We also have audited, in accordance with the standards of the Public Company Accounting Oversight Board (United States) (PCAOB), Verizon's internal control over financial reporting as of December 31, 2019, based on criteria established in Internal Control–Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission (2013 framework) and our report dated February 21, 2020 expressed an unqualified opinion thereon.

Adoption of New Accounting Standards

ASU No. 2016-02
As discussed in Note 1 to the consolidated financial statements, effective January 1, 2019, Verizon changed its method of accounting for leases due to the adoption of Accounting Standards Update (ASU) No. 2016-02, Leases (Topic 842), and the related amendments, using the modified retrospective method.

ASU No. 2014-09
As discussed in Note 1 to the consolidated financial statements, effective January 1, 2018 Verizon changed its method for recognizing revenue as a result of the adoption of ASU No. 2014-09, Revenue from Contracts with Customers (Topic 606), and the amendments in ASUs 2015-14, 2016-08, 2016-10 and 2016-12 using the modified retrospective method.

Basis for Opinion

These financial statements are the responsibility of Verizon's management. Our responsibility is to express an opinion on Verizon's financial statements based on our audits. We are a public accounting firm registered with the PCAOB and are required to be independent with respect to Verizon in accordance with the U.S. federal securities laws and the applicable rules and regulations of the Securities and Exchange Commission and the PCAOB.

We conducted our audits in accordance with the standards of the PCAOB. Those standards require that we plan and perform the audit to obtain reasonable assurance about whether the financial statements are free of material misstatement, whether due to error or fraud. Our audits included performing procedures to assess the risks of material misstatement of the financial statements, whether due to error or fraud, and performing procedures that respond to those risks. Such procedures included examining, on a test basis, evidence regarding the amounts and disclosures in the financial statements. Our audits also included evaluating the accounting principles used and significant estimates made by management, as well as evaluating the overall presentation of the financial statements. We believe that our audits provide a reasonable basis for our opinion.

Critical Audit Matters

The critical audit matters communicated below are matters arising from the current period audit of the financial statements that were communicated or required to be communicated to the audit committee and that: (1) relate to accounts or disclosures that are material to the financial statements and (2) involved our especially challenging, subjective or complex judgments. The communication of critical audit matters does not alter in any way our opinion on the consolidated financial statements, taken as a whole, and we are not, by communicating the critical audit matters below, providing separate opinions on the critical audit matters or on the accounts or disclosures to which they relate.

Impairment Evaluation for Wireline Goodwill

Description of the Matter

At March 31, 2019, the Company's goodwill related to its historical Wireline reporting unit was $3.9 billion and represented 1.4% of total assets. As discussed in Notes 1 and 4 of the consolidated financial statements, goodwill is not amortized but rather is tested for impairment at the reporting unit level at least annually, or more frequently if impairment indicators are present. The impairment test compares the fair value of the reporting unit (calculated using a combination of a market approach and a discounted cash flow method) to its carrying amount. Effective April 1, 2019, the Company transitioned to its new segment reporting structure, which resulted in certain changes to its operating segments and reporting units. On March 31, 2019 the Company performed an impairment assessment of the impacted reporting units, including the Wireline reporting unit, immediately before the segment reorganization became effective.

Auditing management's goodwill impairment test was complex and highly judgmental due to the inherent subjectivity of developing an estimate of the fair value of the reporting unit, which is based on assumptions about future conditions, transactions, or events whose outcome is uncertain and will therefore be subject to change over time. In particular, the fair value estimate was sensitive to significant assumptions such as the weighted average cost of capital, revenue growth rate and operating margin, which are affected by expected future market or economic conditions.

How We Addressed the Matter in Our Audit

We obtained an understanding, evaluated the design and tested the operating effectiveness of controls over the Company's goodwill impairment review process. For example, we tested controls over the Company's development of prospective financial information and management's review of other key assumptions.

To test the estimated fair value of the Company's Wireline reporting unit prior to segment reorganization, our audit procedures included, among others, assessing the suitability and application of the valuation methodologies selected and evaluating the significant assumptions discussed above and underlying data used by the Company in its analysis. We compared the significant assumptions used by management to current industry and economic trends, changes in the Company's business model, customer base or product mix and other relevant factors. We performed sensitivity analyses of significant assumptions to determine what changes in assumptions are particularly sensitive when assessing the likelihood of impairment, or when calculating the amount of an impairment. In addition, we involved a valuation specialist to assist in the evaluation of the assumptions and other relevant information that are most significant to the fair value estimate. We also assessed the historical accuracy of management's forecasts of financial results used in developing prior fair value estimates to assist in evaluating the reliability of the current forecasts.

Valuation of Employee Benefit Obligations

Description of the Matter

The Company sponsors several pension plans and other post-employment benefit plans. At December 31, 2019, the Company's aggregate defined benefit pension obligation was $21.2 billion and exceeded the fair value of pension plan assets of $19.4 billion, resulting in an unfunded defined benefit pension obligation of $1.8 billion. Also, at December 31, 2019, the other postretirement benefits obligation was approximately $15.7 billion. As explained in Note 11 of the consolidated financial statements, the Company updates the estimates used to measure employee benefit obligations and plan assets in the fourth quarter and upon a remeasurement event to reflect the actual return on plan assets and updated actuarial assumptions.

Auditing the employee benefit obligations was complex due to the highly judgmental nature of the actuarial assumptions (e.g., discount rate, health care cost trends, per capita claims cost trends and mortality rates) used in the measurement process. These assumptions had a significant effect on the projected benefit obligation.

How We Addressed the Matter in Our Audit

We obtained an understanding, evaluated the design and tested the operating effectiveness of controls over the employee benefits obligation valuation process. For example, we tested controls over management's review of the employee benefit obligation calculations, the significant actuarial assumptions and the data inputs provided to the actuary.

To test the employee benefit obligations, our audit procedures included, among others, evaluating the methodologies used, the significant actuarial assumptions discussed above and the underlying data used by the Company. We compared the actuarial assumptions used by management to historical trends, current economic factors and evaluated the change in the employee benefit obligations from prior year due to the change in service cost, interest cost, actuarial gains and losses, benefit payments, contributions and other activities. In addition, we involved an actuarial specialist to assist in evaluating management's methodology for determining the discount rate that reflects the maturity and duration of the benefit payments and is used to measure the employee benefit obligations. As part of this assessment, we compared the projected cash flows to prior year projections and compared the current year benefits paid to the prior year projected cash flows. To evaluate the health care cost trends, per capita claims cost trends and the mortality rates, we involved an actuarial specialist to assist in evaluating the assumptions and assessed whether the information is consistent with publicly available information, and whether any market data adjusted for entity-specific adjustments were applied. We also tested the completeness and accuracy of the underlying data, including the participant data provided to management's actuarial specialists.

Income Taxes - Benefit from the disposition of stock of a foreign affiliate

Description of the Matter

As described in Note 12 to the consolidated financial statements, during the fourth quarter of 2019 the Company sold a minority interest in a foreign affiliate to unrelated parties resulting in the recognition of a tax benefit of approximately $2.2 billion.

Auditing the recognition and measurement of this income tax benefit required significant auditor judgment because the determination of whether the tax positions' technical merits are more likely than not to be sustained in an audit by a taxing authority is based on the application and interpretation of the relevant tax laws to the facts of the specific transaction.

How We Addressed the Matter in Our Audit	We obtained an understanding, evaluated the design and tested the operating effectiveness of controls over the Company's income tax processes. For example, we tested controls over management's review of the income tax technical merits of the transaction and the related recognition and measurement of the income tax benefit. To test the income tax benefit related to this transaction, our audit procedures included, among others, assessing the suitability and application of tax laws and legal rulings and evaluating the related conclusions. In addition, we involved our tax professionals to assist in the review and evaluation of management's third-party tax opinions and memoranda and other relevant agreements. We tested the completeness and accuracy of the data and calculations used to determine the amount of the income tax benefit recognized.

Notes to Consolidated Financial Statements Verizon Communications Inc. and Subsidiaries

Note 1. Description of Business and Summary of Significant Accounting Policies

Description of Business

Verizon Communications Inc. (Verizon or the Company) is a holding company that, acting through its subsidiaries, is one of the world's leading providers of communications, information and entertainment products and services to consumers, businesses and government entities. With a presence around the world, we offer voice, data and video services and solutions on our networks that are designed to meet customers' demand for mobility, reliable network connectivity, security and control.

In November 2018, we announced a strategic reorganization of our business. Under the new structure, effective April 1, 2019, there are two reportable segments that we operate and manage as strategic business units - Verizon Consumer Group (Consumer) and Verizon Business Group (Business).

Our Consumer segment provides consumer-focused wireless and wireline communications services and products. Our wireless services are provided across one of the most extensive wireless networks in the United States (U.S.) under the Verizon brand and through wholesale and other arrangements. Our wireline services are provided in nine states in the Mid-Atlantic and Northeastern U.S., as well as Washington D.C., over our 100% fiber-optic network under the Fios brand and over a traditional copper-based network to customers who are not served by Fios. Our Consumer segment's wireless and wireline products and services are available to our retail customers, as well as resellers that purchase wireless network access from us on a wholesale basis.

Our Business segment provides wireless and wireline communications services and products, video and data services, corporate networking solutions, security and managed network services, local and long distance voice services and network access to deliver various Internet of Things (IoT) services and products. We provide these products and services to businesses, government customers and wireless and wireline carriers across the U.S. and select products and services to customers around the world.

Consolidation

The method of accounting applied to investments, whether consolidated or equity, involves an evaluation of all significant terms of the investments that explicitly grant or suggest evidence of control or influence over the operations of the investee. The consolidated financial statements include our controlled subsidiaries, as well as variable interest entities (VIE) where we are deemed to be the primary beneficiary. For controlled subsidiaries that are not wholly-owned, the noncontrolling interests are included in Net income and Total equity. Investments in businesses that we do not control, but have the ability to exercise significant influence over operating and financial policies, are accounted for using the equity method. Equity method investments are included in Investments in unconsolidated businesses in our consolidated balance sheets. All significant intercompany accounts and transactions have been eliminated.

Use of Estimates

We prepare our financial statements using U.S. generally accepted accounting principles (GAAP), which requires management to make estimates and assumptions that affect reported amounts and disclosures. Actual results could differ from those estimates.

Examples of significant estimates include the allowance for doubtful accounts, the recoverability of property, plant and equipment, the incremental borrowing rate for the lease liability, the recoverability of intangible assets and other long-lived assets, fair value measurements, including those related to financial instruments, goodwill, spectrum licenses and intangible assets, unrecognized tax benefits, valuation allowances on tax assets, pension and postretirement benefit obligations, contingencies and the identification and valuation of assets acquired and liabilities assumed in connection with business combinations.

Revenue Recognition

We earn revenue from contracts with customers, primarily through the provision of telecommunications and other services and through the sale of wireless equipment. These services include a variety of communication and connectivity services for our Consumer and Business customers including other carriers that use our facilities to provide services to their customers, as well as professional and integrated managed services for our large enterprises and government customers. We account for these revenues under Accounting Standards Update (ASU) 2014-09, "Revenue from Contracts with Customers" (Topic 606), which we adopted on January 1, 2018, using the modified retrospective approach. This standard update, along with related subsequently issued updates, clarifies the principles for recognizing revenue and develops a common revenue standard for GAAP. The standard update also amends current guidance for the recognition of costs to obtain and fulfill contracts with customers such that incremental costs of obtaining and direct costs of fulfilling contracts with customers are deferred and amortized consistent with the transfer of the related good or service.

We also earn revenues that are not accounted for under Topic 606 from leasing arrangements (such as those for towers and equipment), captive reinsurance arrangements primarily related to wireless device insurance and the interest on equipment financed under a device payment plan agreement when sold to the customer by an authorized agent.

Nature of Products and Services

Telecommunications

Service

We offer wireless services through a variety of plans on a postpaid or prepaid basis. For wireless service, we recognize revenue using an output method, either as the service allowance units are used or as time elapses, because it reflects the pattern by which we satisfy our performance obligation through the transfer of service to the customer. Monthly service is generally billed in advance, which results in a contract liability. See Note 2 for additional information. For postpaid plans, where monthly usage exceeds the allowance, the overage usage represents options held by the customer for incremental services and the usage-based fee is recognized when the customer exercises the option (typically on a month-to-month basis).

For our contracts related to wireline communication and connectivity services, in general, fixed monthly fees for service are billed one month in advance, which results in a contract liability, and service revenue is recognized over the enforceable contract term as the service is rendered, as the customer simultaneously receives and consumes the benefits of the services through network access and usage. While substantially all of our wireline service revenue contracts are the result of providing access to our networks, revenue from services that are not fixed in amount and, instead, are based on usage are generally billed in arrears and recognized as the usage occurs.

Equipment

We sell wireless devices and accessories under the Verizon brand. Equipment revenue is generally recognized when the products are delivered to and accepted by the customer, as this is when control passes to the customer. In addition to offering the sale of equipment on a standalone basis, we have two primary offerings through which customers pay for a wireless device, in connection with a service contract: fixed-term plans and device payment plans.

Under a fixed-term plan, the customer is sold the wireless device without any upfront charge or at a discounted price in exchange for entering into a fixed-term service contract (typically for a term of 24 months or less).

Under a device payment plan, the customer is sold the wireless device in exchange for a non-interest-bearing installment note, which is repaid by the customer, typically over a 24-month term, and concurrently enters into a month-to-month contract for wireless service. We may offer certain promotions that provide billing credits applied over a specified term, contingent upon the customer maintaining service. The credits are included in the transaction price, which are allocated to the performance obligations based on their relative selling price and are recognized when earned.

A financing component exists in both our fixed-term plans and device payment plans because the timing of the payment for the device, which occurs over the contract term, differs from the satisfaction of the performance obligation, which occurs at contract inception upon transfer of the device to the customer. We periodically assess, at the contract level, the significance of the financing component inherent in our fixed-term and device payment plan receivable based on qualitative and quantitative considerations related to our customer classes. These considerations include assessing the commercial objective of our plans, the term and duration of financing provided, interest rates prevailing in the marketplace, and credit risks of our customer classes, all of which impact our selection of appropriate discount rates. Based on current facts and circumstances, we determined that the financing component in our existing wireless device payments and fixed-term contracts sold through the direct channel is not significant and therefore is not accounted for separately. See Note 8 for additional information on the interest on equipment financed on a device payment plan agreement when sold to the customer by an authorized agent in our indirect channel.

Wireless Contracts

For our wireless contracts, total contract revenue, which represents the transaction price for wireless service and wireless equipment, is allocated between service and equipment revenue based on their estimated standalone selling prices. We estimate the standalone selling price of the device or accessory to be its retail price excluding subsidies or conditional purchase discounts. We estimate the standalone selling price of wireless service to be the price that we offer to customers on month-to-month contracts that can be cancelled at any time without penalty (i.e., when there is no fixed-term for service) or when service is procured without the concurrent purchase of a wireless device. In addition, we also assess whether the service term is impacted by certain legally enforceable rights and obligations in our contract with customers, such as penalties that a customer would have to pay to early terminate a fixed-term contract or billing credits that would cease if the month-to-month wireless service is canceled. The assessment of these legally enforceable rights and obligations involves judgment and impacts our determination of the transaction price and related disclosures.

From time to time, we may offer certain promotions that provide our customers on device payment plans with the right to upgrade to a new device after paying a specified portion of their device payment plan agreement amount and trading in their device in good working order. We account for this trade-in right as a guarantee obligation. The full amount of the trade-in right's fair value is recognized as a guarantee liability and results in a reduction to the revenue recognized upon the sale of the device. The guarantee liability was insignificant at December 31, 2019 and 2018. The total transaction price is reduced by the guarantee, which is accounted for outside the scope of Topic 606, and the remaining transaction price is allocated between the performance obligations within the contract.

Our fixed-term plans generally include the sale of a wireless device at subsidized prices. This results in the creation of a contract asset at the time of sale, which represents the recognition of equipment revenue in excess of amounts billed.

For our device payment plans, billing credits are accounted for as consideration payable to a customer and are included in the determination of total transaction price, resulting in a contract liability.

We may provide a right of return on our products and services for a short time period after a sale. These rights are accounted for as variable consideration when determining the transaction price, and accordingly we recognize revenue based on the estimated amount to which we expect to be entitled after considering expected returns. Returns and credits are estimated at contract inception and updated at the end of each reporting period as additional information becomes available. We also may provide credits or incentives on our products and services for contracts with resellers, which are accounted for as variable consideration when estimating the amount of revenue to recognize.

Wireline Contracts

Total consideration for wireline services that are bundled in a single contract is allocated to each performance obligation based on our standalone selling price for each service. While many contracts include one or more service performance obligations, the revenue recognition pattern is generally not impacted by the allocation since the services are generally satisfied over the same period of time. We estimate the standalone selling price to be the price of the services when sold on a standalone basis without any promotional discount. In addition, we also assess whether the service term is impacted by certain legally enforceable rights and obligations in our contract with customers such as penalties that a customer would have to pay to early terminate a fixed-term contract. The assessment of these legally enforceable rights and obligations involves judgment and impacts our determination of transaction price and related disclosures.

We may provide performance-based credits or incentives on our products and services for contracts with our Business customers, which are accounted for as variable consideration when estimating the transaction price. Credits are estimated at contract inception and are updated at the end of each reporting period as additional information becomes available.

Wireless and Wireline Contracts

For offers that include third-party providers, we evaluate whether we are acting as the principal or as the agent with respect to the goods or services provided to the customer. This principal-versus-agent assessment involves judgment and focuses on whether the facts and circumstances of the arrangement indicate that the goods or services were controlled by us prior to transferring them to the customer. To evaluate if we have control, we consider various factors including whether we are primarily responsible for fulfillment, bear risk of loss and have discretion over pricing.

Other

Advertising revenues are generated through display advertising and search advertising. Display advertising revenue is generated by the display of graphical advertisements and other performance-based advertising. Search advertising revenue is generated when a consumer clicks on a text-based advertisement on the search results page. Our Media business, Verizon Media, primarily earns revenue through display advertising on Verizon Media properties, as well as on third-party properties through our advertising platforms, search advertising and subscription arrangements. Revenue for display and search advertising contracts is recognized as ads are delivered, while subscription contracts are recognized over time. We are generally the principal in transactions carried out through our advertising platforms, and therefore report gross revenue based on the amount billed to our customers. The control and transfer of digital advertising inventory occurs in a rapid, real-time environment, where our proprietary technology enables us to identify, enhance, verify and solely control digital advertising inventory that we then sell to our customers. Our control is further supported by us being primarily responsible to our customers for fulfillment and the fact that we can exercise a level of discretion over pricing.

We offer telematics services including smart fleet management and optimization software. Telematics service revenue is generated primarily through subscription contracts. We recognize revenue over time for our subscription contracts.

We report taxes collected from customers on behalf of governmental authorities on revenue-producing transactions on a net basis.

Maintenance and Repairs

We charge the cost of maintenance and repairs, including the cost of replacing minor items not constituting substantial betterments, principally to Cost of services as these costs are incurred.

Advertising Costs

Costs for advertising products and services, as well as other promotional and sponsorship costs, are charged to Selling, general and administrative expense in the periods in which they are incurred. See Note 15 for additional information.

Earnings Per Common Share

Basic earnings per common share are based on the weighted-average number of shares outstanding during the period. Where appropriate, diluted earnings per common share include the dilutive effect of shares issuable under our stock-based compensation plans.

There were a total of approximately 2 million, 4 million and 5 million outstanding dilutive securities, primarily consisting of restricted stock units, included in the computation of diluted earnings per common share for the years ended December 31, 2019, 2018 and 2017, respectively.

Cash, Cash Equivalents and Restricted Cash

We consider all highly liquid investments with an original maturity of 90 days or less when purchased to be cash equivalents. Cash equivalents are stated at cost, which approximates quoted market value and includes amounts held in money market funds.

Cash collections on the device payment plan agreement receivables collateralizing asset-backed debt securities are required at certain specified times to be placed into segregated accounts. Deposits to the segregated accounts are considered restricted cash and are included in Prepaid expenses and other and Other assets in our consolidated balance sheets.

Cash, cash equivalents and restricted cash are included in the following line items in the consolidated balance sheets:

(dollars in millions)

At December 31,	**2019**	2018	**Increase / (Decrease)**
Cash and cash equivalents	**$ 2,594**	$ 2,745	$ (151)
Restricted cash:			
Prepaid expenses and other	**1,221**	1,047	174
Other assets	**102**	124	(22)
Cash, cash equivalents and restricted cash	**$ 3,917**	$ 3,916	$ 1

Investments in Debt and Equity Securities

Investments in equity securities that are not accounted for under equity method accounting or result in consolidation are to be measured at fair value. For investments in equity securities without readily determinable fair values, Verizon elects the measurement alternative permitted under GAAP to measure these investments at cost, less any impairment, plus or minus changes resulting from observable price changes in orderly transactions for an identical or similar investment of the same issuer. For investments in debt securities without quoted prices, Verizon uses an alternative matrix pricing method. Investments in equity securities that do not result in consolidation of the investee are included in Investments in unconsolidated businesses and debt securities are included in Other assets in our consolidated balance sheets.

Allowance for Doubtful Accounts

Accounts receivable are recorded in the consolidated financial statements at cost net of an allowance for credit losses, with the exception of indirect-channel device payment plan loans. We maintain allowances for uncollectible accounts receivable, including our direct-channel device payment plan agreement receivables, for estimated losses resulting from the failure or inability of our customers to make required payments. Indirect-channel device payment loans are considered financial instruments and are initially recorded at fair value net of imputed interest, and credit losses are recorded as incurred. However, loan balances are assessed quarterly for impairment and an allowance is recorded if the loan is considered impaired. Our allowance for uncollectible accounts receivable is based on management's assessment of the collectability of specific customer accounts and includes consideration of the credit worthiness and financial condition of those customers. We record an allowance to reduce the receivables to the amount that is reasonably believed to be collectible. We also record an allowance for all other receivables based on multiple factors including historical experience with bad debts, the general economic environment and the aging of such receivables. Similar to traditional service revenue, we record direct device payment plan agreement bad debt expense based on an estimate of the percentage of equipment revenue that will not be collected. This estimate is based on a number of factors including historical write-off experience, credit quality of the customer base and other factors such as macroeconomic conditions. We monitor the aging of our accounts with device payment plan agreement receivables and write-off account balances if collection efforts are unsuccessful and future collection is unlikely.

Inventories

Inventory consists of wireless and wireline equipment held for sale, which is carried at the lower of cost (determined principally on either an average cost or first-in, first-out basis) or net realizable value.

Plant and Depreciation

We record property, plant and equipment at cost. Property, plant and equipment are generally depreciated on a straight-line basis.

Leasehold improvements are amortized over the shorter of the estimated life of the improvement or the remaining term of the related lease, calculated from the time the asset was placed in service.

When depreciable assets are retired or otherwise disposed of, the related cost and accumulated depreciation are deducted from the property, plant and equipment accounts and any gains or losses on disposition are recognized in income.

We capitalize and depreciate network software purchased or developed within property, plant and equipment assets. We also capitalize interest associated with the acquisition or construction of network-related assets. Capitalized interest is reported as a reduction in interest expense and depreciated as part of the cost of the network-related assets.

In connection with our ongoing review of the estimated useful lives of property, plant and equipment during 2018, we determined that the average useful lives of certain assets would be increased. These changes in estimates were applied prospectively in 2018 and resulted in a decrease to

depreciation expense of $271 million for the year ended December 31, 2018. While the timing and extent of current deployment plans are subject to ongoing analysis and modification, we believe that the current estimates of useful lives are reasonable.

Computer Software Costs

We capitalize the cost of internal-use network and non-network software that has a useful life in excess of one year. Subsequent additions, modifications or upgrades to internal-use network and non-network software are capitalized only to the extent that they allow the software to perform a task it previously did not perform. Planning, software maintenance and training costs are expensed in the period in which they are incurred. Also, we capitalize interest associated with the development of internal-use network and non-network software. Capitalized non-network internal-use software costs are amortized using the straight-line method over a period of 3 to 7 years and are included in Other intangible assets, net in our consolidated balance sheets. For a discussion of our impairment policy for capitalized software costs, see "Goodwill and Other Intangible Assets" below. Also, see Note 4 for additional information of internal-use non-network software reflected in our consolidated balance sheets.

Goodwill and Other Intangible Assets

Goodwill

Goodwill is the excess of the acquisition cost of businesses over the fair value of the identifiable net assets acquired. Impairment testing for goodwill is performed annually in the fourth quarter or more frequently if impairment indicators are present.

To determine if goodwill is potentially impaired, we have the option to perform a qualitative assessment. However, we may elect to bypass the qualitative assessment and perform a quantitative impairment test even if no indications of a potential impairment exist. The quantitative impairment test for goodwill is performed at the reporting unit level and compares the fair value of the reporting unit (calculated using a combination of a market approach and a discounted cash flow method) to its carrying value. Estimated fair values of reporting units are Level 3 measures in the fair value hierarchy, see Fair Value Measurements discussion below for additional information.

Under the qualitative assessment, we consider several qualitative factors, including the business enterprise value of the reporting unit from the last quantitative test and the excess of fair value over carrying value from this test, macroeconomic conditions (including changes in interest rates and discount rates), industry and market considerations (including industry revenue and Earnings before interest, taxes, depreciation and amortization (EBITDA) margin projections), the recent and projected financial performance of the reporting unit, as well as other factors.

The market approach includes the use of comparative multiples of guideline companies to corroborate discounted cash flow results. The discounted cash flow method is based on the present value of two components, a projected cash flows and a terminal value. The terminal value represents the expected normalized future cash flows of the reporting unit beyond the cash flows from the discrete projection period. The fair value of the reporting unit is calculated based on the sum of the present value of the cash flows from the discrete period and the present value of the terminal value. The discount rate represents our estimate of the weighted-average cost of capital, or expected return, that a marketplace participant would have required as of the valuation date. If the carrying value exceeds the fair value, an impairment charge is booked for the excess carrying value over fair value, limited to the total amount of goodwill of that reporting unit. During the fourth quarter each year, we update our five-year strategic planning review for each of our reporting units. Those plans consider current economic conditions and trends, estimated future operating results, our view of growth-rates and-anticipated future economic and regulatory conditions.

See Note 4 for additional information regarding our goodwill impairment testing.

Intangible Assets Not Subject to Amortization

A significant portion of our intangible assets are wireless licenses that provide our wireless operations with the exclusive right to utilize designated radio frequency spectrum to provide wireless communication services. While licenses are issued for only a fixed time, generally ten years, such licenses are subject to renewal by the Federal Communications Commission (FCC). License renewals have occurred routinely and at nominal cost. Moreover, we have determined that there are currently no legal, regulatory, contractual, competitive, economic or other factors that limit the useful life of our wireless licenses. As a result, we treat the wireless licenses as an indefinite-lived intangible asset. We re-evaluate the useful life determination for wireless licenses each year to determine whether events and circumstances continue to support an indefinite useful life. We aggregate our wireless licenses into one single unit of accounting, as we utilize our wireless licenses on an integrated basis as part of our nationwide wireless network.

We test our wireless licenses for potential impairment annually or more frequently if impairment indicators are present. We have the option to first perform a qualitative assessment to determine whether it is necessary to perform a quantitative impairment test. However, we may elect to bypass the qualitative assessment in any period and proceed directly to performing the quantitative impairment test. Our quantitative assessment consists of comparing the estimated fair value of our aggregate wireless licenses to the aggregated carrying amount as of the test date. Using a quantitative assessment, we estimate the fair value of our aggregate wireless licenses using the Greenfield approach. The Greenfield approach is an income based valuation approach that values the wireless licenses by calculating the cash flow generating potential of a hypothetical start-up company that goes into business with no assets except the wireless licenses to be valued. A discounted cash flow analysis is used to estimate what a marketplace participant would be willing to pay to purchase the aggregated wireless licenses as of the valuation date. If the estimated fair value of the aggregated wireless licenses is less than the aggregated carrying amount of the wireless licenses, then an impairment charge is recognized. As part of our qualitative assessment, we consider several qualitative factors including the business enterprise value of our historical Wireless segment, macroeconomic conditions (including changes in interest rates and discount rates), industry and market considerations

(including industry revenue and EBITDA margin projections), the recent and projected financial performance of our historical Wireless segment, as well as other factors. See Note 4 for additional information regarding our impairment tests.

Interest expense incurred while qualifying activities are performed to ready wireless licenses for their intended use is capitalized as part of wireless licenses. The capitalization period ends when the development is discontinued or substantially completed and the license is ready for its intended use.

Wireless licenses can be purchased through public auctions conducted by the FCC. Deposits required to participate in these auctions and purchase licenses are recorded as other non-current assets until the corresponding licenses are received and within Net cash used in investing activities in our consolidated statements of cash flows.

Intangible Assets Subject to Amortization and Long-Lived Assets

Our intangible assets that do not have indefinite lives (primarily customer lists and non-network internal-use software) are amortized over their estimated useful lives. All of our intangible assets subject to amortization and other long-lived assets are reviewed for impairment whenever events or changes in circumstances indicate that the carrying amount of the asset may not be recoverable. If any indications of impairment are present, we would test for recoverability by comparing the carrying amount of the asset group to the net undiscounted cash flows expected to be generated from the asset group. If those net undiscounted cash flows do not exceed the carrying amount, we would perform the next step, which is to determine the fair value of the asset and record an impairment, if any. We re-evaluate the useful life determinations for these intangible assets each year to determine whether events and circumstances warrant a revision to their remaining useful lives.

For information related to the carrying amount of goodwill, wireless licenses and other intangible assets, as well as the major components and average useful lives of our other acquired intangible assets, see Note 4.

Fair Value Measurements

Fair value of financial and non-financial assets and liabilities is defined as an exit price, representing the amount that would be received to sell an asset or paid to transfer a liability in an orderly transaction between market participants. The three-tier hierarchy for inputs used in measuring fair value, which prioritizes the inputs used in the methodologies of measuring fair value for assets and liabilities, is as follows:

Level 1—Quoted prices in active markets for identical assets or liabilities
Level 2—Observable inputs other than quoted prices in active markets for identical assets and liabilities
Level 3—Unobservable pricing inputs in the market

Financial assets and financial liabilities are classified in their entirety based on the lowest level of input that is significant to the fair value measurements. Our assessment of the significance of a particular input to the fair value measurements requires judgment and may affect the valuation of the assets and liabilities being measured and their categorization within the fair value hierarchy.

Income Taxes

Our effective tax rate is based on pre-tax income, statutory tax rates, tax laws and regulations and tax planning strategies available to us in the various jurisdictions in which we operate.

Deferred income taxes are provided for temporary differences in the basis between financial statement and income tax assets and liabilities. Deferred income taxes are recalculated annually at tax rates in effect for the years in which those tax assets and liabilities are expected to be realized or settled. We record valuation allowances to reduce our deferred tax assets to the amount that is more likely than not to be realized.

We use a two-step approach for recognizing and measuring tax benefits taken or expected to be taken in a tax return. The first step is recognition: we determine whether it is more likely than not that a tax position will be sustained upon examination, including resolution of any related appeals or litigation processes, based on the technical merits of the position. In evaluating whether a tax position has met the more-likely-than-not recognition threshold, we presume that the position will be examined by the appropriate taxing authority that has full knowledge of all relevant information. The second step is measurement: a tax position that meets the more-likely-than-not recognition threshold is measured to determine the amount of benefit to recognize in the financial statements. The tax position is measured at the largest amount of benefit that is greater than 50 percent likely of being realized upon ultimate settlement. Differences between tax positions taken in a tax return and amounts recognized in the financial statements will generally result in one or more of the following: an increase in a liability for income taxes payable, a reduction of an income tax refund receivable, a reduction in a deferred tax asset or an increase in a deferred tax liability.

Significant management judgment is required in evaluating our tax positions and in determining our effective tax rate.

Stock-Based Compensation

We measure and recognize compensation expense for all stock-based compensation awards made to employees and directors based on estimated fair values. See Note 10 for additional information.

Foreign Currency Translation and Transactions

The functional currency of our foreign operations is generally the local currency. For these foreign entities, we translate their financial statements into U.S. dollars using average exchange rates for the period for income statement amounts and using end-of-period exchange rates for assets and liabilities. We record these translation adjustments in Accumulated other comprehensive income, a separate component of Equity, in our consolidated balance sheets. We record exchange gains and losses resulting from the conversion of transaction currency to functional currency as a component of Other income (expense), net.

Employee Benefit Plans

Pension and postretirement health care and life insurance benefits earned during the year, as well as interest on projected benefit obligations, are accrued. Prior service costs and credits resulting from changes in plan benefits are generally amortized over the average remaining service period of the employees expected to receive benefits. Expected return on plan assets is determined by applying the return on assets assumption to the actual fair value of plan assets. Actuarial gains and losses are recognized in Other income (expense), net in the year in which they occur. These gains and losses are measured annually as of December 31 or upon a remeasurement event. Verizon management employees no longer earn pension benefits or earn service towards the Company retiree medical subsidy. See Note 11 for additional information.

We recognize a pension or a postretirement plan's funded status as either an asset or liability in the consolidated balance sheets. Also, we measure any unrecognized prior service costs and credits that arise during the period as a component of Accumulated other comprehensive income, net of applicable income tax.

Derivative Instruments

We enter into derivative transactions primarily to manage our exposure to fluctuations in foreign currency exchange rates and interest rates. We employ risk management strategies, which may include the use of a variety of derivatives including cross currency swaps, forward starting interest rate swaps, interest rate swaps, interest rate caps and foreign exchange forwards. We do not hold derivatives for trading purposes.

We measure all derivatives at fair value and recognize them as either assets or liabilities in our consolidated balance sheets. Our derivative instruments are valued primarily using models based on readily observable market parameters for all substantial terms of our derivative contracts and thus are classified as Level 2. Changes in the fair values of derivative instruments not qualifying for hedge accounting are recognized in earnings in the current period. For fair value hedges, the change in the fair value of the derivative instruments is recognized in earnings, along with the change in the fair value of the hedged item. For cash flow hedges, the change in the fair value of the derivative instruments is reported in Other comprehensive income (loss) and recognized in earnings when the hedged item is recognized in earnings. For net investment hedges of certain of our foreign operations, the change in the fair value of the derivative instruments is reported in Other comprehensive income (loss) as part of the cumulative translation adjustment and partially offset the impact of foreign currency changes on the value of our net investment. See Note 9 for additional information.

Variable Interest Entities

VIEs are entities that lack sufficient equity to permit the entity to finance its activities without additional subordinated financial support from other parties, have equity investors that do not have the ability to make significant decisions relating to the entity's operations through voting rights, do not have the obligation to absorb the expected losses, or do not have the right to receive the residual returns of the entity. We consolidate the assets and liabilities of VIEs when we are deemed to be the primary beneficiary. The primary beneficiary is the party that has the power to make the decisions that most significantly affect the economic performance of the VIE and has the obligation to absorb losses or the right to receive benefits that could potentially be significant to the VIE.

Recently Adopted Accounting Standards

The following ASUs were issued by Financial Accounting Standards Board (FASB), and have been recently adopted by Verizon.

Description	Date of Adoption	Effect on Financial Statements
ASU 2016-02, ASU 2018-01, ASU 2018-10, ASU 2018-11, ASU 2018-20 and ASU 2019-01, Leases (Topic 842)		
The FASB issued Topic 842 requiring entities to recognize assets and liabilities on the balance sheet for all leases, with certain exceptions. In addition, Topic 842 enables users of financial statements to further understand the amount, timing and uncertainty of cash flows arising from leases. Topic 842 allowed for a modified retrospective application and was effective as of the first quarter of 2019. Entities were allowed to apply the modified retrospective approach: (1) retrospectively to each prior reporting period presented in the financial statements with the cumulative-effect adjustment recognized at the beginning of the earliest comparative period presented; or (2) retrospectively at the beginning of the period of adoption (January 1, 2019) through a cumulative-effect adjustment. The modified retrospective approach includes a number of optional practical expedients that entities may elect to apply.	1/1/2019	We adopted Topic 842 beginning on January 1, 2019, using the modified retrospective approach with a cumulative-effect adjustment to opening retained earnings recorded at the beginning of the period of adoption. Therefore, upon adoption, we have recognized and measured leases without revising comparative period information or disclosure. We recorded an increase of $410 million (net of tax) to retained earnings on January 1, 2019 which related to deferred sale leaseback gains recognized from prior transactions. Additionally, the adoption of the standard had a significant impact in our consolidated balance sheet due to the recognition of $22.1 billion of operating lease liabilities, along with $23.2 billion of operating lease right-of-use-assets.

The cumulative after-tax effect of the changes made to our consolidated balance sheet for the adoption of Topic 842 were as follows:

(dollars in millions)	At December 31, 2018	Adjustments due to Topic 842	At January 1, 2019
Prepaid expenses and other	$ 5,453	$ (329)	$ 5,124
Operating lease right-of-use assets	—	23,241	23,241
Other assets	11,717	(2,048)	9,669
Accounts payable and accrued liabilities	22,501	(3)	22,498
Other current liabilities	8,239	(2)	8,237
Current operating lease liabilities	—	2,931	2,931
Deferred income taxes	33,795	139	33,934
Non-current operating lease liabilities	—	19,203	19,203
Other liabilities	13,922	(1,815)	12,107
Retained earnings	43,542	410	43,952
Noncontrolling interests	1,565	1	1,566

In addition to the increase to the operating lease liabilities and right-of-use assets and the derecognition of deferred sale leaseback gains through opening retained earnings, Topic 842 also resulted in reclassifying the presentation of prepaid and deferred rent to operating lease right-of-use assets. The operating lease right-of-use assets amount also includes the balance of any prepaid lease payments, unamortized initial direct costs and lease incentives.

We elected the package of practical expedients permitted under the transition guidance within the new standard. Accordingly, we have adopted these practical expedients and did not reassess: (1) whether an expired or existing contract is a lease or contains an embedded lease; (2) lease classification of an expired or existing lease; or (3) capitalization of initial direct costs for an expired or existing lease. In addition, we have elected the land easement transition practical expedient, and did not reassess whether an existing or expired land easement is a lease or contains a lease if it has not historically been accounted for as a lease.

We lease network equipment including towers, distributed antenna systems, small cells, real estate, connectivity mediums which include dark fiber, equipment, and other various types of assets for use in our operations under both operating and finance leases. We assess whether an arrangement is a lease or contains a lease at inception. For arrangements considered leases or that contain a lease that is accounted for separately, we determine the classification and initial measurement of the right-of-use asset and lease liability at the lease commencement date, which is the date that the underlying asset becomes available for use.

For both operating and finance leases, we recognize a right-of-use asset, which represents our right to use the underlying asset for the lease term, and a lease liability, which represents the present value of our obligation to make payments arising over the lease term. The present value of the lease payments is calculated using the incremental borrowing rate for operating and finance leases. The incremental borrowing rate is determined using a portfolio approach based on the rate of interest that the Company would have to pay to borrow an amount equal to the lease payments on a collateralized basis over a similar term. Management uses the unsecured borrowing rate and risk-adjusts that rate to approximate a collateralized rate, which is updated on a quarterly basis.

In those circumstances where the Company is the lessee, we have elected to account for non-lease components associated with our leases (e.g., common area maintenance costs) and lease components as a single lease component for substantially all of our asset classes. Additionally, in arrangements where we are the lessor, we have customer premise equipment for which we apply the lease and non-lease component practical expedient and account for non-lease components (e.g., service revenue) and lease components as combined components under the revenue recognition guidance in Topic 606 as the service revenues are the predominant components in the arrangements.

Rent expense for operating leases is recognized on a straight-line basis over the term of the lease and is included in either Cost of services or Selling, general and administrative expense in our consolidated statements of income, based on the use of the facility or equipment on which rent is being paid. Variable rent payments related to both operating and finance leases are expensed in the period incurred. Our variable lease payments consist of payments dependent on various external indicators, including real estate taxes, common area maintenance charges and utility usage.

Operating leases with a term of 12 months or less are not recorded on the balance sheet; we recognize rent expense for these leases on a straight-line basis over the lease term.

We recognize the amortization of the right-of-use asset for our finance leases on a straight-line basis over the shorter of the lease term or the useful life of the right-of-use asset in Depreciation and amortization expense in our consolidated statements of income. The interest expense related to finance leases is recognized using the effective interest method based on the discount rate determined at lease commencement and is included within Interest expense in our consolidated statements of income.

See Note 6 for additional information related to leases, including disclosure required under Topic 842.

Opening Equity Balance Sheet Adjustments from Accounting Standards Adopted in 2018

On January 1, 2018, we adopted Topic 606, ASU 2018-02, Income Statement-Reporting Comprehensive Income and other ASUs. We adopted Topic 606 using the modified retrospective method. We early adopted ASU 2018-02, which allows a reclassification from accumulated other comprehensive income to retained earnings for stranded tax effects resulting from Tax Cuts and Jobs Act (TCJA). The cumulative after-tax effect of the changes made to our consolidated balance sheet for the adoption of Topic 606, ASU 2018-02 and other ASUs was as follows:

		Adjustments due to			
(dollars in millions)	At December 31, 2017	Topic 606	ASU 2018-02	Other ASUs	At January 1, 2018
Retained earnings	35,635	2,890	(652)	(6)	37,867
Accumulated other comprehensive income	2,659	—	652	(22)	3,289
Noncontrolling interests	1,591	44	—	—	1,635

Recently Issued Accounting Standards

The following ASUs have been recently issued by the FASB.

Description	Date of Adoption	Effect on Financial Statements
ASU 2016-13, ASU 2018-19, ASU 2019-04, ASU 2019-05, Financial Instruments - Credit Losses (Topic 326)		
In June 2016, the FASB issued this standard update which requires certain financial assets be measured at amortized cost net of an allowance for estimated credit losses such that the net receivable represents the present value of expected cash collection. In addition, this standard update requires that certain financial assets be measured at amortized cost reflecting an allowance for estimated credit losses expected to occur over the life of the assets. The estimate of credit losses must be based on all relevant information including historical information, current conditions and reasonable and supportable forecasts that affect the collectability of the amounts. An entity will apply the update through a cumulative effect adjustment to retained earnings as of the beginning of the first reporting period in which the guidance is effective (January 1, 2020). A prospective transition approach is required for debt securities for which an other-than-temporary impairment has been recognized before the effective date. Early adoption of this standard is permitted.	1/1/2020	We established a cross-functional coordinated team to implement the standard update. We have completed our assessment of the expected impacts and updated our processes to meet the standards reporting and disclosure requirements. Upon adoption of this standard on January 1, 2020, we expect the cumulative effect of initially applying the new standard to result in a decrease to the opening balance of retained earnings ranging from approximately $200 million to $300 million on a pre-tax basis ($150 million to $225 million net of tax), primarily related to the expected impact on certain device payment plan agreement receivables. We do not expect our operating results to be significantly impacted by this standard update.

Note 2. Revenue and Contract Costs

We earn revenue from contracts with customers, primarily through the provision of telecommunications and other services and through the sale of wireless equipment. These services include a variety of communication and connectivity services for our Consumer and Business customers including other carriers that use our facilities to provide services to their customers, as well as professional and integrated managed services for our large enterprises and government customers. We account for these revenues under Topic 606, which we adopted on January 1, 2018, using the modified retrospective approach. We also earn revenues that are not accounted for under Topic 606 from leasing arrangements (such as those for towers and equipment), captive reinsurance arrangements primarily related to wireless device insurance and the interest on equipment financed under a device payment plan agreement when sold to the customer by an authorized agent.

We applied the new revenue recognition standard to customer contracts not completed at the date of initial adoption. For incomplete contracts that were modified before the date of adoption, the Company elected to use the practical expedient available under the modified retrospective method, which allows us to aggregate the effect of all modifications when identifying satisfied and unsatisfied performance obligations, determining the transaction price and allocating transaction price to the satisfied and unsatisfied performance obligations for the modified contract at transition. Results for reporting periods beginning after January 1, 2018 are presented under Topic 606, while amounts reported for prior periods have not been adjusted and continue to be reported under accounting standards in effect for those periods.

Prior to the adoption of Topic 606, we were required to limit the revenue recognized when a wireless device was sold to the amount of consideration that was not contingent on the provision of future services, which was typically limited to the amount of consideration received from the customer at the time of sale. Under Topic 606, the total consideration in the contract is allocated between wireless equipment and service based on their relative standalone selling prices. This change primarily impacts our arrangements that include sales of wireless devices at subsidized prices in conjunction with a fixed-term plan, also known as the subsidy model, for service. Accordingly, under Topic 606, generally more equipment revenue is recognized upon sale of the equipment to the customer and less service revenue is recognized over the contract term than was previously recognized under the prior "Revenue Recognition" (Topic 605) standard. At the time the equipment is sold, this allocation results in the recognition

of a contract asset equal to the difference between the amount of revenue recognized and the amount of consideration received from the customer. As of January 2017, we no longer offer Consumer customers new fixed-term plans with subsidized equipment pricing; however, we continue to offer fixed-term plans to our Business customers. At December 31, 2019 and December 31, 2018, approximately 12% and 14% of retail postpaid connections were under fixed-term plans, respectively.

Topic 606 also requires the deferral of incremental costs incurred to obtain a customer contract, which are then amortized to expense, as a component of Selling, general and administrative expense, over the respective periods of expected benefit. As a result, a significant amount of our sales commission costs, which were historically expensed as incurred under our previous accounting, relating to our contracts to provide wireless and wireline services, are now deferred and amortized under Topic 606.

Finally, under Topic 605, at the time of the sale of a device, we imputed risk adjusted interest on the device payment plan agreement receivables. We recorded the imputed interest as a reduction to the related accounts receivable and interest income was recognized over the financed device payment term. Under Topic 606, while there continues to be a financing component in both the fixed-term plans and device payment plans, also known as the installment model, we have determined that this financing component for our customer classes in the direct channels for wireless devices are not significant and therefore we no longer impute interest for these contracts. This change results in additional revenue recognized upon the sale of wireless devices and no interest income recognized over the device payment term.

A reconciliation of the adjustments from the adoption of Topic 606 relative to Topic 605 on certain impacted financial statement line items in our consolidated statements of income is as follows:

	Year Ended December 31, 2018		
(dollars in millions)	As reported	Balances without adoption of Topic 606	Adjustments
Operating Revenues			
Service revenues and other	$ 108,605	$ 109,964	$ (1,359)
Wireless equipment revenues	22,258	20,474	1,784
Total Operating Revenues	130,863	130,438	425
Cost of services (exclusive of items shown below)	32,185	32,240	(55)
Cost of wireless equipment	23,323	23,189	134
Selling, general and administrative expense	31,083	32,588	(1,505)
Equity in losses of unconsolidated businesses	(186)	(187)	1
Income Before Provision For Income Taxes	19,623	17,771	1,852
Provision for income taxes	(3,584)	(3,104)	(480)
Net Income	$ 16,039	$ 14,667	$ 1,372
Net income attributable to noncontrolling interests	$ 511	$ 481	$ 30
Net income attributable to Verizon	15,528	14,186	1,342
Net Income	$ 16,039	$ 14,667	$ 1,372

Revenue by Category

We have two reportable segments that we operate and manage as strategic business units, Consumer and Business. Revenue is disaggregated by products and services within Consumer, and customer groups (Global Enterprise, Small and Medium Business, Public Sector and Other, and Wholesale) within Business. See Note 13 for additional information on revenue by segment.

Corporate and other includes the results of our media business, Verizon Media, and other businesses. Verizon Media generated revenues from contracts with customers under Topic 606 of approximately $7.5 billion and $7.7 billion for the years ended December 31, 2019 and 2018, respectively.

We also earn revenues that are not accounted for under Topic 606 from leasing arrangements (such as those for towers and equipment), captive reinsurance arrangements primarily related to wireless device insurance and the interest on equipment financed under a device payment plan agreement when sold to the customer by an authorized agent. As allowed by the practical expedient within Topic 842, we have elected to combine the lease and non-lease components for those arrangements of customer premise equipment where we are the lessor as components accounted for under Topic 606. Revenues from arrangements that were not accounted for under Topic 606 were approximately $3.1 billion and $4.5 billion for the years ended December 31, 2019 and 2018, respectively.

Remaining Performance Obligations

When allocating the total contract transaction price to identified performance obligations, a portion of the total transaction price may relate to service performance obligations which were not satisfied or are partially satisfied as of the end of the reporting period. Below we disclose

information relating to these unsatisfied performance obligations. Upon adoption, we elected to apply the practical expedient available under Topic 606 that provides the option to exclude the expected revenues arising from unsatisfied performance obligations related to contracts that have an original expected duration of one year or less. This situation primarily arises with respect to certain month-to-month service contracts. At December 31, 2019, month-to-month service contracts represented approximately 88% of our wireless postpaid contracts and 61% of our wireline Consumer and Small and Medium Business contracts, compared to December 31, 2018, for which month-to-month service contracts represented approximately 86% of our wireless postpaid contracts and 56% of our wireline Consumer and Small and Medium Business contracts.

Additionally, certain contracts provide customers the option to purchase additional services. The fees related to these additional services are recognized when the customer exercises the option (typically on a month-to-month basis).

Contracts for wireless services are generally either month-to-month and cancellable at any time (typically under a device payment plan) or contain terms ranging from greater than one month to up to two years (typically under a fixed-term plan). Additionally, customers may incur charges based on usage or additional optional services purchased in conjunction with entering into a contract that can be cancelled at any time and therefore are not included in the transaction price. The transaction price allocated to service performance obligations, which are not satisfied or are partially satisfied as of the end of the reporting period, are generally related to our fixed-term plans.

Our Consumer group customers also include traditional wholesale resellers that purchase and resell wireless service under their own brands to their respective customers. Reseller arrangements generally include a stated contract term, which typically extends longer than two years and, in some cases, include a periodic minimum revenue commitment over the contract term for which revenues will be recognized in future periods.

Consumer customer contracts for wireline services generally have a service term of two years; however, this term may be shorter than twelve months or may be month-to-month. Certain contracts with Business customers for wireline services extend into future periods, contain fixed monthly fees and usage-based fees, and can include annual commitments in each year of the contract or commitments over the entire specified contract term; however, a significant number of contracts for wireline services with our Business customers have a contract term that is twelve months or less.

Additionally, there are certain contracts with Business customers for wireline and telematics services and certain Media contracts with customers that have a contractual minimum fee over the total contract term. We cannot predict the time period when revenue will be recognized related to those contracts; thus, they are excluded from the time bands below. These contracts have varying terms spanning over approximately five years ending in November 2024 and have aggregate contract minimum payments totaling $3.4 billion.

At December 31, 2019, the transaction price related to unsatisfied performance obligations for total Verizon that is expected to be recognized for 2020, 2021 and thereafter was $20.2 billion, $9.4 billion and $1.6 billion, respectively. Remaining performance obligation estimates are subject to change and are affected by several factors, including terminations and changes in the timing and scope of contracts, arising from contract modifications.

Accounts Receivable and Contract Balances

The timing of revenue recognition may differ from the time of billing to our customers. Receivables presented in our consolidated balance sheet represent an unconditional right to consideration. Contract balances represent amounts from an arrangement when either Verizon has performed, by transferring goods or services to the customer in advance of receiving all or partial consideration for such goods and services from the customer, or the customer has made payment to Verizon in advance of obtaining control of the goods and/or services promised to the customer in the contract.

The following table presents information about receivables from contracts with customers:

(dollars in millions)	**At December 31, 2019**	At December 31, 2018	At January 1, 2018
Receivables[1]	**$ 12,078**	$ 12,104	$ 12,073
Device payment plan agreement receivables[2]	**11,741**	8,940	1,461

[1] Balances do not include receivables related to the following contracts: leasing arrangements (such as those for towers and equipment), captive reinsurance arrangements primarily related to wireless device insurance and the interest on equipment financed under a device payment plan agreement when sold to the customer by an authorized agent.

[2] Included in device payment plan agreement receivables presented in Note 8. Balances do not include receivables related to contracts completed prior to January 1, 2018 and receivables derived from the sale of equipment on a device payment plan through an authorized agent.

The following table presents information about contract balances:

(dollars in millions)	At December 31, 2019	At December 31, 2018	At January 1, 2018
Contract asset	$ 1,150	$ 1,003	$ 1,170
Contract liability	5,307	4,943	4,452

Contract assets primarily relate to our rights to consideration for goods or services provided to customers but for which we do not have an unconditional right at the reporting date. Under a fixed-term plan, total contract revenue is allocated between wireless service and equipment revenues, as discussed above. In conjunction with these arrangements, a contract asset is created, which represents the difference between the amount of equipment revenue recognized upon sale and the amount of consideration received from the customer when the performance obligation related to the transfer of control of the equipment is satisfied. The contract asset is reclassified to accounts receivable as wireless services are provided and billed. We have the right to bill the customer as service is provided over time, which results in our right to the payment being unconditional. The contract asset balances are presented in our consolidated balance sheet as Prepaid expenses and other and Other assets. We assess our contract assets for impairment on a quarterly basis and will recognize an impairment charge to the extent their carrying amount is not recoverable.

Contract assets increased $147 million during the year ended December 31, 2019. The change in the contract asset balance was primarily due to new contracts and increases in sales promotions recognized upfront, driven by customer activity related to wireless and Fios services, partially offset by reclassifications to accounts receivable due to billings on existing contracts and impairment charges of $113 million. Contract assets decreased $167 million during the year ended December 31, 2018. The change in the contract asset balance was primarily due to reclassifications to accounts receivable due to billings on existing contracts and impairment charges of $116 million, offset by new contracts related to wireless and Fios services.

Contract liabilities arise when we bill our customers and receive consideration in advance of providing the goods or services promised in the contract. We typically bill service one month in advance, which is the primary component of the contract liability balance. Contract liabilities are recognized as revenue when services are provided to the customer. The contract liability balances are presented in our consolidated balance sheet as Other current liabilities and Other liabilities.

Contract liabilities increased $364 million during the year ended December 31, 2019. The change in contract liabilities was primarily due to increases in sales promotions recognized over time and upfront fees, as well as increases in deferred revenue related to advanced billings, partially offset by the satisfaction of performance obligations related to wireless and Fios services. Contract liabilities increased $491 million during the year ended December 31, 2018. The change in contract liabilities was primarily due to increases in sales promotions, as well as increases in deferred revenue related to advanced billings, partially offset by the satisfaction of performance obligations related to wireless and Fios services.

Revenue recognized during the years ended December 31, 2019 and 2018 related to contract liabilities existing at January 1, 2019 and 2018 were $4.2 billion and $3.9 billion, respectively, as performance obligations related to services were satisfied.

The balance of contract assets and contract liabilities recorded in our consolidated balance sheets were as follows:

(dollars in millions)	At December 31, 2019	At December 31, 2018
Assets		
Prepaid expenses and other	$ 848	$ 757
Other assets	302	246
Total	$ 1,150	$ 1,003
Liabilities		
Other current liabilities	$ 4,651	$ 4,207
Other liabilities	656	736
Total	$ 5,307	$ 4,943

Contract Costs

As discussed in Note 1, Topic 606 requires the recognition of an asset for incremental costs to obtain a customer contract, which is then amortized to expense over the respective period of expected benefit. We recognize an asset for incremental commission costs paid to internal and external sales personnel and agents in conjunction with obtaining customer contracts. We only defer these costs when we have determined the commissions are incremental costs that would not have been incurred absent the customer contract and are expected to be recoverable. Costs to obtain a contract are amortized and recorded ratably as commission expense over the period representing the transfer of goods or services to which the assets relate. Costs to obtain wireless contracts are amortized over both of our Consumer and Business customers' estimated device upgrade cycles, as such costs are typically incurred each time a customer upgrades. Costs to obtain wireline contracts are amortized as expense over the estimated customer relationship period for our Consumer customers. Incremental costs to obtain wireline contracts for our Business customers are insignificant. Costs to obtain contracts are recorded in Selling, general and administrative expense.

We also defer costs incurred to fulfill contracts that: (1) relate directly to the contract; (2) are expected to generate resources that will be used to satisfy our performance obligation under the contract; and (3) are expected to be recovered through revenue generated under the contract. Contract fulfillment costs are expensed as we satisfy our performance obligations and recorded to Cost of services. These costs principally relate to direct costs that enhance our wireline business resources, such as costs incurred to install circuits.

We determine the amortization periods for our costs incurred to obtain or fulfill a customer contract at a portfolio level due to the similarities within these customer contract portfolios.

Other costs, such as general costs or costs related to past performance obligations, are expensed as incurred.

Collectively, costs to obtain a contract and costs to fulfill a contract are referred to as deferred contract costs, and amortized over a 2 to 5-year period. Deferred contract costs are classified as current or non-current within Prepaid expenses and other and Other assets, respectively.

The balances of deferred contract costs included in our consolidated balance sheets were as follows:

(dollars in millions)		**At December 31, 2019**		At December 31, 2018
Assets				
Prepaid expenses and other	**$**	**2,578**	$	2,083
Other assets		**1,911**		1,812
Total	**$**	**4,489**	$	3,895

For the years ended December 31, 2019 and 2018, we recognized expense of $2.7 billion and $2.0 billion, respectively, associated with the amortization of deferred contract costs, primarily within Selling, general and administrative expense in our consolidated statements of income.

We assess our deferred contract costs for impairment on a quarterly basis. We recognize an impairment charge to the extent the carrying amount of a deferred cost exceeds the remaining amount of consideration we expect to receive in exchange for the goods and services related to the cost, less the expected costs related directly to providing those goods and services that have not yet been recognized as expenses. There have been no impairment charges recognized for the years ended December 31, 2019 and 2018.

Note 3. Acquisitions and Divestitures

Spectrum License Transactions

Since 2017, we have entered into or completed several strategic spectrum transactions including:

- During the fourth quarter of 2016, we entered into a license exchange agreement with affiliates of AT&T Inc. (AT&T) to exchange certain Advanced Wireless Services (AWS) and Personal Communication Services (PCS) spectrum licenses. This non-cash exchange was completed in February 2017. As a result, we received $1.0 billion of AWS and PCS spectrum licenses at fair value and recorded a pre-tax gain of $126 million in Selling, general and administrative expense in our consolidated statement of income for the year ended December 31, 2017.

- During the first quarter of 2017, we entered into a license exchange agreement with affiliates of Sprint Corporation to exchange certain PCS spectrum licenses. This non-cash exchange was completed in May 2017. As a result, we received $132 million of PCS spectrum licenses at fair value and recorded an insignificant gain in Selling, general and administrative expense in our consolidated statement of income for the year ended December 31, 2017.

- During the third quarter of 2017, we entered into a license exchange agreement with affiliates of T-Mobile USA Inc. to exchange certain AWS and PCS spectrum licenses. This non-cash exchange was completed in December 2017. As a result, we received $414 million of AWS and PCS spectrum licenses at fair value and recorded a pre-tax gain of $143 million in Selling, general and administrative expense in our consolidated statement of income for the year ended December 31, 2017.

- During 2018, we entered into and completed various wireless license transactions, including the purchase of Straight Path Communications Inc. (Straight Path) and NextLink Wireless LLC (NextLink).

- During 2019, the FCC completed two millimeter wave spectrum license auctions. Verizon participated in these auctions and was the high bidder on 9 and 1,066 licenses, respectively, in the 24 Gigahertz (GHz) and 28 GHz bands. We submitted an application to the FCC and paid cash of approximately $521 million for the licenses. We received the licenses during the fourth quarter of 2019.

- During 2019, we entered into and completed various other wireless license acquisitions for an insignificant amount of cash consideration.

In December 2019, the FCC incentive auction for spectrum licenses in the upper 37 GHz, 39 GHz, and 47 GHz bands commenced. As an incumbent licensee, Verizon received vouchers related to our existing 39 GHz licenses. These vouchers can be converted into cash, the amount of which will not be known until the conclusion of the auction, or applied toward the purchase price of spectrum in the auction. At the conclusion

of the auction, all existing licenses will be cancelled and new reconfigured licenses or cash will be distributed depending on the results of the auction. Due to the FCC's rules restricting communications regarding the auction, we will not disclose our financial plans for the auction during the quiet period for this auction unless legally required. In addition, as of this time, until the completion of the auction process, we cannot determine the resulting financial outcome, including a potential gain or loss. Such gain or loss, if any, may be material.

Acquisition of AOL Inc.

In May 2015, we entered into an Agreement and Plan of Merger with AOL Inc. (AOL) pursuant to which we commenced a tender offer to acquire all of the outstanding shares of common stock of AOL at a price of $50.00 per share, net to the seller in cash, without interest and less any applicable withholding taxes.

On June 23, 2015, we completed the tender offer and merger, and AOL became a wholly-owned subsidiary of Verizon. The aggregate cash consideration paid by Verizon at the closing of these transactions was approximately $3.8 billion. Holders of approximately 6.6 million shares exercised appraisal rights under Delaware law. In September 2018, we obtained court approval to settle this matter for total cash consideration of $219 million of which an insignificant amount relates to interest, resulting in an insignificant gain. We paid the cash consideration in October 2018.

XO Holdings

In February 2016, we entered into a purchase agreement to acquire XO Holdings' wireline business (XO), which owned and operated one of the largest fiber-based Internet Protocol and Ethernet networks in the U.S. Concurrently, we entered into a separate agreement to utilize certain wireless spectrum from a wholly-owned subsidiary of XO Holdings, NextLink, that held XO's millimeter-wave wireless spectrum. The agreement included an option, subject to certain conditions, to acquire NextLink. In February 2017, we completed our acquisition of XO for total cash consideration of approximately $1.5 billion, of which $100 million was paid in 2015, and we prepaid $320 million in connection with the NextLink option which represented the fair value of the option.

In April 2017, we exercised our option to buy NextLink for approximately $493 million, subject to certain adjustments, of which $320 million was prepaid in the first quarter of 2017. The transaction closed in January 2018. The acquisition of NextLink was accounted for as an asset acquisition, as substantially all of the value related to the acquired spectrum. Upon closing, we recorded approximately $657 million of wireless licenses, $110 million of a deferred tax liability and $58 million of other liabilities.

The consolidated financial statements include the results of XO's operations from the date the acquisition closed. If the acquisition of XO had been completed as of January 1, 2016, the results of operations of Verizon would not have been significantly different than our previously reported results of operations.

The acquisition of XO was accounted for as a business combination. The consideration was allocated to the assets acquired and liabilities assumed based on their fair values as of the close of the acquisition. We recorded approximately $1.2 billion of property, plant and equipment, $120 million of goodwill and $194 million of other intangible assets. Goodwill is calculated as the difference between the acquisition date fair value of the consideration transferred and the fair value of the net assets acquired. The goodwill represents future economic benefits that we expect to achieve as a result of the acquisition.

Acquisition of Yahoo! Inc.'s Operating Business

In July 2016, Verizon entered into a stock purchase agreement (the Purchase Agreement) with Yahoo! Inc. (Yahoo). Pursuant to the Purchase Agreement, upon the terms and subject to the conditions thereof, we agreed to acquire the stock of one or more subsidiaries of Yahoo holding all of Yahoo's operating business for approximately $4.83 billion in cash, subject to certain adjustments (the Transaction).

In February 2017, Verizon and Yahoo entered into an amendment to the Purchase Agreement, pursuant to which the Transaction purchase price was reduced by $350 million to approximately $4.48 billion in cash, subject to certain adjustments. Subject to certain exceptions, the parties also agreed that certain user security and data breaches incurred by Yahoo (and the losses arising therefrom) were to be disregarded: (1) for purposes of specified conditions to Verizon's obligations to close the Transaction; and (2) in determining whether a "Business Material Adverse Effect" under the Purchase Agreement had occurred.

Concurrently with the amendment of the Purchase Agreement, Yahoo and Yahoo Holdings, Inc., a wholly-owned subsidiary of Yahoo that Verizon agreed to purchase pursuant to the Transaction, also entered into an amendment to the related reorganization agreement, pursuant to which Yahoo (which changed its name to Altaba Inc. following the closing of the Transaction) retains 50% of certain post-closing liabilities arising out of governmental or third-party investigations, litigations or other claims related to certain user security and data breaches incurred by Yahoo prior to its acquisition by Verizon, including an August 2013 data breach disclosed by Yahoo on December 14, 2016. At that time, Yahoo disclosed that more than one billion of the approximately three billion accounts existing in 2013 had likely been affected. In accordance with the original Transaction agreements, Yahoo will continue to retain 100% of any liabilities arising out of any shareholder lawsuits (including derivative claims) and investigations and actions by the SEC.

In June 2017, we completed the Transaction. The aggregate purchase consideration at the closing of the Transaction was approximately $4.7 billion, including cash acquired of $230 million.

Prior to the closing of the Transaction, pursuant to a related reorganization agreement, Yahoo transferred all of the assets and liabilities constituting Yahoo's operating business to the subsidiaries that we acquired in the Transaction. The assets that we acquired did not include Yahoo's ownership interests in Alibaba, Yahoo! Japan and certain other investments, certain undeveloped land recently divested by Yahoo, certain non-core intellectual property or its cash, other than the cash from its operating business we acquired. We received for our benefit and that of our current and certain future affiliates a non-exclusive, worldwide, perpetual, royalty-free license to all of Yahoo's intellectual property that was not conveyed with the business.

In October 2017, based upon information that we received in connection with our integration of Yahoo's operating business, we disclosed that we believe that the August 2013 data breach previously disclosed by Yahoo affected all of its accounts.

The acquisition of Yahoo's operating business has been accounted for as a business combination. The fair values of the assets acquired and liabilities assumed were determined using the income, cost, market and multiple period excess earnings approaches. The fair value measurements were primarily based on significant inputs that are not observable in the market and thus represent a Level 3 measurement as defined in Accounting Standards Codification 820, Fair Value Measurements and Disclosures, other than long-term debt assumed in the acquisition. The income approach was primarily used to value the intangible assets, consisting primarily of acquired technology and customer relationships. The income approach indicates value for an asset based on the present value of cash flow projected to be generated by the asset. Projected cash flow is discounted at a required rate of return that reflects the relative risk of achieving the cash flow and the time value of money. The cost approach, which estimates value by determining the current cost of replacing an asset with another of equivalent economic utility, was used, as appropriate, for property, plant and equipment. The cost to replace a given asset reflects the estimated reproduction or replacement cost for the property, less an allowance for loss in value due to depreciation.

In June 2018, we finalized the accounting for the Yahoo acquisition. The following table summarizes the final accounting for the assets acquired, including cash acquired of $230 million, and liabilities assumed as of the close of the acquisition, as well as the fair value at the acquisition date of Yahoo's noncontrolling interests:

(dollars in millions)	As of December 31, 2017	Measurement-period adjustments [1]	Adjusted Fair Value
Cash payment to Yahoo's equity holders	$ 4,673	$ —	$ 4,673
Estimated liabilities to be paid	38	—	38
Total consideration	$ 4,711	$ —	$ 4,711
Assets acquired:			
Goodwill	$ 1,929	$ 215	$ 2,144
Intangible assets subject to amortization	1,873	1	1,874
Property, plant, and equipment	1,805	(6)	1,799
Other	1,332	128	1,460
Total assets acquired	6,939	338	7,277
Liabilities assumed:			
Total liabilities assumed	2,178	338	2,516
Net assets acquired:	4,761	—	4,761
Noncontrolling interest	(50)	—	(50)
Total consideration	$ 4,711	$ —	$ 4,711

[1] Adjustments to the fair value measurements to reflect new information obtained about facts and circumstances that existed as of the acquisition date that, if known, would have affected the measurement of the amounts recognized as of that date. The most significant adjustments related to an increase in goodwill and the recognition of liabilities per certain pre-acquisition contingencies.

On the closing date of the Transaction, each unvested and outstanding Yahoo restricted stock unit award that was held by an employee who became an employee of Verizon was replaced with a Verizon restricted stock unit award, which is generally payable in cash upon the applicable vesting date. The value of those outstanding restricted stock units on the acquisition date was approximately $1.0 billion.

Goodwill is calculated as the difference between the acquisition date fair value of the consideration transferred and the fair value of the net assets acquired. The goodwill was primarily attributable to increased synergies that were expected to be achieved from the integration of Yahoo's operating business into our Media business. The goodwill related to this acquisition is included within Corporate and other.

The consolidated financial statements include the results of Yahoo's operating business from the date the acquisition closed. If the acquisition of Yahoo's operating business had been completed as of January 1, 2016, the results of operations of Verizon would not have been significantly different than our previously reported results of operations.

Acquisition and Integration Related Charges

Related to the Yahoo Transaction, we recorded $473 million of acquisition and integration related charges during the year ended December 31, 2018, of which $273 million, $195 million and an insignificant amount are related to Severance, Integration costs and Transaction costs, respectively. In connection with the Yahoo Transaction, we recorded acquisition and integration related charges of approximately $762 million during the year ended December 31, 2017, of which $526 million, $166 million and $70 million related to Severance, Integration costs and Transaction costs, respectively. These charges were recorded in Selling, general and administrative expense in our consolidated statements of income.

Data Center Sale

In December 2016, we entered into a definitive agreement, which was subsequently amended in March 2017, with Equinix, Inc. (Equinix) pursuant to which we agreed to sell 23 customer-facing data center sites in the U.S. and Latin America for approximately $3.6 billion, subject to certain adjustments (Data Center Sale) . The transaction closed in May 2017.

For the year ended December 31, 2017, these sites generated an insignificant amount of revenues and earnings.

In connection with the Data Center Sale and other insignificant divestitures, we recorded a net gain on sale of divested businesses of approximately $1.8 billion in Selling, general and administrative expense in our consolidated statement of income for the year ended December 31, 2017.

Straight Path

In May 2017, we entered into a purchase agreement to acquire Straight Path, a holder of millimeter wave spectrum configured for fifth-generation (5G) wireless services, for total consideration reflecting an enterprise value of approximately $3.1 billion. Under the terms of the purchase agreement, we agreed to pay: (1) Straight Path shareholders $184.00 per share, payable in Verizon shares; and (2) certain transaction costs payable in cash of approximately $736 million, consisting primarily of a fee to be paid to the FCC. The transaction closed in February 2018 at which time we issued approximately 49 million shares of Verizon common stock, valued at approximately $2.4 billion, and paid the associated cash consideration.

The acquisition of Straight Path was accounted for as an asset acquisition, as substantially all of the value related to the acquired spectrum. Upon closing, we recorded approximately $4.5 billion of wireless licenses and $1.4 billion of a deferred tax liability. The spectrum acquired as part of the transaction is being used for our 5G technology deployment. See Note 4 for additional information.

WideOpenWest, Inc.

In August 2017, we entered into a definitive agreement to purchase certain fiber-optic network assets in the Chicago market from WideOpenWest, Inc. (WOW!), a leading provider of communications services. The transaction closed in December 2017. In addition, the parties entered into a separate agreement pursuant to which WOW! was to complete the build-out of the network assets in 2019. This build-out was completed in 2019. The total cash consideration for the transactions was approximately $275 million, of which $226 million was paid in December 2017. During 2019 and 2018, the remaining cash consideration was paid.

Other

In July 2019, Verizon completed a sale-leaseback transaction for buildings and real estate. See Note 6 for additional information related to the transaction. In connection with this transaction and other insignificant transactions, we recorded a pre-tax net gain from dispositions of assets and businesses of $261 million in Selling, general and administrative expense in our consolidated statement of income for the year ended December 31, 2019.

During 2019, 2018 and 2017, we completed various other acquisitions for an insignificant amount of cash consideration.

Note 4. Wireless Licenses, Goodwill and Other Intangible Assets

Wireless Licenses

The carrying amounts of Wireless licenses are as follows:

(dollars in millions)

At December 31,		**2019**		2018
Wireless licenses	**$**	**95,059**	$	94,130

At December 31, 2019 and 2018, approximately $6.2 billion and $8.6 billion, respectively, of wireless licenses were under development for commercial service for which we were capitalizing interest costs. We recorded approximately $321 million and $515 million of capitalized interest on wireless licenses for each of the years ended December 31, 2019 and 2018, respectively.

For the year ended December 31, 2018, we recorded approximately $4.5 billion of wireless licenses in connection with the Straight Path acquisition and $657 million in connection with the NextLink acquisition. See Note 3 for additional information regarding spectrum license transactions in 2019 and 2018.

The average remaining renewal period of our wireless license portfolio was 4.6 years as of December 31, 2019. See Note 1 for additional information.

As discussed in Note 1, we test our wireless licenses for potential impairment annually or more frequently if impairment indicators are present. In 2019, we performed a qualitative assessment to determine whether it was more likely than not that the fair value of our wireless licenses was less than the carrying amount. In 2018, our quantitative impairment test consisted of comparing the estimated fair value of our aggregate wireless licenses estimated using the Greenfield approach to the aggregated carrying amount of the licenses as of the test date. In 2017, we performed a qualitative assessment to determine whether it was more likely than not that the fair value of our wireless licenses was less than the carrying amount. Our assessments in 2019, 2018 and 2017 indicated that the fair value of our wireless licenses exceeded the carrying value and, therefore, did not result in impairment.

Goodwill

The Company transitioned into our new reporting structure as of April 1, 2019, which resulted in certain changes to our operating segments and reporting units. Upon the date of reorganization, the goodwill of our historical Wireless reporting unit, historical Wireline reporting unit and historical Verizon Connect reporting unit were reallocated to our new Consumer and Business reporting units using a relative fair value approach.

Changes in the carrying amount of Goodwill are as follows:

(dollars in millions)

	Consumer	Business	Wireless	Wireline	Other [2]	Total
Balance at January 1, 2018	$ —	$ —	$ 18,397	$ 3,955	$ 6,820	$ 29,172
Acquisitions (Note 3)	—	—	—	(77)	225	148
Reclassifications, adjustments and other	—	—	—	(7)	(108)	(115)
Media goodwill impairment	—	—	—	—	(4,591)	(4,591)
Balance at December 31, 2018	—	—	18,397	3,871	2,346	24,614
Acquisitions	—	—	—	**20**	—	**20**
Reclassifications, adjustments and other	—	—	—	**1**	—	**1**
Balance at March 31, 2019	—	—	**18,397**	**3,892**	**2,346**	**24,635**
Reporting Unit reallocation [1]	**17,104**	**7,269**	**(18,397)**	**(3,892)**	**(2,084)**	—
Balance at April 1, 2019	**17,104**	**7,269**	—	—	**262**	**24,635**
Acquisitions	—	**2**	—	—	—	**2**
Media goodwill impairment	—	—	—	—	**(186)**	**(186)**
Reclassifications, adjustments and other	—	**(2)**	—	—	**(60)**	**(62)**
Balance at December 31, 2019	**$ 17,104**	**$ 7,269**	**$ —**	**$ —**	**$ 16**	**$ 24,389**

[1] Represents the reallocation of goodwill as a result of the Company reorganizing its segments as described in Note 1.
[2] Goodwill is net of accumulated impairment charges of $4.6 billion as of December 31, 2018 and $4.8 billion as of December 31, 2019, related to our Media reporting unit.

We performed impairment assessments of the impacted reporting units, specifically our historical Wireless, historical Wireline and historical Connect reporting units on March 31, 2019, immediately before our strategic reorganization became effective. Our impairment assessments indicated that the fair value for each of our historical Wireless, historical Wireline and historical Connect reporting units exceeded their respective carrying values, and therefore did not result in a goodwill impairment. We then performed quantitative assessments of our Consumer and Business reporting units on April 1, 2019, immediately following our strategic reorganization. Our impairment assessments indicated that the fair value for each of our Consumer and Business reporting units exceeded their respective carrying values and therefore, did not result in a goodwill impairment. Our Media reporting unit was not impacted by the strategic reorganization and there was no indicator of impairment as of the reorganization date.

We performed qualitative impairment assessments for our Consumer and Business reporting units during the fourth quarter of 2019. Our qualitative assessments indicated that it was more likely than not that the fair values for our Consumer and Business reporting units exceeded their respective carrying values and, therefore, did not result in an impairment. We performed quantitative impairment assessments for our Media reporting unit in 2019 and 2018. For details on our Media reporting unit, refer to the discussion below.

Our Media business, Verizon Media, experienced increased competitive and market pressures throughout 2018 that resulted in lower than expected revenues and earnings. These pressures were expected to continue and have resulted in a loss of market positioning to our competitors in the digital advertising business. Our Media business also achieved lower than expected benefits from the integration of the Yahoo and AOL businesses.

In connection with Verizon's annual budget process during the fourth quarter of 2019 and 2018, the leadership at both Verizon Media and Verizon completed a comprehensive five-year strategic planning review of Verizon Media's business prospects resulting in unfavorable adjustments to Verizon Media's financial projections. These revised projections were used as a key input into Verizon Media's annual goodwill impairment tests performed in the fourth quarter of 2019 and 2018.

During the fourth quarter of 2019 and 2018, consistent with our accounting policy, we applied a combination of a market approach and a discounted cash flow method reflecting current assumptions and inputs, including our revised projections, discount rate and expected growth rates, which resulted in the determination that the fair value of the Media reporting unit was less than its carrying amount. As a result, we recorded a non-cash goodwill impairment charge of approximately $186 million ($176 million after-tax) in the fourth quarter of 2019 and a charge of $4.6 billion ($4.5 billion after-tax) in the fourth quarter of 2018 in our consolidated statements of income. The goodwill balance of the Media reporting unit has been fully written off as a result of these impairment charges.

We performed a quantitative impairment assessment for all of the other reporting units in 2018. Our impairment tests indicated that the fair value for each of our historical Wireless, historical Wireline and historical Connect reporting units exceeded their respective carrying value and, therefore, did not result in an impairment.

For 2017, we performed a quantitative impairment assessment for all of our reporting units, except for our historical Wireless reporting unit, for which a qualitative assessment was completed. For 2017, our impairment tests indicated that the fair value for each of our reporting units exceeded their respective carrying value and therefore, did not result in goodwill impairment.

Other Intangible Assets

The following table displays the composition of Other intangible assets, net as well as the respective amortization period:

(dollars in millions)

			2019					2018
At December 31,	**Gross Amount**	**Accumulated Amortization**	**Net Amount**	Gross Amount	Accumulated Amortization	Net Amount
Customer lists (8 to 13 years)	**$ 3,896**	**$ (1,511)**	**$ 2,385**	$ 3,951	$ (1,121)	$ 2,830
Non-network internal-use software (3 to 7 years)	**20,530**	**(14,418)**	**6,112**	18,603	(12,785)	5,818
Other (2 to 25 years)	**1,967**	**(966)**	**1,001**	1,988	(861)	1,127
Total	**$ 26,393**	**$ (16,895)**	**$ 9,498**	$ 24,542	$ (14,767)	$ 9,775

The amortization expense for Other intangible assets was as follows:

Years	(dollars in millions)
2019	**$ 2,311**
2018	2,217
2017	2,213

Estimated annual amortization expense for Other intangible assets is as follows:

Years	(dollars in millions)
2020	**$ 2,235**
2021	**1,931**
2022	**1,651**
2023	**1,317**
2024	**968**

Note 5. Property, Plant and Equipment

The following table displays the details of Property, plant and equipment, which is stated at cost:

(dollars in millions)

At December 31,	Lives (years)	2019	2018
Land	-	**$ 594**	$ 807
Buildings and equipment	**7 to 45**	**31,216**	30,468
Central office and other network equipment	**3 to 50**	**152,733**	147,250
Cable, poles and conduit	**7 to 50**	**52,658**	49,859
Leasehold improvements	**5 to 20**	**9,072**	8,580
Work in progress	-	**9,234**	6,362
Furniture, vehicles and other	**3 to 20**	**10,227**	9,509
		265,734	252,835
Less accumulated depreciation		**173,819**	163,549
Property, plant and equipment, net		**$ 91,915**	$ 89,286

Note 6. Leasing Arrangements

We enter into various lease arrangements for network equipment including towers, distributed antenna systems, small cells, real estate and connectivity mediums including dark fiber, equipment, and other various types of assets for use in our operations. Our leases have remaining lease terms ranging from 1 year to 28 years, some of which include options that we can elect to extend the leases term for up to 25 years, and some of which include options to terminate the leases. For the majority of leases entered into during the current period, we have concluded it is not reasonably certain that we would exercise the options to extend the lease or terminate the lease. Therefore, as of the lease commencement date, our lease terms generally do not include these options. We include options to extend the lease when it is reasonably certain that we will exercise that option.

During March 2015, we completed a transaction with American Tower Corporation (American Tower) pursuant to which American Tower acquired the exclusive rights to lease and operate approximately 11,300 of our wireless towers for an upfront payment of $5.0 billion. We have subleased capacity on the towers from American Tower for a minimum of 10 years at current market rates in 2015, with options to renew. We continue to include the towers in Property, plant and equipment, net in our consolidated balance sheets and depreciate them accordingly. In addition to the rights to lease and operate the towers, American Tower assumed the interest in the underlying ground leases related to these towers. While American Tower can renegotiate the terms of and is responsible for paying the ground leases, we are still the primary obligor for these leases and accordingly, the present value of these ground leases are included in our operating lease right-of-use assets and operating lease liabilities. We do not expect to be required to make ground lease payments unless American Tower defaults, which we determined to be remote.

The components of net lease cost were as follows:

(dollars in millions)

Year Ended December 31,	Classification	2019
Operating lease cost [1]	Cost of services Selling, general and administrative expense	**$ 4,746**
Finance lease cost:		
Amortization of right-of-use assets	Depreciation and amortization expense	**330**
Interest on lease liabilities	Interest expense	**38**
Short-term lease cost [1]	Cost of services Selling, general and administrative expense	**40**
Variable lease cost [1]	Cost of services Selling, general and administrative expense	**218**
Sublease income	Service revenues and other	**(275)**
Total net lease cost		**$ 5,097**
Gain on sale and leaseback transaction, net	Selling, general and administrative expense	**$ (391)**

[1] All operating lease costs, including short-term and variable lease costs, are split between Cost of services and Selling, general and administrative expense in the consolidated statements of income based on the use of the facility or equipment that the rent is being paid on. See Note 1 for additional information. Variable lease costs represent payments that are dependent on a rate or index, or on usage of the asset.

Supplemental disclosure for the statement of cash flows related to operating and finance leases were as follows:

	(dollars in millions)
Year Ended December 31,	**2019**
Cash Flows from Operating Activities	
Cash paid for amounts included in the measurement of lease liabilities	
Operating cash flows for operating leases	**$ (4,392)**
Operating cash flows for finance leases	**(38)**
Cash Flows from Financing Activities	
Financing cash flows for finance leases	**(352)**
Supplemental lease cash flow disclosures	
Operating lease right-of-use assets obtained in exchange for new operating lease liabilities	**3,510**
Right-of-use assets obtained in exchange for new finance lease liabilities	**564**

Supplemental disclosures for the balance sheet related to finance leases were as follows:

	(dollars in millions)
At December 31,	**2019**
Assets	
Property, plant and equipment, net	**$ 939**
Liabilities	
Debt maturing within one year	**$ 336**
Long-term debt	**780**
Total Finance lease liabilities	**$ 1,116**

The weighted-average remaining lease term and the weighted-average discount rate of our leases were as follows:

At December 31,	**2019**
Weighted-average remaining lease term (years)	
Operating Leases	**9**
Finance Leases	**5**
Weighted-average discount rate	
Operating Leases	**4.0%**
Finance Leases	**3.2%**

The Company's maturity analysis of operating and finance lease liabilities as of December 31, 2019 were as follows:

		(dollars in millions)
Years	**Operating Leases**	**Finance Leases**
2020	**$ 4,099**	**$ 366**
2021	**3,764**	**271**
2022	**3,363**	**208**
2023	**3,001**	**152**
2024	**2,484**	**92**
Thereafter	**9,257**	**124**
Total lease payments	**25,968**	**1,213**
Less interest	**4,314**	**97**
Present value of lease liabilities	**21,654**	**1,116**
Less current obligation	**3,261**	**336**
Long-term obligation at December 31, 2019	**$ 18,393**	**$ 780**

As of December 31, 2019, we have contractually obligated lease payments amounting to $1.9 billion for office facility operating leases and small cell colocation and fiber operating leases that have not yet commenced. We have legally obligated lease payments for various other operating leases that have not yet commenced for which the total obligation was not significant. We have certain rights and obligations for these leases, but have not recognized an operating lease right-of-use asset or an operating lease liability since they have not yet commenced.

Real Estate Transaction

On July 23, 2019, Verizon completed a sale-leaseback transaction for buildings and real estate. We received total gross proceeds of approximately $1.0 billion. We leased back a portion of the buildings and real estate sold and accounted for it as an operating lease. The term of the leaseback is for two years with four options to renew for an additional three months each. The proceeds received as a result of this transaction have been classified in Other, net within Cash Flows from Investing Activities in our consolidated statement of cash flows for the year ended December 31, 2019. The net gain as a result of this transaction is included in the components of net lease cost table above.

Disclosures Related to Periods Prior to Adoption of Topic 842

Total rent expense under operating leases amounted to $4.1 billion in 2018 and $3.8 billion in 2017.

Amortization of capital leases was included in Depreciation and amortization expense in the consolidated statements of income. Capital lease amounts included in Property, plant and equipment were as follows:

(dollars in millions)

At December 31,	2018
Capital leases	$ 1,756
Less accumulated amortization	998
Total	$ 758

Note 7. Debt

Outstanding long-term debt obligations as of December 31, 2019 and 2018 are as follows:

(dollars in millions)

At December 31,	Maturities	Interest Rates %		2019	2018
Verizon Communications	**2019-2024**	**1.38 – 5.51**		**$ 19,885**	$ 24,242
	2025-2029	**1.38 – 6.80**		**30,038**	23,711
	2030-2055	**2.65 – 8.95**		**47,777**	54,662
	2019-2024	**Floating**	(1)	**2,210**	2,868
	2025-2029	**Floating**	(1)	**1,789**	1,789
Alltel Corporation	**2025-2029**	**6.80**		**38**	116
	2030-2055	**7.88**		**58**	118
Operating telephone company subsidiaries—debentures	**2019-2024**	**7.88 – 8.00**		**141**	147
	2025-2029	**6.00 – 8.38**		**286**	288
	2030-2055	**5.13 – 8.75**		**339**	361
GTE LLC	**2019-2024**	**8.75**		**141**	178
	2025-2029	**6.94**		**250**	266
Other subsidiaries—asset-backed debt	**2019-2024**	**1.42 – 3.56**		**8,116**	7,962
	2019-2024	**Floating**	(1)	**4,277**	2,139
Finance lease obligations (average rate of 3.2% and 4.1% in 2019 and 2018, respectively)				**1,116**	905
Unamortized discount, net of premium				**(4,480)**	(6,298)
Unamortized debt issuance costs				**(492)**	(541)
Total long-term debt, including current maturities				**111,489**	112,913
Less long-term debt maturing within one year				**10,777**	7,040
Total long-term debt				**$ 100,712**	$ 105,873
Total long-term debt, including current maturities				**$ 111,489**	$ 112,913
Plus short-term notes payable				**—**	150
Total debt				**$ 111,489**	$ 113,063

(1) The debt obligations bore interest at a floating rate based on the London Interbank Offered Rate (LIBOR) plus an applicable interest margin per annum.

Maturities of long-term debt (secured and unsecured) outstanding, including current maturities, excluding unamortized debt issuance costs, at December 31, 2019 are as follows:

Years	(dollars in millions)
2020	**$ 10,470**
2021	**7,269**
2022	**9,162**
2023	**5,591**
2024	**4,212**
Thereafter	**74,161**

During 2019, we received $18.7 billion of proceeds from long-term borrowings, which included $8.6 billion of proceeds from asset-backed debt transactions. The net proceeds were used for general corporate purposes including the repayment of debt. We used $23.9 billion of cash to repay, redeem and repurchase long-term borrowings and finance lease obligations, including $6.3 billion to prepay and repay asset-backed, long-term borrowings.

During 2018, we received $10.8 billion of proceeds from long-term borrowings, which included $4.8 billion of proceeds from asset-backed debt transactions. The net proceeds were used for general corporate purposes including the repayment of debt. We used $14.6 billion of cash to repay, redeem and repurchase long-term borrowings and finance lease obligations, including $3.6 billion to prepay and repay asset-backed, long-term borrowings.

2019 Significant Debt Transactions

The following tables show the significant transactions involving the senior unsecured debt securities of Verizon and its subsidiaries that occurred during the year ended December 31, 2019.

Exchange Offers

(dollars in millions)	**Principal Amount Exchanged**	**Principal Amount Issued**
Verizon 1.750% - 5.150% notes and floating rate notes, due 2021 - 2025	**$ 3,892**	**$ —**
GTE LLC 8.750% debentures, due 2021	**21**	**—**
Verizon 4.016% notes due 2029 [1]	**—**	**4,000**
Total	**$ 3,913**	**$ 4,000**

[1] The principal amount issued in exchange does not include either an insignificant amount of cash paid in lieu of the issuance of fractional new notes or accrued and unpaid interest paid on the old notes accepted for exchange to the date of exchange.

Tender Offers

(dollars in millions)	**Principal Amount Purchased**	**Cash Consideration[1]**
Verizon 4.672% - 5.012% notes due 2054 - 2055	**$ 4,500**	**$ 5,030**
Verizon 3.850% - 6.550% notes due 2039 - 2055	**3,816**	**4,828**
Verizon and other subsidiaries 5.050% - 8.950% notes and debentures due 2021 - 2041	**593**	**837**
Total	**$ 8,909**	**$ 10,695**

[1] The total cash consideration includes the tender offer consideration, plus any accrued and unpaid interest to the date of purchase.

Redemptions, Repurchases and Repayments

(dollars in millions)		Principal Redeemed/ Repurchased/ Repaid	Amount Paid as % of Principal [1]
Verizon 5.900% notes due 2054	$	500	100.000%
Verizon 1.375% notes due 2019		206	100.000%
Verizon 1.750% notes due 2021		621	100.000%
Verizon 3.000% notes due 2021		930	101.061%
Verizon 3.500% notes due 2021		315	102.180%
Verizon 2.625% notes due 2020		831	100.037%
Verizon 3.500% notes due 2021		736	102.238%
Verizon floating rate (LIBOR + 0.770%) notes due 2019		229	100.000%
Verizon 4.200% notes due 2046		2,059	100.000%
Verizon floating rate (LIBOR + 0.370%) notes due 2019		306	100.000%
Verizon 2.600% - 4.300% Internotes due 2022 - 2029		201	100.000%
Open market repurchases of various Verizon notes		543	Various
Total	$	7,477	

[1] Percentages represent price paid to redeem, repurchase and repay.

In February 2020, we redeemed, in whole, approximately $1.5 billion aggregate principal amount of 4.95% Notes due 2047.

Issuances

(dollars in millions)		Principal Amount Issued		Net Proceeds [1]
Verizon 3.875% notes due 2029 [2]	$	1,000	$	994
Verizon 5.000% notes due 2051	$	510		506
Verizon 0.875% notes due 2027	€	1,250		1,391
Verizon 1.250% notes due 2030	€	1,250		1,385
Verizon 2.500% notes due 2031	£	500		647
Verizon 0.875% notes due 2032	€	800		882
Verizon 1.500% notes due 2039	€	500		545
Verizon 1.875% notes due 2030	£	550		672
Verizon 2.100% notes due 2026	A$	450		307
Verizon 2.650% notes due 2030	A$	300		205
Verizon 3.500% notes due 2039	A$	500		341
Total			$	7,875

[1] Net proceeds were net of discount and issuance costs.
[2] An amount equal to the net proceeds from this green bond will be used to fund, in whole or in part, "Eligible Green Investments." "Eligible Green Investments" include new and existing investments made by us during the period from two years prior to the issuance of the green bond through the maturity date of the green bond, in the following categories: (1) renewable energy; (2) energy efficiency; (3) green buildings; (4) sustainable water management; and (5) biodiversity and conservation.

Short-Term Borrowing and Commercial Paper Program

In July 2018, we entered into a short-term uncommitted credit facility with the ability to borrow up to $700 million. As of December 31, 2019 and 2018, there was no outstanding balance.

As of December 31, 2019 and 2018, we had no commercial paper outstanding.

Asset-Backed Debt

As of December 31, 2019, the carrying value of our asset-backed debt was $12.4 billion. Our asset-backed debt includes Asset-Backed Notes (ABS Notes) issued to third-party investors (Investors) and loans (ABS Financing Facilities) received from banks and their conduit facilities (collectively, the Banks). Our consolidated asset-backed debt bankruptcy remote legal entities (each, an ABS Entity or collectively, the ABS Entities) issue the debt or are otherwise party to the transaction documentation in connection with our asset-backed debt transactions. Under the terms of our asset-backed debt, Cellco Partnership (Cellco) and certain other affiliates of Verizon (collectively, the Originators) transfer device payment plan agreement receivables to one of the ABS Entities, which in turn transfers such receivables to another ABS Entity that issues the debt. Verizon entities retain the equity interests in the ABS Entities, which represent the rights to all funds not needed to make required payments on the asset-backed debt and other related payments and expenses.

Our asset-backed debt is secured by the transferred device payment plan agreement receivables and future collections on such receivables. The device payment plan agreement receivables transferred to the ABS Entities and related assets, consisting primarily of restricted cash, will only be available for payment of asset-backed debt and expenses related thereto, payments to the Originators in respect of additional transfers of device payment plan agreement receivables, and other obligations arising from our asset-backed debt transactions, and will not be available to pay other obligations or claims of Verizon's creditors until the associated asset-backed debt and other obligations are satisfied. The Investors or Banks, as applicable, which hold our asset-backed debt have legal recourse to the assets securing the debt, but do not have any recourse to Verizon with respect to the payment of principal and interest on the debt. Under a parent support agreement, Verizon has agreed to guarantee certain of the payment obligations of Cellco and the Originators to the ABS Entities.

Cash collections on the device payment plan agreement receivables collateralizing our asset-backed debt securities are required at certain specified times to be placed into segregated accounts. Deposits to the segregated accounts are considered restricted cash and are included in Prepaid expenses and other, and Other assets in our consolidated balance sheets.

Proceeds from our asset-backed debt transactions are reflected in Cash flows from financing activities in our consolidated statements of cash flows. The asset-backed debt issued and the assets securing this debt are included in our consolidated balance sheets.

ABS Notes

During the year ended December 31, 2019, we completed the following ABS Notes transactions:

(dollars in millions)	Interest Rates %	Expected Weighted-average Life to Maturity (in years)	Principal Amount Issued
March 2019			
A-1a Senior class notes	**2.930**	**2.50**	**$ 900**
A-1b Senior floating rate class notes	**LIBOR + 0.330** [(1)]	**2.50**	**100**
B Junior class notes	**3.020**	**3.22**	**69**
C Junior class notes	**3.220**	**3.40**	**53**
March 2019 total			**1,122**
June 2019			
A-1a Senior class notes	**2.330**	**2.52**	**855**
A-1b Senior floating rate class notes	**LIBOR + 0.450** [(1)]	**2.52**	**145**
B Junior class notes	**2.400**	**3.28**	**69**
C Junior class notes	**2.600**	**3.47**	**53**
June 2019 total			**1,122**
October 2019			
A-1a Senior class notes	**1.940**	**2.51**	**1,276**
A-1b Senior floating rate class notes	**LIBOR + 0.420** [(1)]	**2.51**	**150**
B Junior class notes	**2.060**	**3.23**	**98**
C Junior class notes	**2.160**	**3.41**	**76**
October 2019 total			**1,600**
Total			**$ 3,844**

[(1)] The one-month LIBOR at December 31, 2019 was 1.763%.

Under the terms of each series of ABS Notes, there is a two year revolving period during which we may transfer additional receivables to the ABS Entity. In April, July and November 2019, the two year revolving period of the ABS Notes we issued in March, June and October 2017, respectively, ended, and we began to repay principal on the 2017-1, 2017-2 and 2017-3 Class A senior ABS Notes. In October 2019, in connection with an optional acquisition of receivables and redemption of 2016-1 Notes, we made a principal payment, in whole, for an insignificant amount. During the year ended December 31, 2019, we made aggregate principal repayments of $3.3 billion, for all ABS Notes.

In January 2020, we issued $1.6 billion aggregate principal amount of senior and junior Asset-Backed Notes through an ABS Entity.

ABS Financing Facility

In May 2018, we entered into an ABS financing facility with a number of financial institutions (2018 ABS Financing Facility). One loan agreement was entered into in connection with the 2018 ABS Financing Facility. In May 2019, the $540 million outstanding under the loan agreement was prepaid, and the loan agreement was terminated.

In September 2016, we entered into an ABS financing facility with a number of financial institutions (2016 ABS Financing Facility). Two loan agreements were entered into in connection with the 2016 ABS Financing Facility in September 2016 and May 2017. In April and May 2019, we paid off both the 2016 and 2017 loans for an aggregate of $671 million, and the loan agreements were terminated.

In May 2019, the 2016 ABS Financing Facility was amended and restated (2019 ABS Financing Facility). Under the terms of the 2019 ABS Financing Facility, which is an uncommitted facility, the financial institutions make advances under asset-backed loans backed by device payment plan agreement receivables of both consumer and business customers. One loan agreement was entered into in connection with the 2019 ABS Financing Facility. The 2019 loan agreement has a final maturity date in May 2023 and bears interest at floating rates. There is a one year revolving period until May 2020, which may be extended with the approval of the financial institutions. Under the 2019 loan agreement, we have the right to prepay all or a portion of the advances at any time without penalty, but in certain cases, with breakage costs. Subject to certain conditions, we may also remove receivables from the ABS Entity. In May 2019, we borrowed $1.8 billion under the 2019 loan agreement. In August 2019, we prepaid $1.5 billion of the loan made in May 2019 under the 2019 loan agreement. In November 2019, we borrowed an additional $1.5 billion under the 2019 loan agreement. In December 2019, the 2019 loan agreement was amended to increase the facility by an additional $1.5 billion, and an additional $1.5 billion was borrowed under the 2019 loan agreement. The aggregate outstanding balance under the 2019 ABS Financing Facility was $3.3 billion as of December 31, 2019. In January 2020, we prepaid $1.3 billion of the loan under the 2019 loan agreement.

Variable Interest Entities

The ABS Entities meet the definition of a VIE for which we have determined that we are the primary beneficiary as we have both the power to direct the activities of the entity that most significantly impact the entity's performance and the obligation to absorb losses or the right to receive benefits of the entity. Therefore, the assets, liabilities and activities of the ABS Entities are consolidated in our financial results and are included in amounts presented on the face of our consolidated balance sheets.

The assets and liabilities related to our asset-backed debt arrangements included in our consolidated balance sheets were as follows:

(dollars in millions)	At December 31, 2019	At December 31, 2018
Assets		
Accounts receivable, net	**$ 10,525**	$ 8,861
Prepaid expenses and other	**1,180**	989
Other assets	**3,856**	2,725
Liabilities		
Accounts payable and accrued liabilities	**11**	7
Debt maturing within one year	**5,578**	5,352
Long-term debt	**6,791**	4,724

See Note 8 for additional information on device payment plan agreement receivables used to secure asset-backed debt.

Long-Term Credit Facilities

			At December 31, 2019	
(dollars in millions)	**Maturities**	**Facility Capacity**	**Unused Capacity**	**Principal Amount Outstanding**
Verizon revolving credit facility [1]	**2022**	**$ 9,500**	**$ 9,390**	**N/A**
Various export credit facilities [2]	**2022-2027**	**5,500**	**—**	**4,471**
Total		**$ 15,000**	**$ 9,390**	**$ 4,471**

[1] The revolving credit facility does not require us to comply with financial covenants or maintain specified credit ratings, and it permits us to borrow even if our business has incurred a material adverse change. The revolving credit facility provides for the issuance of letters of credit.
[2] During 2019 and 2018, we drew down $1.5 billion and $3.0 billion from these facilities, respectively. We use these credit facilities to finance equipment-related purchases.

Non-Cash Transaction

During the years ended December 31, 2019, 2018 and 2017, we financed, primarily through vendor financing arrangements, the purchase of approximately $563 million, $1.1 billion, and $501 million, respectively, of long-lived assets consisting primarily of network equipment. At both December 31, 2019 and 2018, $1.1 billion relating to these financing arrangements, including those entered into in prior years and liabilities assumed through acquisitions, remained outstanding. These purchases are non-cash financing activities and therefore are not reflected within Capital expenditures in our consolidated statements of cash flows.

Early Debt Redemptions

During 2019, 2018 and 2017, we recorded losses on early debt redemptions of $3.7 billion, $681 million, and $2.0 billion, respectively.

We recognize losses on early debt redemptions in Other income (expense), net, in our consolidated statements of income. The total losses are reflected as an adjustment to reconcile net income to Net cash used in operating activities and the portion of the losses representing cash payments are reflected within Net cash used in financing activities in our consolidated statements of cash flows.

Guarantees

We guarantee the debentures of our operating telephone company subsidiaries. As of December 31, 2019, $765 million aggregate principal amount of these obligations remained outstanding. Each guarantee will remain in place for the life of the obligation unless terminated pursuant to its terms, including the operating telephone company no longer being a wholly-owned subsidiary of Verizon.

We also guarantee the debt obligations of GTE LLC as successor in interest to GTE Corporation that were issued and outstanding prior to July 1, 2003. As of December 31, 2019, $391 million aggregate principal amount of these obligations remain outstanding.

Debt Covenants

We and our consolidated subsidiaries are in compliance with all of our restrictive covenants in our debt agreements.

Note 8. Wireless Device Payment Plans

Under the Verizon device payment program, our eligible wireless customers purchase wireless devices under a device payment plan agreement. Customers that activate service on devices purchased under the device payment program pay lower service fees as compared to those under our fixed-term service plans, and their device payment plan charge is included on their wireless monthly bill. As of January 2017, we no longer offer Consumer customers new fixed-term, subsidized service plans for phones; however, we continue to offer subsidized plans to our Business customers. We also continue to service existing plans for customers who have not yet purchased and activated devices under the Verizon device payment program.

Wireless Device Payment Plan Agreement Receivables

The following table displays device payment plan agreement receivables, net, that are recognized in our consolidated balance sheets:

(dollars in millions)

At December 31,		**2019**		2018
Device payment plan agreement receivables, gross	**$**	**19,493**	$	19,313
Unamortized imputed interest		**(454)**		(546)
Device payment plan agreement receivables, net of unamortized imputed interest		**19,039**		18,767
Allowance for credit losses		**(472)**		(597)
Device payment plan agreement receivables, net	**$**	**18,567**	$	18,170
Classified in our consolidated balance sheets:				
Accounts receivable, net	**$**	**13,045**	$	12,624
Other assets		**5,522**		5,546
Device payment plan agreement receivables, net	**$**	**18,567**	$	18,170

Included in our device payment plan agreement receivables, net at December 31, 2019 and December 31, 2018, are net device payment plan agreement receivables of $14.3 billion and $11.5 billion, respectively, which have been transferred to ABS Entities and continue to be reported in our consolidated balance sheets. See Note 7 for additional information. We believe the carrying value of our installment loans receivables approximate their fair value using a Level 3 expected cash flow model.

We may offer certain promotions that allow a customer to trade in their owned device in connection with the purchase of a new device. Under these types of promotions, the customer receives a credit for the value of the trade-in device. In addition, we may provide the customer with additional future credits that will be applied against the customer's monthly bill as long as service is maintained. We recognize a liability for the customer's right to trade-in the device measured at fair value, which is determined by considering several factors, including the weighted-average selling prices obtained in recent resales of similar devices eligible for trade-in. Future credits are recognized when earned by the customer. Device payment plan agreement receivables, net does not reflect the trade-in device liability. At December 31, 2019 and December 31, 2018, the amount of trade-in liability was $103 million and $64 million, respectively.

From time to time, we offer certain marketing promotions that allow our customers to upgrade to a new device after paying down a certain specified portion of the required device payment plan agreement amount, as well as trading in their device in good working order. When a customer enters into a device payment plan agreement with the right to upgrade to a new device, we account for this trade-in right as a guarantee obligation.

For indirect channel wireless contracts with customers, we impute risk adjusted interest on the device payment plan agreement receivables. We record the imputed interest as a reduction to the related accounts receivable. Interest income, which is included within Service revenues and

other in our consolidated statements of income, is recognized over the financed device payment term. See Note 2 for additional information on financing considerations with respect to wireless direct channel contracts with customers.

When originating device payment plan agreements for Consumer customers, we use internal and external data sources to create a credit risk score to measure the credit quality of a customer and to determine eligibility for the device payment program. If a customer is either new to Verizon or has 45 days or less of customer tenure with Verizon, the credit decision process relies more heavily on external data sources. If the customer has more than 45 days of customer tenure with Verizon (an existing customer), the credit decision process relies on a combination of internal and external data sources. External data sources include obtaining a credit report from a national consumer credit reporting agency, if available. Verizon uses its internal data and/or credit data obtained from the credit reporting agencies to create a custom credit risk score. The custom credit risk score is generated automatically (except with respect to a small number of applications where the information needs manual intervention) from the applicant's credit data using Verizon's proprietary custom credit models, which are empirically derived and demonstrably and statistically sound. The credit risk score measures the likelihood that the potential customer will become severely delinquent and be disconnected for non-payment. For a small portion of new customer applications, a traditional credit report is not available from one of the national credit reporting agencies because the potential customer does not have sufficient credit history. In those instances, alternate credit data is used for the risk assessment.

Based on the custom credit risk score, we assign each customer to a credit class, each of which has specified offers of credit including an account level spending limit and either a maximum amount of credit allowed per device or a required down payment percentage. During the fourth quarter of 2018, Verizon moved all Consumer customers, new and existing, from a required down payment percentage, between zero and 100%, to a maximum amount of credit per device.

Subsequent to origination, Verizon monitors delinquency and write-off experience as key credit quality indicators for its portfolio of device payment plan agreements and fixed-term service plans. The extent of our collection efforts with respect to a particular customer are based on the results of proprietary custom empirically derived internal behavioral scoring models that analyze the customer's past performance to predict the likelihood of the customer falling further delinquent. These customer scoring models assess a number of variables, including origination characteristics, customer account history and payment patterns. Based on the score derived from these models, accounts are grouped by risk category to determine the collection strategy to be applied to such accounts. We continuously monitor collection performance results and the credit quality of our device payment plan agreement receivables based on a variety of metrics, including aging. Verizon considers an account to be delinquent and in default status if there are unpaid charges remaining on the account on the day after the bill's due date.

The balance and aging of the device payment plan agreement receivables on a gross basis were as follows:

			(dollars in millions)
At December 31,		**2019**	2018
Unbilled	**$**	**18,203**	$ 18,043
Billed:			
Current		**1,002**	986
Past due		**288**	284
Device payment plan agreement receivables, gross	**$**	**19,493**	$ 19,313

Activity in the allowance for credit losses for the device payment plan agreement receivables was as follows:

			(dollars in millions)
		2019	2018
Balance at January 1,	**$**	**597**	$ 848
Bad debt expense		**915**	459
Write-offs		**(1,040)**	(710)
Balance at December 31,	**$**	**472**	$ 597

Sales of Wireless Device Payment Plan Agreement Receivables

In 2015 and 2016, we established programs pursuant to a Receivables Purchase Agreement (RPA) to sell from time to time, on an uncommitted basis, eligible device payment plan agreement receivables to a group of primarily relationship banks (Purchasers) on both a revolving and non-revolving basis, collectively the Programs. Under the Programs, eligible device payment plan agreement receivables were transferred to the Purchasers for upfront cash proceeds and additional consideration upon settlement of the receivables, referred to as the deferred purchase price. In December 2017, the RPA and all other related transaction documents were terminated and as of December 31, 2017 we had no further continuing involvement with any of the receivables sold under the RPA program.

There were no sales of device payment plan agreement receivables under the Programs during 2017.

Deferred Purchase Price

Collections of deferred purchase price were $1.4 billion during 2017. During 2017, we repurchased all outstanding receivables previously sold to the Purchasers in exchange for the obligation to pay the associated deferred purchase price to the wholly-owned subsidiaries that were bankruptcy remote special purpose entities (Sellers). At December 31, 2017, our deferred purchase price receivable was fully satisfied. Collections

following the repurchase of receivables were insignificant, $195 million and $238 million during 2019, 2018 and 2017, respectively. Collections of both deferred purchase price and repurchased receivables were recorded in Cash flows used in investing activities in our consolidated statement of cash flows.

Note 9. Fair Value Measurements and Financial Instruments

Recurring Fair Value Measurements

The following table presents the balances of assets and liabilities measured at fair value on a recurring basis as of December 31, 2019:

(dollars in millions)

	Level 1[1]	Level 2[2]	Level 3[3]	Total
Assets:				
Other assets:				
Fixed income securities	$ —	$ 442	$ —	$ 442
Interest rate swaps	—	568	—	568
Cross currency swaps	—	211	—	211
Foreign exchange forwards	—	5	—	5
Total	$ —	$ 1,226	$ —	$ 1,226
Liabilities:				
Other liabilities:				
Interest rate swaps	$ —	$ 173	$ —	$ 173
Cross currency swaps	—	912	—	912
Forward starting interest rate swaps	—	604	—	604
Total	$ —	$ 1,689	$ —	$ 1,689

The following table presents the balances of assets and liabilities measured at fair value on a recurring basis as of December 31, 2018:

(dollars in millions)

	Level 1 [1]	Level 2 [2]	Level 3 [3]	Total
Assets:				
Other assets:				
Fixed income securities	$ —	$ 405	$ —	$ 405
Interest rate swaps	—	3	—	3
Cross currency swaps	—	220	—	220
Interest rate caps	—	14	—	14
Total	$ —	$ 642	$ —	$ 642
Liabilities:				
Other liabilities:				
Interest rate swaps	$ —	$ 813	$ —	$ 813
Cross currency swaps	—	536	—	536
Forward starting interest rate swaps	—	60	—	60
Interest rate caps	—	4	—	4
Total	$ —	$ 1,413	$ —	$ 1,413

[1] Quoted prices in active markets for identical assets or liabilities
[2] Observable inputs other than quoted prices in active markets for identical assets and liabilities
[3] Unobservable pricing inputs in the market

Certain of our equity investments do not have readily determinable fair values and are excluded from the tables above. Such investments are measured at cost, less any impairment, plus or minus changes resulting from observable price changes in orderly transactions for an identical or similar investment of the same issuer and are included in Investments in unconsolidated businesses in our consolidated balance sheets. As of December 31, 2019 and December 31, 2018, the carrying amount of our investments without readily determinable fair values was $284 million and $248 million, respectively. During 2019, there were insignificant adjustments due to observable price changes and we recognized an insignificant impairment charge. Cumulative adjustments due to observable price changes and impairment charges were insignificant.

Fixed income securities consist primarily of investments in municipal bonds. For fixed income securities that do not have quoted prices in active markets, we use alternative matrix pricing resulting in these debt securities being classified as Level 2.

Derivative contracts are valued using models based on readily observable market parameters for all substantial terms of our derivative contracts and thus are classified within Level 2. We use mid-market pricing for fair value measurements of our derivative instruments. Our derivative instruments are recorded on a gross basis.

We recognize transfers between levels of the fair value hierarchy as of the end of the reporting period. There were no transfers between Level 1 and Level 2 during 2019 and 2018.

Fair Value of Short-term and Long-term Debt

The fair value of our debt is determined using various methods, including quoted prices for identical terms and maturities, which is a Level 1 measurement, as well as quoted prices for similar terms and maturities in inactive markets and future cash flows discounted at current rates, which are Level 2 measurements. The fair value of our short-term and long-term debt, excluding finance leases, was as follows:

(dollars in millions)

At December 31,	2019		2018	
	Carrying Amount	**Fair Value**	Carrying Amount	Fair Value
Short- and long-term debt, excluding finance leases	**$ 110,373**	**$ 129,200**	$ 112,159	$ 118,535

Derivative Instruments

The following table sets forth the notional amounts of our outstanding derivative instruments:

(dollars in millions)

At December 31,	2019	2018
Interest rate swaps	**$ 17,004**	$ 19,813
Cross currency swaps	**23,070**	16,638
Forward starting interest rate swaps	**3,000**	4,000
Interest rate caps	**679**	2,218
Foreign exchange forwards	**1,130**	600

Interest Rate Swaps

We enter into interest rate swaps to achieve a targeted mix of fixed and variable rate debt. We principally receive fixed rates and pay variable rates that are currently based on LIBOR, resulting in a net increase or decrease to Interest expense. These swaps are designated as fair value hedges and hedge against interest rate risk exposure of designated debt issuances. We record the interest rate swaps at fair value in our consolidated balance sheets as assets and liabilities. Changes in the fair value of the interest rate swaps are recorded to Interest expense, which are offset by changes in the fair value of the hedged debt due to changes in interest rates.

During 2019, we entered into interest rate swaps with a total notional value of $510 million and settled interest rate swaps with a total notional value of $3.3 billion. During 2018, we entered into interest rate swaps with a total notional value of $730 million and settled interest rate swaps with a total notional value of $1.1 billion.

The ineffective portion of these interest rate swaps was $54 million and insignificant for the years ended December 31, 2019 and 2018, respectively.

The following amounts were recorded in Long-term debt in our consolidated balance sheets related to cumulative basis adjustments for fair value hedges:

(dollars in millions)

At December 31,	2019	2018
Carrying amount of hedged liabilities	**$ 17,337**	$ 18,903
Cumulative amount of fair value hedging adjustment included in the carrying amount of the hedged liabilities	**433**	(785)

Cross Currency Swaps

We have entered into cross currency swaps designated as cash flow hedges to exchange our British Pound Sterling, Euro, Swiss Franc and Australian Dollar-denominated cash flows into U.S. dollars and to fix our cash payments in U.S. dollars, as well as to mitigate the impact of foreign currency transaction gains or losses.

During 2019, we entered into cross currency swaps with a total notional value of $6.4 billion and did not settle any cross currency swaps. A pre-tax loss of $385 million was recognized in Other comprehensive loss with respect to these swaps.

During 2018, we did not enter into or settle any cross currency swaps. A pre-tax loss of $720 million was recognized in Other comprehensive loss with respect to these swaps.

A portion of the losses recognized in Other comprehensive loss was reclassified to Other income (expense), net to offset the related pre-tax foreign currency transaction gain or loss on the underlying hedged item.

Forward Starting Interest Rate Swaps

We have entered into forward starting interest rate swaps designated as cash flow hedges in order to manage our exposure to interest rate changes on future forecasted transactions.

During 2019, we did not enter into any forward starting interest rate swaps and we settled forward starting interest rate swaps with a total notional value of $1.0 billion. A pre-tax loss of $565 million, resulting from interest rate movements was recognized in Other comprehensive loss with respect to these swaps.

During 2018, we entered into forward starting interest rate swaps with a total notional value of $4.0 billion. A pre-tax loss of $60 million was recognized in Other comprehensive loss with respect to these swaps.

We hedge our exposure to the variability in future cash flows of based on the expected maturities of the related forecasted debt issuance.

Net Investment Hedges

We have designated certain foreign currency instruments as net investment hedges to mitigate foreign exchange exposure related to non-U.S. dollar net investments in certain foreign subsidiaries against changes in foreign exchange rates. The notional amount of the Euro-denominated debt as a net investment hedge was €750 million as of both December 31, 2019 and 2018, respectively.

Undesignated Derivatives

We also have the following derivative contracts which we use as economic hedges but for which we have elected not to apply hedge accounting.

Interest Rate Caps

We enter into interest rate caps to mitigate our interest exposure to interest rate increases on our ABS Financing Facility and ABS Notes. During both 2019 and 2018, we recognized an insignificant amount in Interest expense related to interest rate caps.

Foreign Exchange Forwards

We enter into British Pound Sterling and Euro foreign exchange forwards to mitigate our foreign exchange rate risk related to non-functional currency denominated monetary assets and liabilities of international subsidiaries. During 2019, we entered into foreign exchange forwards with a total notional value of $12.0 billion and settled foreign exchange forwards with a total notional value of $11.5 billion. During 2018, we entered into foreign exchange forwards with a total notional value of $2.8 billion and settled foreign exchange forwards with a total notional value of $2.2 billion. During 2019 and 2018, a pre-tax loss of insignificant amount was recognized in Other income (expense), net.

Treasury Rate Locks

During 2019, we entered into treasury rate locks with a total notional value of $1.5 billion to hedge the tender offers conducted in May 2019 for fifteen series of notes issued by Verizon with coupon rates ranging from 4.672% to 5.012% and maturity dates ranging from 2054 to 2055 (May Tender offers). In addition, we entered into treasury rate locks with a total notional value of $1.5 billion to hedge the tender offers conducted in November and December 2019 for eleven and twenty series of notes and debentures, respectively, issued by Verizon and other subsidiaries with coupon rates ranging from 3.850% to 8.950% and maturity dates ranging from 2021 to 2055 (November and December Tender offers). Upon the early settlement of the May, November and December Tender Offers, we settled these hedges and recognized an insignificant gain in Other income (expense), net.

During 2018, we entered into treasury rate locks with a total notional value of $2.0 billion to hedge the tender offers conducted in September 2018 for eight series of notes issued by Verizon with coupon rates ranging from 3.850% to 5.012% and maturity dates ranging from 2039 to 2055 (September Tender Offers). Upon the early settlement of the September Tender Offers, we settled these hedges and recognized an insignificant loss in Other income (expense), net.

Concentrations of Credit Risk

Financial instruments that subject us to concentrations of credit risk consist primarily of temporary cash investments, short-term and long-term investments, trade receivables, including device payment plan agreement receivables, certain notes receivable, including lease receivables, and derivative contracts.

Counterparties to our derivative contracts are major financial institutions with whom we have negotiated derivatives agreements (ISDA master agreements) and credit support annex (CSA) agreements which provide rules for collateral exchange. Negotiations and executions of new ISDA master agreements and CSA agreements with our counterparties continued during 2018. The CSA agreements contain rating based thresholds such that we or our counterparties may be required to hold or post collateral based upon changes in outstanding positions as compared to established thresholds and changes in credit ratings. At December 31, 2019, we held an insignificant amount and at December 31, 2018, we posted approximately $0.1 billion of collateral related to derivative contracts under collateral exchange arrangements, which were recorded as Other current liabilities and Prepaid expenses and other, respectively, in our consolidated balance sheets. While we may be exposed to credit

losses due to the nonperformance of our counterparties, we consider the risk remote and do not expect that any such nonperformance would result in a significant effect on our results of operations or financial condition due to our diversified pool of counterparties.

Note 10. Stock-Based Compensation

Verizon Long-Term Incentive Plan

In May 2017, Verizon's shareholders approved the 2017 Long-Term Incentive Plan (the 2017 Plan) and terminated Verizon's authority to grant new awards under the Verizon 2009 Long-Term Incentive Plan (the 2009 Plan). The 2017 Plan provides for broad-based equity grants to employees, including executive officers, and permits the granting of stock options, stock appreciation rights, restricted stock, restricted stock units, performance shares, performance stock units and other awards. Upon approval of the 2017 Plan, Verizon reserved for issuance under the 2017 Plan the number of shares that were remaining but not issued under the 2009 Plan. Shares subject to outstanding awards under the 2009 Plan that expire, are canceled or otherwise terminated will also be available for awards under the 2017 Plan. As of December 31, 2019, 89 million shares are reserved for future issuance under the 2017 Plan.

Restricted Stock Units

Restricted Stock Units (RSUs) granted under the 2017 Plan generally vest in three equal installments on each anniversary of the grant date. The RSUs that are paid in stock upon vesting and are thus classified as equity awards are measured using the grant date fair value of Verizon common stock and are not remeasured at the end of each reporting period. The RSUs that are settled in cash are classified as liability awards and the liability is measured at its fair value at the end of each reporting period. All RSUs granted under the 2017 Plan have dividend equivalent units, which will be paid to participants at the time the RSU award is paid, and in the same proportion as the RSU award.

In February 2018, Verizon announced a broad-based employee special award of RSUs under the 2017 Plan to eligible full-time and part-time employees. These RSUs are vested in two equal installments on each anniversary of the grant date and paid in cash. The first installment of the restricted stock units was vested and paid in February 2019 and the remaining restricted stock units will be vested and paid in February 2020.

In connection with our acquisition of Yahoo's operating business, on the closing date of the Transaction each unvested and outstanding Yahoo RSU award that was held by an employee who became an employee of Verizon was replaced with a Verizon RSU award, which is generally payable in cash upon the applicable vesting date. These awards are classified as liability awards and are measured at fair value at the end of each reporting period.

We estimate forfeitures at the time of grant and revise those estimates in subsequent periods if actual forfeitures differ from those estimates. We use historical data to estimate forfeitures and recognize that estimated compensation cost of restricted stock units, net of estimated forfeitures, on a straight-line basis over the vesting period.

Performance Stock Units

The 2017 Plan also provides for grants of Performance Stock Units (PSUs) that generally vest at the end of the third year after the grant. As defined by the 2017 Plan, the Human Resources Committee of the Board of Directors determines the number of PSUs a participant earns based on the extent to which the corresponding performance goals have been achieved over the three-year performance cycle. The PSUs are classified as liability awards because the PSU awards are paid in cash upon vesting. The PSU award liability is measured at its fair value at the end of each reporting period and, therefore, will fluctuate based on the price of Verizon common stock as well as performance relative to the targets. All PSUs granted under the 2017 Plan have dividend equivalent units, which will be paid to participants at the time that PSU award is determined and paid, and in the same proportion as the PSU award. The granted and cancelled activity for the PSU award includes adjustments for the performance goals achieved.

The following table summarizes Verizon's Restricted Stock Unit and Performance Stock Unit activity:

	Restricted Stock Units		Performance
(shares in thousands)	**Equity Awards**	**Liability Awards**	**Stock Units**
Outstanding January 1, 2017	13,308	—	17,919
Granted	4,216	25,168	6,564
Payments	(4,825)	(8,487)	(6,031)
Cancelled/Forfeited	(66)	(2,690)	(217)
Outstanding December 31, 2017	12,633	13,991	18,235
Granted	4,134	15,157	5,779
Payments	(5,977)	(6,860)	(4,526)
Cancelled/Forfeited	(213)	(2,362)	(2,583)
Outstanding December 31, 2018	10,577	19,926	16,905
Granted	**3,169**	**5,814**	**4,593**
Payments	**(6,397)**	**(9,429)**	**(3,255)**
Cancelled/Forfeited	**(90)**	**(1,598)**	**(2,692)**
Outstanding December 31, 2019	**7,259**	**14,713**	**15,551**

As of December 31, 2019, unrecognized compensation expense related to the unvested portion of Verizon's RSUs and PSUs was approximately $765 million and is expected to be recognized over approximately two years.

The equity RSUs granted in 2019 and 2018 have weighted-average grant date fair values of $56.66 and $49.19 per unit, respectively. During 2019, 2018 and 2017, we paid $737 million, $773 million and $750 million, respectively, to settle RSUs and PSUs classified as liability awards.

Stock-Based Compensation Expense

After-tax compensation expense for stock-based compensation related to RSUs and PSUs described above included in Net income attributable to Verizon was $872 million, $720 million and $384 million for 2019, 2018 and 2017, respectively.

Note 11. Employee Benefits

We maintain non-contributory defined benefit pension plans for certain employees. In addition, we maintain postretirement health care and life insurance plans for certain retirees and their dependents, which are both contributory and non-contributory, and include a limit on our share of the cost for certain current and future retirees. In accordance with our accounting policy for pension and other postretirement benefits, operating expenses include service costs associated with pension and other postretirement benefits while other credits and/or charges based on actuarial assumptions, including projected discount rates, an estimated return on plan assets, and impact from health care trend rates are reported in Other income (expense), net. These estimates are updated in the fourth quarter to reflect actual return on plan assets and updated actuarial assumptions or upon a remeasurement. The adjustment is recognized in the income statement during the fourth quarter or upon a remeasurement event pursuant to our accounting policy for the recognition of actuarial gains and losses.

Pension and Other Postretirement Benefits

Pension and other postretirement benefits for certain employees are subject to collective bargaining agreements. Modifications in benefits have been bargained from time to time, and we may also periodically amend the benefits in the management plans. The following tables summarize benefit costs, as well as the benefit obligations, plan assets, funded status and rate assumptions associated with pension and postretirement health care and life insurance benefit plans.

Obligations and Funded Status

(dollars in millions)

	Pension		Health Care and Life	
At December 31,	**2019**	2018	**2019**	2018
Change in Benefit Obligations				
Beginning of year	**$ 19,567**	$ 21,531	**$ 16,364**	$ 19,460
Service cost	**247**	284	**96**	127
Interest cost	**695**	690	**629**	615
Plan amendments	**—**	230	**(22)**	(8)
Actuarial (gain) loss, net	**2,860**	(1,418)	**(414)**	(2,729)
Benefits paid	**(1,248)**	(1,475)	**(984)**	(1,101)
Curtailment and termination benefits	**—**	181	**—**	—
Settlements paid	**(873)**	(456)	**—**	—
End of year	**21,248**	19,567	**15,669**	16,364
Change in Plan Assets				
Beginning of year	**17,816**	19,175	**1,175**	1,119
Actual return on plan assets	**3,385**	(494)	**103**	(26)
Company contributions	**371**	1,066	**449**	1,183
Benefits paid	**(1,248)**	(1,475)	**(984)**	(1,101)
Settlements paid	**(873)**	(456)	**—**	—
End of year	**19,451**	17,816	**743**	1,175
Funded Status				
End of year	**$ (1,797)**	$ (1,751)	**$ (14,926)**	$ (15,189)

(dollars in millions)

At December 31,	Pension 2019	Pension 2018	Health Care and Life 2019	Health Care and Life 2018
Amounts recognized on the balance sheet				
Noncurrent assets	**$ 5**	$ 3	**$ —**	$ —
Current liabilities	**(67)**	(71)	**(603)**	(292)
Noncurrent liabilities	**(1,735)**	(1,683)	**(14,323)**	(14,897)
Total	**$ (1,797)**	$ (1,751)	**$ (14,926)**	$ (15,189)
Amounts recognized in Accumulated Other Comprehensive Income (Pre-tax)				
Prior service cost (benefit)	**$ 524**	$ 585	**$ (3,749)**	$ (4,698)
Total	**$ 524**	$ 585	**$ (3,749)**	$ (4,698)

The accumulated benefit obligation for all defined benefit pension plans was $21.2 billion and $19.5 billion at December 31, 2019 and 2018, respectively.

2018 Collective Bargaining Negotiations

The extension agreement ratified in August 2018 extended our collective bargaining agreements with the Communications Workers of America and the International Brotherhood of Electrical Workers that were due to expire on August 3, 2019 for four years until August 5, 2023. Amendments triggered by the collective bargaining negotiations were made to certain pension plans for certain union-represented employees and retirees. The impact of the plan amendments was an increase in our defined benefit pension plans plan obligations and a net decrease to Accumulated other comprehensive income of $230 million (net of taxes of $170 million). The annual impact of the amount recorded in Accumulated other comprehensive income that will be reclassified to net periodic benefit cost is insignificant.

2017 Postretirement Plan Amendments

During 2017, amendments were made to certain postretirement plans related to retiree medical benefits for management and certain union-represented employees and retirees. The impact of the plan amendments was a reduction in our postretirement benefit plan obligations of approximately $527 million, which has been recorded as a net increase to Accumulated other comprehensive income of $317 million (net of taxes of $210 million). The impact of the amount recorded in Accumulated other comprehensive income that will be reclassified to net periodic benefit cost is insignificant.

2016 Collective Bargaining Negotiations

During 2016, we adopted changes to our defined benefit pension plans and other postretirement benefit plans to reflect the agreed upon terms and conditions of the collective bargaining agreements ratified in June 2016. The impact includes a net increase to Accumulated other comprehensive income of $2.9 billion (net of taxes of $1.8 billion). The amount recorded in Accumulated other comprehensive income will be reclassified to net periodic benefit cost on a straight-line basis over the average remaining service period of the respective plans' participants, which, on a weighted-average basis, is 12.2 years for defined benefit pension plans and 7.8 years for other postretirement benefit plans. The above-noted reclassification resulted in a decrease to net periodic benefit cost and increase to pre-tax income of approximately $658 million during 2019, 2018 and 2017, respectively.

Information for pension plans with an accumulated benefit obligation in excess of plan assets follows:

(dollars in millions)

At December 31,	2019	2018
Projected benefit obligation	**$ 21,190**	$ 19,510
Accumulated benefit obligation	**21,134**	19,461
Fair value of plan assets	**19,388**	17,757

Net Periodic Benefit Cost (Income)

The following table summarizes the components of net periodic benefit cost (income) related to our pension and postretirement health care and life insurance plans:

(dollars in millions)

	Pension			Health Care and Life		
Years Ended December 31,	**2019**	2018	2017	**2019**	2018	2017
Service cost - Cost of services	**$ 202**	$ 230	$ 215	**$ 78**	$ 104	$ 116
Service cost - Selling, general and administrative expense	**45**	54	65	**18**	23	33
Service cost	**247**	284	280	**96**	127	149
Amortization of prior service cost (credit)	**61**	48	39	**(971)**	(976)	(949)
Expected return on plan assets	**(1,130)**	(1,293)	(1,262)	**(37)**	(44)	(53)
Interest cost	**695**	690	683	**629**	615	659
Remeasurement loss (gain), net	**606**	369	337	**(480)**	(2,658)	546
Curtailment and termination benefits	**—**	181	11	**—**	—	—
Other components	**232**	(5)	(192)	**(859)**	(3,063)	203
Total	**$ 479**	$ 279	$ 88	**$ (763)**	$ (2,936)	$ 352

The service cost component of net periodic benefit cost (income) is recorded in Cost of services and Selling, general and administrative expense in the consolidated statements of income while the other components, including mark-to-market adjustments, if any, are recorded in Other income (expense), net.

Other pre-tax changes in plan assets and benefit obligations recognized in other comprehensive (income) loss are as follows:

(dollars in millions)

	Pension			Health Care and Life		
At December 31,	**2019**	2018	2017	**2019**	2018	2017
Prior service cost (benefit)	**$ —**	$ 230	$ —	**$ (22)**	$ (8)	$ (544)
Reversal of amortization items						
Prior service cost (benefit)	**(61)**	(48)	(39)	**971**	976	949
Total recognized in other comprehensive loss (income) (pre-tax)	**$ (61)**	$ 182	$ (39)	**$ 949**	$ 968	$ 405

The estimated prior service cost for the defined benefit pension plans that will be amortized from Accumulated other comprehensive income into net periodic benefit cost over the next fiscal year is $61 million. The estimated prior service cost for the defined benefit postretirement plans that will be amortized from Accumulated other comprehensive income into net periodic benefit income over the next fiscal year is $1.0 billion.

Assumptions

The weighted-average assumptions used in determining benefit obligations follow:

	Pension		Health Care and Life	
At December 31,	**2019**	2018	**2019**	2018
Discount Rate	**3.30%**	4.40%	**3.20%**	4.30%
Rate of compensation increases	**3.00**	3.00	**N/A**	N/A

The weighted-average assumptions used in determining net periodic cost follow:

	Pension			Health Care and Life		
At December 31,	**2019**	2018	2017	**2019**	2018	2017
Discount rate in effect for determining service cost	**4.60%**	4.10%	4.70%	**4.60%**	3.90%	4.60%
Discount rate in effect for determining interest cost	**3.80**	3.40	3.40	**4.00**	3.20	3.50
Expected return on plan assets	**6.80**	7.00	7.70	**4.30**	4.80	4.50
Rate of compensation increases	**3.00**	3.00	3.00	**N/A**	N/A	N/A

In determining our pension and other postretirement benefit obligations, we used a weighted-average discount rate of 3.3% in 2019. The rates were selected to approximate the composite interest rates available on a selection of high-quality bonds available in the market at December 31, 2019. The bonds selected had maturities that coincided with the time periods during which benefits payments are expected to occur, were non-callable and available in sufficient quantities to ensure marketability (at least $300 million par outstanding).

In order to project the long-term target investment return for the total portfolio, estimates are prepared for the total return of each major asset class over the subsequent 10-year period. Those estimates are based on a combination of factors including the current market interest rates and valuation levels, consensus earnings expectations and historical long-term risk premiums. To determine the aggregate return for the pension trust, the projected return of each individual asset class is then weighted according to the allocation to that investment area in the trust's long-term asset allocation policy.

The assumed health care cost trend rates are as follows:

	Health Care and Life		
At December 31,	**2019**	2018	2017
Healthcare cost trend rate assumed for next year	**6.10%**	6.30%	7.00%
Rate to which cost trend rate gradually declines	**4.50**	4.50	4.50
Year the rate reaches the level it is assumed to remain thereafter	**2027**	2027	2026

A one-percentage point change in the assumed health care cost trend rate would have the following effects:

(dollars in millions)

One-Percentage Point	Increase	Decrease
Effect on 2019 service and interest cost	**$ 20**	**$ (21)**
Effect on postretirement benefit obligation as of December 31, 2019	**626**	**(696)**

Plan Assets

The Company's overall investment strategy is to achieve a mix of assets that allows us to meet projected benefit payments while taking into consideration risk and return. While target allocation percentages will vary over time, the current target allocation for plan assets is designed so that 48% to 68% of the assets have the objective of achieving a return in excess of the growth in liabilities (comprised of public equities, private equities, real estate, hedge funds and emerging debt) and 35% to 55% of the assets are invested as liability hedging assets (where cash flows from investments better match projected benefit payments, typically longer duration fixed income) and a maximum of 15% is in cash. This allocation will shift as funded status improves to a higher allocation of liability hedging assets. Target policies will be revisited periodically to ensure they are in line with fund objectives. Both active and passive management approaches are used depending on perceived market efficiencies and various other factors. Due to our diversification and risk control processes, there are no significant concentrations of risk, in terms of sector, industry, geography or company names.

Pension and healthcare and life plans assets do not include significant amounts of Verizon common stock.

Pension Plans

The fair values for the pension plans by asset category at December 31, 2019 are as follows:

(dollars in millions)

Asset Category	**Total**	**Level 1**	**Level 2**	**Level 3**
Cash and cash equivalents	**$ 1,529**	**$ 1,507**	**$ 22**	**$ —**

Health Care and Life Plans

The fair values for the other postretirement benefit plans by asset category at December 31, 2019 are as follows:

(dollars in millions)

Asset Category	Total	Level 1	Level 2	Level 3
Cash and cash equivalents	**$ 220**	**$ 167**	**$ 53**	**$ —**
Equity securities	**225**	**225**	**—**	**—**
Fixed income securities				
U.S. Treasuries and agencies	**28**	**28**	**—**	**—**
Corporate bonds	**76**	**76**	**—**	**—**
International bonds	**18**	**18**	**—**	**—**
Total investments at fair value	**567**	**514**	**53**	**—**
Investments measured at NAV	**176**			
Total	**$ 743**	**$ 514**	**$ 53**	**$ —**

The fair values for the other postretirement benefit plans by asset category at December 31, 2018 are as follows:

(dollars in millions)

Asset Category	Total	Level 1	Level 2	Level 3
Cash and cash equivalents	$ 471	$ 431	$ 40	$ —
Equity securities	239	239	—	—
Fixed income securities				
U.S. Treasuries and agencies	24	24	—	—
Corporate bonds	96	96	—	—
International bonds	18	18	—	—
Total investments at fair value	848	808	40	—
Investments measured at NAV	327			
Total	$ 1,175	$ 808	$ 40	$ —

The following are general descriptions of asset categories, as well as the valuation methodologies and inputs used to determine the fair value of each major category of assets.

Cash and cash equivalents include short-term investment funds (less than 90 days to maturity), primarily in diversified portfolios of investment grade money market instruments and are valued using quoted market prices or other valuation methods. The carrying value of cash equivalents approximates fair value due to the short-term nature of these investments.

Investments in securities traded on national and foreign securities exchanges are valued by the trustee at the last reported sale prices on the last business day of the year or, if no sales were reported on that date, at the last reported bid prices. Government obligations, corporate bonds, international bonds and asset-backed debt are valued using matrix prices with input from independent third-party valuation sources. Over-the-counter securities are valued at the bid prices or the average of the bid and ask prices on the last business day of the year from published sources or, if not available, from other sources considered reliable such as multiple broker quotes.

Commingled funds not traded on national exchanges are priced by the custodian or fund's administrator at their net asset value (NAV). Commingled funds held by third-party custodians appointed by the fund managers provide the fund managers with a NAV. The fund managers have the responsibility for providing this information to the custodian of the respective plan.

The investment manager of the entity values venture capital, corporate finance and natural resource limited partnership investments. Real estate investments are valued at amounts based upon appraisal reports prepared by either independent real estate appraisers or the investment manager using discounted cash flows or market comparable data. Loans secured by mortgages are carried at the lesser of the unpaid balance or appraised value of the underlying properties. The values assigned to these investments are based upon available and current market information and do not necessarily represent amounts that might ultimately be realized. Because of the inherent uncertainty of valuation, estimated fair values might differ significantly from the values that would have been used had a ready market for the securities existed. These differences could be material.

Forward currency contracts, futures, and options are valued by the trustee at the exchange rates and market prices prevailing on the last business day of the year. Both exchange rates and market prices are readily available from published sources. These securities are classified by the asset class of the underlying holdings.

Hedge funds are valued by the custodian at NAV based on statements received from the investment manager. These funds are valued in accordance with the terms of their corresponding offering or private placement memoranda.

Commingled funds, hedge funds, venture capital, corporate finance, natural resource and real estate limited partnership investments for which fair value is measured using the NAV per share as a practical expedient are not leveled within the fair value hierarchy and are included as a reconciling item to total investments.

Employer Contributions

In 2019, we made a $300 million discretionary contribution to our qualified pension plans, $71 million of contributions to our nonqualified pension plans and $449 million of contributions to our other postretirement benefit plans. No qualified pension plans contributions are expected to be made in 2020. Nonqualified pension plans contributions are estimated to be approximately $70 million and contributions to our other postretirement benefit plans are estimated to be approximately $700 million in 2020.

Estimated Future Benefit Payments

The benefit payments to retirees are expected to be paid as follows:

(dollars in millions)

Year	Pension Benefits	Health Care and Life
2020	**$ 2,227**	**$ 961**
2021	**1,680**	**947**
2022	**1,620**	**930**
2023	**1,577**	**968**
2024	**1,072**	**951**
2025 to 2029	**5,248**	**4,569**

Savings Plan and Employee Stock Ownership Plans

We maintain four leveraged employee stock ownership plans (ESOP). We match a certain percentage of eligible employee contributions to certain savings plans with shares of our common stock from this ESOP. At December 31, 2019, the number of allocated shares of common stock in this ESOP was 49 million. There were no unallocated shares of common stock in this ESOP at December 31, 2019. All leveraged ESOP shares are included in earnings per share computations.

Total savings plan costs were $897 million in 2019, $1.1 billion in 2018 and $838 million in 2017.

Severance Benefits

The following table provides an analysis of our severance liability:

(dollars in millions)

Year	Beginning of Year	Charged to Expense	Payments	Other	End of Year
2017	$ 656	$ 581	$ (564)	$ (46)	$ 627
2018	627	2,093	(560)	(4)	2,156
2019	**2,156**	**260**	**(1,847)**	**(4)**	**565**

Severance, Pension and Benefits (Credits) Charges

During 2019, in accordance with our accounting policy to recognize actuarial gains and losses in the period in which they occur, we recorded net pre-tax pension and benefits charges of $126 million in our pension and postretirement benefit plans. The charges were recorded in Other income (expense), net in our consolidated statement of income and were primarily driven by a decrease in our discount rate assumption used to determine the current year liabilities of our pension plans and postretirement benefit plans from a weighted-average of 4.4% at December 31, 2018 to a weighted-average of 3.3% at December 31, 2019 ($4.3 billion), partially offset by the difference between our estimated return on assets and our actual return on assets ($2.3 billion) and other assumption adjustments of $1.9 billion, of which $1.6 billion related to healthcare claims experience. During 2019, we also recorded net pre-tax severance charges of $260 million in Selling, general and administrative expense in our consolidated statements of income.

During 2018, we recorded net pre-tax pension and benefits credits of $2.1 billion in accordance with our accounting policy to recognize actuarial gains and losses in the period in which they occur. The pension and benefits remeasurement credits of $2.3 billion, which were recorded in Other income (expense), net in our consolidated statements of income, were primarily driven by an increase in our discount rate assumption used to determine the current year liabilities of our pension plans and postretirement benefit plans from a weighted-average of 3.7% at December 31, 2017 to a weighted-average of 4.4% at December 31, 2018 ($2.6 billion), and mortality and other assumption adjustments of $1.7 billion, $1.6 billion of which related to healthcare claims and trend adjustments, offset by the difference between our estimated return on assets of 7.0% and our actual return on assets of (2.7)% ($1.9 billion). The credits were partially offset by $177 million due to the effect of participants retiring under the Voluntary Separation Program.

In September 2018, Verizon announced a Voluntary Separation Program for select U.S.-based management employees. Approximately 10,400 eligible employees separated from the Company under this program as of the end of June 2019. The severance benefit payments to these employees were substantially completed by the end of September 2019. Principally as a result of this program but also as a result of other headcount reduction initiatives, the Company recorded a severance charge of $1.8 billion ($1.4 billion after-tax) during the year ended December 31, 2018, which was recorded in Selling, general and administrative expense in our consolidated statement of income. During 2018, we also recorded $339 million in severance costs under our other existing separation plans.

During 2017, we recorded net pre-tax severance, pension and benefits charges of $1.4 billion, exclusive of acquisition related severance charges, in accordance with our accounting policy to recognize actuarial gains and losses in the period in which they occur. The pension and benefits remeasurement charges of approximately $911 million, which were recorded in Other income (expense), net in our consolidated statements of income, were primarily driven by a decrease in our discount rate assumption used to determine the current year liabilities of our pension and postretirement benefit plans from a weighted-average of 4.2% at December 31, 2016 to a weighted-average of 3.7% at December 31, 2017 ($2.6 billion). The charges were partially offset by the difference between our estimated return on assets of 7.0% and our actual return on assets

of 14.0% ($1.2 billion), a change in mortality assumptions primarily driven by the use of updated actuarial tables (MP-2017) issued by the Society of Actuaries ($227 million) and other assumption adjustments ($320 million). As part of these charges, we also recorded severance costs of $497 million under our existing separation plans, which were recorded in Selling, general and administrative expense in our consolidated statement of income.

Note 12. Taxes

The components of income before provision (benefit) for income taxes are as follows:

(dollars in millions)

Years Ended December 31,	2019	2018	2017
Domestic	**$ 21,655**	$ 19,801	$ 19,645
Foreign	**1,078**	(178)	949
Total	**$ 22,733**	$ 19,623	$ 20,594

The components of the provision (benefit) for income taxes are as follows:

(dollars in millions)

Years Ended December 31,	2019	2018	2017
Current			
Federal	**$ 518**	$ 2,187	$ 3,630
Foreign	**221**	267	200
State and Local	**974**	741	677
Total	**1,713**	3,195	4,507
Deferred			
Federal	**1,150**	175	(14,360)
Foreign	**(13)**	30	(66)
State and Local	**95**	184	(37)
Total	**1,232**	389	(14,463)
Total income tax provision (benefit)	**$ 2,945**	$ 3,584	$ (9,956)

The following table shows the principal reasons for the difference between the effective income tax rate and the statutory federal income tax rate:

Years Ended December 31,	2019	2018	2017
Statutory federal income tax rate	**21.0 %**	21.0 %	35.0 %
State and local income tax rate, net of federal tax benefits	**3.7**	3.7	1.6
Preferred stock disposition	**(9.9)**	—	—
Affordable housing credit	**(0.4)**	(0.6)	(0.6)
Employee benefits including ESOP dividend	**(0.3)**	(0.3)	(0.5)
Impact of tax reform re-measurement	**—**	—	(81.6)
Internal restructure	**—**	(9.1)	(0.6)
Noncontrolling interests	**(0.5)**	(0.5)	(0.6)
Non-deductible goodwill	**0.1**	4.7	1.0
Other, net	**(0.7)**	(0.6)	(2.0)
Effective income tax rate	**13.0 %**	18.3 %	(48.3)%

The effective income tax rate for 2019 was 13.0% compared to 18.3% for 2018. The decrease in the effective income tax rate and the provision for income taxes was primarily due to the recognition of approximately $2.2 billion of a non-recurring tax benefit in connection with the disposition of preferred stock, representing a minority interest in a foreign affiliate in 2019 compared to the non-recurring deferred tax benefit of approximately $2.1 billion, as a result of an internal reorganization of legal entities within the historical Wireless business, which was offset by a goodwill charge that is not deductible for tax purposes in 2018.

The effective income tax rate for 2018 was 18.3% compared to (48.3)% for 2017. The increase in the effective income tax rate and the provision for income taxes was primarily due to the non-recurring, non-cash income tax benefit of $16.8 billion recorded in 2017 for the re-measurement of U.S. deferred tax liabilities at the lower 21% U.S. federal corporate income tax rate, as a result of the enactment of the TCJA on December 22, 2017. In addition, the provision for income taxes for 2018 includes the tax impact of the Media goodwill impairment charge not deductible for tax purposes, offset by the reduction in the statutory U.S federal corporate income tax rate from 35% to 21%, effective January 1, 2018 under the TCJA and a non-recurring deferred tax benefit of approximately $2.1 billion as a result of an internal reorganization of legal entities within the historical Wireless business.

In December 2017, the Securities and Exchange Commission staff issued Staff Accounting Bulletin (SAB) 118 to provide guidance for companies that had not completed their accounting for the income tax effects of the TCJA. Due to the complexities involved in accounting for the enactment of the TCJA, SAB 118 allowed for a provisional estimate of the impacts of the TCJA in our earnings for the year ended December 31, 2017, as well as up to a one year measurement period that ended on December 22, 2018, for any subsequent adjustments to such provisional estimate. In 2018, Verizon completed its analysis of the impacts of the TCJA, including analyzing the effects of any IRS and U.S. Treasury guidance issued, and state tax law changes enacted, within the one year measurement period resulting in no significant adjustments to the $16.8 billion provisional amount recorded in December 2017.

The amounts of cash taxes paid by Verizon are as follows:

(dollars in millions)

Years Ended December 31,	**2019**	2018	2017
Income taxes, net of amounts refunded	**$ 3,583**	$ 2,213	$ 4,432
Employment taxes	**1,044**	1,066	1,207
Property and other taxes	**1,551**	1,598	1,737
Total	**$ 6,178**	$ 4,877	$ 7,376

Deferred Tax Assets and Liabilities

Deferred taxes arise because of differences in the book and tax bases of certain assets and liabilities. Significant components of deferred tax assets and liabilities are as follows:

(dollars in millions)

At December 31,	**2019**	2018
Deferred Tax Assets		
Employee benefits	**$ 5,048**	$ 5,403
Tax loss and credit carry forwards	**3,012**	3,576
Other - assets	**5,595**	1,650
	13,655	10,629
Valuation allowances	**(2,260)**	(2,741)
Deferred tax assets	**11,395**	7,888
Deferred Tax Liabilities		
Spectrum and other intangible amortization	**22,388**	21,976
Depreciation	**16,884**	15,662
Other - liabilities	**6,742**	3,976
Deferred tax liabilities	**46,014**	41,614
Net deferred tax liability	**$ 34,619**	$ 33,726

At December 31, 2019, undistributed earnings of our foreign subsidiaries indefinitely invested outside the U.S. amounted to approximately $3.8 billion. The majority of Verizon's cash flow is generated from domestic operations and we are not dependent on foreign cash or earnings to meet our funding requirements, nor do we intend to repatriate these undistributed foreign earnings to fund U.S. operations. Furthermore, a portion of these undistributed earnings represents amounts that legally must be kept in reserve in accordance with certain foreign jurisdictional requirements and are unavailable for distribution or repatriation. As a result, we have not provided U.S. deferred taxes on these undistributed earnings because we intend that they will remain indefinitely reinvested outside of the U.S. and therefore unavailable for use in funding U.S. operations. Determination of the amount of unrecognized deferred taxes related to these undistributed earnings is not practicable.

At December 31, 2019, we had net after-tax loss and credit carry forwards for income tax purposes of approximately $3.0 billion that primarily relate to state and foreign taxes. Of these net after-tax loss and credit carry forwards, approximately $2.0 billion will expire between 2020 and 2039 and approximately $1.0 billion may be carried forward indefinitely.

During 2019, the valuation allowance decreased approximately $481 million. The balance of the valuation allowance at December 31, 2019 and the 2019 activity is primarily related to state and foreign taxes.

Unrecognized Tax Benefits

A reconciliation of the beginning and ending balance of unrecognized tax benefits is as follows:

(dollars in millions)

	2019	2018	2017
Balance at January 1,	**$ 2,871**	$ 2,355	$ 1,902
Additions based on tax positions related to the current year	**149**	160	219
Additions for tax positions of prior years	**297**	699	756
Reductions for tax positions of prior years	**(300)**	(248)	(419)
Settlements	**(58)**	(40)	(42)
Lapses of statutes of limitations	**(89)**	(55)	(61)
Balance at December 31,	**$ 2,870**	$ 2,871	$ 2,355

Included in the total unrecognized tax benefits at December 31, 2019, 2018 and 2017 is $2.4 billion, $2.3 billion and $1.9 billion, respectively, that if recognized, would favorably affect the effective income tax rate.

We recognized the following net after-tax expenses related to interest and penalties in the provision for income taxes:

Years Ended December 31,	(dollars in millions)
2019	**$ 35**
2018	75
2017	77

The after-tax accruals for the payment of interest and penalties in the consolidated balance sheets are as follows:

At December 31,	(dollars in millions)
2019	**$ 385**
2018	348

Verizon and/or its subsidiaries file income tax returns in the U.S. federal jurisdiction, and various state, local and foreign jurisdictions. As a large taxpayer, we are under audit by the IRS and multiple state and foreign jurisdictions for various open tax years. The IRS is currently examining the Company's U.S. income tax returns for tax years 2013-2014 and Cellco Partnership's U.S. income tax return for tax year 2013-2014. Tax controversies are ongoing for tax years as early as 2005. The amount of the liability for unrecognized tax benefits will change in the next twelve months due to the expiration of the statute of limitations in various jurisdictions and it is reasonably possible that various current tax examinations will conclude or require reevaluations of the Company's tax positions during this period. An estimate of the range of the possible change cannot be made until these tax matters are further developed or resolved.

Note 13. Segment Information

Reportable Segments

As discussed in Note 1, in November 2018, we announced a strategic reorganization of our business. Under the new structure, effective April 1, 2019, there are two reportable segments that we operate and manage as strategic business units - Consumer and Business. We measure and evaluate our reportable segments based on segment operating income, consistent with the chief operating decision maker's assessment of segment performance.

Our segments and their principal activities consist of the following:

Segment	Description
Verizon Consumer Group	Our Consumer segment provides consumer-focused wireless and wireline communications services and products. Our wireless services are provided across one of the most extensive wireless networks in the United States under the Verizon brand and through wholesale and other arrangements. Our wireline services are provided in nine states in the Mid-Atlantic and Northeastern U.S., as well as Washington D.C., over our 100% fiber-optic network under the Fios brand and over a traditional copper-based network to customers who are not served by Fios.
Verizon Business Group	Our Business segment provides wireless and wireline communications services and products, video and data services, corporate networking solutions, security and managed network services, local and long distance voice services and network access to deliver various IoT services and products. We provide these products and services to businesses, government customers and wireless and wireline carriers across the U.S. and select products and services to customers around the world.

Our Consumer segment's wireless and wireline products and services are available to our retail customers, as well as resellers that purchase wireless network access from us on a wholesale basis. Our Business segment's wireless and wireline products and services are organized by the primary customer groups targeted by these offerings: Global Enterprise, Small and Medium Business, Public Sector and Other, and Wholesale.

Corporate and other includes the results of our media business,Verizon Media, and other businesses, investments in unconsolidated businesses, unallocated corporate expenses, certain pension and other employee benefit related costs and interest and financing expenses. Corporate and

other also includes the historical results of divested businesses and other adjustments and gains and losses that are not allocated in assessing segment performance due to their nature. Although such transactions are excluded from the business segment results, they are included in reported consolidated earnings. Gains and losses from these transactions that are not individually significant are included in segment results as these items are included in the chief operating decision maker's assessment of segment performance.

We completed our acquisition of Yahoo's operating business on June 13, 2017 and as such results are included since the acquisition date.

In May 2017, we completed the Data Center Sale, where we sold 23 customer-facing data center sites in the U.S. and Latin America to Equinix. The results of operations for this divestiture and other insignificant transactions are included within Corporate and other for all periods presented to reflect comparable segment operating results consistent with the information regularly reviewed by our chief operating decision maker.

The reconciliation of segment operating revenues and expenses to consolidated operating revenues and expenses below includes the effects of special items that the chief operating decision maker does not consider in assessing segment performance, primarily because of their nature.

The following tables provides operating financial information for our two reportable segments:

(dollars in millions)

2019	Consumer	Business	Total Reportable Segments
External Operating Revenues			
Service	**$ 65,384**	**$ —**	**$ 65,384**
Wireless equipment	**18,048**	**—**	**18,048**
Other	**7,384**	**—**	**7,384**
Global Enterprise	**—**	**10,815**	**10,815**
Small and Medium Business	**—**	**11,447**	**11,447**
Public Sector and Other	**—**	**5,922**	**5,922**
Wholesale	**—**	**3,198**	**3,198**
Intersegment revenues	**240**	**61**	**301**
Total Operating Revenues[1]	**91,056**	**31,443**	**122,499**
Cost of services	**15,884**	**10,655**	**26,539**
Cost of wireless equipment	**18,219**	**4,733**	**22,952**
Selling, general and administrative expense	**16,639**	**8,188**	**24,827**
Depreciation and amortization expense	**11,353**	**4,105**	**15,458**
Total Operating Expenses	**62,095**	**27,681**	**89,776**
Operating Income	**$ 28,961**	**$ 3,762**	**$ 32,723**

[1] Service and other revenues and Wireless equipment revenues included in our Business segment amounted to approximately $27.9 billion and $3.5 billion, respectively, for the year ended December 31, 2019.

(dollars in millions)

2018	Consumer	Business	Total Reportable Segments
External Operating Revenues			
Service	$ 64,207	$ —	$ 64,207
Wireless equipment	18,874	—	18,874
Other	6,447	—	6,447
Global Enterprise	—	11,197	11,197
Small and Medium Business	—	10,732	10,732
Public Sector and Other	—	5,830	5,830
Wholesale	—	3,713	3,713
Intersegment revenues	234	62	296
Total Operating Revenues[1]	89,762	31,534	121,296
Cost of services	15,335	10,859	26,194
Cost of wireless equipment	18,763	4,560	23,323
Selling, general and administrative expense	15,701	7,689	23,390
Depreciation and amortization expense	11,952	4,258	16,210
Total Operating Expenses	61,751	27,366	89,117
Operating Income	$ 28,011	$ 4,168	$ 32,179

(1) Service and other revenues and Wireless equipment revenues included in our Business segment amounted to approximately $28.1 billion and $3.4 billion, respectively, for the year ended December 31, 2018.

(dollars in millions)

2017	Consumer	Business	Total Reportable Segments
External Operating Revenues			
Service	$ 63,769	$ —	$ 63,769
Wireless equipment	17,292	—	17,292
Other	5,735	—	5,735
Global Enterprise	—	11,444	11,444
Small and Medium Business	—	9,793	9,793
Public Sector and Other	—	5,652	5,652
Wholesale	—	3,978	3,978
Intersegment revenues	258	46	304
Total Operating Revenues[1]	87,054	30,913	117,967
Cost of services	14,981	11,094	26,075
Cost of wireless equipment	17,713	4,434	22,147
Selling, general and administrative expense	17,292	7,448	24,740
Depreciation and amortization expense	11,308	4,483	15,791
Total Operating Expenses	61,294	27,459	88,753
Operating Income	$ 25,760	$ 3,454	$ 29,214

(1) Service and other revenues and Wireless equipment revenues included in our Business segment amounted to approximately $29.3 billion and $1.6 billion, respectively, for the year ended December 31, 2017.

The following table provides Fios revenues for our two reportable segments:

(dollars in millions)

Years Ended December 31,	**2019**	2018	2017
Consumer	**$ 11,175**	$ 11,056	$ 10,903
Business	**967**	883	788
Total Fios revenue	**$ 12,142**	$ 11,939	$ 11,691

The following table provides Wireless service revenue for our reportable segments and includes intersegment activity:

(dollars in millions)

Years Ended December 31,	2019	2018	2017
Consumer	**$ 53,791**	$ 52,459	$ 51,954
Business	**11,188**	10,484	11,093

Equity in losses of unconsolidated businesses	**(15)**	(186)	(77)
Other income (expense), net	**(2,900)**	2,364	(2,021)
Interest expense	**(4,730)**	(4,833)	(4,733)
Income Before (Provision) Benefit For Income Taxes	**$ 22,733**	$ 19,623	$ 20,594

No single customer accounted for more than 10% of our total operating revenues during the years ended December 31, 2019, 2018 and 2017. International operating revenues are not significant.

The chief operating decision maker does not review disaggregated assets on a segment basis; therefore, such information is not presented. Depreciation included in the measure of segment profitability is primarily allocated based on proportional usage.

Note 14. Equity and Comprehensive Income

Equity

In December 2019, 46,100 preferred shares of a foreign affiliate of Verizon was sold for cash consideration of $51 million and is reflected in non-controlling interests. The preferred shares pay cumulative dividends of 8.25% per annum.

Common Stock

In February 2020, the Verizon Board of Directors authorized a share buyback program to repurchase up to 100 million shares of the Company's common stock. The program will terminate when the aggregate number of shares purchased reaches 100 million, or a new share repurchase plan superseding the current plan is authorized, whichever is sooner. During the years ended December 31, 2019, 2018, and 2017, Verizon did not repurchase any shares of Verizon's common stock under our previously authorized share buyback programs. At December 31, 2019, the maximum number of shares that could be purchased by or on behalf of Verizon under our share buyback program was 100 million.

Common stock has been used from time to time to satisfy some of the funding requirements of employee and shareholder plans. During the years ended December 31, 2019, 2018, and 2017, we issued 3.8 million, 3.5 million and 2.8 million common shares from Treasury stock, respectively, which had an insignificant aggregate value.

In connection with our acquisition of Straight Path in February 2018, we issued approximately 49 million shares of Verizon common stock, valued at approximately $2.4 billion.

Accumulated Other Comprehensive Income

Comprehensive income consists of net income and other gains and losses affecting equity that, under U.S. GAAP, are excluded from net income. Significant changes in the components of Other comprehensive income, net of provision for income taxes are described below.

The changes in the balances of Accumulated other comprehensive income by component are as follows:

(dollars in millions)	Foreign currency translation adjustments	Unrealized gains (losses) on cash flow hedges	Unrealized gains (losses) on marketable securities	Defined benefit pension and postretirement plans	Total
Balance at January 1, 2017	$ (713)	$ (80)	$ 46	$ 3,420	$ 2,673
Other comprehensive income	245	818	10	327	1,400
Amounts reclassified to net income	—	(849)	(24)	(541)	(1,414)
Net other comprehensive income (loss)	245	(31)	(14)	(214)	(14)
Balance at December 31, 2017	(468)	(111)	32	3,206	2,659
Opening balance sheet adjustment (Note 1)	(15)	(24)	(13)	682	630
Adjusted opening balance	(483)	(135)	19	3,888	3,289
Other comprehensive income (loss)	(117)	(574)	—	(164)	(855)
Amounts reclassified to net income	—	629	1	(694)	(64)
Net other comprehensive income (loss)	(117)	55	1	(858)	(919)
Balance at December 31, 2018	**(600)**	**(80)**	**20**	**3,030**	**2,370**
Other comprehensive income (loss)	**16**	**(699)**	**8**	**—**	**(675)**
Amounts reclassified to net income	**—**	**(37)**	**(1)**	**(659)**	**(697)**
Net other comprehensive income (loss)	**16**	**(736)**	**7**	**(659)**	**(1,372)**
Balance at December 31, 2019	**$ (584)**	**$ (816)**	**$ 27**	**$ 2,371**	**$ 998**

The amounts presented above in net other comprehensive income (loss) are net of taxes. The amounts reclassified to net income related to unrealized gains (losses) on cash flow hedges in the table above are included in Other income (expense), net and Interest expense in our consolidated statements of income. See Note 9 for additional information. The amounts reclassified to net income related to unrealized gains (losses) on marketable securities in the table above are included in Other income (expense), net in our consolidated statements of income. The amounts reclassified to net income related to defined benefit pension and postretirement plans in the table above are included in Cost of services and Selling, general and administrative expense in our consolidated statements of income. See Note 11 for additional information.

Note 15. Additional Financial Information

The following tables provide additional financial information related to our consolidated financial statements:

Income Statement Information

	$ (2,917)	$ (1,824)	$ (4,439)

Note 16. Commitments and Contingencies

In the ordinary course of business, Verizon is involved in various commercial litigation and regulatory proceedings at the state and federal level. Where it is determined, in consultation with counsel based on litigation and settlement risks, that a loss is probable and estimable in a given matter, the Company establishes an accrual. In none of the currently pending matters is the amount of accrual material. An estimate of the reasonably possible loss or range of loss in excess of the amounts already accrued cannot be made at this time due to various factors typical in contested proceedings, including: (1) uncertain damage theories and demands; (2) a less than complete factual record; (3) uncertainty concerning legal theories and their resolution by courts or regulators; and (4) the unpredictable nature of the opposing party and its demands. We continuously monitor these proceedings as they develop and adjust any accrual or disclosure as needed. We do not expect that the ultimate resolution of any pending regulatory or legal matter in future periods will have a material effect on our financial condition, but it could have a material effect on our results of operations for a given reporting period.

Verizon is currently involved in approximately 25 federal district court actions alleging that Verizon is infringing various patents. Most of these cases are brought by non-practicing entities and effectively seek only monetary damages; a small number are brought by companies that have sold products and could seek injunctive relief as well. These cases have progressed to various stages and a small number may go to trial in the coming 12 months if they are not otherwise resolved.

In connection with the execution of agreements for the sales of businesses and investments, Verizon ordinarily provides representations and warranties to the purchasers pertaining to a variety of nonfinancial matters, such as ownership of the securities being sold, as well as indemnity from certain financial losses. From time to time, counterparties may make claims under these provisions, and Verizon will seek to defend against those claims and resolve them in the ordinary course of business.

Subsequent to the sale of Verizon Information Services Canada in 2004, we continue to provide a guarantee to publish directories, which was issued when the directory business was purchased in 2001 and had a 30-year term (before extensions). The preexisting guarantee continues, without modification, despite the subsequent sale of Verizon Information Services Canada and the spin-off of our domestic print and Internet yellow pages directories business. The possible financial impact of the guarantee, which is not expected to be adverse, cannot be reasonably estimated as a variety of the potential outcomes available under the guarantee result in costs and revenues or benefits that may offset each other. We do not believe performance under the guarantee is likely.

As of December 31, 2019, letters of credit totaling approximately $632 million, which were executed in the normal course of business and support several financing arrangements and payment obligations to third parties, were outstanding.

During 2019, Verizon entered into a renewable energy purchase agreement (REPA) with a third party. The REPA is based on the expected operation of a renewable energy-generating facility and has a fixed price term of 12 years from the commencement of the facility's entry into commercial operation, which is expected to begin by the end of 2020. The REPA generally is expected to be financially settled based on the prevailing market price as energy is generated by the facility.

We have various commitments, totaling $18.8 billion, primarily to purchase programming and network services, equipment, software and marketing services, which will be used or sold in the ordinary course of business, from a variety of suppliers. Of this total amount, $8.4 billion is attributable to 2020, $7.5 billion is attributable to 2021 through 2022, $1.4 billion is attributable to 2023 through 2024 and $1.5 billion is attributable to years thereafter. These amounts do not represent our entire anticipated purchases in the future, but represent only those items that are the subject of contractual obligations. Our commitments are generally determined based on the noncancelable quantities or termination

amounts. Purchases against our commitments totaled approximately $10.9 billion for 2019, $9.0 billion for 2018 and $8.2 billion for 2017. Since the commitments to purchase programming services from television networks and broadcast stations have no minimum volume requirement, we estimated our obligation based on number of subscribers at December 31, 2019, and applicable rates stipulated in the contracts in effect at that time. We also purchase products and services as needed with no firm commitment.

Note 17. Quarterly Financial Information (Unaudited)

(dollars in millions, except per share amounts)

Quarter Ended	**First Quarter**	**Second Quarter**	**Third Quarter**	**Fourth Quarter**	**Full Year**
2019

Historical Wireless legal entity restructuring	**—**	**—**	**—**	**—**	—	—	—	(2,065)

Disposition of Preferred Stock

During the fourth quarter of 2019, we completed the disposition of preferred stock, representing a minority interest in a foreign affiliate, which resulted in a non-recurring income tax benefit of approximately $2.2 billion in our consolidated statement of income for the year ended December 31, 2019.

Historical Wireless Legal Entity Restructuring

During the fourth quarter of 2018, we completed an internal reorganization of legal entities within the historical Wireless business which resulted in a non-recurring income tax benefit of approximately $2.1 billion in our consolidated statement of income for the year ended December 31, 2018, which reduced our deferred tax liability by the same amount.

Report on Schedule

To the Shareholders and the Board of Directors of Verizon Communications Inc.:

We have audited the consolidated financial statements of Verizon as of December 31, 2019 and 2018, and for each of the three years in the period ended December 31, 2019, and have issued our report thereon dated February 21, 2020 incorporated by reference in this Annual Report (Form 10-K) of Verizon from the 2019 Annual Report to Shareholders of Verizon. Our audits of the consolidated financial statements included the financial statement schedule listed in Item 15(a) of this Annual Report (Form 10-K) (the “schedule”). This schedule is the responsibility of Verizon's management. Our responsibility is to express an opinion on Verizon’s schedule based on our audits.

In our opinion, the schedule presents fairly, in all material respects, the information set forth therein when considered in conjunction with the consolidated financial statements.

Clarence Otis, Jr.

POWER OF ATTORNEY

WHEREAS, VERIZON COMMUNICATIONS INC., a Delaware corporation (hereinafter referred to as the "Company"), proposes to file with the Securities and Exchange Commission under the provisions of the Securities Exchange Act of 1934, as amended, an annual report on Form 10-K (the "Form 10-K") for the fiscal year ended December 31, 2019.

NOW, THEREFORE, the undersigned hereby appoints Hans E. Vestberg, Matthew D. Ellis and Anthony T. Skiadas and each of them, his true and lawful attorneys-in-fact and agents with full power of substitution, for him and in his name, place and stead, in any and all capacities, to sign the Form 10-K and any and all amendments to the Form 10-K, and to file the same, with all exhibits thereto and all documents in connection therewith, making such changes in the Form 10-K as such person or persons so acting deems appropriate, with the Securities and Exchange Commission, granting unto said attorneys-in-fact and agents, and each of them, full power and authority to do and perform each and every act and thing requisite and necessary to be done in and about the premises, as fully to all intents and purposes as he might or could do in person, hereby ratifying and confirming all that said attorneys-in-fact and agents or any of them, or his, her or their substitute or substitutes, may lawfully do or cause to be done by virtue hereof.

IN WITNESS WHEREOF, the undersigned has executed this Power of Attorney this 20th day of February, 2020.

/s/ Daniel H. Schulman

EXHIBIT 31.1

I, Hans E. Vestberg, certify that:

1. I have reviewed this annual report on Form 10-K of Verizon Communications Inc.;

2. Based on my knowledge, this report does not contain any untrue statement of a material fact or omit to state a material fact necessary to make the statements made, in light of the circumstances under which such statements were made, not misleading with respect to the period covered by this report;

3. Based on my knowledge, the financial statements, and other financial information included in this report, fairly present in all material respects the financial condition, results of operations and cash flows of the registrant as of, and for, the periods presented in this report;

4. The registrant's other certifying officer and I are responsible for establishing and maintaining disclosure controls and procedures (as defined in Exchange Act Rules 13a-15(e) and 15d-15(e)) and internal control over financial reporting (as defined in Exchange Act Rules 13a-15(f) and 15d-15(f)) for the registrant and have:

   (a) Designed such disclosure controls and procedures, or caused such disclosure controls and procedures to be designed under our supervision, to ensure that material information relating to the registrant, including its consolidated subsidiaries, is made known to us by others within those entities, particularly during the period in which this report is being prepared;

   (b) Designed such internal control over financial reporting, or caused such internal control over financial reporting to be designed under our supervision, to provide reasonable assurance regarding the reliability of financial reporting and the preparation of financial statements for external purposes in accordance with generally accepted accounting principles;

   (c) Evaluated the effectiveness of the registrant's disclosure controls and procedures and presented in this report our conclusions about the effectiveness of the disclosure controls and procedures, as of the end of the period covered by this report based on such evaluation; and

   (d) Disclosed in this report any change in the registrant's internal control over financial reporting that occurred during the registrant's most recent fiscal quarter that has materially affected, or is reasonably likely to materially affect, the registrant's internal control over financial reporting; and

5. The registrant's other certifying officer and I have disclosed, based on our most recent evaluation of internal control over financial reporting, to the registrant's auditors and the audit committee of the registrant's board of directors (or persons performing the equivalent functions):

   (a) All significant deficiencies and material weaknesses in the design or operation of internal control over financial reporting which are reasonably likely to adversely affect the registrant's ability to record, process, summarize and report financial information; and

   (b) Any fraud, whether or not material, that involves management or other employees who have a significant role in the registrant's internal control over financial reporting.

Hvilken proces man normalt vil benytte ved godkendelse af miljøtoksin?

(MST, reference 1):

side 5: Hovedparten af befolkningen skal fortsat beskyttes (dvs.

hensyntagen til særligt udsatte skal også inddrages).
- Der skal tages specifikt hensyn til børn.
- Det fastholdes, at der højst anvendes en samlet usikkerhedsfaktor på 10.000, når resultater fra dyreforsøg overføres til mennesker.[1]
- Der accepteres fortsat en livstidsrisiko på 10^{-6}.

Denne vejledning indarbejder disse principper og gennemgår de metoder, som skal anvendes ved fastsættelse kvalitetskriterier for jord, luft og drikkevand med henblik på at beskytte sundheden[2].

1.1.2 Generelle principper for fastsættelse af kvalitetskriterier for kemikalier

Kvalitetskriterierne fastsættes på et niveau, hvor udsættelse gennem et helt liv ikke fører til skadevirkninger i befolkningen. De fastsættes på baggrund af den eksisterende viden og under hensyntagen til de mangler, der ligger i datagrundlaget. For at minimere risici for skadelig påvirkning af befolkningen indgår beskyttelse af særligt følsomme grupper fx børn, gravide, syge, ældre og svækkede ved fastsættelse af kvalitetskriterier. Viden om et kemisk stofs sundhedsskadelige egenskaber og om bestemte befolkningsgruppers særlige følsomhed er sjældent så eksakt, at der kan fastsættes et kvalitetskriterium, der præcist definerer skillelinien (hvis en sådan overhovedet findes) mellem et ufarligt og farligt niveau. Kvalitetskriterierne kan således ikke opfattes som en streg i sandet, hvor enhver overskridelse er farlig. Ved fastsættelse af kvalitetskriterier for kemikalier skal anvendes en forsigtighedstilgang, da målet er at sikre et højt beskyttelsesniveau for alle ved udsættelse over et helt liv.

---

1 : Her er NTP studiet og Ramazinistudiet særdeles relevant. NTP studiet bruger eksponeringer omkring (over og under) nuværende grænseværdier. Dermed bør grænseværdierne sænkes med en faktor 10.000. Rammazinistudiet viser effekter ved langt lavere værdier, altså burde eksponeringen være endnu lavere

Hvilke krav vil der normalt blive stillet til et miljøtoksin, førend det godkendes?

Hvilke tests vil man normalt udføre, forud for godkendelse?

Ref 1 (MST):
Det videnskabelige grundlag for fastsættelse af sundhedsmæssigt *baserede kvalitetskriterier for kemiske stoffer i jord, luft og drikkevand består af en* ***farlighedsvurdering, en dosis- respons (effekt) vurdering (farlighedskarakterisering), samt en eksponeringsvurdering***[2]***.*** *Farlighedsvurderingen og farlighedskarakteriseringen tager udgangspunkt i undersøgelser af* ***det pågældende stofs toksikologiske effekter i mennesker og i dyr.***

På næste side gives en oversigt over det væsentligste indhold i de enkelte kapitler i miljøstyrelsens vejledning

---

2 Der er ikke foretaget en sådan vurdering for RF-EMF i DK. Fra EU foreligger: ***1999/519/EC: Council Recommendation of 12 July 1999 on the limitation of exposure of the general public to electromagnetic fields (0 Hz to 300 GHz).***
https://op.europa.eu/en/publication-detail/-/publication/9509b04f-1df0-4221-bfa2-c7af77975556/language-en (ICNIRPs standard stort set pakket ind i EU anbefaling til medlemslandende, Ikke bindende - Ifølge denne recommendation er ICNIRPs grænseværdier et minimumskrav (for beskyttelse af mennesker) og der er ingen recommendation for beskyttelse af miljøet. Ifølge recomendationen er det op til det enkelte medlemdsland selv at følge med I forskningen på feltet og vurdere om der skal skrappere grænseværdier for beskyttelse af menneskers sundhed (punkt 19). Dette er IKKE sket i DK, jvf implementationsrapport og DK har ikke fastalgt gennemførselsforanstaltninger i forbindelse med basisrestriktionerne. Jeg vil mene, at Dk ikke lever op til recommendation III, V, VI og VII.

På side 17 i "First Implementation report 1999-2001":
"Denmark follows the ICNIRP recomendations and **has not implementedany legally binding measures** to protect the **public** against exposure to electromagnetic fields. Its Labour Inspectorate follows ICNIRP recomendations when evaluating exposure.
"https://ec.europa.eu/health/ph_determinants/environment/EMF/implement_rep_en.pdf

Second Implementation report 2002-2007: (2st version) https://op.europa.eu/en/publication-detail/-/publication/5dbcd92f-7849-4017-8cee-742f40ff8143
s 4-5 (og Skema 2) : *De fleste medlemsstater har gennemført henstillingen, og nogle har indført bindende foran-staltninger for at begrænse offentlighedens eksponering for elektromagnetiske felter..... Imidlertid er der i Cypern, Danmark, Tyskland, Irland, Litauen, Slovenien og Slovakiet ikke fastlagt gennemførselsforanstaltninger i forbindelse med basisrestriktioner.*

Ifølge 1999/519/EC anbefales det at evaluere hvert 3. år (se side 3 stk VII.). Så der burde være en rapport hvert 3. år fra 1999-2020 – men vi har kun kunnet finde de to.

Se desuden ref 4: Hollandsk regeringsrapport om EMF Grænseværdier i Europa:
Comparison of international policies on electromagnetic fields 2018.pdf

- I kapitel 2 omtales *Datagrundlaget* som anvendes som udgangspunkt for arbejdet. Data hentes primært fra internationale og nationale dokumenter, via litteratursøgning i internationale databaser, samt fra originalartikler. [3]
- Kapitel 3 behandler de faglige metoder, der anvendes i forbindelse med farlighedsvurderingen og farlighedskarakteriseringen. Dosis-effekt og dosis-responssammenhænge og udpegning af NOAEL (No Observed Adverse Effect Level) og LOAEL (Lowest Observed Adverse Effect Level) beskrives.
- I kapitel 4 beskrives hvordan farlighedskarakteriseringen udmunder i udpegning af en kritisk effekt,[4] som danner udgangspunkt for fastsættelse af en *tolerabel daglig indtagelse,TDI*. Her omtales, hvordan anvendelsen af usikkerhedsfaktorer indgår i beregningerne.
- I kapitel 5 omtales, hvordan TDI beregnes for kræftfremkaldende stoffer uden tærskelværdi.[5] Risikoniveauet for TDI-værdien defineres, og der gives retningslinier medhensyn til valg af metode til, hvordan beregningen af dette risikoniveau foretages.

---

3 Kapitel 2: "*kvalitetetskriterierne vil som oftest være baseret på viden opnået fra dyreforsøg med mere veldefineret udsættelse eller in vitro data*". - For EMF igenoreres dyrestudierne, påstås irrelevante for mennesker!

"*Ved fastsættelsen af kvalitetskriterier anvendes der internationalt anerkendte principper. I denne forbindelse skal fremhæves de principper og metoder, der er beskrevet i to publikationer af WHO/ IPCS[6,7] om udarbejdelsen af vejledende grænseværdier og risikovurdering af kemisk udsættelse "*

"Det anbefales generelt, at data, der skal danne udgangspunkt for beregning af kvalitetskriteriet, altid hjemskaffes som originallitteratur til vurdering af den konkrete undersøgelses kvalitet og relevans."

4 Der er ikke fastsat nogen form for dosis-effekt sammenhænge for hverken mennesker eller miljø. Der vil altid være huller I viden, men der er virkelig mange eksperimentelle dyrestudier (insekter og en lang række hvirveldyr) af forskellig art som man kunne anvende til at undersøge dette aspekt for RF-EMR. Ref 1, s20: En længerevarende dyreeksperimentel undersøgelse vil således kunne give viden om forskellige typer effekter ved forskellige eksponeringsniveauer (dosis-effekt), og om hvor lang tid det tager, før de optræder i forhold til eksponeringen. Bemærk side 24 vedr. Artsspecifikke effekter. For FR-EMR er der observeret effekter I så mange dyrearter, at man kan udelukke at effekterne af EMR kun ses i én dyreart. Derfor må dyreforsøgene vurderes som repræsentative for mennesker.

5 Dette er relevant ift EMF, idet det også gælder agens i kategori 2B, jvf side 36 i dokumentet. Bemærk iøvrigt hvad der skrives om genotoksiske agens. Da der er mindst 40 studier som viser DNA skader er dette ikke uvæsentligt.

Supplerende bemærkninger:

- Det største problem er at de definerede normer går på kemiske miljøgifte. Men det er relevant til sammenligning af fremdrage procedurerne for kemiske stoffer i både DK (MST) og EU. De er meget velbeskrevne.

- Desuden har EU kommissionens " Scientific Committee on Health, Environmental and Emerging Risks " =SCHEER defineret EMR som muligt miljøtoksin (fysisk hazard), som foreløbigt vurderes af være af størst mulig betydning for ikke bare menneskers sundhed men også for økosystemer og andre arter (Ref 2, punkt 4.4): Højeste ranking for "urgency", højeste ranking for "scale" (omfang), og højeste rank for interactions (interaktion med ikke bare mennsker men også økosystemer og andre arter). Desuden tilføjes: This concern is more related to the change to 5G rather than a completely new concern. Preliminary Estimation of importance: RF-EMR gives højest mulig rank

- Endelig har EEA vurderet at forsigtighedsprincippet bør tages i anvendelse overfor RF EMR (Ref 3, nederst side 38 til side 39): It is therefore very important that large scale emerging technologies, such as biotechnologies, nanotechnologies and information **and communication technologies**, apply the precautionary principle based on the experiences and lessons learned from these and other case studies.
- Det afviger fra EUs normale procedurer at udpege en privat organisation til at fastsætte grænseværdier. Da der er tale om et "large scale ermerging" miljøtoksin burde EU burde rådgivning fra EEA højere.
- Samtidig siger EU også at det er op til de enkelte lande at vurdere om det er nødvendigt med strammere grænseværdier end dem ICNIRP fastsætter (- se fodnote 2 ovenfor) – men dette vedrører kun eksponering af mennsker. Der er INGEN miljøvurdering overhovedet, af effekter på selve miljøet.

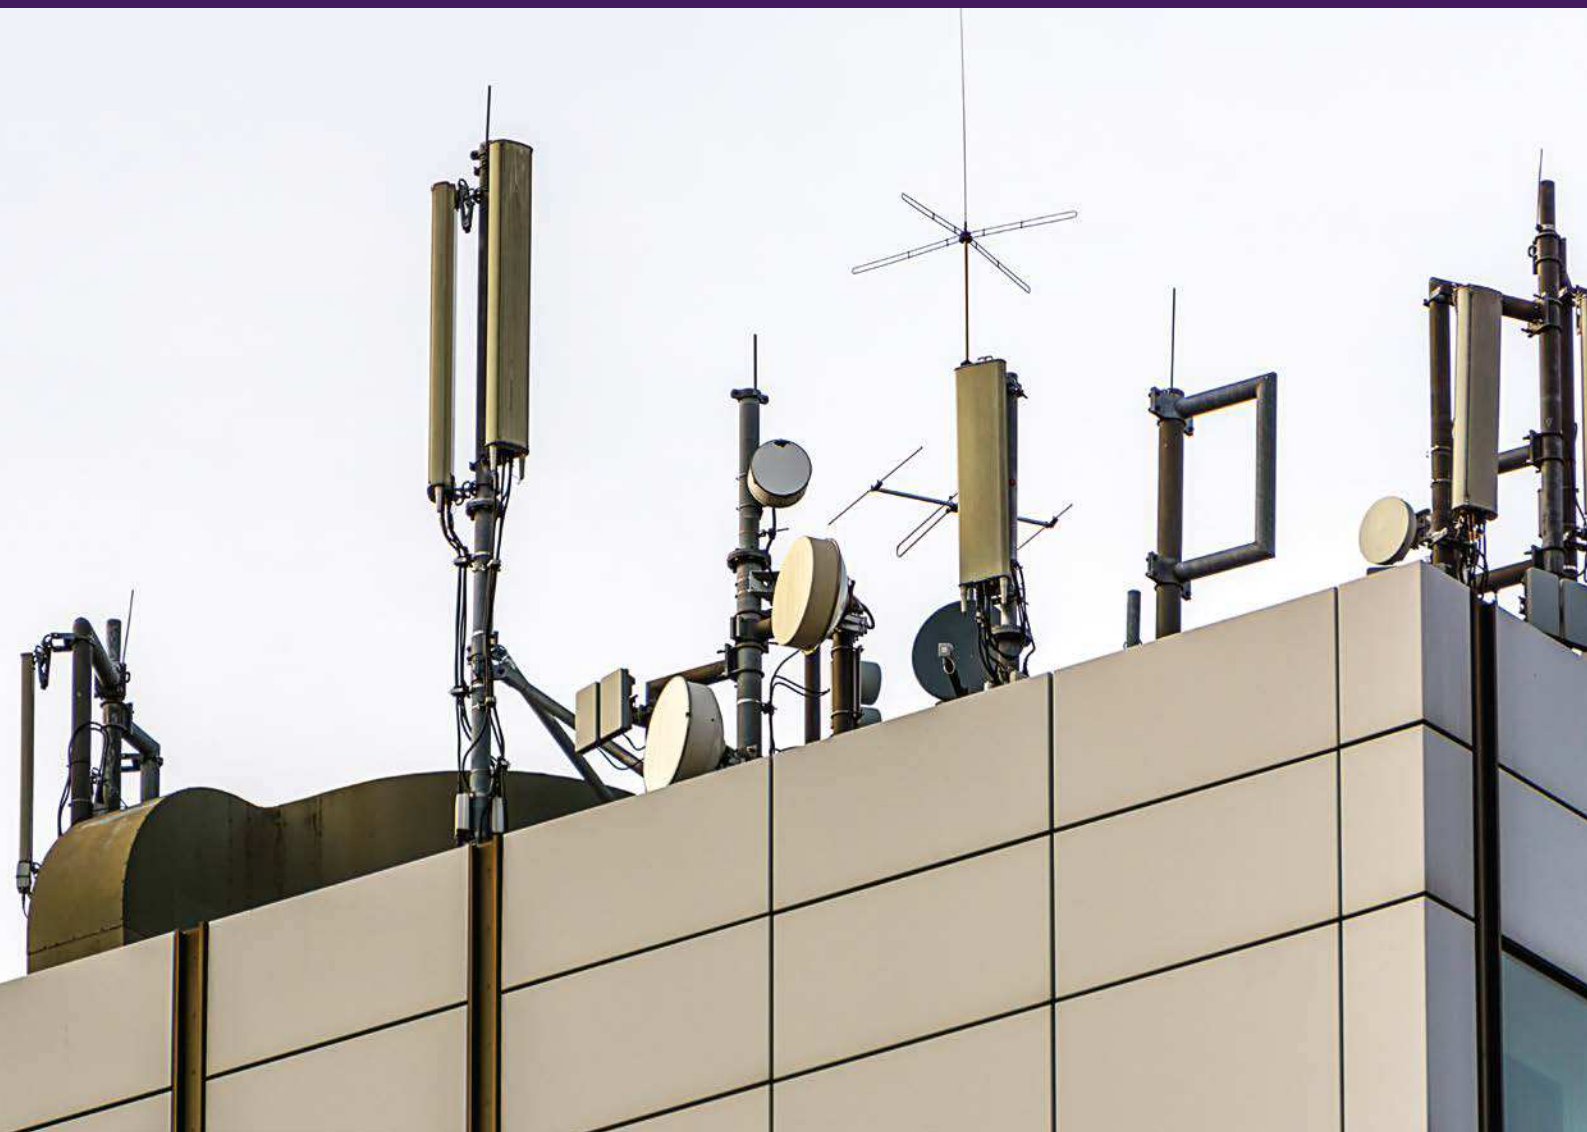
Ministry of Health, Welfare and Sport

Comparison of *international* policies on *electromagnetic fields*

(power frequency and radiofrequency fields)



Comparison of international policies on electromagnetic fields *(power frequency and radiofrequency fields)*

This document is an update of an earlier overview from May 2011 (RIVM 118/2011). It was prepared as part of a research project commissioned by the Ministry of Infrastructure and Water Management and the Ministry of Social Affairs and Employment of the Netherlands. The information that forms the basis for this summary was obtained from searches of governmental and scientific websites, scientific publications, policy summaries by other organisations and personal contacts with experts in the countries in question. The information was last updated in the period from January to July 2017 [1].

Introduction

Time-varying electric, magnetic and electromagnetic fields (EMF) are generated by moving electric charges and by variable electric fields such as those generated near a conductor for alternating current. Power frequency EMF are generated in the production, transport, distribution and use of electricity. The frequency of alternating current and the resulting EMF is 50 hertz in Africa, most of Asia, Australia, Europe and part of South America and 60 hertz in the remainder of America, the Philippines, Korea, Saudi-Arabia and part of Japan. Radiofrequency EMF are generated, among others, by mobile telecommunication systems, broadcasting transmitters, radar installations, microwave ovens and dryers, plastic welders, certain medical applications and equipment for electronic article surveillance and identification.

In 1999, the Council of the European Union (EU) published a Recommendation (1999/519/EC, further called 'EU recommendation') on the limitation of exposure of the general public to EMF (0 hertz to 300 gigahertz). It contains basic restrictions for the induced electric fields and currents and the absorbed power in the body and reference levels for the strength of EMF outside the body (for values at selected frequencies, see **Table 1**). The limits in the EU recommendation are derived from the 1998 guidelines for limiting exposure to EMF by the International Commission on Non-Ionizing Radiation Protection (ICNIRP). ICNIRP has issued new guidelines for EMF with frequencies between 1 hertz and 100 kilohertz in 2010, and for frequencies between 0 and 1 hertz in 2014, but these have not yet led to changes in the EU recommendation.

In 2013, the European Parliament and the Council of the EU issued a directive (2013/35/EU, further called 'EU directive') on the minimum health and safety requirements regarding the exposure of workers to the risks arising from physical agents (EMF). It contains exposure limit values for the induced electric fields and the absorbed power in the body and action levels for the strength of EMF outside the body (for values at selected frequencies, see **Table 2**). The limits for static and low frequency fields in the EU directive are derived from the 2009 and 2010 ICNIRP guidelines for limiting exposure to static and low frequency time-varying EMF. The limits for radiofrequency fields are derived from the 1998 ICNIRP guidelines. ICNIRP has reconfirmed the validity of its 1998 guidelines for EMF with frequencies between 100 kilohertz and 300 gigahertz in a 2009 statement. For the sake of consistency, the terminology of the EU recommendation and EU directive is also used for equivalent public and occupational exposure limits in national legislation in the present summary, regardless of whether these are derived directly from ICNIRP or from other sources.

The European Parliament and Council of the EU have also issued directives on the marketing of low voltage electrical equipment (2014/35/EU) and radio equipment (2014/53/EU), which require that such equipment does not endanger the health or safety of persons. The European Committee for Electrotechnical Standardisation (CENELEC), in liaison with the European Telecommunications Standards Institute (ETSI), has developed harmonised standards for measurement and calculation of EMF exposure which can be used to demonstrate that this requirement is met.

[1] **Disclaimer:** The author has taken care to obtain correct and up-to-date information from relevant websites, policy documents and experts in the countries in question. However, no rights can be deduced from any of the information in this document. For further information and corrections, please contact Dr. R. Stam, National Institute for Public Health and the Environment, the Netherlands. E-mail: *rianne.stam@rivm.nl*

Apart from ICNIRP, influential guidelines on the protection against risks of EMF have also been published by the Institute of Electrical and Electronics Engineers (IEEE), for both exposure of the general public and controlled environments (occupational exposure). For power frequency fields, the IEEE basic restrictions for induced electric fields are similar to those of ICNIRP and EU for exposure of the head (brain) but less strict than ICNIRP for exposure of the rest of the body. For radiofrequency fields, IEEE basic restrictions are the same as those of ICNIRP and EU. The reference levels of IEEE are less strict than those of ICNIRP and EU (for radiofrequency fields only at some frequencies). Differences in the limits between different guidelines are mainly caused by differences in the dosimetric models of the human body and in the use of safety factors. The limits advised by IEEE are used in national EMF legislation of some countries outside the EU and referred to in a safety standard of the North Atlantic Treaty Organization (NATO).

Exposure of the general public, power frequency fields

European Union

Because the EU recommendation is not legally binding, EMF policy in member states can be divided into three different approaches. Details on limits at selected frequencies per member state can be found in **Table 1** and a visual overview in **Figure 1**. In the **first group** of member states the EU recommendation has been transposed in binding national legislation or national policy. This means that the basic restrictions and reference levels must be applied. EU member states in this group are the *Czech Republic, Estonia, France, Greece, Hungary, Ireland, Luxemburg, Portugal* and *Romania*. In the *Czech Republic*, the reference levels differ from the EU recommendation, but the basic restrictions are the same. In *France* the limits only apply to new or modified installations. In *Germany* and *Slovakia* the reference levels in the EU recommendation are applied as *de facto* exposure limits, without reference to basic restrictions.

In the **second group** of member states, the national limits based on the EU recommendation or ICNIRP are not binding, there are more lenient limits or there is no regulation. However, it may be that the authorities or grid companies apply the limits in the EU recommendation in practice. EU member states in this group are *Austria, Cyprus, Denmark, Finland, Latvia, Malta, the Netherlands, Spain, Sweden* and *the United Kingdom*.

Whether or not they have legally binding limits on the strength of power frequency fields, in some of the EU member states in the first and second group a precautionary policy has been advised by the government or voluntarily agreed to by the electricity supply sector to limit the exposure of members of the general population to power frequency magnetic fields. Alternatively, the legislation contains an obligation to minimise fields as far as this can be done with reasonable cost and with reasonable consequences. The motivation is either the epidemiological evidence for a possibly increased risk of childhood leukaemia in children who live near overhead power lines, or a more general argument to keep fields as low as reasonably possible in the light of scientific uncertainty. These precautionary policies in addition to formal legislation are as follows:

First group

France: A ministerial recommendation advises the Prefectures to avoid as far as possible the creation of new hospitals, maternity wards and childcare facilities near power lines, cables, transformers and bus bars where children are exposed to a magnetic field stronger than 1 microtesla. For new or modified electricity infrastructure, the grid operator usually tries to avoid as much as possible the creation of new electricity infrastructure near such locations when planning a new grid development. The grid operator has the legal obligation to monitor the strength of EMF near power lines in urbanised areas. Citizens can also request information about the strength of EMF from local power lines via their mayor.

Germany: National legislation requires that all possibilities to minimise EMF should be exhausted in accordance with the technical state of the art when creating or substantially modifying direct current and alternating current facilities with voltages greater than 1 kilovolt. High-voltage power lines for alternating current on a newly planned route may not pass over buildings meant for the long-term stay of people. The obligation to minimise EMF only applies to locations with homes, hospitals, schools, childcare facilities, playgrounds or any other location not exclusively meant for the temporary stay of people. Minimisation measures need to be proportional with regard to cost, functionality, or negative effects on the environment, well-being and occupational safety.

Luxemburg: There is a ministerial recommendation not to create any new living spaces in the immediate vicinity of overhead power lines (within 20 metres for 65 kilovolt lines and 30 metres for 100 to 220 kilovolt lines).

Second group

Austria: Although precautionary limits are not formally advised, the panel of experts appointed by the relevant authority for new electricity lines requiring environmental impact assessment usually require compliance with a maximum magnetic flux density of 1 microtesla (1% of the reference level in the EU recommendation), derived from Swiss legislation.

Denmark: The Danish Health Authority (Sundhetsstyrelsen) recommended in 1993 not to build new homes or children's institutions close to power lines or new power lines close to homes or children's institutions. The exact distance was left to pragmatic considerations. The Danish electricity sector has published guidelines for situations where measures at reasonable cost to reduce the magnetic field must be investigated. Like the Danish Health Authority's advice, the guidelines apply only to new developments.

Finland: The Radiation safety authority (STUK) recommends avoiding the construction of permanent residences in areas where the magnetic flux density continuously exceeds the level of approximately 0.4 microtesla.

Netherlands: A ministerial recommendation advises local authorities and grid companies to avoid as far as reasonably possible creating new situations with long-term stay of children in areas around overhead high-voltage power lines with an annually averaged magnetic flux density greater than 0.4 microtesla. The advice applies when making spatial plans and determining the trajectory of overhead high-voltage power lines, or when changing existing plans or existing overhead high-voltage power lines. For existing situations, the reference level in the EU recommendation should apply.

United Kingdom: In response to the conclusions of a national stakeholders' dialogue, the government noted that ICNIRP exposure guidelines in place in the United Kingdom remain appropriate. It also supports the implementation of low-cost options such as optimal phasing to reduce the magnetic field of overhead power lines, but considers additional exposure reduction by creating exclusion zones between homes and power lines to be disproportionate in the light of the evidence on the potential health risks. The government also supported exploring the reinforcement of best practice for wiring of distribution circuits and providing consistent, helpful and proportionate public health messages to raise awareness.

In the **third group** of member states, there are stricter basic restrictions and/or reference levels, based on the precautionary principle or due to public pressure. These stricter reference levels are often applied as a *de facto* exposure limit that may not be exceeded. Since there is a great diversity in particular rules and limits, a summary is given per member state:

Belgium: In Belgium, the limitation of EMF exposure of the general population is a matter for the three devolved regions. In Flanders, a ministerial recommendation for the planning of new power lines states that passing over schools and childcare centres should be avoided and passing over homes kept to a minimum. New schools and childcare centres should not be placed in the magnetic field zone with year-averaged exposure greater than 0.4 microtesla (0.4% of the reference level in de EU recommendation). In addition, an indoor environment decree requires those responsible for building or managing homes and public buildings to keep exposure to power frequency magnetic fields below 10 microtesla (10% of the reference level in de EU recommendation) and advises them to strive for a 'quality aim' of 0.2 microtesla (0.2% of the reference level in de EU recommendation). In the Brussels region, a ministerial instruction for environmental permits requires that the magnetic field in places near newly installed transformers where children under 15 may stay is kept below a 24-hour average of 0.4 microtesla. Wallonia does not have a precautionary policy for power frequency magnetic fields, but applies the limits in the EU recommendation to transformers.

Bulgaria: Minimal distances between homes and power lines or substations are in force depending on voltage. There are no other limits for exposure of the general public to power frequency EMF except for limits on emission by video screens. At a distance of 50 centimetres from video screens, the limit is 0.5% of the reference level in the EU recommendation for electric field strength and 0.25% for magnetic flux density.

Croatia: For public spaces in general, limits for the electric and magnetic field identical to the reference levels in the EU recommendation may not be exceeded. For 'sensitive areas' (homes, offices, schools, playgrounds, kindergartens, maternity wards, hospitals, homes for the elderly and disabled and tourist accommodations), the limits for the electric and magnetic field are 40% of the reference levels in the EU recommendation.

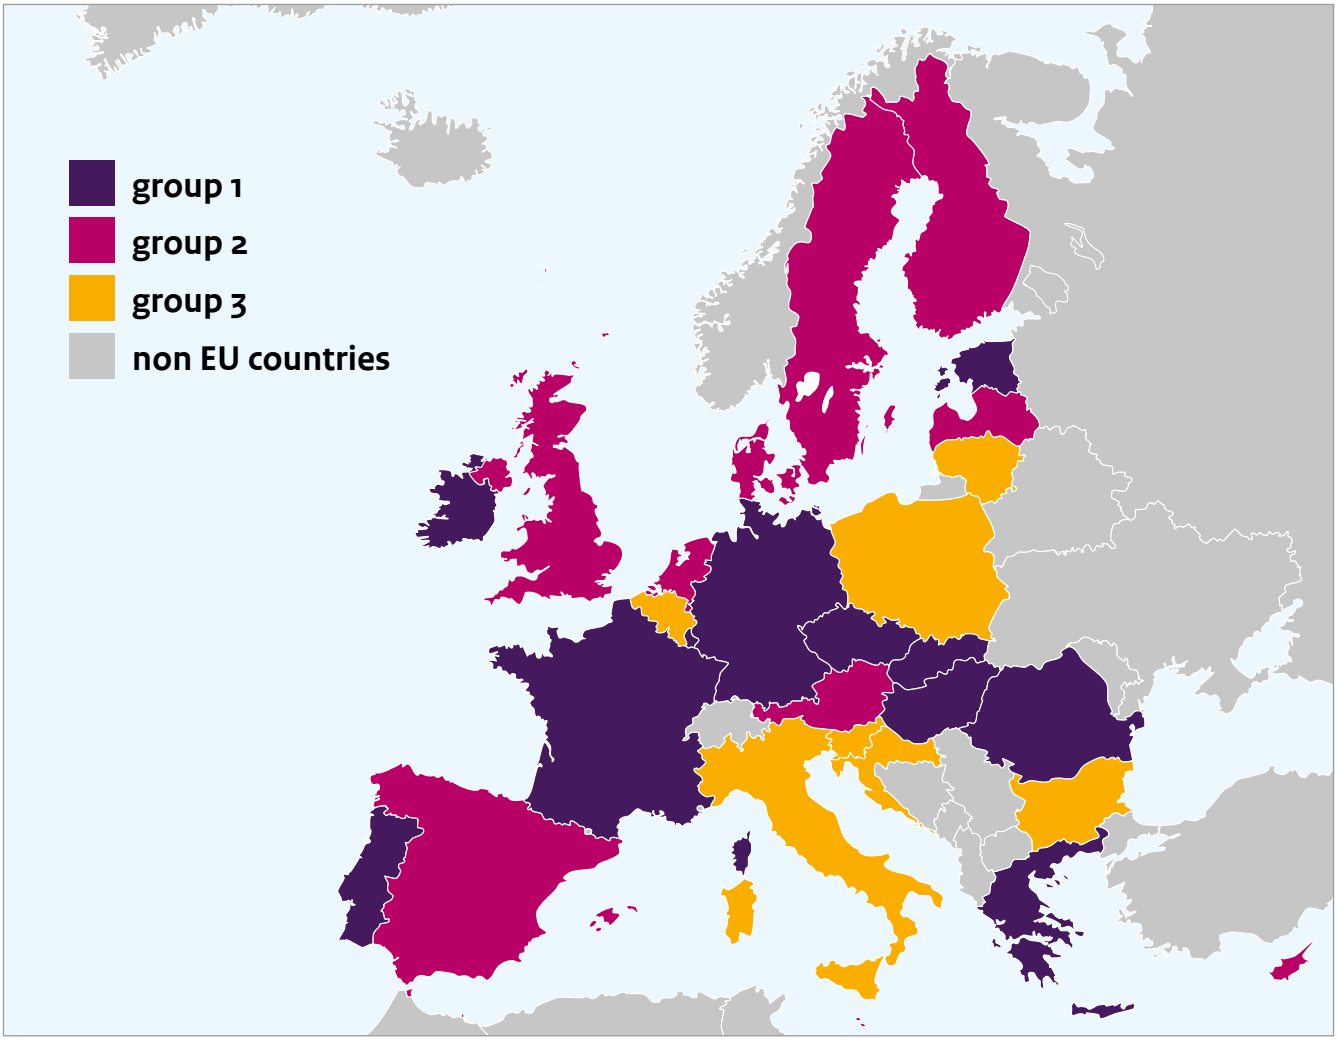
Italy: For all low frequency sources other than power lines, the reference levels and basic restrictions in the EU recommendation apply. For 50-hertz electric and magnetic fields from power lines and associated installations, the reference level in the EU recommendation may not be exceeded. In addition, a precautionary 'attention value' and 'quality goal' apply to 24-hour median exposure in homes, playgrounds, schools and places where people can stay for more than four hours. The 'attention value' of 10% of the EU reference level for magnetic flux density applies to existing situations. The 'quality goal' of 3% of the EU reference level for magnetic flux density applies to new situations. An even stricter limit for magnetic flux density (0.2% of the reference level) was adopted in three regions before the federal law came into force. This too applies to power lines near homes, schools and other places where people may stay for more than 4 hours per day.

Lithuania: A limit of 10% (electric field) or 20% (magnetic field) of the reference level in the EU recommendation applies inside residential and public buildings. A limit of 20% (electric field) or 40% (magnetic field) of the reference level in the EU recommendation applies to the living environment outside buildings.

Poland: A limit of 20% (electric field) or 75% (magnetic field) of the reference level in the EU recommendation applies to residential areas.

Slovenia: A limit of 10% of the reference level in the EU recommendation applies to electric and magnetic fields from new or modified sources near homes, schools, kindergartens, hospitals, sanatoria, playgrounds, parks, recreational areas, public buildings and buildings with a tourist destination. For other locations, limits equal to the reference levels in the EU recommendation apply.

Figure 1 Overview of limits for exposure of the general population to power frequency EMF in the EU.
Group 1 (purple): legal limits derived from EU recommendation, precautionary policy in some countries;
Group 2 (pink): no legal limits or limits less strict than in EU recommendation, precautionary policy in some countries;
Group 3 (yellow): stricter limits than in EU recommendation.



Other countries

Different approaches to limiting exposure to power frequency EMF also exist in industrialised countries outside Europe. Seven examples are given below and further details on exposure limits can be found in **Table 1**.

Australia: No official government regulation or guidelines for exposure of the general population to EMF with frequencies lower than 3 kilohertz are currently in place. The Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) has stated that the ICNIRP low frequency guidelines are consistent with its interpretation of the scientific basis for the protection of the general public from exposure to low frequency EMF. The grid operators have a 'prudent avoidance' policy to take reasonable steps to limit field exposures from new facilities (overhead power lines, underground cables and substations) at no cost or very low cost while not unduly compromising other issues such as worker safety, site availability, reliability and environmental impact.

China: A national standard for protection of the general population under the Environmental Protection Law sets limits for environmental exposure to EMF, but does not apply to household appliances. The limits for power frequency magnetic fields equal the reference levels in the EU recommendation up to 800 hertz, but are lower for frequencies greater than 800 hertz. For electric fields the limits are lower than the reference levels in the EU recommendation for all frequencies. The standard also cites the precautionary principle and encourages facility and equipment owners to take effective measures to reduce public exposure.

India: There is no national regulation of the strength of power frequency EMF. Technical standards for the electricity supply sector give minimal distances to buildings, but these measures are related to electrical safety.

Japan: Ministerial regulations for technical standards of electrical equipment and railways limit power frequency magnetic fields to the reference level in the 2010 ICNIRP guidelines (200 microtesla at 50 hertz). The limit for power frequency electric fields (3000 volt per metre at 50 hertz) is lower than that in the ICNIRP guidelines and EU recommendation and meant to prevent electric shocks.

Russia: General rules for the protection are set in a 1999 framework law. Exposure limits for specific frequency ranges are set in so-called 'Hygienic-epidemiological standards'. The public exposure limit for power frequency magnetic fields is 5% of the reference level in the EU recommendation for living quarters, preschool, children's, general and medical institutions; 10% of the reference level in the EU recommendation for non-residential parts of residential buildings and in public and administrative buildings; 20% of the reference level in the EU recommendation in inhabited areas outside residential built-up areas; equal to the reference level in the EU recommendation in non-populated areas with occasional stay of people.

Switzerland: An Ordinance relating to Protection from Non-Ionising Radiation has been in force since 2000. Exposure limits identical to the reference levels in the EU recommendation apply to all areas accessible to the public. A stricter, precautionary limit on magnetic flux density of 1% of the reference level in the EU recommendation applies at so called places of sensitive use (for example apartments, schools, children's playgrounds) to the following classes of installations, unless the owner can prove that all technically possible and economically acceptable measures to reduce exposure have been taken: new high voltage power lines (overhead and cables); significant modification of existing high voltage power lines; existing and new transformers and substations. For existing high voltage power lines, the phase order has to be optimised when the precautionary limit on magnetic flux density is exceeded.

United States: No federal legislation is in force. In some states (Colorado, Connecticut, Hawaii, Maryland, Ohio), variations on the 'prudent avoidance' principle have been adopted. This means that exposure of the public to EMF of 60 hertz must be limited at reasonable cost. In other states, fixed limits for the electric or magnetic field of power lines are set, varying from 20% to 240% of the reference level in the EU recommendation (Florida, Minnesota, Montana, New Jersey, New York, Oregon).

Exposure of the general public, radiofrequency fields

European Union

Because the EU recommendation is not legally binding, EMF policy in member states can be divided into three different approaches. Details on exposure limits per member state can be found in **Table 1** and a visual overview in **Figure 2**. In the **first group** of member states the EU recommendation has been transposed in binding national legislation or national policy. This means that the basic restrictions and reference levels must be applied. Member states in this group are *Cyprus, Czech Republic, Estonia, Finland, France, Hungary, Ireland, Malta, Portugal, Romania* and *Spain.* In *Germany* and *Slovakia* the reference levels have become *de facto* exposure limits. In *France* there is an additional legal obligation to provide information on options for exposure reduction when selling or promoting a mobile phone and to provide citizens with measurement results for the strength of radiofrequency EMF in their homes or in public buildings.

In the **second group** of member states, the national limits based on the EU recommendation or ICNIRP are not binding, there are more lenient limits or there is no regulation. Member states in this group are *Austria, Denmark, Latvia, the Netherlands, Sweden* and *the United Kingdom*. In some countries, for example the Netherlands and the United Kingdom, telecommunication companies have signed up to a voluntary code to respect the limits in the EU recommendation in places accessible to the public. In the United Kingdom the national planning policy framework for local government also requires that applications for expansion of base stations certify that these limits will not be exceeded.

In the **third group** of member states, there are stricter reference levels and/or basic restrictions based on the precautionary principle and/or due to public pressure. The limits chosen are sometimes based on the principle 'as low as reasonably achievable without endangering service'. One practical choice for stricter limits can be to adopt the lower limit for interference in the European standards for electromagnetic compatibility (for example in Belgium). In other countries the reasons for particular limits are unclear or arbitrary (for example in Greece and Italy). In some member states the stricter reference levels are applied as exposure limits that may not be exceeded. Since there is a great diversity in particular rules and limits, a summary is given per member state:

Belgium: The advertising and sale of mobile phones specially designed for children younger than 7 years is prohibited. For all other phones, information must be provided on specific absorption rate and possibilities to lower exposure. Regulation of exposure limits in Belgium is a matter for the three devolved regions. In Flanders, the limit for electrical field strength per antenna for telecommunication is 7% of the reference level in the EU recommendation in places of stay like homes, schools, rest homes and nurseries. The maximum exposure in all publicly accessible places is 50% of the reference level for frequencies between 10 megahertz and 10 gigahertz. The Brussels Region limits total exposure in residences for frequencies between 100 kilohertz and 300 gigahertz to a power density of 2% of the reference level in the EU recommendation (corresponding with 15% for the electric field strength). For the same frequency range, Wallonia sets a fixed limit for the electrical field strength per antenna in residences which is 7% of the reference level at 900 megahertz.

Bulgaria: Fixed limits for electrical field strength and power density are set. Their percentage of the reference levels in the EU recommendation decreases with frequency. For power density it is 2% at 900 megahertz and less than 2% for higher frequencies.

Croatia: For public spaces in general, fixed limits for the electric and magnetic fields are applied which are 95% of the reference levels in the EU recommendation (90% for power density). For 'sensitive areas' (homes, offices, schools, playgrounds, kindergartens, maternity wards, hospitals, homes for the elderly and disabled and tourist accommodations), the limits for the electric and magnetic field are 40% of the reference levels in the EU recommendation (16% for power density).

Greece: The law on electronic communications sets basic restrictions of 70% of those in the EU recommendation and 60% when antenna stations are located closer than 300 metres from the property boundaries of schools, kindergartens, hospitals or eldercare facilities. Installation of mobile phone antenna stations is not allowed within the property boundaries of aforementioned facilities. Reference levels calculated from these two basic restrictions are 84% and 77% of the reference levels in the EU recommendation (70% and 60% for power density).

Italy: For EMF from high frequency sources other than fixed systems for telecommunication and radio or TV broadcasting, the reference levels and basic restrictions in the EU recommendation apply. For EMF from fixed systems for telecommunication and radio or TV broadcasting, there are exposure limits in terms of the strength of environmental EMF that may not be exceeded. In contrast with the limits in the EU recommendation, these are constant (not frequency dependent) between 3 megahertz and 3 gigahertz.

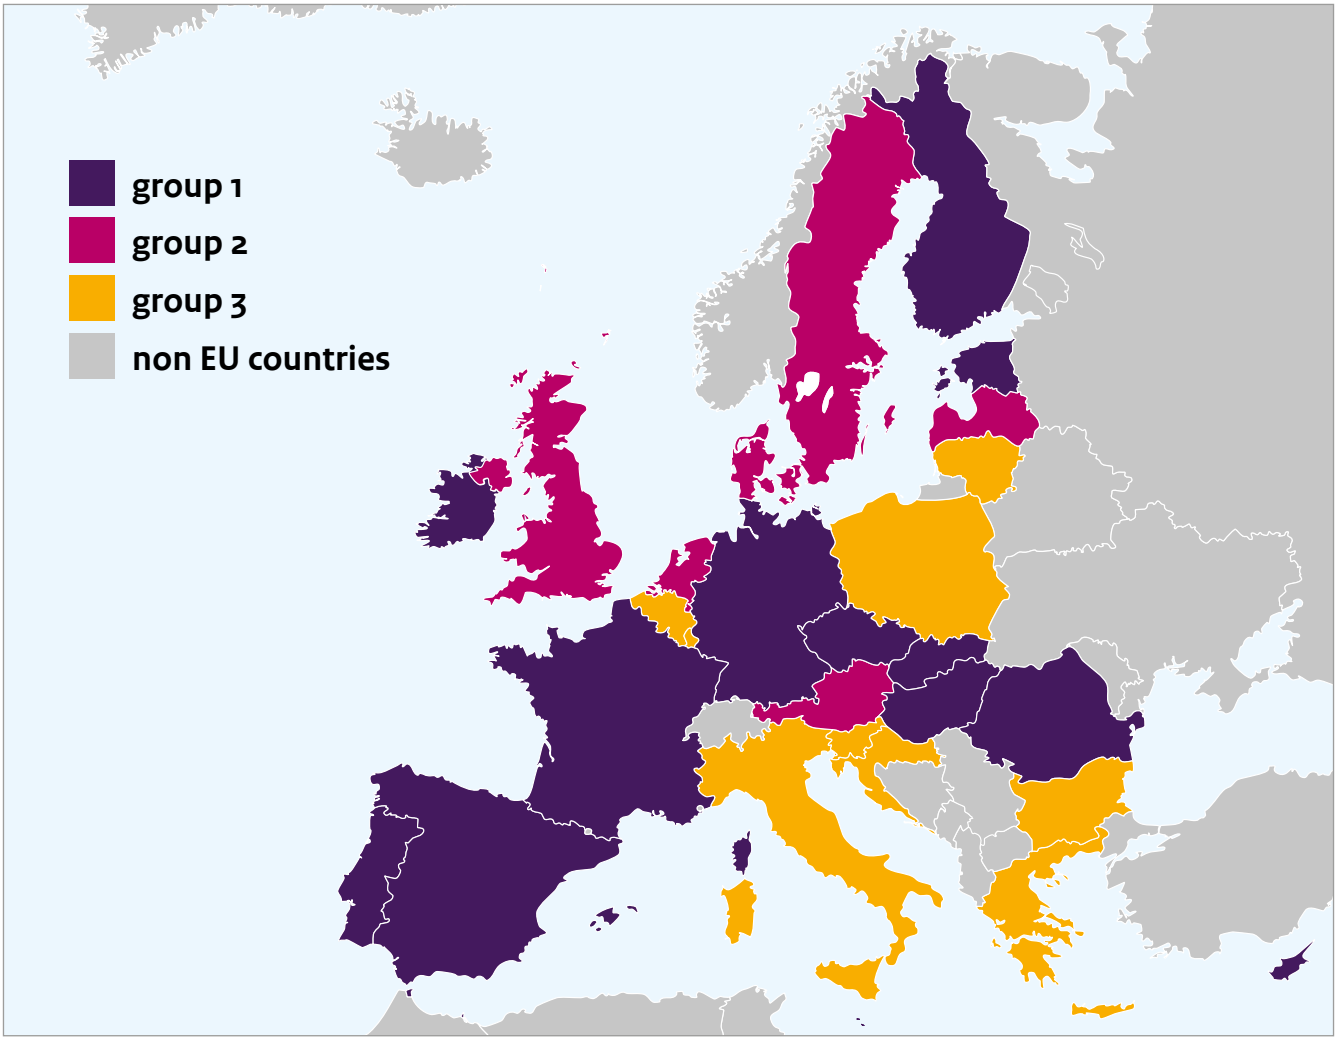
The exposure limit for electric field strength at 900 megahertz is 49% of the reference level in the EU recommendation (22% for power density). In homes, schools, playgrounds and places where people may stay for longer than four hours, the 'attention value' for electric field strength is 15% of the reference level in the EU recommendation at 900 megahertz (2% for power density). The 'quality goal' for highly frequented outdoor areas is identical to the attention value.

Lithuania: There are limits for EMF with frequencies between 10 megahertz and 300 gigahertz inside and surrounding residential and public buildings which may not be exceeded and are lower than the reference levels in the EU recommendation. The percentage varies with frequency, but for power density the limit is 10% of the EU reference level at 900 megahertz.

Luxemburg: Precautionary policy is applied to mobile telephony through a law on classified locations and technical standards. These set a fixed exposure limit for the electrical field strength per radiating element for antennas with a power of 100 watt and higher which is 7% of the reference level in the EU recommendation at 900 megahertz. The limit for other antennas and for the total number of antenna elements in one location equals the reference level in the EU recommendation.

Poland: In locations that are accessible to the public, frequency-dependent exposure limits lower than the reference levels in the EU recommendation are set for electrical field strength and power density. At 900 megahertz the limit for electrical field strength is 17% of the reference level in the EU recommendation (2% for power density).

Figure 2 Overview of limits for exposure of the general population to radiofrequency EMF in the EU. Group 1 (purple): legal limits derived from EU recommendation; Group 2 (pink): no legal limits or limits less strict than in EU recommendation; Group 3 (yellow): stricter limits than in EU recommendation.



Slovenia: For frequencies higher than 10 kilohertz, exposure limits for electric and magnetic field strength of 31% of the reference levels in the EU recommendation (10% for power density) apply in 'sensitive areas' such as homes, schools and hospitals. In all other locations the reference levels in the EU recommendation are applied as *de facto* exposure limits that may not be exceeded.

Other countries

Industrialised countries outside the EU also have different ways of limiting exposure of the public to radiofrequency EMF. Seven examples are given below and further details on exposure limits can be found in **Table 1**.

Australia: The mandatory basic restrictions and reference levels in the national radiation protection and radiocommunication standards are identical to those in the EU recommendation.

China: A national standard for protection of the general population under the Environmental Protection Law sets limits for environmental exposure to EMF, but does not apply to wireless communication terminal equipment. The limits are lower than the reference levels in the EU recommendation, but the percentage varies with frequency. At 900 megahertz the limit for electric field strength is 29% of the reference level in the EU recommendation (9% for power density). The standard also cites the precautionary principle and encourages facility and equipment owners to take effective measures to reduce public exposure. The basic restrictions for mobile phones in a separate standard are identical to those in the EU recommendation.

India: A ministerial memorandum amending the Unified Access Service License sets limits on exposure of the general public to EMF from telecommunication base stations. The limit is 33% of the reference levels in the EU recommendation for electric and magnetic field strength and 10 % for power density. Government-approved interministerial committee recommendations set a limit on the specific absorption rate for mobile handsets which is 80% of the basic restriction for local exposure of the head in the EU recommendation.

Japan: The ministerial radiofrequency radiation protection guidelines for human exposure to EMF contain a mandatory basic restriction for mobile phones which is identical to that in the EU recommendation. The guidelines also contain mandatory basic restrictions with reference levels for the strength of EMF from mobile phone base stations, which are almost identical to the reference levels in the EU recommendation.

Russia: General conditions for protection of the population are set in a 1999 framework law. Limits for specific frequency ranges are set in subsequent 'Hygienic-epidemiological requirements'. The exposure limit for power density for EMF with frequencies between 300 megahertz and 300 gigahertz in and around residential buildings and inside public and industrial premises is 2% of the reference level in the EU recommendation. The reason is to prevent biological effects that are not generally seen as a health risk in Western countries. There is no basic restriction in terms of specific absorption rate, but there is a limit on the plain wave power density of mobile phones which is 22% of the reference level in the EU recommendation.

Switzerland: An Ordinance relating to Non-Ionising Radiation is in force since 2000. Mandatory exposure limits identical to the reference levels in the EU recommendation apply in all areas accessible to the public. A stricter, precautionary limit for the electric field strength of approximately 10 % of the reference level in the EU Recommendation applies at so called places of sensitive use (for example apartments, schools, children's playgrounds) near mobile phone antennae, broadcasting and radar installations.

United States: The basic restriction for whole body exposure in federal legislation for radio transmitters is identical to that in the EU recommendation. However, the reference levels are higher because a different model is used to calculate them. At 900 megahertz the difference is 15% and 14% for the electric and magnetic field strength respectively (33% for power density). The reference levels are applied as *de facto* exposure limits for non-portable devices. For portable devices close to the body, the mandatory basic restriction for local exposure of all parts of the body except the extremities is 80% of the basic restriction for head and trunk in the EU recommendation. The basic restriction for the extremities (hands, wrists, ankles, feet, outer ears) is identical to the basic restriction for limbs in the EU recommendation.

In addition to the above legal obligations, in Australia, Austria, Belgium, Cyprus, Denmark, Finland, France, Germany, Greece, Ireland, India, Italy, Luxemburg, the Netherlands, Spain, Sweden, Russia, Switzerland, the United Kingdom and the United States the government or national scientific organisations have published advice on how to reduce exposure to radiofrequency EMF from mobile phones, such as limiting calling time, using earpieces or speakers, not holding the phone close to the body, avoiding calls in areas with poor reception and texting instead of calling.

Occupational exposure, Power frequency fields

European Union

In all member states of the EU, protection or workers against the risks of EMF is regulated by national legislation based on directive 2013/35/EU. The directive contains general rules and appendices with exposure limits. The directive distinguishes three layers of action levels for low frequency magnetic fields: low action levels related to sensory effects exposure limit values (equivalent to ICNIRP's 2010 basic restrictions for the central nervous system) and high action levels and limb action levels related to health effects exposure limit values (equivalent to ICNIRP's 2010 basic restrictions for the peripheral nervous system). When the action levels are exceeded, this is an indication that the related exposure limit values could be exceeded.

The directive sets minimum requirements, but allows member states to set stricter rules or limits, which are detailed below and in **Table 2**. The directive also gives member states the possibility to apply a conditional exemption from the exposure limits (but not from the general rules) for worker exposure related to magnetic resonance imaging (MRI) for patients in the health sector, to apply a different but equivalent or more specific protection system for military personnel and to allow the exposure limits to be temporarily exceeded under certain conditions for specific sectors or activities in duly justified circumstances. Details of whether and how individual member states have applied these possibilities for exemptions can be found in **Table 2**. Two member states have action levels and/or exposure limit values that differ from those in the EU directive:

Czech Republic: For EMF with frequencies from 1 hertz to 10 megahertz, there is only one action level, which is equivalent to the low action level in the EU directive. Nevertheless, there are still two levels of exposure limit values for the internal electric field, the higher for exposure of the head and the lower for exposure of the rest of the body.

Poland: For EMF with frequencies between 0 and 300 gigahertz, there are six sets of action levels delimiting a 'danger zone', 'threat zone' and 'intermediate zone', action levels for local exposure of extremities and ancillary action levels for peak levels for modulated fields. The two levels of exposure limit values for the internal electric field are identical to the sensory effects and health effects exposure limit values in the EU directive, but have been extended to frequencies between 0 and 1 hertz based on the 2014 ICNIRP guidelines for magnetic fields below 1 hertz.

Other countries

Australia: There are radiation protection regulations which are only applicable to Commonwealth employees and set limits on occupational exposure to EMF from 'controlled apparatus', that is, specified categories of devices that could cause EMF which exceed these limits (for example induction heaters). Its reference levels and basic restrictions are identical to those in the 2009 and 2010 ICNIRP guidelines on static and low frequency fields. They therefore have the same basis as the limits in the EU directive, but apply to a narrower range of devices. The reference levels equal the low action levels in the EU directive. For non-Commonwealth employees there is no official government regulation but the ARPANSA advice on the ICNIRP guidelines also applies to workers.

China: The national standard with occupational exposure limits for physical agents in the workplace has a limit of 5 kilovolt per metre for exposure to power frequency electric fields. There are no occupational limits for power frequency magnetic fields.

India: There are no legally binding limits on occupational exposure to power frequency EMF. Protection of workers would therefore fall under general health and safety legislation such as the Factories Act.

Japan: There are no legally binding limits on occupational exposure to power frequency EMF. The Japan Society for Occupational Health has recommended occupational exposure limits for EMF in terms of the strength of external electric and magnetic field, which are identical to the low action levels in the EU directive.

Russia: A national standard sets limits for power frequency magnetic fields, which depend on the exposure duration. For exposures shorter than 1 hour, the limit for whole body exposure is 33% of the high action level, but for 8 hours it is 2% of the high action level in the EU directive. The limit for 'limbs only' exposure is four to ten times higher than the limit for whole body exposure.

Switzerland: The federal law on accident insurance gives general rules to prevent illness caused by physical agents. The national accident insurer has specified that exposure limits identical to the occupational reference levels in the 1998 ICNIRP guidelines may not be exceeded. For power frequency, the limit is 50% of the low action level in the EU directive for the magnetic field and 100% for the electric field.

United States: There are no legal limits for occupational exposure to power frequency EMF. The American Conference of Governmental Industrial Hygienists has recommended 'threshold limit values' which are 20% of the high action level in EU directive for magnetic fields but 125% of the high action level for electric fields. These are to be used by trained industrial hygienists as a supplement to their occupational safety and health program.

NATO: The standardisation treaty for protection of military personnel of the North Atlantic Treaty Organization (NATO) refers to a standard of the Institute of Electrical and Electronics Engineers (IEEE). The level of the IEEE equivalent of exposure limit values for the induced electric field in the brain is similar to that of the sensory effects exposure limit values in the EU directive. The IEEE equivalent of exposure limit values for the rest of the body are less strict than the health effects exposure limit values in the EU directive (263% at 50 hertz for restricted working environments). The corresponding IEEE equivalent of action levels are less strict than the EU high action levels, due to different dosimetric considerations and safety factors. The IEEE limits for contact currents are also less strict than those in the EU directive.

Occupational exposure, radiofrequency fields

European Union

In all member states of the EU, protection or workers against the risks of EMF is regulated by national legislation based on directive 2013/35/EU. The directive sets minimum requirements, but allows member states to set stricter rules or limits and conditional exemptions, which are detailed below and in **Table 2**. For radiofrequency fields, the EU directive has action levels in terms of the electric field strength, magnetic flux density and power density outside the body, which are related to the health effects exposure limit values (equivalent to ICNIRP occupational basic restrictions for specific absorption rate and power density). One member state has action levels that differ from those in the EU directive:

Poland: For EMF with frequencies between 0 and 300 gigahertz, there are six sets of action levels delimiting a 'danger zone', 'threat zone' and 'intermediate zone', action levels for local exposure of extremities and ancillary action levels for peak levels for modulated fields. The exposure limit values for specific absorption rate are identical to the health effects exposure limit values in the EU directive.

Other countries

Australia: The national radiation protection regulations, which are only applicable to Commonwealth employees, set limits on occupational exposure to EMF from 'controlled apparatus', that is specified categories of devices that could cause EMF exceeding these limits (for example diathermy equipment). Its reference levels and basic restrictions are set by the national radiation protection standard and are identical to those in the 1998 ICNIRP guidelines. They therefore have the same basis as the limits in the EU directive, but apply to a narrower range of devices. In addition, a national radiocommunications standard limits the exposure of 'aware users' of mobile radiofrequency devices to basic restrictions identical to those in the EU directive.

China: The national standard with occupational exposure limits for physical agents in the workplace has limits for radiofrequency EMF with frequencies from 100 kilohertz to 300 gigahertz. For frequencies from 100 kilohertz to 300 megahertz, exposure limits are 8% to 41% of the action levels in the EU directive. For frequencies from 300 megahertz to 300 gigahertz, exposure limits do not vary with frequency but depend on the duration of exposure. At 900 megahertz the limit for whole body exposure varies from 222% of the EU action level for short exposure to 1% of the EU action level for 8-hour average exposure. Limits for partial body exposure are ten times higher than those for whole body exposure.

India: There are no legally binding limits on occupational exposure to radiofrequency EMF. Protection of workers would therefore fall under general health and safety legislation such as the Factories Act.

Japan: There are no legally binding limits on occupational exposure to radiofrequency EMF. The Japan Society for Occupational Health has recommended occupational exposure limits for EMF in terms of the strength of external electric and magnetic field and power density. These are identical to the thermal effects action levels in the EU directive.

Russia: The relevant 'Hygienic-epidemiological requirements' set a fixed limit per frequency band for maximum exposure to radiofrequency EMF with frequencies between 3 kilohertz and 300 gigahertz which is 44% of the action value for power density in the EU directive at 900 megahertz for whole body exposure and 222% for peak exposure of limbs. There are also lower time-dependent limits.

Switzerland: The federal law on accident insurance gives general rules to prevent illness caused by physical agents. The national accident insurer has specified that exposure limits identical to the action levels in the EU directive may not be exceeded.

United States: The equivalent of exposure limit values for whole body and for local exposure of the extremities (hands, wrists, ankles, feet, outer ears) in the federal legislation for transmitters are identical to those for whole body and for local exposure of limbs in the EU directive. The equivalent of exposure limit values for local exposure of all parts of the body except the extremities is 80% of that in the EU directive. The equivalent of action levels for electric and magnetic field strength are 18% higher than those in the EU directive (33% for power density), because a different model is used to calculate them. The equivalent of exposure limit values in the United States must be used for portable devices close to the body. The action levels are applied as *de facto* exposure limits for non-portable devices.

NATO: The standardisation treaty for protection of military personnel of the North Atlantic Treaty Organization (NATO) refers to a standard of the Institute of Electrical and Electronics Engineers (IEEE) with the same level of the equivalent of exposure limit values and action levels as those in the federal legislation of the United States, with the exception of the IEEE equivalent of exposure limit values for local exposure of the head which is identical to that in the EU directive. The limits for contact currents are higher than those in the EU directive.

Table 1 Reference levels or exposure limits for the general public for electromagnetic fields in inhabited areas in member states of the European Union and selected industrial nations outside the European Union (situation July 2017)

Legend to Table 1: All limits are given as root mean square (rms) value. Where necessary magnetic flux density was calculated from magnetic field strength using a magnetic permeability of $4\pi \times 10^{-7}$ H/m. Normal typeface: reference level for the external field in the meaning of Recommendation 1999/519/EC, derived from basic restriction. Application is mandatory unless value is in square brackets. Italic typeface: mandatory exposure limit in terms of the external field outside the body. Radiofrequency limits are standardised to approximate mobile telecommunication frequency bands in Europe, but actual network frequencies may vary.

Notes:

1) *For new power lines requiring environmental impact assessment, authorities usually require compliance with Swiss limit of 1 µT*
2) *Flanders: indoor environment limit 10 µT, quality aim 0.2 µT, government recommendation for new situations near power line 0.4 µT; Brussels: 0.4 µT near new transformers and 100 µT near existing transformers; Wallonia: 5000 V/m and 100 µT near transformers*
3) *Limit in table is for publicly accessible places in Flanders, limit per antenna in places of stay 3.0 V/m at 900 MHz, 4.2 V/m at 1800 MHz, 4.5 V/m at 2100 MHz; Wallonia: limit per antenna 3 V/m; Brussels: limit per location 0.096 W/m² at 900 MHz, 0.19 W/m² at 1800 MHz, 0.22 W/m² at 2100 MHz*
4) *Minimal distances to power lines and to electrical distribution systems, differentiated by voltage; separate regulation for video display units*
5) *In homes, offices, schools, kindergartens, playgrounds, hospitals, care homes, tourist facilities; for other public spaces reference levels in 1999/519/EC apply*
6) *Danish Health Authority recommends that new homes and new institutions where children stay should not be built close to existing power lines and new power lines should not be built close to existing homes and institutions where children stay*
7) *Radiation safety authority recommends avoiding construction of permanent residences and premises meant for children in areas where magnetic flux density exceeds 0.4 µT*
8) *For new or modified installations; there is also government advice to local authorities not to create new establishments with children in zones with magnetic flux density above 1 µT*
9) *For new or modified installations exhaust all possibilities to minimise EMF; new power lines ≥ 220 kV may not span buildings for long-term stay of people*
10) *For antenna stations closer than 300 m to sensitive locations (schools, kindergartens, hospitals, care homes); elsewhere 35 V/m, 0.11 µT, 3.1 W/m² at 900 MHz; 49 V/m, 0.16 µT, 6.3 W/m² at 1800 MHz; 51 V/m, 0.17 µT, 7 W/m² at 2100 MHz*
11) *For new energy infrastructure, State Companies and energy developers must comply with ICNIRP limits and associated EU Recommendations as an intrinsic part of the planning process*
12) *For new situations with power lines near homes, schools, playgrounds, places with stay > 4 hours; 10 µT for existing situations near homes, schools, playgrounds, places with stay > 4 hours; 100 µT and 5000 kV/m for all other exposures from power lines*
13) *EMF from fixed systems for telecommunication and radio or TV broadcasting near homes and their outdoor annexes, in schools and playgrounds, in places with stay greater than 4 hours; elsewhere 20 V/m, 0.06 µT, 1 W/m²*
14) *Inside residential and public buildings; limits for living environment outside residential and public buildings 1000 V/m, 40 µT*
15) *Security conditions for electricity lines, there are also voluntary minimal distances to power lines for new developments*
16) *Limit per antenna at places where people can stay 3.0 V/m, applies to antennas with power of 100 W and higher*
17) *Ministerial recommendation: create no new situations of long-term stay of children in magnetic flux density greater than 0.4 µT around overhead power lines, otherwise reference level in 1999/519/EC applies*
18) *Applies to homes, hospitals, health resorts, public buildings, tourism buildings, schools, nurseries, playgrounds, parks, recreational areas; otherwise limit for external electric and magnetic field strength equal to reference level in 1999/519/EC; for power frequency limits apply to new or reconstructed sources only*
19) *No binding national limits for 50 Hz fields, but in practice electricity companies and the authorities apply the limits in 1999/519/EC*
20) *Limit listed is for 50 Hz fields, power frequency is 50 Hz in East Japan and 60 Hz in West Japan*
21) *Limit for living quarters, children's, preschool, general and medical institutions; non-residential premises 10 µT, inhabited areas outdoors 20 µT, uninhabited areas 100 µT*
22) *Limit at places of sensitive use (buildings in which persons regularly stay for longer periods, playgrounds) for all high voltage installations except existing powerlines; otherwise reference level in 1999/519/EC applies at all places accessible for the public*
23) *Limit at places of sensitive use (buildings in which persons regularly stay for longer periods, playgrounds) for individual antenna installations; otherwise reference level in 1999/519/EC applies at all places accessible for the public*
24) *Power frequency is 60 Hz; no federal regulation, limits in some states, prudent avoidance policy in others (measures to reduce exposure at reasonable cost)*

Legend to Table 2: All limits are given as root mean square (rms) value. Where necessary magnetic flux density was calculated from magnetic field strength using a magnetic permeability of $4\pi \times 10^{7}$ H/m. Normal typeface: action level (AL)/reference level for the external field in the meaning of Directive 2013/35/EU or ICNIRP guidelines, derived from exposure limit value (ELV)/basic restriction. Application is mandatory unless value is in square brackets. Italic typeface: mandatory exposure limit in terms of the external field outside the body.

Notes:

1) *Limits in EU recommendation 1999/519/EC apply to pregnant workers; AL may not be exceeded for workers younger than 18 years; sensory effects ELV may only be exceeded for resistance welding and electricity supply sector*
2) *Sensory and health effects ELV may be temporarily exceeded for workers in delimited areas in establishments for generation, transport and distribution of electrical energy*
3) *Limits in EU recommendation 1999/519/EC apply to pregnant workers; sensory effects ELV may not be exceeded for workers younger than 18 years*
4) *Exemption with additional obligations to those in Directive 2013/35/EU*
5) *For any temporary exemption from ELV for a specific sector or activity, the National Occupational Health & Safety Council shall give its expert opinion beforehand*
6) *Regional radiation safety officer may allow exposure of workers to exceed health effects ELV in specific circumstances where state-of-the-art technical and organisational protection measures have been implemented; annexes to national legislation contain list of equipment requiring risk assessment approval, including MRI*
7) *Ministers of Labour and Social Policy and of Health may grant a conditional and temporary derogation at the request of the employer, with additional requirements for MRI*
8) *Scope extended: military personnel or national security, public security and customs officials as determined by Lithuanian intelligence regulations*
9) *Employer is obliged to check the appropriateness of the measures taken with an approved expert acting within the competences and authority of the labour inspectorate*
10) *Values listed are for basic 'threat' AL, there are also higher 'danger' AL, lower 'intermediate' AL for indirect effects and ancillary AL for modulated fields*
11) *Employer shall ensure that the exposure of workers to electromagnetic fields is reduced to the lowest possible level, but in any case it should not exceed ELV*
12) *Sensory and health effects ELV may be temporarily exceeded for workers in police, other units and services for protection, rescue and relief in specific circumstances*
13) *Temporary conditional exemption from ELV for electrolysis, dielectric heating, induction heating, manual resistance welding, MRI equipment other than that for patients*
14) *Limit for short exposures, for longer exposures limits decrease down to 0.5 W/m^2 (continuous wave) or 0.25 W/m^2 (pulsed) for 8 hours with whole body exposure*
15) *No legal limits for workers, Japan Society for Occupational Health has recommended occupational exposure limits in terms of the strength of external electric and magnetic field and power density identical to the low action levels and thermal effects action levels in the EU directive*
16) *Limit for exposures shorter than 1 hour, for longer exposures limits decrease down to 100 µT for 8 hours; for radiofrequency fields there are also limits on exposure x time*
17) *For pregnant workers, exposure limits identical to the reference levels in EU recommendation 1999/519/EC apply*
18) *No legal limits for workers, American Conference of Governmental Industrial Hygienists has recommended 'threshold limit values' of 25000 V/m and 1000 µT at 60 Hz as guidelines to assist in the control of potential workplace health hazards*

MILJØMINISTERIET

Miljøstyrelsen

Metoder til fastsættelse af kvalitetskriterier for kemiske stoffer i jord, luft og drikkevand med henblik på at beskytte sundheden

Vejledning fra Miljøstyrelsen **Nr. 5** 2006

Indhold

Forord

Principperne for vurdering og fastsættelse af kvalitetskriterier for kemikalier med henblik på at beskytte sundheden er beskrevet tidligere[1]. Men i forbindelse med Miljøministerens redegørelse om jordforureningsloven i 2003, besluttede regeringen at nedsætte en arbejdsgruppe, som fik til opgave at "*vurdere, hvorvidt de sundhedsmæssige kvalitetskriterier ligger på det rigtige niveau i relation til international praksis, samt give forslag til ændringer*.

Arbejdsgruppen udpegede en række politiske valg, der indgår i principperne for fastsættelse af kvalitetskriterier. På den baggrund blev der i december 2005 indgået en aftale mellem Miljøministeren og et bredt udsnit af Folketingets partier, som bl.a. fastlægger følgende generelle principper for fastsættelsen af forebyggende kriterier :

- Hovedparten af befolkningen skal fortsat beskyttes (dvs. hensyntagen til særligt udsatte skal også inddrages).
- Der skal tages specifikt hensyn til børn.
- Det fastholdes, at der højst anvendes en samlet usikkerhedsfaktor på 10.000, når resultater fra dyreforsøg overføres til mennesker.
- Der accepteres fortsat en livstidsrisiko på 10^{-6}.

Denne vejledning indarbejder disse principper og gennemgår de metoder, som skal anvendes ved fastsættelse kvalitetskriterier for jord, luft og drikkevand med henblik på at beskytte sundheden[2].

---

[1] Miljøstyrelsens Vejledning nr. 1 "Sundhedsmæssig vurdering af kemiske stoffer i drikkevand ", 1992, og i bilag til Miljøstyrelsens Vejledning nr. 6, 1990 "Begrænsning af luftforurening fra virksomheder" samt i Miljøprojekt nr. 12, 1995 "Toksikologiske kvalitetskriterier for jord og drikkevand".

[2] Principper for fastsættelse af kvalitetskriterier med henblik på at beskytte miljøet er tilsvarende beskrevet i Miljøstyrelsens vejled-

Vejledningen henvender sig til centrale og lokale myndigheder, herunder embedslægeinstitutionerne, konsulenter, rådgivere og virksomheder.

Miljøstyrelsen fastsætter løbende kvalitetskriterier for konkrete kemiske stoffer i jord, luft og drikkevand med henblik på at beskytte sundheden, jf. Miljøbeskyttelsesloven § 14, stk. 1,. Kvalitetskriterierne bliver fastsat på baggrund af videnskabelige rapporter og efter drøftelse i en styregruppe med deltagelse af bl.a. Fødevarestyrelsen, Arbejdstilsynet og Sundhedsstyrelsen.

Denne vejledning og detaljeringsgraden, ikke mindst i den tilhørende faglige rapport[3], skal give grundlag for større forståelse for, hvordan kvalitetskriterier skal udarbejdes.

Kvalitetskriterierne anvendes dels til at vurdere alvoren af en allerede given forurening, og dels når myndighederne stiller krav i forbindelse med udledning af konkrete stoffer til omgivelserne.

---

ning nr. 4 (2004): Principper for fastsættelse af vandkvalitetskriterier for stoffer i overfladevand.

[3] Miljøprojekt Nr. 974, Miljøstyrelsen (2005). Principper for sundhedsmæssig vurdering af kemiske stoffer med henblik på fastsættelse af kvalitetskriterier for luft, jord og vand. Rapporten er udarbejdet af Institut for Fødevaresikkerhed og Ernæring, Fødevaredirektoratet (nu Danmarks Fødevareforskning) i samarbejde med Miljøstyrelsen.

1 Indledning

1.1 Hvad er kvalitetskriterier

1.1.1 Formål med fastsættelse af kvalitetskriterier for kemikalier

Denne vejledning beskriver den administrative praksis ved fastsættelse af kvalitetskriterier for kemikalier med henblik på at beskytte sundheden.

Kvalitetskriterier danner basis for en række vurderinger af administrativ karakter, som vedrører både jord, luft og drikkevand.

Målsætningen ved fastsættelsen af kvalitetskriterier for kemikalier er, at de skal medvirke til *at forebygge forurening og skader på sundheden*. Kvalitetskriterierne ses som et element i lovens overordnede politiske målsætning om at oppebære et højt beskyttelsesniveau for befolkningens sundhed og sikre en bæredygtig udvikling, herunder fremme af renere teknologi.

Kvalitetskriterierne angiver et højt beskyttelsesniveau, hvor ingen effekt kan forventes, selv ved udsættelse gennem et helt liv, eller hvis der er tale om et stof uden tærskelværdi, en teoretisk forøget risiko for kræft hos én ud af en million mennesker, som er udsat for stoffer gennem et helt liv på 70 år.

Kvalitetskriterierne bruges af myndighederne i forbindelse med vurdering af alvoren af et givet forureningsniveau. Det kan være relevant, hvis der er tale om en eksisterende forurening (fortidens synder), eller hvis der skal fastsættes kravværdier for udledning af konkrete stoffer i miljøet (forebyggende). For begge situationer kan andre forhold end de sundhedsmæssige spille ind, såsom baggrundsniveauer og tekniske/økonomiske overvejelser. Ved indsatsen i forhold til eksisterende forureninger kan der også være behov for at

vurdere, hvad der er sundhedsmæssigt forsvarligt, når der tages hensyn til overordnede samfundsmæssige prioriteringer. Med udgangspunkt i de sundhedsmæssigt fastsatte kvalitetskriterier udarbejdes således en række administrativt fastsatte kriterier.

Eksempler på administrative kriterier som er baseret på kvalitetskriterier er:

1. Luftkvalitetskriteriet anvendes som udgangspunkt til at fastsætte bidrags værdier (B-værdier), der anvendes i forbindelse med regulering af virksomheders udslip af kemiske stoffer til udeluften.
2. Luftkvalitetskriteriet anvendes til at vurdere afdampning af kemiske stoffer fra jordforureninger. Det anvendes også ved kortlægning og offentlig oprydning af forurenede grunde.
3. Jordkvalitetskriterier anvendes som udgangspunkt ved fastsættelse af administrative kriterier, der anvendes ved de lokale myndigheders kortlægning af forurenede grunde og i forbindelse med vurderinger af arealanvendelse, samt ved offentlig oprydning af forurenede grunde[4].
4. Jordkvalitetskriteriet anvendes endvidere som udgangspunktet for fastsættelse af afskæringskriteriet for visse immobile stoffer. Afskæringskriteriet anvendes ved lettere forurenede områder som skillelinie mellem det niveau, hvor det er nødvendigt at fjerne jorden og det niveau, hvor det er tilstrækkeligt at iværksætte særlige forholdsregler i forbindelse med følsom anvendelse af områderne, som fx private haver eller børneinstitutioner.
5. Drikkevandskvalitetskriteriet anvendes af de centrale og decentrale myndigheder i forbindelse med håndtering af konkrete sager med kemisk forurening af drikkevand, som et supplement til de kravværdier, der er fastsat i bekendtgørelsen om vandkvalitet.
6. Drikkevandskvalitetskriterierne anvendes som udgangspunkt ved fastsættelse af grundvandskvalitetskriterier i tilknytning til nedsivning fra jordforureninger,

[4] Kvalitetskriterierne omfatter normalt ikke en vurdering af om arealer kan anvendes til dyrkning af nytteplanter eller til afgræsning for husdyr.

idet grundvandet skal være af en kvalitet, så de fastsatte drikkevandskrav/ -kvalitetskriterier kan overholdes.

Der eksisterer en række vejledninger og lister, som nærmere beskriver baggrunden for, hvordan et kvalitetskriterium kan anvendes.[5]

1.1.2 Generelle principper for fastsættelse af kvalitetskriterier for kemikalier

Kvalitetskriterierne fastsættes på et niveau, hvor udsættelse gennem et helt liv ikke fører til skadevirkninger i befolkningen. De fastsættes på baggrund af den eksisterende viden og under hensyntagen til de mangler, der ligger i datagrundlaget.

For at minimere risici for skadelig påvirkning af befolkningen indgår beskyttelse af særligt følsomme grupper fx børn, gravide, syge, ældre og svækkede ved fastsættelse af kvalitetskriterier.

Viden om et kemisk stofs sundhedsskadelige egenskaber og om bestemte befolkningsgruppers særlige følsomhed er sjældent så eksakt, at der kan fastsættes et kvalitetskriterium, der præcist definerer skillelinien (hvis en sådan overhovedet findes) mellem et ufarligt og farligt niveau. Kvalitetskriterierne kan således ikke opfattes som en streg i sandet, hvor enhver overskridelse er farlig. Ved fastsættelse af kvalitetskriterier for kemikalier skal anvendes en forsigtighedstilgang, da målet er at sikre et højt beskyttelsesniveau for alle ved udsættelse over et helt liv.

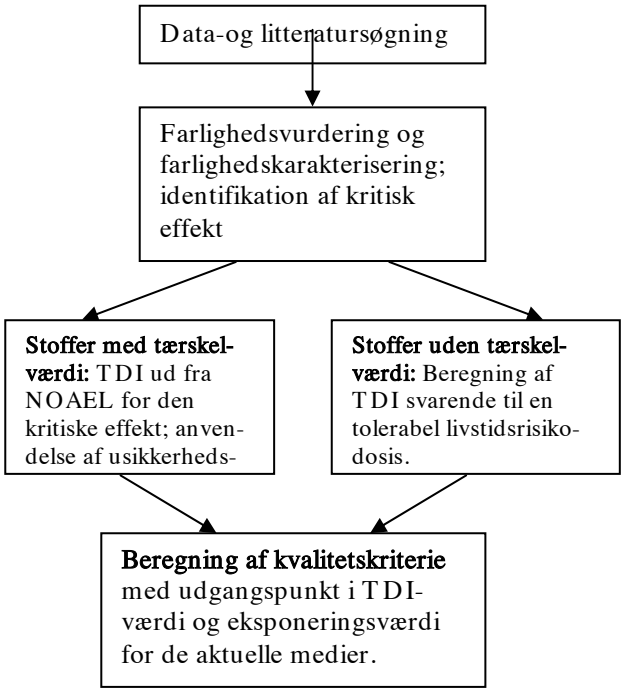
Et kvalitetskriterium skal således opfattes som en sikkerhedsgrænse og ikke en faregrænse. En overskridelse er "det gule lys", som advarer om, at her er noget, som måske kan blive et reelt problem.

---

[5] Luftvejledningen, Miljøstyrelsens Vejledning nr. 2, 2001; Oprydning på forurenede lokaliteter

1.2 Vejledningens opbygning og indhold

Vejledningen udstikker retningslinier for den faglige risikovurdering og for de metoder/ principper der anvendes. Dernæst beskrives proceduren for beregning af kvalitetskriterierne (se figur 1).



Figur 1.
Fremgangsmåden ved beregning af kvalitetskriterium (TDI=Tolerabel Dagligt Indtag)

Det videnskabelige grundlag for fastsættelse af sundhedsmæssigt baserede kvalitetskriterier for kemiske stoffer i jord, luft og drikkevand består af en farlighedsvurdering, en dosis-respons (effekt) vurdering (farlighedskarakterisering), samt en eksponeringsvurdering. Farlighedsvurderingen og farlighedskarakteriseringen tager udgangspunkt i undersøgelser af det pågældende stofs toksikologiske effekter i mennesker og i dyr.

I kapitel 2 omtales *Datagrundlaget* som anvendes som udgangspunkt for arbejdet. Data hentes primært fra internationale og nationale dokumenter, via litteratursøgning i internationale databaser, samt fra originalartikler.

Kapitel 3 behandler de faglige metoder, der anvendes i forbindelse med farlighedsvurderingen og farlighedskarakteriseringen. Dosis-effekt og dosis-responssammenhænge og udpegning af NOAEL (No Observed Adverse Effect Level) og LOAEL (Lowest Observed Adverse Effect Level) beskrives.

I kapitel 4 beskrives hvordan farlighedskarakteriseringen udmunder i udpegning af en kritisk effekt, som danner udgangspunkt for fastsættelse af en *tolerabel daglig indtagelse, TDI*. Her omtales, hvordan anvendelsen af usikkerhedsfaktorer indgår i beregningerne.

I kapitel 5 omtales, hvordan TDI beregnes for kræftfremkaldende stoffer uden tærskelværdi. Risikoniveauet for TDI-værdien defineres, og der gives retningslinier med hensyn til valg af metode til, hvordan beregningen af dette risikoniveau foretages.

Kapitel 6 beskriver, hvordan den videre beregning af kvalitetskriterier for kemiske stoffer i jord, luft og drikkevand foretages ud fra de fastsatte TDI-værdier. I bilag 2 til vejledningen omtales rationalet for at anvende konkrete standardbetragtninger m.h.t. personers udsættelse for forureninger gennem jord, luft og drikkevand. Endvidere omtales hvilke andre faktorer (fx hensyntagen til lugt eller smag) end de rent sundhedsmæssige, der i visse tilfælde kan have indflydelse på kvalitetskriteriet.

1.3 Ændringer i forhold til tidligere praksis

Ved fastsættelsen af kvalitetskriterier anvendes der internationalt anerkendte principper. I denne forbindelse skal fremhæves de principper og metoder, der er beskrevet i to publikationer af WHO/ IPCS[6,7] om udarbejdelsen af vejledende grænseværdier og risikovurdering af kemisk udsættelse. WHO´s publikationer[8,9] omhandlende risikovurdering og fastsættelse af vejledende grænseværdier for en række kemiske stoffer i drikkevand og luft har også indgået i arbejdet. På tilsvarende vis er der en tæt sammenhæng med de principper og metoder, der anvendes i forbindelse med EU´s risikovurderingsprogram for kemiske stoffer[10].

På visse områder indebærer denne vejledning, at den hidtidige praksis for fastsættelse af kvalitetskriterier justeres. Dette gælder fx for beregning af kvalitetskriterier for kemikalier i luft og drikkevand, idet der nu som udgangspunkt anvendes standardværdier for børns udsættelse (se kapitel 6 og bilag 2).

I forbindelse med ekstrapolering af tolerabelt risikoniveau for genotoksiske kræftfremkaldende stoffer (dvs. kræftfremkaldende stoffer hvor der ikke anses at være en tærskelværdi for effekt), anvendes lineær ekstrapolation ud fra den så-

Technical Guidance Document in support of Commission Directive 93/67/EEC on risk assessment for new notified substances and Commission Regulation (EC) No. 1488/94 on risk assessment for existing substances and Directive 98/8/EC of the European Parliament and of the Council concerning the placing of biocidal products on the market.

kaldte T25- metode udviklet i forbindelse med EU´s risikovurderingsprogram (kapitel 5).

Hvis datagrundlaget er til stede, anbefales det at anvende benchmark-metoden ved fastsættelse af TDI (kapitel 3).

Det skal bemærkes, at denne vejledning anvender begrebet usikkerhedsfaktorer, hvor man tidligere anvendte begrebet sikkerhedsfaktorer. Dels beskriver ordet *usikkerhed* i højere grad faktorernes anvendelse, idet de netop tager højde for usikkerheder. Dels imødegås den misforståelse, at en stor sikkerhedsfaktor for et stof medfører større sikkerhed for dette stof i forhold til en lille anvendt sikkerhedsfaktor for et andet stof. Faktorerne anvendes derimod for at opnå et ensartet beskyttelsesniveau, og størrelsen af faktorerne afspejler usikkerheder som følge af usikker viden og manglende datagrundlag.

De angivne metoder i vejledningen anvendes fremover ved fastsættelse af kvalitetskriterier.

De ændringer der er sket i forhold til tidligere praksis betyder ikke, at de eksisterende kvalitetskriterier skal "laves om", idet anvendelse af de nye metoder ikke vurderes at påvirke beskyttesesniveauet væsentligt. Når et kvalitetskriterium tages op til revurdering bør dette ske både m.h.t. til revurdering af de sundhedsmæssige data og af de eksponeringsmæssige forhold. En revurdering foretages derfor fuldt ud med alle de vurderingsmæssige og beregningsmæssige faser, der er beskrevet i vejledningen.

2 Datagrundlag for vurdering af farlighed

Fastsættelse af kvalitetskriterier for et kemisk stof sker på baggrund af eksisterende viden om stoffets sundhedsskadelige egenskaber.

Kvalitetskriterierne fastsættes med henblik på beskyttelse af menneskers sundhed, og det ideelle datagrundlag for fastsættelse af et kvalitetskriterium er derfor viden, hvor mennesker har været udsat for det konkrete stof. For langt de fleste kemiske stoffer er der kun begrænset viden om veldefineret udsættelse og effekter hos mennesker, og kvalitetetskriterierne vil som oftest være baseret på viden opnået fra dyreforsøg med mere veldefineret udsættelse eller *in vitro* data[11].

For en mere detaljeret beskrivelse af nedenstående afsnit henvises til kapitel 2, Miljøprojekt Nr. 974 (2005).

2.1 Data fra mennesker

Fordelen ved at anvende data, hvor mennesker har været udsat for et kemisk stof, er, at man undgår at skulle overføre data fra dyreforsøg, og estimere hvad en tilsvarende udsættelse betyder hos mennesker. Erfaringer med menneskers udsættelse kan stamme fra en række forskellige typer undersøgelser og afrapporteringer, der groft kan deles op på følgende måde:

- *case reports og kliniske undersøgelser*
- *befolkningsundersøgelser (fx arbejdsmiljø eller udvalgte dele af befolkningen)*
- *undersøgelser af frivillige forsøgspersoner*

[11] Data fra reagensglasforsøg.

Ved *case reports og kliniske undersøgelser* opnås data fra forgiftningstilfælde eller erfaringer fra undersøgelser i klinikken, hvor personer fx i behandlingsøjemed udsættes for stoffer for at vurdere eventuelle allergiske reaktioner. Fordelen ved disse typer data er, at man her umiddelbart kan se en sammenhæng mellem udsættelse og (akutte) effekter.

I *befolkningsundersøgelser* vurderes en større gruppe af mennesker mere systematisk med hensyn til sammenhængen mellem udsættelse og sundhedsskader. Disse undersøgelser kan fx omfatte sundhedsovervågning af særlige grupper i arbejdsmiljøet, hvor personerne er karakteriseret ved en særlig udsættelse, eller man kan undersøge, om der hos personer, der har udviklet nogle konkrete sygdomme, er nogle fælles karakteristika med hensyn til kemiske påvirkninger. Fordelen ved at anvende data fra denne type undersøgelser er, at man er meget tæt på den målgruppe, man ønsker at beskytte med kvalitetskriterierne. Samtidig ses effekterne i sammenhæng med den dagligdag, som mennesker nu engang fungerer i, hvor man udsættes for en kompleks blanding af livsstilsfaktorer og miljøfaktorer. Ulempen er, at det ofte er vanskeligt at vurdere omfanget af udsættelsen af en given komponent, og at det pga. mange andre samvirkende faktorer kan være svært at påvise sammenhænge, som kan være sløret af al "støjen" fra andre faktorer. Ligesom undersøgelserne kun sjældent kan dokumentere en årsagsvirkningssammenhæng, vil de også kun uhyre sjældent kunne anvendes til at dokumentere manglende sammenhæng, dvs. frikende stoffer.

I *undersøgelser med frivillige forsøgspersoner* udsætter man i reglen forsøgspersonerne i en kortere varighed for et konkret stof for at vurdere effekterne. Disse undersøgelser er meget sammenlignelige med dyreforsøg, hvor man tilsvarende har en meget veldefineret udsættelse. De naturlige og etiske begrænsninger ved disse undersøgelser betyder, at der hos mennesker kun kan undersøges for lettere grader af akutte effekter og i sammenhæng med kortere tids forsøgsudsættelse. Endvidere er forsøgspersonerne sjældent særligt følsomme, som visse undergrupper i befolkningen kan være.

Man skal være meget opmærksom på det etiske aspekt m.h.t. anvendelse af frivillige forsøgspersoner. I forbindelse

med vurdering af konkrete humane undersøgelser i risikovurderingssammenhæng, bør anvendelsen af disse data vurderes nøje såvel ud fra etiske som kvalitetsmæssige hensyn. Især ældre undersøgelser kan være udført under stærkt kritisable forhold og med store undersøgelsesmæssige mangler.

Kvalitetskriterier for kemikalier fastsættes ud fra eksisterende data, og det frarådes generelt at igangsætte humanforsøg for at opnå øget viden om konkrete stoffers skadelige effekter.

2.2 Dyreeksperimentelle undersøgelser

For de fleste kemiske stoffer foreligger der ikke data fra menneskers udsættelse, hvorfor kvalitetskriterier hyppigst baseres på data fra dyreeksperimentelle undersøgelser. Resultaterne fra dyreforsøgene anvendes således som model og anvendes til at forudsige hvilke effekter, der kan forventes hos mennesker. Dyreeksperimentelle data kan også benyttes som supplement til humane data, der ikke er entydige, eller til at udpege de aktive stoffer, når mennesker har været udsat og reageret over for blandinger af stoffer.

Fordelene ved dyreforsøg er, at der er tale om standardiserede forsøgsbetingelser, og at der er mulighed for at afsløre væsentlig flere effekter hos forsøgsdyr end hos mennesker, da organer og væv kan undersøges efter forsøgets afslutning. Der er også mulighed for at undersøge virkningsmekanismer og detaljerede dosis-effekt og dosis-responssammenhænge for enkeltstoffer.

Ideelt set ønskes der ved fastsættelsen af kvalitetskriterier for et kemikalie et fuldt datasæt bestående af dyreeksperimentelle undersøgelser til vurdering af en række toksikologiske egenskaber: Toksikokinetik (optagelse og udskillelse), akut toksicitet, irritation, sensibilisering (allergi), toksicitet ved gentagen administration af stoffet, mutagenicitet og genotoksicitet (påvirkning af arvematerialet), kræftfremkaldende effekter, samt effekter på reproduktion og fosterudvikling.

Dyreforsøg har imidlertid også begrænsninger, da nogle effekter kan være vanskelige at afsløre fx lettere grader af slimhindeirritation i øjne og luftveje, lettere grader af påvirkning af centralnervesystemet og visse typer nerveskader.

Endelig kan nogle dyrearter udvikle artspecifikke effekter over for visse stoffer, hvor relevansen i forhold til udsættelse af mennesker er meget omdiskuteret (se afsnit 3).

Det er endvidere vigtigt at vurdere kvaliteten af de dyreeksperimentelle undersøgelser, der anvendes som udgangspunkt for fastsættelse af kvalitetskriterier. Undersøgelser af høj kvalitet, som er udført efter eller på niveau med OECD´s eller EU´s retningslinier for forsøgsdyrstestning, bør foretrækkes. Ved risikovurderingen i forbindelse med fastsættelse af kvalitetskriterier er der dog ikke nogle formelle kvalitetskrav til undersøgelserne, idet en lang række undersøgelser i den videnskabelige litteratur ofte vil være udført i forskningsøjemed uden at undersøgelserne er udført efter en officiel forsøgsguideline eller i overensstemmelse med GLP-reglerne.[12] Sådanne undersøgelser, der ofte er kvalitetssikret i peer-reviewede tidsskrifter, kan indeholde væsentlig information. Forsøgets kvalitet og validitet må i de aktuelle tilfælde vurderes, og der tages stilling til om forsøget kan være af betydning ved fastsættelse af et kvalitetskriterium.

På baggrund af de etiske aspekter ved dyreforsøg arbejdes der internationalt med at udvikle alternative *in vitro* metoder.

2.3 Andre typer data

Ud over forsøg på levende dyr foreligger der ofte undersøgelser der er udført på udtagne organer, væv eller isolerede celler. Disse *in vitro* metoder finder især anvendelse til vurdering af stoffers toksiske effekt på organ-/celleniveau særligt m.h.t. mutagene og genotoksiske effekter.

[12] GLP står for Good Laboratory Practice, og er et regelsæt udviklet af OECD for at sikre kvaliteteten af undersøgelserne.

Normalt kan *in vitro* forsøg ikke anvendes til at fastlægge tærskel for effekt (NOAEL e.l.), men de vil indgå i bedømmelsen af stoffets farlighed. In vitro-data kan således styrke mistanken om skadeeffekter og derved påvirke valget af usikkerhedsfaktorer (se afsnit 4).

Ved mangel på data for et konkret stof kan data fra nært beslægtede stoffer indgå i vurderingen ud fra betragtninger om kemisk strukturlighed og sammenfaldende effekter. Sådanne data kan have indflydelse på den rent kvalitative, men også i visse tilfælde i den kvantitative vurdering, hvis det konkret vurderes, at der er grundlag for meget snævert koblede analogislutninger.

Endvidere kan der udføres en mere systematisk analyse vedrørende kvantitative struktur-aktivitets relationer (engelsk: Quantitative Structure Activity Relationships – QSARs). Anvendelse af denne form for computerbaserede modeller har i en række tilfælde vist sig som et alternativ til dyreforsøg med henblik på forudsigelse af toksikologiske egenskaber (MST 2001[13]). Vurderingerne kan sjældent anvendes som udgangspunkt for beregning af kvalitetskriteriet, men vil i visse tilfælde kunne anvendes til styrkelse af mistanken om konkrete effekter. QSAR vil således kunne påvirke valget af usikkerhedsfaktorer ved beregning af kvalitetskriteriet.

2.4 Indhentning af data

Som udgangspunkt for udarbejdelse af kvalitetskriterier anvendes i udstrakt grad internationalt anerkendte stofmonografier og dokumenter, hvor det aktuelle stof er vurderet og beskrevet m.h.t. dets sundhedsskadelige effekter. En række af disse værker (kilder) er nævnt i afsnit 2.5.1 i Miljøprojekt Nr. 974 (2005) . Sådanne dokumenter, der ofte er baseret på en grundig faglig vurdering ved en særlig nedsat ekspertgruppe, vil typisk kunne anvendes til at udpege de relevante undersøgelser og data, der skal anvendes til den videre beregning af kvalitetetskriteriet. Det anbefales gene-

[13] Miljøstyrelsen (2001). Report on the advisory list for selfclassification of dangerous substances. Environmental Project No. 636 2001. http://www.mst.dk/udgiv/publications/2001/87-7944-694-9/html/

relt, at data, der skal danne udgangspunkt for beregning af kvalitetskriteriet, altid hjemskaffes som originallitteratur til vurdering af den konkrete undersøgelses kvalitet og relevans.

Endvidere søges i en række relevante databaser (se afsnit 2.5.2 i den faglige rapport). Sådanne søgninger er især relevante, hvis en international stofmonografi for det konkrete stof ikke foreligger, eller hvis vurderingen ligger nogle år tilbage.
For visse stoffer kan man komme ud for at datasøgning giver så ringe resultat, at der ikke er tilstrækkeligt datagrundlag til at foretage en vurdering af stoffet. For eksempel hvis der kun er akutte studier til rådighed, eller ingen studier fastlægger NO(A)EL/LO(A)EL.

Referencer

Miljøstyrelsen (2005). Miljøprojekt Nr. 974. Principper for sundhedsmæssig vurdering af kemiske stoffer med henblik på fastsættelse af kvalitetskriterier i jord, luft og drikkevand.

3 Farlighedsvurdering og farlighedskarakterisering

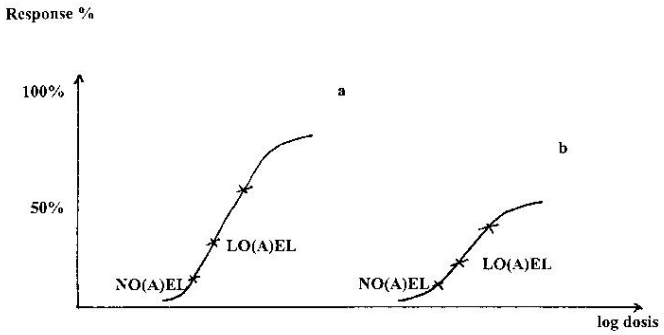
Farlighedsvurderingen og farlighedskarakteriseringen har til formål at beskrive stoffets farlige egenskaber. Der opstilles i videst muligt omfang dosis-effekt og dosis-respons sammenhænge, der danner baggrund for identifikation af den kritiske effekt. Den kritiske effekt er den effekt, der anses for at være den afgørende ved den sundhedsmæssige vurdering. Nuleffekt niveauet (evt. laveste effektniveau) for denne effekt anvendes til beregning af TDI (tolerabelt dagligt indtag/ tolerabelt daglig eksponering), som i den videre proces benyttes til beregning af kvalitetskriteriet.

3.1 Dosis-effekt og dosis-respons sammenhænge

Udsættelse for et kemisk stof kan medføre forskellige typer effekter afhængig af eksponeringsvej, eksponeringens størrelse og varighed. Lettere grader af effekter kan være forbigående genevirkninger i form af fx slimhindeirritation, mens alvorlige effekter kan være dødeligt forløbende akutte forgiftninger eller udvikling af kroniske sygdomme som kræft.

En længerevarende dyreeksperimentel undersøgelse vil således kunne give viden om forskellige typer effekter ved forskellige eksponeringsniveauer (dosis-effekt), og om hvor lang tid det tager, før de optræder i forhold til eksponeringen.

Yderligere vil man fra undersøgelsen kunne se, hvor stor en andel af de doserede dyr der er ramt af effekten (dosis-respons). Visse effekter kan være opdelt i forskellige sværhedsgrader eller stadier, hvor der så for hver af disse kan foreligge dosis-responssammenhænge.



Figur 1 Eksempler på dosisrespons-sammenhænge

Ovenstående figur viser, hvordan dosisrepons-kurver for forskellige effekter kan optegnes ud fra konkrete forsøgsdata med forskellige eksponeringsniveauer og observerede effekter ved disse (markeret med krydser). Kurve a angiver fx dosis-respons forløbet for luftvejsirritation hos forsøgsdyrene, og er her karakteriseret ved at være meget stejl (alle dyr påvirkes inden for et forholdsvist lille dosisinterval, dvs. lille spredning i følsomhed). Kurve b angiver forekomsten af kræftsvulster og viser en dosisrespons sammenhæng ved højere eksponeringsniveauer, og beskriver en noget fladere dosis-respons sammenhæng (dvs. dyrenes følsomhed over for udvikling af kræft er mere spredt). NOAEL-markeringerne på figuren repræsenterer eksponeringsniveauer, hvor der ikke blev fundet statistisk signifikant flere dyr i eksponeringsgruppen end i kontrolgruppen, der udvikler den pågældende effekt, mens LOAEL-værdierne repræsenterer det laveste eksponeringsniveau, der har medført en signifikant forøget forekomst af effekten.

Den faglige baggrundsrapport (Miljøprojekt Nr. 974 (2005)) angiver i afsnit 3.1 mere detaljerede beskrivelser og tolkningen af forskellige dosis-respons forløb.

3.2 Fastsættelse af nul-effektniveau og laveste effektniveau

For langt de fleste typer effekter vurderes der at være en tærskelværdi, der adskiller effektniveauer fra ikke-

effektniveauer, dvs. eksponeringen skal overskride en vis tærskelværdi før dosis er tilstrækkelig til at udløse effekt. Niveauet umiddelbart under denne teoretiske tærskelværdi betegnes nuleffektniveauet, der er den højeste dosis, der ikke medfører effekt. Dosisniveauet umiddelbart over tærskelværdien betegnes laveste effektniveau, da dette er det laveste dosisniveau, der lige netop udløser effekten.

I praksis anvendes for nuleffektniveauet det såkaldte *no observed adverse effect level*, *NOAEL*, der er den højeste af de i forsøget anvendte doser, hvor der i et konkret forsøg ikke er *observeret* den givne effekt. For laveste effekt-niveau anvendes det såkaldte *lowest observed adverse effect level, LOAEL*, der er den laveste dosis i forsøget hvor der er observeret den givne effekt.

I litteraturen anvendes betegnelserne NOAEL og NOEL (*no observed effect level)* samt LOAEL og LOEL (*lowest observed effect level).* Når betegnelserne anvendes korrekt, er det for at sondre mellem om de effektniveauer eller nuleffektniveauer der beskrives, er i forhold til *skadelige (adverse)* effekter eller effekter generelt, hvor også lettere grader af effekter som påvirkning af enzymniveauer og andre effekter af ikke direkte skadelig karakter er omfattet.

Man må dog være opmærksom på, at denne skelnen mellem skadelige og ikke-skadelige effekter i mange tilfælde ikke er gjort konsekvent i litteraturen, og at betegnelserne ofte benyttes i flæng. Det kan således i konkrete tilfælde være vanskeligt at afgøre, hvor grænsen går for, om en effekt skal tolkes som skadelig eller ej, og dermed om et LOEL snarere skal tolkes som et LOAEL.

Se endvidere afsnit 3.2 i den faglige rapport (1).

3.3 Benchmark-metoden

NO(A)EL/ LO(A)EL metoden til udpegning af et eksponeringsniveau er afhængig af, hvilke eksponeringsniveauer man har valgt ved udførelse af et forsøg, og i nogle tilfælde har man måske ikke engang fundet et NO(A)EL. Dette har medført, at en nyere metode, benchmark-metoden, visse

steder har vundet indpas i forbindelse med risikovurderinger, idet der ikke anvendes en NO(A)EL eller LO(A)EL men en benchmark-dosis for den videre beregning af TDI. Ved denne metode foretages en computerbaseret modellering af dosis-responskurven ud fra de tilgængelige data. På dosis-respons kurven findes ED_5 – eller ED_{10}-niveauet (dvs. det eksponeringsniveau, der medfører respons hos 5% eller 10% af de eksponerede). Denne dosis vælges derpå som udgangspunkt (benchmark-dosis, BMD_5 eller BMD_{10}) for den videre beregning på tilsvarende måde som man anvender en NO(A)EL- eller LO(A)EL-værdi.

Metoden anvendes af de canadiske miljømyndigheder og af US EPA, og også af WHO i forbindelse med "Air quality Guidelines for Europe" (2). WHO angiver i denne forbindelse, at en BMD_5 ud fra en gennemsnitsbetragtning kan sammenlignes med et NO(A)EL, mens en BMD_{10} kan sammenlignes med et LO(A)EL.

WHO omtaler også anvendelsen af benchmark-metoden som en alternativ metode i forbindelse med publikation om risikovurdering fra 1999 (3) og i forbindelse med publikation om fastsættelse af vejledende grænseværdier fra 1994 (4).

På nuværende tidspunkt haves der kun sparsom erfaring med anvendelsen af metoden herhjemme. Som det faglige miljøprojekt anfører, kan benchmark-metoden ikke umiddelbart anvendes for alle typer data, og metoden kræver for de relevante effektområder, hvor den kan anvendes, ofte flere dosis-niveauer end der sædvanligvis haves.

Benchmark-metoden er, når der foreligger tilstrækkelige data, et supplement til den traditionelle NO(A)EL/ LO(A)EL metode i forbindelse med fastsættelse af kvalitetskriterier. Uanset hvilken metode man vælger, bør man vurdere og begrunde den fra gang til gang, dvs. man bør referere til og begrunde de anvendte beregningsmetoder eller henvise til de originalreferencer, hvor den benyttede benchmark-dosis er beregnet.

3.4 Udpegning af kritisk effekt

Ved den samlede vurdering af dosis-effekt og dosis-respons sammenhænge foretages udpegning af den kritiske effekt samt udpegning af den NO(A)EL/ LO(A)EL værdi (evt. benchmarkdosis), der vurderes som mest relevant ved fastsættelse af kvalitetskriteriet. Ofte, men ikke nødvendigvis, vil dette være den laveste NO(A)EL/ LO(A)EL værdi, der er rapporteret vedrørende en skadelig effekt eller potentielt skadelig effekt.

Ved udpegning af den kritiske effekt vurderes relevansen af eksponeringsmåden (eksponeringsvejen i en given undersøgelse) i forhold til eksponeringsvejen for det medie (jord, luft eller vand) kvalitetskriteriet skal udarbejdes for. Alvorligheden af forskellige effekter sammenholdes i forhold til, hvor langt de ligger fra hinanden i eksponeringsniveau. Det vurderes fx om en alvorlig effekt kan være en følge af mindre alvorlige effekter, som således kan ses som en forløber og indikator for udvikling af en egentlig skadeeffekt. Endvidere vurderes i det konkrete tilfælde, om der optræder visse artsspecifikke effekter hos forsøgsdyrene, og om dokumentationen er tilstrækkelig til, at disse fund kan vurderes at være irrelevante i forhold til mennesker (se afsnit 3.5).

Ved tvivlstilfælde om udpegning af kritisk effekt og NO(A)EL/LO(A)EL værdi kan det være nødvendigt at udpege flere NO(A)ELs/LO(A)ELs for de potentielt kritiske effekter og anvende disse sideløbende ved den efterfølgende beregning af TDI/ kvalitetskriterier. Dette er for at vurdere, hvordan anvendelse af usikkerhedsfaktorer og andre beregningsmæssige forhold får indflydelse på kvalitetskriteriet, når der anvendes forskellige udgangspunkter m.h.t. kritisk effekt og NO(A)EL/LO(A)EL.

3.5 Relevans af visse effekter i forsøgsdyr

Som udgangspunkt anvendes dyremodeller som troværdige modeller ved forudsigelse af stoffets egenskaber hos mennesker. Visse effekter, der optræder i forsøgsdyr, har vist sig at være tæt knyttet til bestemte dyrearter. I tilfælde, hvor der foreligger dokumentation for at effekterne alene er forårsa-

get af en sådan artsspecifik virkningsmåde, anses disse for at være af meget begrænset relevans ved den videre vurdering af stoffet.

Især inden for kræftområdet har man fundet flere typer svulster (tumorer), hvor relevansen i forhold til mennesker i de enkelte tilfælde bør vurderes nøjere. I Miljøprojekt Nr. 974 (2005) er en række af disse beskrevet i afsnit 3.7.

4 Beregning af TDI for stoffer med tærskelværdi

4.1 TDI-begrebet

Det sidste trin i farlighedskarakteriseringen er beregning af tolerabelt dagligt indtag, *TDI (*eller tolerabel koncentration, *TK)*. Ved beregning for stoffer, hvor der anses at være en nedre tærskel for effekt anvendes usikkerhedsfaktorer:

$$TDI\,(TK) = \frac{NO(A)EL^{a}}{UF_{I} \times UF_{II} \times UF_{III}}$$

[a] *Alternativt kan et LO(A)EL eller en Benchmark-dosis* BMD_{x} *anvendes, se afsnit 3.3.*

Den tolerable daglige indtagelse (TDI) er et udtryk for den daglige gennemsnitsdosis (fra alle kilder), som befolkningen vurderes at kunne udsættes for (tolerere) gennem et helt livsforløb, uden at der forventes at opstå sundhedsskadelige effekter.
TDI angives sædvanligvis i enheden mg/kg legemsvægt per dag.

Analogt til TDI kan betegnelsen tolerabel koncentration (TK) defineres som den koncentration af et stof i jord, luft eller drikkevand som befolkningen vurderes at kunne udsættes for (tolerere) gennem et helt livsforløb, uden at der forventes at opstå sundhedsskadelige effekter. TK angives fx i enheden mg/m^3 (luft), mg/l (drikkevand), eller i mg/kg (jord).

For nogle stoffer er det nødvendigt at fastsætte en PTWI – værdi (Provisional Tolerable Weekly Intake – PTWI), der angiver det tolerable ugentlige indtag, i stedet for TDI. PTWI benyttes sædvanligvis over for stoffer, hvor det er

vigtigt at understrege, at det er den samlede eksponering over længere tid, der er af betydning for forekomst af effekter (fx bly og cadmium).

Begrundelse for anvendelse af usikkerhedsfaktorer omtales kort nedenfor, idet en mere detaljeret beskrivelse er givet i Miljøprojekt Nr. 974 (2005) afsnit 4.4

4.2 Anvendelse af usikkerhedsfaktorer

I kommentarerne til Miljøbeskyttelsesloven angives at "Miljøministeriet ved udstedelse af regler og vejledninger kan operere med fx sikkerhedsfaktorer ved fastsættelse af grænseværdier eller retningslinier for forureningsmæssige beregninger på de områder, hvor der ikke foreligger et tilstrækkeligt eksakt vidensgrundlag"

Tidligere har man anvendt begrebet sikkerhedsfaktorer. Det har imidlertid vist sig, at denne betegnelse kan misforstås, således at man forventer større sikkerhed, jo større sikkerhedsfaktor der anvendes. Dette er ikke i overensstemmelse med, hvordan faktorerne anvendes, idet de benyttes for at tage hensyn til usikkerheder og manglende viden i datagrundlaget, dvs. jo større usikkerhed jo større faktor. Ved brugen af disse faktorer tilstræbes det, at der opnås et ensartet beskyttelsesniveau udtrykt ved TDI-værdien. På denne baggrund er det derfor mere korrekt at anvende betegnelsen usikkerhedsfaktorer.

Også i udenlandsk litteratur anvendes forskellige termer for denne faktor fx: safety factor, uncertainty factor, Sicherheitsfaktor, assessment factor, bedömningsfaktor.

Nedenfor angives hvilke elementer og hensyn, der indgår i de tre usikkerhedsfaktorer.

4.2.1 Usikkerhedsfaktor I

Usikkerhedsfaktor I (UF_I) anvendes for at tage højde for, at mennesker kan være mere følsomme over for et givent stof end forsøgsdyr. Denne faktor har historisk været sat til 10.

Ekstrapolation af data fra dyr til mennesker kan opfattes som omhandlende to forskellige aspekter:

1) korrektion af dosis for forskelle i kropsstørrelse mellem forsøgsdyr og mennesker, såkaldt allometrisk skalering, og
2) andre former for forskelle mellem forsøgsdyr og mennesker, som ikke nødvendigvis afspejles i forskellene i kropsstørrelse.

Miljøprojekt Nr. 974 (2005) har gennemgået den eksisterende viden og understøtter, at der fortsat som udgangspunkt anvendes en standardværdi på 10 for UF_I, hvilket også er i overensstemmelse med international praksis, når dosis hos dyr omsættes til human dosis med samme enhed.

Hvis der foreligger veldokumenteret viden om toksikokinetiske og/eller toksikodynamiske forskelle mellem det givne forsøgsdyr og mennesker, anbefales det at tage udgangspunkt i denne viden med henblik på fastsættelse af en dataspecifik faktor i stedet for anvendelse af en standardværdi på 10. I den forbindelse kan 10-faktoren evt. opdeles i underfaktorer, hvor størrelsen af disse "delfaktorer" må vurderes konkret fra gang til gang.

Ved beregning af tolerabel koncentration (TK), hvor udgangspunktet er dyreforsøg, hvor eksponeringen foregår via inhalation, bør ekstrapolering til humaneksponering ved inhalation foretages direkte ud fra eksponeringsniveauet angivet i mg stof /m^3 (omregnet til kontinuerlig gennemsnitskoncentration per dag), frem for at foretage omregning fra indåndet dosis til mg/kg lgv/d for forsøgsdyrene. Ved at anvende indåndingskoncentrationen direkte svarer dette til at doseringen foretages i forhold til stofskiftet, hvilket anses for at være den mest relevante metode, når der skal korrigeres for forskelle i kropsstørrelse. Anvendelse af en UF_I skal ses i lyset heraf og bør derfor i denne situation ligge lavere end 10. En værdi på en halv tierpotens ($10^{0,5}$) kan som udgangspunkt anvendes til resterende forskelle m.h.t. artsforskelle i kinetik og dynamik, medmindre konkrete data tilsiger højere eller lavere værdi.

Der bør i videst muligt omfang tages hensyn til en række mætningsfænomener (fx mætning af absorption, metabolisme eller udskillelse), der kan forekomme i dyreforsøg ved høj dosering, idet disse mætningsfænomener ofte ikke vil være relevante ved lavere miljømæssigt relevante niveauer. I sådanne tilfælde bør der om muligt omregnes til "effektiv" dosis/ koncentration som dyrene har været udsat for.

4.2.2 Usikkerhedsfaktor II

Usikkerhedsfaktor II (UF_{II}) anvendes for at tage højde for, at nogle individer i befolkningen kan være mere følsomme over for et givent stof end den generelle befolkning (for eksempel børn, gravide, ældre, svækkede, kronisk syge). Denne faktor har oftest været sat til 10. Forskellene i følsomhed skyldes den biologiske variation, der findes mellem mennesker. Faktorer som alder, køn, graviditet, genotype, helbred, og livsstil kan være medvirkende til en øget biologisk følsomhed, som afspejler dels forskelle i toksikokinetik og dels i toksikodynamik.

Miljøprojekt Nr. 974 (2005) henviser til en række analyser, der har vurderet variationen mellem mennesker og dermed størrelsen af UF_{II}. Sammenfattende understøtter disse analyser anvendelse af en standardværdi på 10 for denne variation.

Denne usikkerhedsfaktor skal derfor som udgangpunkt sættes til 10. En alternativ værdi kan anvendes, hvis udgangspunktet for NO(A)EL/LO/A)EL værdien specifikt er relateret til data for særligt følsomme personer eller den kritiske effekt er en effekt, hvor man har særligt kendskab til variationsbredden i følsomhed.

4.2.3 Usikkerhedsfaktor III

Usikkerhedsfaktor III (UF_{III}) anvendes for at tage højde for manglende kvalitet og relevans af de tilgængelige data. I relation til fastsættelse af kvalitetskriterier i jord, luft og drikkevand har denne faktor typisk varieret fra 1 til 100 afhængigt af datagrundlaget for de pågældende stoffer.

I UF_{III} indgår bl.a. følgende elementer :

- kvaliteten af datasættet (fx ekstrapolation fra subkronisk nuleffektniveau til kronisk nuleffektniveau),,
- ekstrapolation fra en eksponeringsvej til en anden ("route to route" ekstrapolation fx omregning fra oral dosis til inhalationsdosis),
- ekstrapolation fra LO(A)EL til NO(A)EL,
- og alvorligheden af effekterne (fx kræftfremkaldende effekter).

Det er ikke muligt at pege på en specifik størrelsesorden for en standardværdi, hverken for de enkelte delelementer af UF_{III} eller for den samlede UF_{III}.

Der henvises til Miljøprojekt Nr. 974 (2005) for en nærmere beskrivelse af UF_{III} i rapportens afsnit 4.4.3.

Nedenfor anføres mere kortfattet retningslinierne for fastsættelse af UF_{III}.

Kvalitet og relevans af data

UF_{III} skal tage højde for, om der er kvalitetsmæssige eller datamæssige mangler. Vurdering af kvalitet, omfatter vurdering af om de enkelte undersøgelser (og især undersøgelserne der refererer til de kritiske effekter og effektniveauer) er udført og afrapporteret på en måde, så resultaterne anses for relevante og pålidelige. Selve omfanget af datasættet vurderes for data vedrørende alle relevante effektområder i relation til kortvarig og langvarig eksponering, og det vurderes om der i datasættet er væsentlige mangler i forhold til vurdering af kritisk effekt og estimering af TDI. En faktor på 1 anvendes ved datasæt, som vurderes at være fuldt tilstrækkeligt for det givne stof, mens der ved mindre eller større mangler har været anbefalet faktorer i størrelsesordenen 3-10. I visse tilfælde med store mangler kan en faktor på helt op til 100 komme på tale. Fastlæggelse af UF_{III} må ofte baseres på en ekspertvurdering og foretages under hensyntagen til det enkelte stofs toksikologiske profil.

Et særligt aspekt, er manglende viden om børn og ufødtes følsomhed for konkrete kemiske påvirkninger. For at beskyt-

te børn og ufødte er det vigtigt ved fastsættelse af UF_{III} at vurdere om der er tilstrækkelig viden om disse forhold ud fra reproduktionsforsøg og flergenerationsforsøg. Er disse forhold ikke tilstrækkeligt belyst bør mangel på data have indflydelse på valget af UF_{III}. Størrelsen af en sådan delfaktor må ses i sammenhæng med stoffets toksikologiske profil og hvilke øvrige data, der haves.

Ekstrapolation fra en eksponeringsvej til en anden

Ved mangel på data for den relevante eksponeringsvej kan det blive nødvendigt at foretage en "route-to-route" ekstrapolation. De analyser, der er foretaget med hensyn til ekstrapolation fra oralt NO(A)EL til et NO(A)EC ved inhalation, peger generelt på, at en ekstrapoleret værdi ofte vil være væsentligt højere end en observeret værdi (dvs toksiciteten undervurderes). Det modsatte gør sig generelt gældende når der ekstrapoleres fra oralt NO(A)EL til NO(A)EL ved hudkontakt, hvor den ekstrapolerede værdi ofte vil være lavere end en observeret værdi (dvs. toksiciteten overvurderes). Der kan imidlertid ikke peges på en konkret størrelse for usikkerhedsfaktor III ved disse ekstrapolationer, der hviler på et meget usikkert grundlag. Vurderingen af om en "route-to route" ekstrapolation skal foretages, og i hvilken udstrækning der skal anvendes en usikkerhedsfaktor i tilknytning hertil, må bero på en ekspertvurdering i det konkrete tilfælde.

For stoffer, hvor der kun findes subakutte eller subkroniske undersøgelser, er det ikke muligt at fastsætte et NO(A)EL for livstidseksponering, som generelt må forventes at ligge lavere. Der har været foretaget flere analyser af forholdet mellem NOAELs og LOAELs opnået i studier af forskellige eksponeringsvarigheder. Med baggrund i disse synes der at være belæg for en usikkerhedsfaktor af størrelsesorden minimum 10. En af de nyere analyser har således vist, at en faktor på 10 vil være tilstrækkelig i knap 90% af tilfældene, når der var tale om ekstrapolation fra subkroniske data, mens der ved ekstrapolation fra subakutte data skulle anvendes en væsentlig højere faktor (>20).

Ved ekstrapolation fra LO(A)EL til NO(A)EL kan der ikke peges på en generel faktorstørrelse, som afspejler en generel

usikkerhed. Praksis inden for området og de tilgængelige analyser af problemstillingen peger på, at en værdi omkring en faktor 10 i langt de fleste tilfælde er tilstrækkelig. Vurderingen må imidlertid bero på en ekspertvurdering i hvert enkelt tilfælde.

Med baggrund i vægtning af ovenstående aspekter anvendes en UF_{III} på 10 som udgangspunkt. Denne værdi kan så korrigeres, når der er grundlag for dette i konkrete tilfælde.

Denne problemstilling kan i visse situationer omgås, når det ud fra data er muligt at beregne en benchmark-dosis, således at denne anvendes i stedet for LO(A)EL-værdien.

Alvorligheden af effekter

Det har været praksis ved fastsættelse af kvalitetskriterier, at særligt alvorlige effekter (fx kræftfremkaldende effekt eller fosterbeskadigende effekter) afspejles i usikkerhedsfaktor III. Det gælder især i de tilfælde, hvor den alvorlige effekt optræder ved lave dosisniveauer. Her kan anvendes *en ekstra faktor* på op til 10 for at tage hensyn til dette. For at få den endelige værdi for UF_{III} ganger man de enkelte værdier sammen.

Sammenfattende kan det konkluderes, at det ikke er muligt at sætte en standardværdi for en samlet UF_{III}. Usikkerhederne inden for de forskellige områder må vægtes, når der tages stilling til en samlet faktor for UF_{III}, da en multiplikation af mange delfaktorer i UF_{III} kan give en meget høj værdi, og i visse tilfælde give et skævt billede af det samlede videngrundlag og kvaliteten heraf. Fastsættelse af UF_{III} bør således i høj grad bero på en ekspertvurdering, hvor valget af faktoren og elementerne heri tydeligt begrundes.

4.2.4 Samlet usikkerhedsfaktor

Ved beregning af TDI divideres NO(A)EL evt. LO(A)EL med de tre usikkerhedsfaktorer, der således ganges sammen.

Ved multiplikation af UF_I, UF_{II} og UF_{III} bør der imidlertid tages stilling til størrelsen af den samlede usikkerhedsfaktor,

og der bør foretages en overordnet vurdering i forhold til det givne datasæt.

En meget stor usikkerhedsfaktor, der kan medføre en meget lille TDI-værdi, betyder ikke nødvendigvis, at stoffet er lige så potent eller farligt som andre, mere velkendte stoffer med tilsvarende lave TDI-værdi. Den beregnede lave værdi må snarere ses som en følge af store usikkerheder i datagrundlaget. En samlet usikkerhedsfaktor på 10.000 og derover, bør derfor ikke anvendes.

5 Beregning af TDI for kræftfremkaldende stoffer

5.1 Kræftfremkaldende stoffer med og uden tærskelværdi

Kræftfremkaldende stoffer anses for at kunne deles op i to grupper grundet deres virkningsmekanisme. Den ene gruppe består af stoffer, der virker kræftfremkaldende som følge af evnen til at påvirke cellernes delings- og differentieringshastighed. Dette kan ske gennem direkte eller indirekte påvirkning af cellernes receptorer. For sådanne stoffer antages der at være en nedre tærskelværdi for denne effekt. Derfor kan TDI beregnes ved hjælp af usikkerhedsfaktorer, som omtalt i forrige afsnit.

Den anden gruppe af kræftfremkaldende stoffer virker gennem kemisk interaktion med cellernes arvemasse, og den kræftfremkaldende effekt vurderes at være en følge af stoffets beskadigelse af cellernes arveanlæg (mutagen/genotoksisk aktivitet). For disse stoffer anses der ikke at være et nedre eksponeringsniveau uden øget risiko for skadevirkninger. For sådanne stoffer anvendes ikke usikkerhedsfaktorer ved beregning af TDI. I stedet beregnes TDI ved hjælp af en matematisk modelberegning, hvor man på forhånd definerer et risikoniveau man vil acceptere, og beregner så hvilken udsættelse, som giver denne risiko.

Ved vurdering af kræftfremkaldende effekt er det således af stor betydning, om det kræftfremkaldende stof falder ind under den ene eller den anden kategori. Der findes stoffer, som både er genotoksiske – dvs. kræftfremkaldende uden tærskel for effekt, og kræftfremkaldende ved andre mekanismer, hvor der anses at være en tærskel. Ved vurdering af denne type stoffer, kræver det en ekspertvurdering at afgøre, om de data der ligger til grund, bedst giver grundlag for at vurdere stoffet som tilhørende den ene eller anden kategori. Der har således i EU været arbejdet på at udvikle

nærmere vejledning i hvordan disse typer stoffer kan vurderes[14].

5.2 Vurdering af kræftfremkaldende effekt

EU, WHO IARC (International Agency for Research on Cancer) og US EPA anvender en række forholdsvis sammenlignelige procedurer/ kriterier ved vurdering af, om et stof skal i kategorien "kræftfremkaldende". Stofferne indplaceres i forskellige underkategorier alt efter dokumentationens omfang, og under hensyntagen til om dokumentationen stammer fra humandata eller dyredata.

Yderligere indgår der i vurderingerne også stillingtagen til virkningsmekanismer, fx om stoffer virker gennem en mutagen/ genotoksisk mekanisme. I EU´s klassificeringssystem for kemiske stoffer er der også kriterier for, hvornår et stof skal kategoriseres som "mutagent".

Principperne for inddeling af kræftfremkaldende stoffer i kategorier er mere udførligt beskrevet i Miljøprojekt Nr. 974 (2005) afsnit 3.6.

Ved vurdering af et stofs kræftfremkaldende effekt i forbindelse med risikokarakterisering og beregning af kvalitetskriterier tages der så vidt muligt udgangspunkt i de ovennævnte vurderinger, idet der suppleres med opdateret viden fra litteraturen. Det vurderes om der er dokumentation for at den kræftfremkaldende effekt er en følge af genotoksisk virkning, og om stoffet derfor skal betragtes som værende uden en nedre tærskel for effekt.

Hvis data taler for, at stoffet virker gennem en ikke-genotoksisk mekanisme, anses stoffet for at besidde en tærskelværdi for skadelig effekt. For en række stoffer vil data og viden vedrørende virkningsmekanisme være meget mangelfuld, og det kan være vanskeligt at sondre, om stoffet skal betragtes som værende enten med eller uden tærskelværdi. Sådanne tvivlstilfælde kan bedst håndteres ved at betragte

[14] European Food Safety Authority (2005). Opinion on a Harmonised Approach for Risk Assessment of Compounds Which are both Genotoxic and Carcinogenic.

stoffet som havende en tærskelværdi, og i den forbindelse anvende en øget usikkerhedsfaktor (UF_{III}) for at tage hensyn til usikkerheden om eksistensen af en tærskelværdi. Der bør således være et vist datagrundlag, der peger hen mod en genotoksisk mekanisme, før stoffet vurderes efter en model uden nedre grænse.

Ved vurderingen af kræftfremkaldende effekt tages stilling til om den er knyttet til bestemte eksponeringsveje, og om disse er relevante i forbindelse med et kvalitetskriterium for stoffet i jord, luft eller drikkevand.

Visse kræftformer kan være forsøgsdyrsspecifikke, og når sådanne kræftfund kan dokumenteres som ikke-relevante i human sammenhæng, tillægges disse fund kun begrænset vægt (se afsnit 3.5).

Ved vurderinger i relation til kvalitetskriterier tages der alene stilling til om stoffet skal betragtes som kræftfremkaldende, og om stoffet ud fra dets virkningsmekanisme skal anses for at have en tærskelværdi eller ej. Der foretages således ikke en mere detaljeret indplacering i forskellige kategorier i forhold til dokumentationens art og omfang, dvs. der inddeles ikke i kategorier for humane og dyreeksperimentelle kræftfremkaldende stoffer.

Et stof, som på baggrund af dokumentationen indplaceres i EU's Carc1 eller Carc 2, i IARC's gruppe 1 eller gruppe 2A/2B, og/eller i US EPA's gruppe A eller B1/B2, vil som udgangspunkt medføre, at stoffet betragtes som kræftfremkaldende, med mindre der er nyere undersøgelser eller velunderbyggede informationer og fortolkninger af data, der taler imod en sådan vurdering.

Tilsvarende gælder stoffer, som er opført på Arbejdstilsynets liste over stoffer, som anses for at være kræftfremkaldende. Det skal dog understreges, at stoffer, som hverken er vurderet af EU, IARC og/eller US EPA eller er indplaceret i en lavere kategori (EU Carc3, IARC gruppe 3 og/eller US EPA gruppe C/D), godt kan blive betragtet som kræftfremkaldende i relation til fastsættelse af kvalitetskriterier for kemikalier i jord, luft og drikkevand, hvis der er velunderbyggede data, der taler for det. Det kan for eksempel være i

tilfælde af, at der er publiceret nye undersøgelser siden en eventuel vurdering er foretaget af EU, IARC og/eller US EPA, eller der kan være stor kemisk strukturlighed med andre kendte kræftfremkaldende stoffer. I sidstnævnte tilfælde kan QSAR-modellering indgå som supplerende støtte for vurderingen.

5.3 Beregning af TDI for kræftfremkaldende stoffer uden tærskelværdi

5.3.1 Tolerabelt risikoniveau

TDI-værdien for kræftfremkaldende stoffer uden tærskelværdi fastsættes til en værdi, der repræsenterer et accepteret risikoniveau for udvikling af kræft. Denne værdi har traditionelt været fastsat til en 10^{-6} livstidsrisiko, og vil også med udsendelse af denne vejledning være det ønskede risikoniveau.

Konkret betyder dette, at man med udgangspunkt i humandata eller dyreforsøg, hvor den kræftfremkaldende effekt er påvist, ved hjælp af matematisk modellering estimerer dosis-respons kurvens forløb så langt ned i lav-eksponeringsområdet, at en eksponering svarende til en 10^{-6} livstidsrisiko kan beregnes. TDI er således den daglige gennemsnitseksponering, der ud fra *teoretiske beregninger* svarer til en forøget risiko for cancer på 1 ud af en million mennesker, som er udsat for stoffet gennem en hel livstid.

5.3.2 Metode til beregning af TDI og livstidsrisiko

Der er udviklet forskellige metoder til beregning af, hvor stor en risiko for udvikling af svulster en given eksponering for et genotoksisk kræftfremkaldende stof udgør. For alle metoder gælder, at der anvendes en eller anden form for matematisk ekstrapolation fra dosisniveauer med de kendte eksperimentelle værdier for forekomsten af svulster til de som regel meget lavere dosisniveauer, der svarer til en forekomst hos 1 ud af en million. Metoderne beskriver relationen mellem den daglige eksponering (udtrykt som dosis

eller koncentration) og den sammenhørende sandsynlighed for udvikling af svulster.

Beskrivelse af forskellige metoder og sammenligning mellem disse fremgår af Miljøprojekt Nr. 974 (2005) afsnit 5.3 og 5.4.

Den foretrukne metode til fastsættelse af TDI er T25-metoden, som også anvendes i EU-regi. Den baserer sig ligesom one-hit metoden på lineær ekstrapolation med udgangspunkt i laveste dosisniveau, hvor der optræder signifikant forøget antal svulster[15].

Metoden er en simplificeret lineær metode med udgangspunkt i en beregnet T25-dosis. T25-dosis defineres i denne sammenhæng som den kroniske eksponering (enhed: mg/kg legemsvægt per dag eller mg/m^3), som vil give 25% af forsøgsdyrene svulster i et specifikt væv, efter korrektion for den spontane hyppighed, indenfor den standardiserede levetid for den pågældende dyreart. Med udgangspunkt i denne T25-dosis foretages lineær ekstrapolation ved simpel forholdsregning ned til en dosis, der svarer til et tolerabelt risikoniveau.

Metoden og dens konkrete anvendelse i forhold til et tolerabelt 10^{-6} livstidsrisikoniveau er nøjere beskrevet i bilag 1.

5.3.3 Anvendelse af risikoestimater angivet i litteraturen

I en række tilfælde vil eksponeringsniveauet svarende til en 10^{-6} livstidsrisiko (eller "unit-risk"-estimater) på forhånd være beregnet af ekspertgrupper under fx WHO eller US EPA. For især nyere vurderinger kan det være relevant at anvende disse værdier som ligeværdigt udgangspunkt på

[15] Miljøstyrelsen har tidligere som administrativ praksis anvendt one-hit metoden. Anvendelse af T25-metoden vil i forhold til den medføre lidt højere værdier (skønsmæssigt en faktor 2-4). Denne forskel skal dog ses i et 10^{-6} perspektiv, og må anses som meget beskeden, og i praksis uden betydning i forbindelse med det tilstræbte beskyttelsesniveau.

linie med T25-metoden ved beregning af TDI og kvalitetskriterier.

Argumenterne for at vælge et risikoestimat frem for et andet kan dels være rent faglige (fx bero på konkrete virkningsmekanismer) og dels være mere pragmatiske, idet man også bør vurdere nødvendigheden af at foretage selvstændige beregninger af et risikoniveau. For eksempel kan opgaven være meget omfattende for stoffer med stor datarigdom (fx PAH-stoffer), hvor en selvstændig vurdering vil kræve ulige mange resurser og inddragelse af høj faglig ekspertise på området for at kunne leve op til kvaliteten af en international vurdering.

Derfor vil man i konkrete tilfælde kunne basere kvalitetskriterier for kræftfremkaldende stoffer på andre metoder end T25 metoden.

6 Beregning af kvalitetskriterier for kemikalier

Dette kapitel beskriver hvorledes kvalitetskriterierne for kemikalier i jord, luft og drikkevand kan beregnes med udgangspunkt i førnævnte TDI-værdier.
Første led i beregningen er en vurdering af, om hele TDI-værdien eller kun en brøkdel heraf tildeles til beregning af det konkrete kvalitetskriterium. Dette kan dels være begrundet i eksponeringsmæssige overvejelser - den såkaldte allokering, hvor der tages hensyn til evt. andre kilder, der har betydning for eksponeringen. Eller det kan være begrundet i øvrige forhold, der kan være afgørende for, om der anvendes en reduktionsfaktor, så kun en mindre brøkdel af TDI-værdien anvendes ved beregning af kvalitetskriteriet.

Kapitlet angiver hvilke værdier for medieeksponering der anvendes ved beregning af kvalitetskriterierne. En mere uddybet forklaring på valget af disse værdier er givet i bilag 2.

6.1 Generel metode for beregning af et kvalitetskriterium

Et sundhedsmæssigt baseret kvalitetskriterium for et stof i jord, luft eller drikkevand beregnes ud fra den tolerable daglige indtagelse, ved at dividere TDI-værdien med den daglige eksponering for det relevante medie WHO/IPCS[16,17]. Det vil sige, at selve beregningen af kvalitetskriteriet ud fra TDI i princippet er ens for de tre medier, jord, luft og drikkevand

[16] WHO/IPCS (1994). Assessing human health risks of chemicals: Derivation of guidance values for health-based exposure limits. Environmental Health Criteria no. 170. International Programme on Chemical Safety.
[17] WHO/IPCS (1999). Principels for the assessment of risks to human health from exposure to chemicals. Environmental Health Criteria no. 210. International Programme on Chemical Safety.

og for alle stoffer, uanset om der foreligger tærskelværdi for den kritiske effekt eller ej.

Følgende generelle beregningsmetode kan opstilles:

$$KK_{l,j,v} = \frac{TDI \times V \times f}{E_{l,j,v}}$$

hvor

$KK_{l,j,v}$: kvalitetskriterium for jord, luft eller drikkevand
TDI: angives i mg/ kg legemsvægt/ d
V: legemsvægt i kg
f: allokeringsfaktor, brøkdel af TDI som ud fra eksponeringsfordeling anvendes til eksponering fra jord, luft eller drikkevand
$E_{l,j,v}$: daglig udsættelse/ forbrug af luft (m^3/d), jord (kg/d), eller drikkevand (liter/d).
(Hvis $E_{l,j,v}$ angives i (m^3/kg lgv/ d), (kg/kg lgv/d), eller (liter/kg lgv/d) udgår V i ovenstående formel).

6.1.2 Anvendelse af TDI

For stoffer hvor der ikke anses at være en tærskelværdi for effekt, dvs. de genotoksiske kræftfremkaldende stoffer, anvendes TDI-værdien (sv.t til en 10^{-6} livstidsrisikodosis) direkte til beregning af kvalitetskriteriet.
For andre stoffer, hvor der anses at være en tærskelværdi, indgår efterfølgende overvejelser vedrørende anvendelse af en allokeringsfaktor eller reduktionsfaktor.

Allokering

Allokeringsfaktoren "*f*" angiver den brøkdel af TDI som tildeles udsættelsen via det enkelte medie. Ofte tildeles mindre end 100% af et kemisk stof til beregning af et kvalitetskriterium, da der for en række kemiske stoffer vil være udsættelse gennem andre medier end det enkelte medie jord, luft og vand. I en række tilfælde vil bidrag gennem forurening af fødevarer eller gennem påvirkning fra indeklimaet udgøre hovedkilden for en persons udsættelse, og vil dermed "lægge beslag på" en betydelig del af TDI-værdien, hvorfor der kun tildeles en mindre andel til kvalitetskriteriet.

I de tilfælde hvor bidrag fra andre medier ikke forventes, fastsættes kvalitetskriterierne som udgangspunkt ved, at hele TDI allokeres til det pågældende medie. Når det vurderes, at der foreligger øvrige betydende kilder allokeres som udgangspunkt 10% af TDI til det pågældende medie, med mindre der er konkret viden om øvrige kilders bidrag, der siger noget andet. For visse stoffer, hvor langt de største bidrag kommer fra øvrige kilder, kan der således allokeres helt ned til kun 1% af TDI (dette er for eksempel gjort for visse plastblødgørere i forbindelse med et kvalitetskriterium for drikkevand).

Reduktionsfaktor

I særlige tilfælde kan andre forhold end de rent eksponeringsmæssige betragtninger medføre, at der anvendes en reduktionsfaktor, således at der kun anvendes en vis brøkdel af TDI til beregning af kvalitetskriteriet. En sådan faktor kan efter individuel vurdering komme på tale fx :

- ved særligt kritiske forhold som persistens og bioakkumulering af stoffet,
- i tilfælde, hvor kvalitetskriteriet er udarbejdet ud fra et enkelt stofs effekter, men hvor stoffet repræsenterer en hel stofgruppe, og hvor eksponeringen typisk vil være karakteriseret ved en blandingseksponering med denne stofgruppe,
- i tilfælde hvor der samtidig kan optræde eksponering fra flere stoffer, og hvor der er formodning om, at der ved de relevante niveauer vil kunne optræde kombinationseffekter (fx samvirkende effekter) fra denne blandingseksponering.

6.1.3 Eksponeringsbetragtninger

Målet for eksponeringen i nævneren i brøken til kvalitetskriterie-beregningen baseres på standardbetragtninger for daglig udsættelse.

I afsnit 6 i Miljøprojekt Nr. 974 (2005) er der foretaget en opdateret gennemgang af viden om befolkningens udsættelse for jord, luft og vand, samt angivet hvilke standardbe-

tragtninger der anvendes inden for WHO, US EPA og i EU.

Ud fra hensigten om specifikt at tage hensyn til børns eksponering er der foretaget en revision af den hidtidige praksis. Grundlaget for den reviderede praksis er anført i bilag 2.

6.2 Beregning af luftkvalitetskriteriet

Følgende fremgangsmåde anvendes til beregning af luftkvalitetskriteriet (KK_{luft}), når TDI for de(n) kritiske effekt(er) er fra studier hvor stoffet er givet via munden og angivet i enheden mg/kg legemsvægt/dag:

$$KK_{luft} = \frac{TDI \times f}{E_{luft}} \quad \text{hvor}$$

TDI: tolerabel daglig indtagelse (mg/ kg lgv/d)
f: brøkdel af TDI, der allokeres til udeluften
E_{luft}: eksponering luft, standardværdi for dagligt indåndingsvolumen: 0,5 m^3/kg lgv/d for 1-5 årige børn.

Følgende fremgangsmåde anvendes, når (nul)effektniveauer NO(A)EL eller LO(A)EL) for de(n) kritiske effekt(er) er fra studier hvor stoffet er inhaleret og angivet som en koncentration i enheden mg/m^3:

$$KK_{luft} = TK \times f$$

f: allokeringsfaktor
TK: tolerabel koncentration

$$\text{hvor} \quad TK = \frac{NO(A)EC \text{ eller } LO(A)EC}{UF_I \times UF_{II} \times UF_{III}}$$

For de fleste typer af systemiske effekter anses det at være den samlede dosis og ikke stoffets koncentration i luften, der er af betydning for udvikling af disse effekter. Ved fastsæt-

telse af luftkvalitetskriteriet i disse tilfælde foretages en omregning af det fastlagte (nul)effektniveau til et gennemsnitligt døgnniveau (kontinuert eksponering) ud fra de i studiets aktuelle eksponeringsbetingelser. Det vil sige, at der kompenseres for, at eksponeringen ikke har foregået i alle døgnets timer over en fuld uge. Hvis eksponeringen for eksempel er foretaget 6 timer per dag i 5 dage per uge, korrigeres der med en faktor 6/24 til kontinuert eksponering gennem et helt døgn og en faktor 5/7 til kontinuert eksponering gennem hele ugen.

For visse lokale effekter (effekter, der optræder lokalt i luftvejene samt direkte effekter på hud og øjne) anses det sædvanligvis at være stoffets koncentration i luften og ikke den samlede dosis som sådan, der er af betydning for udvikling af disse effekter. For sådanne stoffer kan omregning til en kontinuert eksponering sædvanligvis udelades fra en konkret vurdering.

Lugt

Nogle kemiske stoffer har en meget kraftig lugt, og hensyntagen til lugt ved fastsættelse af luftkvalitetskriteriet vil for mange stoffer (fx en række organiske opløsningsmidler) medføre lavere luftkvalitetskriterium end det sundhedsbaserede luftkvalitetskriterium, idet luftkvalitetskriteriet fastsættes til 1/3 af 50 %-lugtgrænsen.

Lugtgrænsen for et kemisk stof er generelt defineret som den koncentration i luften, hvor 50 % af et lugtpanel (kontrolleret laboratorieforsøg med bestemmelse af lugtgrænse med frivillige forsøgspersoner) kan registrere lugten.

Som et luftkvalitetskriterium vurderes en sådan 50 % lugtgrænse at kunne medføre gener hos en ikke uvæsentligt del af befolkningen.

I en analyse af en række laboratoriedata, hvor lugtgrænsen er blevet bestemt for kemiske stoffer, viser det sig, at dosis-respons sammenhængen generelt er ret stejl for et lugtpanel (DK-Teknik 2001). For personer, med intakt lugtesans (svarende til personer, der indgår i et lugtpanel), er der ge-

nerelt en forholdsvis lille spredning m.h.t. hvornår en lugt kan opfattes. Ud fra disse data vurderes, at ved et niveau på 1/3 af lugtgrænsen vil maksimalt 1-5% af befolkningen under optimale betingelser kunne fornemme lugt.

Lugtgrænser, der er angivet i litteraturen, kan variere voldsomt (flere størrelsesordner) Dette skyldes, at metoder til bestemmelse af lugtgrænser kan variere meget, alt efter hvor og hvornår de er blevet foretaget, samt at der kan være foretaget undersøgelser af forskellige stofkvaliteter, hvor stofferne ikke er entydigt definerede.

Medmindre lugtgrænsen er bestemt ud fra nye og meget velbeskrevne metoder, hvor kvalitet og pålidelighed af undersøgelsen kan vurderes, anbefales det at fastsætte luftkvalitetskriterier på baggrund af lugt fra bestemmelse af lugtgrænse foretaget af et akkrediteret laboratorium.

6.3 Beregning af jordkvalitetskriteriet

Følgende fremgangsmåde anvendes ved beregning af jordkvalitetskriteriet, når de(n) kritiske effekt(er) er en følge af gentagen udsættelse:

$$KK_{jord} = \frac{TDI \times V \times f}{E_{I,jord} \text{ (eller } E_{H,jord})} \quad \text{hvor}$$

f: procentdel af TDI, der allokeres til indtagelse af jord
V: legemsvægt, 1-3 årigt barn: 13 kg
$E_{I,jord}$: daglig eksponering (indtagelse) for jord, standardværdi:

1) 0,0002 kg/d (sv.t. 95-percentilgrænsen) i tilfælde hvor hele TDI-værdien eller hovedparten af denne anvendes til beregning af kvalitetskriteriet
2) 0,0001 kg/d (sv.t. medianudsættelse) i tilfælde hvor TDI er en 10^{-6} livstidsrisikodosis for et kræftfremkaldende stof, eller i tilfælde, hvor der anvendes en mindre del af TDI til jordkvalitetskriteriet

$E_{H,jord}$: daglig eksponering (hudkontakt) for jord, standardværdi: 0,001 kg/d for barn.

$E_{H,jord}$ anvendes i forbindelse med særligt hudgennemtrængelige stoffer, hvor systemisk bidrag fra hudoptag summeres med det orale bidrag. $E_{H,jord}$ anvendes separat hvis den kritiske effekt er relateret til den direkte hudpåvirkning af forureningskomponenten.

Følgende fremgangsmåde anvendes ved beregning af jordkvalitetskriteriet, når den kritiske effekt er akut toksicitet:

$$KK_{jord} = \frac{TD \times V}{E_{I,jord} \text{ (eller } E_{H,jord})} \quad \text{hvor}$$

TD: tolerabel enkeltdosis

$$\text{hvor} \quad TD = \frac{NO(A)EL_{akut} \text{ eller } LO(A)EL_{akut}}{UF_I \times UF_{II} \times UF_{III}}$$

V: legemsvægt, 1-3 årigt barn: 13 kg
E_I: maksimum enkeltindtag af jord (0,010 kg)
E_H: maksimal hudkontakt med jord (0,010 kg) (Anvendes for særligt hudgennemtrængende stoffer).

Ved beregning bør data for optagelse fra mave-tarmkanalen (biotilgængelighed[18]) så vidt muligt inkluderes, idet de forurenende stoffer i visse tilfælde kan binde sig kraftigt til jordpartikler og derved medføre en reduceret biotilgængelighed. Hvis data ikke foreligger, regnes med samme biotilgængelighed, som i de forsøg, der ligger til grund for TDI-beregningen (dette kan typisk være forsøg, hvor teststoffet er opblandet i foderet eller i drikkevandet).

[18] "Biotilgængelighed" refererer i denne sammenhæng til det engelske "bioaccessibility". Bioaccessibility beskriver den pool af stoffet, som jorden kan frigive, og den indeholder således også let bundne former.

Lugt, udseende

Ud over rent sundhedsmæssige aspekter tages der ved fastsættelse af jordkvalitetskriteriet hensyn til, at jorden ikke må lugte eller syne forurenet. Det vil sige, at jorden ikke ved inspektion må afgive lugt fra forureningen eller se forurenet ud (klumper af stof(fer) eller misfarvning. Der foreligger ikke nøjere retningslinier for en sådan subjektiv vurdering. Med hensyn til lugt i forbindelse med afdampning henvises til Miljøprojekt Nr. 974 (2005) afsnit 7.4.3, der beskriver anvendelsen af luftkvalitetskriteriet i forbindelse med afdampning af forurenende stoffer fra jord.

6.4 Beregning af drikkevandskvalitetskriteriet

Følgende fremgangsmåde anvendes ved beregning af drikkevandskvalitetskriteriet:

$$KK_{drikkevand} = \frac{TDI \times f}{E_{drikkevand}} \quad \text{hvor}$$

TDI: tolerabelt dagligt indtagelse (mg/ kg lgv/d)
f: er den procentdel af TDI, der allokeres til indtagelse af drikkevand
$E_{drikkevand}$: daglig eksponering for drikkevand, standardværdi:

1) 0,08 liter/ kg lgv/d (sv.t. 95-percentilen) for 1-10 årige børn. Anvendes i forbindelse med akutvirkende stoffer eller når hovedparten af TDI-værdien benyttes til beregning af drikkevandskvalitetskriteriet.
2) 0,03 liter/ kg lgv/d (sv.t. medianværdi for 1-10 årige børn) i tilfælde hvor TDI er en 10^{-6} livstidsrisikodosis for et kræftfremkaldende stof, eller i tilfælde hvor kun en mindre andel af TDI-værdien benyttes til beregning af drikkevandskvalitetskriteriet.

Kemiske stoffer, der er særligt hudoptagelige, vil kunne optages i en ikke uvæsentlig mængde i forbindelse med badning, og stoffer, der let fordamper (for eksempel mange opløsningsmidler), kan især ved brusebadning indåndes som dampe/aerosoler. Omfanget af disse eksponeringsformer via brusebadning og karbadning afhænger af, hvor letoptageligt stoffet er gennem huden, og i hvor stor udstrækning stoffet frigives ved fordampning fra vandet. Der bør derfor i konkrete tilfælde (stoffer med høj hudgennemtrængelighed og stoffer med høj flygtighed fra vandfasen), tages højde for disse bidrag ved fastsættelse af drikkevandskvalitetskriteriet, således at den samlede optagelse via drikkevand og badevand ikke overskrider den del af TDI, som er allokeret til drikkevand.

Der er ikke opstillet konkrete modeller for beregningen af sådanne bidrag, hvorfor bidragene må vurderes fra sag til sag under inddragelse af de data og de vurderinger, der er foretaget for det konkrete stof.

Lugt, smag, udseende

Drikkevandet må ikke lugte, smage eller syne forurenet og smag, lugt og udseende af drikkevandet har en væsentlig betydning, også selv om det ikke udgør en sundhedsfare i relation til indtagelse af drikkevand.

Det vil i nogle tilfælde være lugt, smag, eller udseende, og ikke stoffets sundhedsmæssige effekter, der er bestemmende for værdien af drikkevandskvalitetskriteriet.

Lugt- og smagsgrænser, der findes opgivet i litteraturen, kan variere voldsomt selvom de forskellige undersøgelser er udført med samme stof. Dette skyldes, at metoder kan variere meget alt efter hvor, og hvornår de er blevet foretaget.

Medmindre lugt- og smagsgrænsen er bestemt ud fra nye og meget velbeskrevne metoder, hvor kvalitet og pålidelighed af undersøgelsen kan vurderes, anbefales det, at fastsættelse af drikkevandskvalitetskriterier på baggrund af lugt og smag foretages ud fra bestemmelse af lugt- og smagsgrænse foretaget af et akkrediteret laboratorium.

Udgangspunktet for fastsættelse af et lugt- og smagsbaseret kvalitetskriterium bør være et nul-effekt-niveau (NOEL) i testpanelet, dvs. den koncentration hvor testpanelet som helhed ikke kan lugte eller smage stoffet.

Ofte angives lugt- og smagsgrænser i vand på tilsvarende måde som lugtgrænse i luft, dvs. det niveau, hvor 50 % af et testpanelet kan lugte/smage stoffet. Angives således lugtgrænsen i den tilgængelige litteratur som 50 %-grænsen ganges denne værdi med 1/3 (som beskrevet under luftkvalitetskriteriet), idet anvendelse af en sådan faktor skønnes at sikre, at kun en mindre andel af befolkningen vil kunne fornemme stoffet ved dette niveau.

Bilag 1

Kvantitativ vurdering ved benyttelse af T25 ekstrapolationsmetoden.

Anbefaling af T25-metoden

Der er udviklet forskellige metoder til beregning af, hvor stor en risiko for udvikling af svulster en given eksponering for et genotoksisk kræftfremkaldende stof udgør. Ens for dem alle er at der anvendes en form for statistisk ekstrapolation fra dosisniveauer med kendte eksperimentelle værdier til de som regel meget lavere dosisniveauer, der oftest er relevante i relation til den generelle befolknings eksponering for kemiske stoffer i miljøet. Metoderne beskriver relationen mellem den administrerede daglige dosis (eller koncentration) og den resulterende hyppighed af svulster.

Som anført i afsnit 5.3.2. anbefales det at anvende T25-ekstrapolering som beskrevet i en baggrundsrapport udarbejdet af en arbejdsgruppe i forbindelse med EU´s risikovurderingsarbejde (EU-Commission 1999).

T25-metoden er blevet evalueret ved at sammenligne resultater opnået ved denne metode med resultater opnået ved anvendelse af US EPA´s LMS-metode (Linearised Multistage Model) og ved LED_{10} metoden, hvor der foretages lineær ekstrapolation ned i lavdosisområdet ud fra en benchmark-dosis på 10 % effektniveau (se afsnittene 5.3.2-4 i Miljøprojekt Nr. 974 (2005)). Ved gennemgang af resultaterne for lavdosis-estimaterne vurderede man at de er sammenlignelige.

Ved sammenligning af one-hit metoden og T25-metoden vurderes de at medføre sammenlignelige værdier, idet udgangspunktet for begge vurderingerne i princippet er at anvende laveste dosis med signifikant respons, og herfra

foretage lineær ekstrapolation ned i lavdosisområdet. I T25-metoden divideres med en skaleringsfaktor fra dyr til menneske opløftet i ¼ (sv.t. skalering i forhold til stofskiftet), mens tilsvarende skaleringsfaktor i one-hit metoden er opløftet til 1/3 (sv.t. skalering i forhold til overfladeareal). Dette forhold alene vil maksimalt bevirke en forskel på de to metoder på ca. en faktor 2.

Anvendelse af T25-metoden

T25 defineres som den kroniske dosis (enhed: mg/kg legemsvægt per dag), som vil give 25 % af forsøgsdyrene svulster i et specifikt væv, efter korrektion for den spontane hyppighed, inden for den standardiserede levetid af den pågældende art.

T25 beregnes med udgangspunkt i et langtidscancerstudie, hvor den laveste dosis, der giver en signifikant forøgelse af forsøgsdyr med svulster i et specifikt væv, som udgangspunkt anvendes ved beregningen af T25. Forekomsten af ondartede og godartede svulster sammenlægges, når de godartede svulster må mistænkes for at kunne udvikles til ondartede. Hvis der er en højere hyppighed ved en højere dosis, der giver en lavere T25, anvendes sidstnævnte, med mindre der er særlige begrundelser for ikke at tage udgangspunkt i denne. Hvis der er flere data- sæt, beregnes T25 for det mest relevante datasæt. Hvis forskellige datasæt giver T25-værdier, som ligger inden for et relativt snævert interval, anvendes gennemsnittet af disse T25-værdier. Hvis sidstnævnte procedure ikke anvendes, skal rationalet for anvendelse af en anden procedure begrundes nøje.

Beregning af T25 foretages ved at gange dosis D (mg/kg lgv/dag), hvor signifikant forøget antal svulster forekommer med faktoren 0,25/p, hvor p er den aktuelle hyppighed af svulster: $T25 = D \times 0{,}25/p$.

Ud fra denne T25 foretages lineær ekstrapolation ned i lavdosisområdet, idet dosis svarende til et givent risikoniveau beregnes ved simpel forholdsregning. En gennemsnitlig daglig dosis svarende til en øget livstidsrisiko på 10^{-6} kan således beregnes på følgende måde:

$$Dosis_{(10\text{-}6\ livstidsrisiko)} = 10^{-6} / 0{,}25 \times T25\text{-dosis}$$

Imidlertid indgår der i beregningerne også dosiskorrektion med baggrund i en skaleringsfaktor mellem dyr og mennesker, og en faktor som angiver andelen af dyrenes levetid, hvor eksponeringen har fundet sted.

Konkret kan TDI svarende til en 10^{-6} livstidsrisiko beregnes ud fra følgende formel, når T25 er beregnet ud fra forsøg med oral eller dermal eksponering hos dyr:

$$TDI = \frac{I_t \times [L_e / L]^2 \times [(T25 \times l_e) / L_e]}{0{,}25 \times [W_h / W_a]^{0,25}}$$

I_t: Den tolerable livstidsrisiko (10^{-6}).
L_e: Den aktuelle levetid for dyrene.
L: Den teoretiske gennemsnitslængde af levetiden for dyrene.
T25: Beregnet daglig dosis (mg/kg legemsvægt per dag), der medfører en 25% forøget forekomst af tumorer hos forsøgsdyrene.
l_e: Eksponeringstid.
$[W_h / W_a]^{0,25}$: Dosiskorrektion på basis af stofskifte
hvor
W_h: Menneskets vægt i kg (sættes oftest til 70 kg).
W_a: Gennemsnitsvægt af det pågældende forsøgsdyr (kg).

L, L_e l_e:
Hvis eksponeringsvarigheden er kortere end standardlevetiden for den pågældende art, eller hvis studiet afsluttes inden standardlevetiden, foretages dosiskorrektion, som beskrevet i den anførte formel. Standardlevetiden for mus, rotter og hamstre sættes med mindre andet er angivet for den specifikke stamme til 24 måneder.

Dosis (T25)
Når konkrete data ikke specifikt angiver dyrenes legemsvægt, og dosis i mg/kg lgv/d i forbindelse med dosering gennem foder eller drikkevand, anvendes følgende værdier i beregningen:

Dyreart	Legemsvægt (kg)	Indtagelse af foder (g/kg/dag)	Indtagelse af drikkevand (ml/kg/dag)
Rotte	0,10 (ung) 0,40 (ældre)	100 50	 75
Mus	0,020	150	-
Marsvin	0,75	40	-
Kanin	2,0	30	-
Hund	10,0	25	-
Abe	5,0	50	-

$(W_h/W_a)^{0,25}$

Er stoffet givet oralt eller dermalt , foretages der en dosiskorrektion for forskelle i kropsstørrelse mellem dyr og mennesker ved at omregne T25 til den tilsvarende humane dosis i mg/kg lgv./dag ved allometrisk skalering på basis af stofskiftet (afsnit 4.4.1.2). Denne skalering opnås ved at dividere T25-dosis med faktoren $(W_h/W_a)^{0,25}$

Ved beregning ud fra inhalationsundersøgelse beregnes den tolerable indåndingskoncentration TC ved anvendelse af formlen:

$$TC = \frac{I_t \times [L_e / L]^2 \times [(T25 \times l_e) / L_e]}{0{,}25}$$

I_t: Den tolerable livstidsrisiko (10^{-6}).
L_e: Den aktuelle levetid for dyrene.
L: Den teoretiske gennemsnitslængde af levetiden for dyrene.
T25: Beregnet daglig dosis (mg/m³ i indåndingsluften), der medfører en 25% forøget forekomst af tumorer hos forsøgsdyrene.
l_e: Eksponeringstid.

Ved indsættelse af T25 anvendes koncentration i indåndingsluften og der foretages sædvanligvis omregning til en gennemsnitligt indåndingskoncentration , hvis forsøget ikke er udført med kontinuerlig eksponering. Dette gøres ved at korrigere for antal timer pr. dag og antal dage pr. uge hvor eksponeringen har fundet sted.

Bilag 2

Baggrund for anvendte eksponeringsværdier ved beregning af kvalitetskriterier

I denne vejledning ændres praksis med hensyn til de eksponeringsværdier, der anvendes ved beregning af kvalitetskriterierne for kemikalier.

Tidligere har man i forbindelse med beregning af jordkvalitetskriterier som udgangspunkt antaget, at et barn dagligt indtager 0,2 g jord/d (0,0002 kg/d), mens man ved beregning af luftkvalitetskriterier har anvendt et scenarie, hvor en voksen person dagligt indånder 20 m^3 luft. Ved beregning af kvalitetskriterier for kemikalier i drikkevand har udgangspunktet været et dagligt indtag på 2 liter vand for en voksen.

Børn
Beskyttelse af børn er de senere år i stigende grad kommet i fokus, og det har i den forbindelse været debateret i hvilken udstrækning kvalitetskriterier beregnet ud fra voksnes udsættelse i tilstrækkeligt omfang beskytter børn, da børn i forhold til deres legemsvægt generelt indtager/ indånder en større mængde drikkevand/ luft.

I miljøprojekt nr. 589 "Children and the unborn child – exposure and susceptibility to chemical subtances-" fra 2001, blev der foretaget en detaljeret gennemgang af børns særlige følsomhed og udsættelsesmønster i forbindelse med miljøforureninger og kemiske stoffer. I miljøprojektet konkluderes, at der ved fremtidig fastsættelse af kvalitetskriterier for kemikalier bør tages udgangspunkt i eksponeringsværdier for børn, for at opnå at børn er fuldt omfattet af det beskyttelsesniveau, kvalitetskriteriet repræsenterer. Denne vejledning indarbejder således ønsket om, at principperne for fastsættelse af kvalitetskriterier tager hensyn til børns særlige udsættelse.

Børns udsættelse vil således være udgangspunktet for de fremtidige standardværdier for eksponering i forbindelse med jord, luft og drikkevand.

Standardværdien for børns legemsvægt vil i fremtiden være 13 kg.

Særligt udsatte undergrupper
Almindelig biologisk variation og forskellige former for adfærd vil betyde, at nogle grupper vil være mere udsatte end andre for en given påvirkning via miljøet. Der er således også med denne vejledning taget stilling til, i hvilken udstrækning kvalitetskriterier/grænseværdier for kemikalier skal tage hensyn til de mere udsatte grupper i befolkningen.

Når kvalitetskriterier for kemikalier beregnes ved at anvende eksponeringsværdier, der svarer til befolkningsvægtede gennemsnitsværdier eller medianværdier, betyder dette, at ca. halvdelen af den befolkning, som kvalitetskriteriet skal søge at beskytte, vil kunne blive udsat for *større* eksponering end udgangspunktet for beregningen (fx en TDI-værdi). Hvis sigtet med et kvalitetskriterium er, at størstedelen af befolkningen skal være omfattet at det ønskede beskyttelsesniveau, vil det således være nødvendigt at anvende en øvre fraktilværdi for befolkningens udsættelse.

Det skal nævnes, at de standardværdier der hidtil har været anvendt for børn (jord) og voksne (luft og drikkevand) jf. beskrivelsen af eksponeringsværdier, svarer til sådanne øvre percentilgrænser.

Kvalitetskriterier for kemikalier skal fortsat sigte mod at beskytte flertallet af befolkningen, dvs. også de mere udsatte undergrupper. I de tilfælde hvor befolkningsfordelingen af eksponeringerne kendes, vil valg af øvre eksponeringsværdier typisk kunne foretages ved at tage udgangspunkt i værdier svarende til 90- eller 95-percentilerne.

For at sikre særligt udsatte grupper anvendes følgende principper :

a) I situationer, hvor man ved beregning af kvalitetskriteriet har tildelt hele TDI-værdien, hovedparten eller der er eksakt

viden om størrelsen af udsættelsen via det aktuelle medie, vil det være nødvendigt at anvende øvre percentilgrænser for eksponering. Herved sikres at kun en mindre andel af befolkningen vil blive eksponeret over TDI-niveau.

b) *I andre tilfælde, hvor der anvendes en reduceret TDI-værdi som følge af anvendelse af en allokeringsfaktor (evt. en særlig reduktionsfaktor), anvendes derimod medianværdier for udsættelse med mediet. Dette forhold begrundes med, at anvendelse af en allokeringsfaktor eller reduktionsfaktor sædvanligvs betyder anvendelse af runde værdier (10 % eller 1% af TDI), som ofte vil være på "den sikre side". I sådanne tilfælde, hvor der i forvejen er indbygget en øget grad af sikkerhed, vil det ikke være påkrævet også at anvende en øvre percentilværdi for eksponering. Anvendelse af en medianværdi vurderes her, at kunne opfylde målet om at beskytte størstedelen af befolkningen.*

c) *For kræftremkaldende stoffer uden tærskelværdi for effekt foretages som tidligere nævnt ingen allokering af TDI. I disse tilfælde anvendes medianværdier for eksponering ved beregning af kvalitetskriteriet, idet TDI-værdien repræsenterer en daglig dosis for en befolkningsvægtet gennemsnitlig livstidsrisikoforøgelse (en ekstrarisiko på 1 ud af 1 million udsatte over livstid), hvorfor en gennemsnits-/medianværdi for befolkningens udsættelse må være udgangspunktet.*

Luft, daglig standardeksponering

I forbindelse med valg af standardeksponering for luft tages der udgangspunkt i afsnit 6.1.1 i Miljøprojekt Nr. 974 (2005). I dette afsnit vurderes US EPA´s eksponeringsvurderinger at udgøre det bedste grundlag. I EU´s risikovurderingprogram for kemiske stoffer henvises ligeledes til de amerikanske værdier.

Uddrag af tabel 6.1.1

Alder	Legemsvægt (kg)	V_R – gennemsnit (m^3/dag)	V_R – inaktiv[a] (m^3/dag)	V_R - aktiv (m^3/dag)
Børn:				
Under 1 år	7.6	4.5	2.35	6.35
1 – 2 år	13	6.8	4.16	9.15

3 – 5 år	18	8.3	4.98	10.96
6 – 8 år	26	10	5.95	13.09

V_R = Respirations Volumen som henholdsvis gennemsnit, inaktivitet og aktivitet.

Værdierne er alders- og kønsopdelte, men angivelserne omfatter ikke spredningen (fordelingen) i de enkelte aldersgrupper. Det er således ikke ud fra de forliggende data muligt at aflæse en 90- eller 95 percentilværdi for eksponeringen af de forskellige aldersgrupper.

Som ovenfor nævnt vil der ved fastsættelsen af luftkvalitetskriterier blive taget hensyn til eksponeringen af børn.

Fra tabellen ses, at børn under 1 år i gennemsnit over et døgn indånder 4,5 m^3 svarende til 0,59 m^3/kg lgv/dag, mens børn i aldersgruppen 1-2 år og 3-5 år indånder henholdsvis 6,8 m^3 og 8,3 m^3 (svarende til henholdsvis 0,52 og 0,46 m^3/kg lgv/dag). Især de 1-5 årige må anses at være udeaktive.

På denne baggrund vil der ved beregning af luftkvalitetskriterier fremover blive anvendt en standardværdi for 1-5 årige børn på 0,5 m^3 luft/ kg lgv.

Til sammenligning kan nævnes at luftkvalitetskriteriet hidtil er blevet beregnet ud fra et dagligt indåndingsvolumen på 0,3 m^3/ kg lgv., idet udgangspunktet her var en voksen person (70 kg), der dagligt indåndede 20 m^3 luft.

Jord, daglig standardeksponering

Miljøprojekt Nr. 974 (2005) sammenfatter i afsnit 6.1.2 den seneste viden med hensyn til børns udsættelse for jord samt anfører forskellige organisationers vurdering.

Ud fra en sammenfattende vurdering kan følgende eksponeringsværdier for børn opstilles:

Eksponeringsvej	Eksponeringsværdi
Oralt, maksimum enkeltindtag	10 g

Oralt, dagligt gennemsnit	0,1 g/d
Oralt, 95-percentil	0,2 g/d
Hudkontakt, dagligt gennemsnit	1 g/d
Hudkontakt, maksimum	10 g/d

For børns indtag gennem munden fastsættes jordkvalitetskriteriet for akut toksiske stoffer ud fra et enkeltindtag på 10 g jord.

I tilfælde, hvor hele TDI eller hovedparten af TDI anvendes til beregning af jordkvalitetskriteriet, tages der specifikt hensyn til særligt udsatte børn, idet der ved beregning af jordkvalitetskriteriet tages udgangspunkt i 95-percentilen for udsættelse dvs. 0,2 g jord/d for herved at minimere risikoen for at overskride TDI-værdien.

I andre tilfælde, hvor der kun anvendes en mindre del af TDI-værdien til jordkvalitetskriteriet, anvendes ved beregningen af jordkvalitetskriteriet 0,1 g jord/d som et gennemsitligt standardindtag.

For kræftfremkaldende stoffer, hvor TDI svarer til en gennemsnitlig 10^{-6} livstidsrisikodosis blandt børn, anvendes 0,1 g jord/dag som udgangspunkt for beregning af jordkvalitetskriteriet.

Drikkevand, daglig standardeksponering

I Miljøprojekt Nr. 974 (2005) i afsnit 6.1.3 gennemgås viden om forskellige aldersgruppers indtagelse af drikkevand, idet indtagelse både opgives for forskellige aldersgrupper og fordelingen inden for disse (gennemsnitsværdier og 90-/95 percentiler). Beskrivelse i baggrundsrapporten omfatter vurdering og anbefalingerne fra US EPA´s Exposure Factors Handbook.

Baggrundsrapporten henviser i forbindelse med børns indtag af drikkevand til tabel 6.1.3 D, der angiver US EPA´s anbefalede værdier:

Alder	Gennemsnit (mean)	50 Percentil	90 Percentil	95 percentil

Under 1 år	0,30 liter/dag 44 ml/kg/dag	0,24 liter/dag 35 ml/kg/dag	0,65 liter/dag 102 ml/kg/dag	0,76 liter/dag 127 ml/kg/dag
Under 3 år	0,61 liter/dag		1,5 liter/dag	
3 – 5 år	0,87 liter/dag		1,5 liter/dag	
1 – 10 år	0,74 liter/dag 35 ml/kg/dag	0,66 liter/dag 31 ml/kg/dag	1,3 liter/dag 64 ml/kg/dag	1,5 liter/dag 79,4 ml/kg/dag

For spædbørn angives medianindtaget at være 35 ml/ kg lgv/d mens 95-percentilen angives at være på 127 ml/ kg lgv/d. For børn i aldersgruppen 1-10 år anføres tilsvarende en medianværdi på 31 ml/kg lgv./d og en 95-percentil på 79,4 ml/kg lgv./d.

Som standardværdi vurderes det mest relevant at anvende værdien for 1-10 årige børn, idet evt. forskelle i vaner m.h.t. amning i USA og Danmark kan have stor indflydelse på drikkevandsindtagelse for spædbørn. Endelig dækker TDI-begrebet alene moderens direkte eksponering og derved barnets indirekte udsættelse gennem modermælken, og TDI er således ikke formelt set beregnet til at dække spædbarnets direkte udsættelse. Gennemsnitligt er indtagene dog direkte sammenlignelige.

Ved beregning af drikkevandskvalitetskriteriet, hvor der ved en given forureningskomponent er foretaget en allokering på 100 % eller hovedparten af TDI til drikkevandet, eller i situationer hvor den kritiske effekt er en akut toksisk effekt, anvendes 95-percentilværdien for 1-10 årige børns indtag, dvs. et dagligt indtag på 0,08 liter/ kg lgv/d. I disse situationer, vil drikkevandskvalitetskriteriet således også omfatte spædbørns direkte udsættelse, idet dette også afspejler indtaget for børn under 1 år, som har en høj direkte udsættelse.

Ved beregning i andre situationer, hvor der er foretaget en allokering på en mindre del af TDI til drikkevandskvalitetskriteriet (eller der er anvendt en reduktionsfaktor) anvendes medianværdien for 1-10-åriges forbrug af drikkevand sv.t. 0,03 liter/ kg lgv/d. Allokeringen vil også betyde at spædbørns direkte udsættelse er omfattet af kvalitetskriteriet.

For kræftfremkaldende stoffer, hvor TDI svarer til en gennemsnitlig 10^{-6} livstidsrisikodosis blandt børn, anvendes

0,03 liter/ kg lgv/d som udgangspunkt for beregning af drikkevandskvalitetskriteriet.

Acknowledgements

This report has been prepared by the European Environment Agency (EEA) with substantial contributions from many external authors. The EEA is particularly grateful to those authors who wrote the case study chapters.

Originator of the *Late lessons from early warnings* project at the EEA was David Gee.

Acknowledgement is given to the editorial team: David Gee, Philippe Grandjean, Steffen Foss Hansen, Sybille van den Hove, Malcolm MacGarvin, Jock Martin, Gitte Nielsen, David Quist and David Stanners.

The EEA also thanks advisory board members who have contributed their experience to the project over many years: Joan Martinez Alier, Philippe Bourdeau, Sylvaine Cordier, Sven Dammann, Michael Depledge, Frans Evers, Silvio Funtowicz, Thomas Jakl, Martin Krayer von Krauss, Owen McIntyre, Jerome Ravetz, Nicolas de Sadeleer, László Somlyódy, Sofia Vaz and Theo Vermeire.

Production support: Mike Asquith, John James O'Doherty, Peter Saunders, Pia Schmidt and Bart Ullstein.

Contributing authors**:** Jeroen Aerts, Maria Albin, Mikael Skou Andersen, Iulie Aslaksen, Anders Baun, Constança Belchior, Henk van den Berg, Lisa A. Bero, Keith Beven, Eula Bingham, Riana Bornman, Henk Bouwman, Diana M. Bowman, Sarah Brunel, Michael Carlberg, Argelia Castaño, Barry Castleman, David Owain Clubb, Charlie Clutterbuck, Carl Cranor, Paul Dorfman, Eladio Fernández-Galiano, Gary Fooks, Aleksandra Fucic, Silvio Funtowicz, David Gee, Piero Genovesi, Andreas Gies, Anna Gilmore, Philippe Grandjean, Hartmut Grassl, Tee L. Guidotti, Nigel Haigh, Steffen Foss Hansen, Mazazumi Harada, Lennart Hardell, Jack A. Heinemann, Vernon H. Heywood, Sybille van den Hove, James Huff, Susan Jobling, Bill Kovarik, Christoph Kueffer, Zbigniew W. Kundzewicz, Henrik Kylin, Malcolm MacGarvin, Laura Maxim, Andrew Maynard, Jacqueline McGlade, Owen McIntyre, Marc Le Menestrel, Bert Metz, David Michaels, Erik Millstone, Celeste Monforton, Anne I. Myhr, Herbert Needleman, Joy Onasch, Richard Owen, David Ozonoff, Andrew R.G. Price, David Quist, James W. Readman, Johnny Reker, David M. Richardson, Julian Rode, Christina Rudén, Jennifer Beth Sass, Richard Schmuck, Noelle E. Selin, Jeroen van der Sluijs, Katherine Smith, Morando Soffritti, Ana M. Soto, Hans von Storch, Stephen Thomas, Joel A. Tickner, Klement Tockner, Toshihide Tsuda, Pier Vellinga and Takashi Yorifuji.

Case study chapters have been peer reviewed from a broad range of perspectives. The EEA would like to thank all institutions and experts who have given so generously of their time and knowledge during the peer review process.

The EEA would also like to thank Domingo Jiménez Beltrán, Philippe Bourdeau, Jane Keys, Malcolm MacGarvin, Andy Stirling and Brian Wynne for being continuing sources of inspiration and ideas throughout the process of producing both volumes of *Late lessons from early warnings.*

The EEA would like to remember, with great appreciation Poul Harremöes, chairman of the editorial team for *Late lessons from early warnings* Volume 1, and Masazumi Harada, co-author of Chapter 5 on Minamata disease, who worked throughout his career on mercury pollution.

Preface

An investment in knowledge pays the best interest
— Benjamin Franklin '*The Way to Wealth*' (1758).

There is something profoundly wrong with the way we are living today. There are corrosive pathologies of inequality all around us — be they access to a safe environment, healthcare, education or clean water. These are reinforced by short-term political actions and a socially divisive language based on the adulation of wealth. A progressive response will require not only greater knowledge about the state of the planet and its resources, but also an awareness that many aspects will remain unknown. We will need a more ethical form of public decision-making based on a language in which our moral instincts and concerns can be better expressed. These are the overall aims of Volume 2 of *Late lessons from early warnings*.

Volume 1 of *Late lessons from early warnings* was published at a time when the world was experiencing an economic slowdown, China had joined the World Trade Organization and western Europe was still a 15-member Union. Global grain production had declined for the third time in four years due mainly to droughts in North America and Australia, and the world saw major recalls of contaminated meat, foot and mouth disease and bovine spongiform encephalopathy (mad cow disease). Global temperatures continued to climb and many bird populations were in decline, but the United States of America had rejected the Kyoto Protocol. We were seeing ourselves through the lens of the first human genome sequence, yet we were trying to manage chemicals known to be harmful to humans and ecosystems, through international conventions and treaties such as the Basel Convention to deal with toxic waste dumping in the developing world; the OSPAR/HELCOM Conventions to reduce the discharges, emissions and the loss of hazardous substances into the sea and the Montreal Protocol, to phase out ozone-depleting substances. The destruction of the World Trade Center had just happened.

Since then, we have witnessed a period of extraordinary hubris. Most visibly, the financial profligacy of the first decade of the century led inexorably to the crises of 2007–2009 whereby the major components of the international financial system were weakened to the extreme by indebtedness, mispriced products, lax monetary policies and mis-engineered protection against risks and uncertainty. The world experienced more not less volatility. Political systems became silted up by vested interests and a determination by citizens to protect assets accumulated in easier times, and beneath it all lay a deeper environmental crisis epitomised by climate change and biodiversity loss.

There was also a collapse of trust, not only in financial institutions but in big companies, as they abandoned staff, pensions and health care schemes. Recent evidence from social psychology has shown that despite rising levels of education and innovation in products and services, people trust only those they know and not strangers. As Stephen Green said in *Good value: reflections on money, morality, and an uncertain world* in 2009:

> 'There has been a massive breakdown of trust: trust in the financial system, trust in bankers, trust in business and business leaders, trust in politicians, trust in the media, trust in the whole process of globalisation — all have been severely damaged, in rich countries and poor countries alike'.

The scientific elites have also been slowly losing public support. This is in part because of the growing number of instances of misplaced certainty about the absence of harm, which has delayed preventive actions to reduce risks to human health, despite evidence to the contrary.

Suddenly, our problems have grown into what Charles W. Churchman in 1967 termed *wicked problems* — difficult or impossible to solve because of incomplete, contradictory and changing requirements, difficult to recognize, resistant to resolution because of the complexity of their interdependencies and needing to be tackled not by one but via many forms of social power. Solving

them requires a new combination of hierarchical power, solidarity and individualism.

What could this mean, for example, for the 100 thousand chemicals currently in commercial use?

To begin with we have more conventions and treaties in place than a decade ago: the 2004 Rotterdam Convention on the Prior Informed Consent (PIC) Procedure covering international trade of 24 pesticides, four severely hazardous pesticide formulations and 11 industrial chemicals; the 2004 Stockholm Convention on Persistent Organic Pollutants to protect human health and the environment from substances which are highly toxic, persistent, bio-accumulative and move long distances in the environment, such as DDT, PCBs, various industrial chemicals, and a set of unintentional chemical by-products such as dioxin. But these conventions only address the top-down hierarchical approach to power.

At the same time Europe has put in place legislation to achieve a global regulatory influence including the EU Cosmetic Directive banning the use of chemicals known or strongly suspected of being carcinogens, reproductive toxins, or mutagens causing cancer, mutation or birth defects; the EU Restriction of Hazardous Substances Directive, which restricts the use of hazardous materials in the manufacture of various types of electronic and electrical equipment including lead, mercury, cadmium, hexavalent chromium, the flame retardents polybrominated biphenyls and polybrominated diphenyl ethers, and which encourages the substitution to safe/or safer alternatives in the electric and electronic equipment industry; the closely linked 2006 EU Waste Electrical and Electronic Equipment Directive for collection, recycling and recovery of electrical goods; the 2006 Strategic Approach to International Chemicals Management (SAICM); and the 2007 EU Registration, Evaluation and Authorisation of Chemicals, widely known as REACH, to assign greater responsibility to industry to manage the risks from chemicals and to provide safety information on substances. The effects of these regulatory tools are described in different chapters, but once again point to the main economic actors rather than communities or individuals.

One thing that has become clearer over the past decade is that certain chemical substances are highly stable in nature and can have long-lasting and wide ranging effects before being broken down into a harmless form. The risk of a stable compound is that it can be bio-accumulated in fatty tissues at concentrations many times higher than in the surrounding environment. Predators, such as polar bears, fish and seals, are known to bio-magnify certain chemicals in even higher concentrations with devastating consequences for both humans and ecosystems. So exposure to toxic chemicals and certain foodstuffs are at risk of causing harm, especially to vulnerable groups such as foetuses in the womb or during childhood when the endocrine system is being actively built. Even with small dose exposures, the consequences can in some instances be devastating with problems ranging from cancer, serious impacts on human development, chronic diseases and learning disabilities. Here the power to act could be more properly set by well-informed individuals and communities.

The relationship between knowledge and power lies at the heart of Volume 2. In many chapters, the implicit links between the sources of scientific knowledge about pollutants, changes in the environment and new technologies, and strong vested interests, both economic and paradigmatic, are exposed. A number of authors also explore in greater depth, the short-sightedness of regulatory science and its role in the identification, evaluation and governance of natural resources, physical and chemical hazards. By creating a better understanding of these normally invisible aspects, it is hoped that this volume will enable communities and people to become more effective stakeholders and participants in the governance of innovation and economic activities in relation to the associated risks to humans and the planet.

Much of what we are able to learn from the histories of past environmental and public health mistakes is also directly applicable to the better regulation and governance of global institutions and financial and economic risks. Robin G. Collingwood argued in his *Autobiography* (1939), that:

> 'History can offer something altogether different from [scientific] rules, namely insight. The true function of insight is to inform people about the present…we study history in order to see more clearly into the situation in which we are called upon to act… the plane on which, ultimately, all problems arise is the plane of 'real' life: that to which they are referred for their solution is history.'

In this volume, we go further. Whilst still drawing lessons from such widely accepted tragedies as leaded petrol, mercury poisoning in Japan's

Minamata Bay and older pesticides which sterilised many men who used it, we have ventured into the uncertainties of potential yet contested harm, from genetically modified products; nanotechnologies; chemicals such as Bisphenol A; new pesticides and mobile phones. There is also an examination of the 80 or so potential 'false positives' where there had been indications of harm but where it was subsequently claimed that there were in fact no risks to prevent: these cases too can provide information that can help to improve future decision-making about innovation and emerging technologies.

A major part of effective decision-making lies in the way issues are framed. In the case of climate change, the first order question is whether it is worth worrying about at all. US Vice President Al Gore chose to make the question a matter of choice between believers and sceptics. However, problems arose when the public was asked to make a scientific decision when too few people had the qualifications to make any kind of reasoned judgement. They were in fact asked to make a false choice. Instead the question should have been framed around which areas should people and governments make decisions and which should be delegated to experts.

In the end there are few certain and enduring truths in the ecological and biological sciences, nor in the economics, psychologies, sociologies and politics that we use to govern them. One, however, comes from the work of Elinor Ostrom, a late and widely missed colleague, who showed from her work on managing fisheries and ecosystems that complex problems can be solved if communication is transparent and open, visions are shared, trust is high and communities are activated to work from the bottom-up as well as from the top down.

As we navigate the Anthropocene, the epoch named in recognition of our impact on the planet, we will need to encourage more people to become involved in solving the wicked problems of our times. Whether through gathering local information or becoming more aware of the many uncertainties and unpredictabilities in our surroundings, the power structures of knowledge will need to change. And if we are to respond more responsibly to the early warning signals of change, we will need to re-design our style of governance to one which reflects a future defined by the local and specific rather than only the global and the average. We hope that Volume 2 of *Late lessons from early warnings* with its many lessons and insights can help us all meet such a challenge.

Professor Jacqueline McGlade,
Executive Director

1 Introduction

Why further late lessons from early warnings?

The 2013 *Late lessons from early warnings* report is the second of its type produced by the European Environment Agency (EEA) in collaboration with a broad range of external authors and peer reviewers.

Volume 1 of *Late lessons from early warnings: the precautionary principle 1896–2000* published in 2001, looked at the history of a selection of occupational, public health and environmental hazards and asked whether we could have been better at taking action early enough to prevent harm. Twelve key lessons for better decision-making were drawn from cases where public policy was formulated against a background of scientific uncertainty and 'surprises' — and where clear evidence of hazards to people and the environment was often ignored (see box on page 11).

The 14 case studies and 12 key lessons from the 2001 report remain highly pertinent today, and underline four main reasons for a second report. The first relates to expanding the late lessons approach to consider long-known, important additional issues with broad societal implications such as lead in petrol, mercury, environmental tobacco smoke and DDT, as well as issues from which lessons have emerged more recently such as the effects of the contraceptive pill on feminisation of fish and the impacts of insecticides on honeybees.

The second concerns filling an acknowledged gap in the 2001 report, by analysing the issue of false positives where government regulation was undertaken based on precaution but later turned out to be unnecessary. Most of the cases examined in the *Late lessons from early warnings* reports are 'false negatives' — instances where early warnings existed but no preventive actions were taken.

The third reason is to address the rapid emergence of new society-wide challenges such as radiation from mobile phones, genetically-modified products, nanotechnologies and invasive alien species as well as if, how and where precautionary actions can play a role.

The final reason relates to how precautionary approaches can help manage the fast-changing, multiple, systemic challenges the world faces today, what new insights can be drawn in this context and how these can underpin opportunities for sustainable innovations and, supported by information technologies, greater public participation in their selection.

Overall approach

As for Volume 1, the approach in Volume 2 has been to include a wide range of relevant case studies produced by external authors along with chapters written by members of the report's editorial team (see acknowledgements section for details). The relevant topics for case study treatment were selected on the basis of advice from the editor, in collaboration with the editorial team and an advisory board, members of the EEA Scientific Committee and the Collegium Ramazzini ([1]).

The chapters in Volume 2 are grouped into five parts: A. Lessons from health hazards; B. Emerging lessons from ecosystems; C. Emerging issues; D. Costs, justice and innovation; and E. Implications for science and governance.

The chapters have been written by authors who, to varying degrees, have had substantial involvement in the subject area being addressed. Indeed they would not have been approached if

([1]) The Collegium Ramazzini is an independent, international academy founded in 1982 by Irving J. Selikoff, Cesare Maltoni and other eminent scientists. Its mission is to advance the study of occupational and environmental health issues and to be a bridge between the world of scientific discovery and the social and political centers, which must act on the discoveries of science to protect public health.

they had not already extensively studied the case that they were asked to write about. All of them, as respected experts in their fields and in line with their professional scientific training, were expected to be as objective as possible in answering the questions put to them by EEA. To support this, and to develop consistency between chapters, the authors were provided with seven structuring questions to be followed when building their chapter.

The case studies have been peer-reviewed by recognised experts in the respective fields who gave of their time freely and provided their feedback within a set of editorial guidelines provided by the EEA.

Scope

The report has been designed, structured and written in order to, inter alia, help politicians, policymakers and the public to:

i understand better the ways in which **scientific knowledge** is financed, created, evaluated, ignored, used and misused in taking timely and precautionary decisions about how to reduce harms, whilst stimulating benign innovations and generating useful employment;

ii learn from some **very expensive 'mistakes' in the past** so as to help societies make fewer mistakes now, and in the future, especially with some of the relatively new, largely unknown, yet already widespread technologies like nanotechnology and mobile phones;

iii be aware of less visible, important factors such as the skewed ways in which the **costs of actions and inactions** for hazardous technologies have been estimated, and the role that **some businesses** have played in ignoring early warnings and in manufacturing doubt about the science supporting such warnings;

iv consider how the law, or administrative arrangements, could be better used to deliver **justice, to those people (and ecosystems) that have been, or could be, harmed** by poorly designed, or badly deployed, innovations;

v explore how best to **engage the public** in helping to make **strategic choices over innovations**, and their technological and social pathways, as well as their involvement in **ecosystems management** and in long term monitoring through **citizen science**.

Part A of the report commences with an analysis of 'false positives' showing that these are few and far between as compared to false negatives and that carefully designed precautionary actions can stimulate innovation, even if the risk turns out not to be real or as serious as initially feared. The remaining nine chapters address false negatives — lead in petrol, perchlorethylene contaminated water, Minamata disease, occupational beryllium disease, environmental tobacco smoke, vinyl chloride, dibromochloropropane (DBCP), Bisphenol A and dichlorodiphenyltrichlorethane (DDT) — from which three common themes emerge: there was more than sufficient evidence for much earlier action; slow and sometimes obstructive behaviour by businesses whose products endangered workers, the public and the environment; and the value of independent scientific research and risk assessments.

Part B focuses on emerging lessons from the degradation of natural systems and their wider implications for society — booster biocides, the pill and the feminisation of fish, climate change, floods, insecticides and honeybees as well as ecosystem resilience more broadly. It considers, like its predecessor, the issues of scientific evidence as the basis for action/inaction, the multiple, often complex factors and feedback loops in play, many of which are not fully understood, as well as the interfaces between science, policy and society and how all actors can move together towards necessary actions in the context of heightened systemic risks, and substantial unknowns.

Part C analyses some newly emerging and large-scale products, technologies and trends, which potentially offer many benefits but also potentially much harm to people and ecosystems and thereby ultimately economic development. Cases addressed include the Chernobyl and Fukushima nuclear accidents; genetically modified agricultural crops and agroecology; the growing threat of invasive alien species; mobile phones and the risk of brain tumours; and nanotechnologies. There is often little science, and very little direct hindsight, to assist in the management of these emerging technologies but the lessons from the historical case studies need to be applied if hazards are to be avoided.

The evidence from the chapters in Part C is that, by and large, societies are not making the most use of the costly lessons that can be gleaned from their histories. A key question is how this can be improved given the many reasons identified from the case studies why taking actions have been delayed including: the novel

and challenging nature of the issues themselves; poorly or inconsistently evaluated information; strong opposition by the corporate and scientific establishments of the day; and the tendency by the decision making institutions, practices and cultures to favour the status quo and the short term perspective. This section also illustrates the value of bottom up as well as top down approaches to innovations in ensuring that the directions of technological pathways, the equitable distributions of benefits, costs and knowledge ownership, and the diversity of locally sensitive technological options are relevant to the food, energy and ecosystems crises.

The historical chapters illustrate numerous harms which for the most part have been caused by irresponsible corporations. This fact, coupled with shortcomings in how decisions are made by governments on when to act on early warnings, and in the law when it comes to compensating victims of harm, are analysed in three chapters in Part D of the report. Each chapter analyses the reasons behind prevailing practice and then goes on to offer insights, for example, on how cost calculation methods can be improved; on how insurance schemes could be used to compensate future victims of harm; and on the reasons why businesses frequently ignore early warnings.

The cases in Parts A–D form the basis for considering in Part E the governance implications for science, public policy and public engagement, and how current practices could be improved to enable society to maximise the benefits of innovations while minimising harms. The main insights are that science could be more relevant for precautionary decision-making; that the wider use of the precautionary principle can avert harm and stimulate innovation; and that the late lessons of history and precautionary approaches are highly pertinent to today's multiple and inter-connected crises — such as those arising from finance, economics, the use of ecosystems, climate change, and the use and supply of energy and food.

Finally, many of the historical and recent case studies illustrate the value of engaging the public in broadening the knowledge base and stimulating robust innovations.

Twelve late lessons

Based on the case studies of Volume 1 of *Late lessons from early warnings* (EEA, 2001), twelve key lessons for better decision-making were drawn:

1	Acknowledge and respond to ignorance, as well as uncertainty and risk, in technology appraisal and public policymaking
2	Provide adequate long-term environmental and health monitoring and research into early warnings
3	Identify and work to reduce 'blind spots' and gaps in scientific knowledge
4	Identify and reduce interdisciplinary obstacles to learning
5	Ensure that real world conditions are adequately accounted for in regulatory appraisal
6	Systematically scrutinise the claimed justifications and benefits alongside the potential risks
7	Evaluate a range of alternative options for meeting needs alongside the option under appraisal, and promote more robust, diverse and adaptable technologies so as to minimise the costs of surprises and maximise the benefits of innovation
8	Ensure use of 'lay' and local knowledge, as well as relevant specialist expertise in the appraisal
9	Take full account of the assumptions and values of different social groups
10	Maintain the regulatory independence of interested parties while retaining an inclusive approach to information and opinion gathering
11	Identify and reduce institutional obstacles to learning and action
12	Avoid 'paralysis by analysis' by acting to reduce potential harm when there are reasonable grounds for concern

2 The precautionary principle and false alarms — lessons learned

Steffen Foss Hansen and Joel A. Tickner

Most of the cases examined in the *Late lessons from early warnings* reports are 'false negatives' — instances where early warnings existed but no preventive actions were taken. In debates surrounding the precautionary principle it is often claimed that widespread application of the principle will lead to a large number of regulatory false positives — over-regulation of minor risks and regulation of non-existent risks, often due to unwarranted public 'fears'. Understanding and learning from past false positives as well as false negatives is essential for improving decision-making about public health and the environment.

This chapter reviews incidents of 'false positives', where government regulation was undertaken based on precaution but later turned out to be unnecessary. In total 88 cases were identified to be alleged false positives, however, following a detailed analysis most of them turned out to be either real risks, or cases where 'the jury is still out', or unregulated alarms, or risk-risk trade-offs, rather than false positives.

The analysis revealed four regulatory false positives: US swine flu, saccharin, food irradiation, and Southern leaf corn blight. Numerous important lessons can be learned from each, although there are few parallels between them in terms of when and why each risk was falsely believed to be real. This is a lesson in itself: each risk is unique, as is the science and politics behind it and hence a flexible approach is therefore needed, adapted to the nature of the problem. The costs of the false positives identified were mainly economic, although the actions taken to address swine flu in 1976 did lead to some unintended deaths and human suffering, and diverted resources from other potentially serious health risks. Determining the net costs of mistaken regulatory action, however, requires a complete assessment of the impacts of the regulation, including the costs and benefits of using alternative technologies and approaches.

Overall, the analysis shows that fear of false positives is misplaced and should not be a rationale for avoiding precautionary actions where warranted. False positives are few and far between as compared to false negatives and carefully designed precautionary actions can stimulate innovation, even if the risk turns out not to be real or as serious as initially feared. There is a need for new approaches to characterising and preventing complex risks that move debate from the 'problem' sphere to the 'solutions' sphere. By learning from the lessons in this chapter, more effective preventive decisions can be made in the future.

The scarcity of genuine false positives compared to the large number of 'mistaken false positives' could partly be the result of a deliberate strategy in risk communication. Several references and leaked documents have shown that some regulated parties have consciously recruited reputable scientists, media experts and politicians to call on if their products are linked to a possible hazard. Manufacturing doubt, disregarding scientific evidence of risks and claiming over-regulation appear to be a deliberate strategy for some industry groups and think tanks to undermine precautionary decision-making.

3 Lead in petrol 'makes the mind give way'

Herbert Needleman and David Gee

This chapter addresses the widespread use of lead in petrol. It focuses on the period 1925–2005, when leaded petrol was first widely marketed in the US and then spread to the rest of the world before being gradually phased out from the 1970s. In Europe, the Aarhus Protocol (www.unece.org/env/pp/treatytext.html) initiated the phase-out of leaded petrol in the period 1998–2005.

The neurotoxic effects of lead were recognised as far back as Roman times. And in 1925, at the 'one day trial' of leaded petrol in the US, many experts warned of the likely health impacts of adding lead to petrol. Yet, despite the availability of an equally effective alcohol additive which was assessed by experts to be cleaner, the leaded route to fuel efficiency was chosen in the US and then exported to the rest of the world.

For several decades after the introduction of leaded petrol, virtually no independent research was carried out and the main source of information was industry and industry-sponsored researchers. Not until the 1960s and 1970s did independent scientists from outside this group show, for example, that body burdens of lead arising from human activities were not 'normal', as industry claimed, but were hundreds of times higher than before the industrial revolution and were therefore likely to be harmful.

At its peak in the mid-1970s, leaded petrol released about 200 000 tonnes of lead into the atmosphere annually in both the US and Europe. Following the subsequent phase-out, blood lead levels in children (the most sensitive group exposed) quickly fell, in line with the decrease in air concentrations. The lessons nevertheless remain relevant globally today. Although nearly all countries worldwide had phased out leaded petrol by 2012, lead concentrations in soils and sediments remain high. Meanwhile, electronic wastes containing lead and other contaminants also cause elevated blood lead levels.

Supplementary panel texts focus on the events leading up to the US choice of leaded petrol as the primary fuel source in 1925 and more recent accounts of EU policymaking on lead in petrol and the road to phase-outs in Germany and the United Kingdom.

4 Too much to swallow: PCE contamination of mains water

David Ozonoff

PCE (perchlorethylene, also known as 'perc' or tetrachloroethylene), was used in the production of plastic linings for drinking water distribution pipes in the late 1960s and 1970s. This new and relatively untested type of distribution pipe was used in over 700 miles of New England's water distribution systems. Not until 1976 was it discovered that PCE had been leaching into the water from the pipe lining, causing widespread contamination of water supplies that still today require continuous remediation.

Before the pipes were put into production there was a substantial amount of scientific information available about the potential hazards of PCE. This did not include current concerns about PCE's carcinogenicity, teratogenicity and other health consequences of relatively low-level exposure upper most among today's concerns, but many early warnings suggested the need for caution in introducing PCE-based mains pipe linings.

PCE had been used to treat hookworm and data on side effects were in the literature, while later a variety of occupational users were studied, including aircraft workers, small companies in countries where biological monitoring was required, and dry-cleaning firms. Several environmental studies were also conducted to see if drinking water contaminated with PCE or its close relative, TCE (trichloroethylene), was associated with cancer. Results were mixed and the chemical industry consistently denied that PCE was a human carcinogen.

This case study explores the early (pre 1970) history researching the toxicity of the chemical. It also focuses on the failure of one manufacturer, Johns-Manville Corporation, to recognise the warning signals about using a suspected toxic substance. It examines why a new product was deployed without thought to the public health consequences and why evidence of the potential hazard was ignored.

The science has not been hidden. It has been ineffective in guiding and catalysing action. Whether the problem is a failed duty of care or a lack of clarity about what evidence will trigger action, the contemporary argument over how to interpret the scientific evidence is irresolvable within science itself. There are no overarching criteria from the philosophy of science that can dictate a solution.

This chapter also includes two supplementary texts. A panel that analyses the differences between the conclusions of risk assessments based on the same data, focusing in particular on assessments of PCE and TCE. A further panel describes the opportunities to switch to wet-cleaning technologies to reduce the current use of PCE in dry cleaning.

5 Minamata disease: a challenge for democracy and justice

Takashi Yorifuji, Toshihide Tsuda and Masazumi Harada

Minamata disease, which can induce lethal or severely debilitating mental and physical effects, was caused by methylmercury-contaminated effluent released into Minamata Bay by Chisso, Japan's largest chemical manufacturer. It resulted in widespread suffering among those who unknowingly ate the contaminated fish. This chapter documents the story in three phases.

The disease first came to prominence in the 1950s. It was officially identified in 1956 and attributed to factory effluent but the government took no action to stop contamination or prohibit fish consumption. Chisso knew it was discharging methylmercury and could have known that it was the likely active factor but it chose not to collaborate and actively hindered research. The government concurred, prioritising industrial growth over public health. In 1968 Chisso stopped using the process that caused methylmercury pollution and the Japanese government then conceded that methylmercury was the etiologic agent of Minamata disease.

The second part of the story addresses the discovery that methylmercury is transferred across the placenta to affect the development of unborn children, resulting in serious mental and physical problems in later life. Experts missed this at first because of a medical consensus that such transfer across the placenta was impossible.

The third phase focuses on the battle for compensation. Initially, Chisso gave token 'sympathy money' under very limited criteria. In 1971 the Japanese government adopted a more generous approach but after claims and costs soared a more restrictive definition was introduced in 1977, justified by controversial 'expert opinions'. Legal victories for the victims subsequently made the government's position untenable and a political solution was reached in 1995–1996. In 2003, the 'expert opinions' were shown to be flawed and the Supreme Court declared the definition invalid in 2004.

In September 2011 there were 2 273 officially recognised patients. Still, the continuing failure to investigate which areas and communities were affected means that the financial settlement's geographic and temporal scope is still not properly determined. Alongside deep-seated issues with respect to transparency in decision-making and information sharing, this indicates that Japan still faces a fundamental democratic deficit in its handling of manmade disasters.

This chapter is followed by three short updates on the effects of mercury poisoning since Minamata; on attempts to contain it, including the 2009 global agreement to phase mercury out of economic activity; and on the need for better information about contaminant exposures to enable policymakers to make informed choices that balance the benefits of fish consumption against the assumed adverse effects of low-level methylmercury exposures.

6 Beryllium's 'public relations problem'

David Michaels and Celeste Monforton

Scores of workers employed in nuclear weapons production have been diagnosed with chronic beryllium disease (CBD), a progressive and irreversible inflammatory lung disease. This chapter presents a history of knowledge and public policy about preventing beryllium-related disease, focusing primarily on the United States beryllium industry's role in shaping US regulatory policy.

Over several decades increasingly compelling evidence accumulated that CBD was associated with beryllium exposure at levels below the existing regulatory standard. The beryllium industry had a strong financial incentive to challenge the data and decided to be proactive in shaping interpretation of scientific literature on beryllium's health effects. It hired public relations and 'product defence' consulting firms to refute evidence that the standard was inadequate. When the scientific evidence became so great that it was no longer credible to deny that workers developed CBD at permitted exposure levels, the beryllium industry responded with a new rationale to delay promulgation of a new, more protective exposure limit.

This case study underscores the importance of considering the hazards from toxic materials throughout the entire product life cycle. While primary producers of beryllium products may be able to control exposures in their own facilities, it is unlikely that many secondary users and recyclers have the expertise, resources and knowledge necessary to prevent beryllium disease in exposed workers and residents in nearby communities.

The primary lessons of this chapter are widely applicable to many environmental health controversies. In particular, it illustrates the practice of 'manufacturing uncertainty' — a strategy used by some polluters and manufacturers of hazardous products to prevent or delay regulation or victim compensation.

This chapter is followed by an analysis of the rationale for corporate behaviour in the regulation of beryllium. It is argued that the availability of occasional and limited opportunities for companies to change course without suffering onerous consequences would encourage them to rethink their position and create an obligation on shareholders to take the responsible course. Although this may be perceived as letting them 'get away with it', the end result may be better public policy and corporate responsibility.

7 Tobacco industry manipulation of research

Lisa A. Bero

This chapter differs in some ways from the others in Volume 2 of *Late lessons from early warnings*. The history of 'second hand', 'passive' or 'environmental tobacco smoke' (ETS), to which non-smokers are exposed overlaps with the history of active smoking. Those affected include the partners and children of smokers, and the bartenders and other workers who have to work in smoky environments.

The focus in this chapter is on the strategies used by the tobacco industry to deny, downplay, distort and dismiss the growing evidence that, like active smoking, ETS causes lung cancer and other effects in non-smokers. It does not address the history of scientific knowledge about tobacco and how it was used or not used to reduce lung cancer and other harmful effects of tobacco smoke. There is much literature on this and a table at the end of the chapter summarises the main dates in the evolution of knowledge in this area.

The chapter concentrates on the 'argumentation' that was used to accept, or reject, the growing scientific evidence of harm. Who generated and financed the science used to refute data on adverse health effects? What were the motivations? What kind of science and information, tools and assumptions were used to refute data on the adverse health of tobacco?

The release of millions of internal tobacco industry documents due to law suits in the US has given insights into the inner workings of the tobacco industry and revealed their previously hidden involvement in manipulating research. However, this insight is not available for most corporate sectors. The chapter discusses the possibilities of 'full disclosure' of funding sources and special interests in research and risk assessment in order to secure independence and prevent bias towards particular viewpoints.

While smoking bans are now being introduced in more and more countries, other industries are drawing inspiration from tobacco company strategies, seeking to maintain doubt about harm in order to keep hazardous products in the marketplace.

The chapter also includes a summary of the tobacco industry's role in shaping risk assessment in the US and Europe to serve its own interests.

8 Vinyl chloride: a saga of secrecy

Morando Soffritti, Jennifer Beth Sass, Barry Castleman and David Gee

This chapter is about how early warnings in the 1950s and 1960s concerning the short-term harm of vinyl chloride (VC) to the skin and bones of workers, and to the livers of laboratory animals, were initially hidden from other workers and regulators. This was despite some early misgivings by company experts whose advice was initially ignored by their employers. This pattern was repeated when the later, more devastating news of a rare liver cancer in workers was revealed by long-term animal studies and by an attentive and concerned company physician.

Unlike many other histories, however, this story features a very prompt response from the global chemical industry to the publication of the liver cancer evidence, a response that included funding cancer testing and later compliance with a large reduction in the permissible exposure limits. The case also provides early evidence of reproductive effects of vinyl chloride monomer (VCM).

Other features of this story presage the later and common responses of the corporate world to heightened public awareness and pressure from non-governmental organisations (NGOs) and trade unions, including greatly exaggerated estimates of the likely costs of complying with tighter pollution controls; a frequent mismatch between the position of the trade association and that of many, more progressive companies within the association; but also some relatively quick corporate responses to public, NGO and regulatory pressure.

The chapter also features two legal aspects, which, though more common in the US, are also valuable for Europeans. First, the potentially positive role that judicial review of regulatory proposals can play in providing a societal judgement about the behaviour of corporations. This can embrace not just moral judgements but also judgements about the state of the science and what society should do with it.

Second, the role that document discovery in legal compensation cases can play in revealing the real and until then secret activities of corporations. Any proposals to promote justice for victims of environmental and health harms via no fault administrative arrangements need to be accompanied by other measures to extract information about corporate behaviour.

The chapter is followed by a panel analysing the value of animal testing for identifying carcinogens.

9 The pesticide DBCP and male infertility

Eula Bingham and Celeste Monforton

Dibromochloropropane (DBCP) is a pesticide used against nematodes (roundworms or threadworms) that damage pineapples, bananas and other tropical fruits. It was introduced into US agriculture in 1955 and approved for use as a fumigant in 1964. By 1961 laboratory experiments had shown that it made the testicles of rodents shrink and significantly reduced the quantity and quality of sperm. Nonetheless, the compound was widely marketed and became a commercial success.

In 1977, workers at a production plant became worried that they were unable to father children. An emergency study by a US government agency discovered that in many cases the workers were suffering from deficient or absent sperm. While controls were improved at US facilities, the product continued to be marketed and sprayed in Latin America, the Philippines, some African countries, and elsewhere.

By the 1990s, tens of thousands of plantation workers in these countries had allegedly suffered adverse reproductive effects from DBCP use.

The story continues today with contentious legal claims for compensation, contamination of drinking water and industry attempts to prevent a Swedish documentary on the issue from being screened.

This chapter looks at the knowledge available about the hazards and the actions taken, or not taken, to avert them. The DBCP story is significant as it is the first clear example of reproductive damage to workers who manufactured and used a synthetic chemical. This is one of many examples supporting the growing concerns about increasing rates of reproductive and developmental disease, and about the endocrine disrupting chemicals that seem to be playing a role in these disorders.

Protecting production workers, users, consumers and the environment from chemicals that may damage reproduction demands closer integration of scientific disciplines, as well as government action. The lessons of DBCP may help in ensuring timely protection from harm, based on precautionary approaches to scientific evidence.

10 Bisphenol A: contested science, divergent safety evaluations

Andreas Gies and Ana M. Soto

Bisphenol A (BPA) is currently one of the world's best-selling chemicals and primarily used to make polycarbonate plastics. It is widely used in common products such as baby bottles, household electronics, medical devices and coatings on food containers. BPA is known to mimic the female hormone oestrogen and has been found to leach from the materials where it is used.

Studies have suggested that even exposure to low doses of BPA may cause endocrine disrupting effects. As with other hormones, it appears that an organism is most sensitive during development but that effects are often not observed until much later in the lifecycle. This means that at the time when the effects become detectable, the chemical exposure has vanished. This makes it extremely difficult to link exposure to effects in humans.

This chapter maps some of the findings in studies of rodents and humans. It also discusses the challenges of evaluating scientific findings in a field where industry-sponsored studies and independent scientific research seem to deviate strongly. The authors offer suggestions for ways to uncouple financial interests from scientific research and testing.

A widely used and dispersed industrial chemical like Bisphenol A is a controversial example of an endocrine disrupting substance that has implications for policymakers. Different approaches to risk assessment for BPA by US and European authorities are presented. It throws light on the ways in which similar evidence is evaluated differently in different risk assessments and presents challenges for applying the precautionary principle.

The intense discussion and scientific work on BPA have slowly contributed to a process of improving test strategies. While traditional toxicology has relied on a monotonic increasing dose-response relationship as evidence that the effect is caused by the test agent, studies on BPA and other endocrine disruptor chemicals (EDCs) have demonstrated the limitations of this approach and adjustments have been made in some cases.

It has also been widely accepted that effects cannot be predicted by simply thinking of BPA as a weak oestrogen and extrapolating from what is observed for more potent endogenous oestrogens. This lesson is particularly evident in the intense pharmaceutical interest in selective oestrogen response modifiers (SERMs).

The chapter is followed by a panel analysing the value of animal testing for identifying carcinogens.

11 DDT: fifty years since *Silent Spring*

Henk Bouwman, Riana Bornman, Henk van den Berg and Henrik Kylin

'There was a strange stillness. The birds for example — where had they gone? Many people spoke about them, puzzled and disturbed. The feeding stations in the backyards were deserted. The few birds seen anywhere were moribund: they trembled violently and could not fly. It was a spring without voices ... only silence lay over the fields and woods and marsh.'

The book *Silent Spring* by Rachel Carson is mainly about the impacts of chemicals (in particular dichlorodiphenyltrichlorethane also known as DDT) on the environment and human health. Indeed, the close association between humans and birds remains very apt. Representing the only two warm-blooded groups of life on Earth, mammals and birds share the same environments and threats.

Carson's claim that she lived in 'an era dominated by industry, in which the right to make a dollar at whatever cost is seldom challenged' still resonates strongly with the problems that societies face all over the world. One chapter heading, 'The obligation to endure', derived from the French biologist and philosopher Jean Rostand's famous observation that, 'the obligation to endure gives us the right to know'. United States President John F. Kennedy responded to the challenge posed by Carson by investigating DDT, leading to its complete ban in the US. The ban was followed by a range of institutions and regulations concerned with environmental issues in the US and elsewhere, driven by public demand for knowledge and protection.

DDT was the primary tool used in the first global malaria eradication programme during the 1950s and 1960s. The insecticide is sprayed on the inner walls and ceilings of houses. Malaria has been successfully eliminated from many regions but remains endemic in large parts of the world. DDT remains one of the 12 insecticides — and the only organochlorine compound — currently recommended by the World Health Organization (WHO), and under the Stockholm Convention on Persistent Organic Pollutants, countries may continue to use DDT. Global annual use of DDT for disease vector control is estimated at more than 5 000 tonnes.

It is clear that the social conscience awakened by Rachel Carson 50 years ago gave momentum to a groundswell of actions and interventions that are slowly but steadily making inroads at myriad levels. Chapter 17 of her book, 'The other road' reminds the reader of the opportunities that should have been seized much earlier. With more than 10 % of bird species worldwide now threatened in one way or another, it is clear that we missed early warnings or failed to act on them. Will we continue to miss signposts to 'other roads'? Are our obligations to endure met by our rights to know? As Carson said 50 years ago: 'The choice, after all, is ours to make.'

12 Booster biocide antifoulants: is history repeating itself?

Andrew R. G. Price and James W. Readman

Tributyltin (TBT) was widely used as an effective antifouling agent in paints for ships and boats until the European Community restricted its use in 1989 because of its proven harm to the environment and shellfisheries. Thereafter, booster biocides were introduced to enhance the performance of antifouling paints. They were believed to be less damaging to aquatic life than TBT. Subsequently, however, it has been established that booster biocides can also create significant environmental risks.

This chapter outlines the background to booster biocide use, the early warnings about their potential physiological and ecological impacts on non-target species, and the actions taken in response. The science that set some alarm bells ringing is described, along with lessons that could influence the future of an industry still searching for less environmentally invasive solutions.

Booster biocide antifouling agents threaten a variety of habitats — from coral reefs and seagrass beds to open moorings — within the EU and globally. Their primarily herbicidal properties mean that coral zooxanthellae, phytoplankton and periphyton are particularly vulnerable. Compared to TBT, an antifouling agent with a quite specific action, booster biocides have more broad-spectrum impacts. The wider ecological effect of shifting to booster biocides remain poorly understood but of considerable concern because they may affect the base of marine food chains.

From a toxicological viewpoint, booster biocides do not threaten to have endocrine disrupting properties similar to TBTs. At current environmental concentrations, however, some can damage primary producers and some are persistent. While legislation has been introduced to control their use, the rigour of regulations varies between countries. These geographical disparities need to be addressed, and future biocidal products and novel approaches to antifouling should be better appraised.

For policymakers, the challenge is to protect non-target biological communities from selective change resulting from booster biocide use. Persistence, bioaccumulative and toxic (PBT) criteria can be used to evaluate the relative potential impact from the available biocides, and consequently target appropriate legislation. Nevertheless, lateral thinking, aiming to identify novel materials and strategies to address antifouling, could pay dividends in the future.

13 Ethinyl oestradiol in the aquatic environment

Susan Jobling and Richard Owen

Many decades of research have shown that when released to the environment, a group of hormones known as oestrogens, both synthetic and naturally occurring, can have serious impacts on wildlife. This includes the development of intersex characteristics in male fish, which diminishes fertility and fecundity. Although often sublethal, such impacts may be permanent and irreversible.

This chapter describes the scientific evidence and regulatory debates concerning one of these oestrogens, ethinyloestradiol (EE2), an active ingredient in the birth control pill. First developed in 1938, it is released to the aquatic environment via wastewater treatment plants. Although it is now clear that wildlife species are exposed to and impacted by a cocktail of endocrine disrupting chemicals, there is also reasonable scientific certainty that EE2 plays a significant role, and at vanishingly low levels in the environment.

In 2004 the Environment Agency of England and Wales accepted this, judging the evidence sufficient to warrant consideration of risk management. In 2012, nearly 75 years after its synthesis, the European Commission proposed to regulate EE2 as a EU-wide 'priority substance' under the Water Framework Directive (the primary legislation for protecting and conserving European water bodies). This proposal was subsequently amended, delaying any decision on a regulatory 'environmental quality standard' until at least 2016.

This is in part because control of EE2 will come at a significant price. Complying with proposed regulatory limits in the environment means removing very low (part per trillion) levels of EE2 from wastewater effluents at considerable expense.

Is this a price we are willing to pay? Or will the price of precautionary action be simply too high — a pill too bitter to swallow? To what extent is society, which has enjoyed decades of flexible fertility and will also ultimately pay for the control and management of its unintended consequences, involved in this decision? And what could this mean for the many thousands of other pharmaceuticals that ubiquitously infiltrate our environment and which could have sublethal effects on aquatic animals at similarly low levels?

14 Climate change: science and the precautionary principle

Hartmut Grassl and Bert Metz

The first scientifically credible early warning about the possible dangers of climate change due to carbon dioxide (CO_2) emissions from burning fossil fuels came in 1897. While the basic physical principles of global warming are simple, however, the more detailed science of climate change is exceedingly complicated. Even now, more than a hundred years since the first early warning, many important details of climate change cannot be predicted with certainty. It is therefore unsurprising that the science of climate change and questions about the true value of burning fossil fuels have fostered sustained scientific and political controversy.

When the first volume of *Late lessons from early warnings* was drafted there appeared to be too much legitimate controversy about climate change for the issue to be included. A case study could have led to arguments that distracted attention from the valuable and robust lessons from more established issues such as asbestos, polychlorinated biphenyls (PCBs), chlorofluorocarbons (CFCs) and the ozone-hole, X-rays and acid rain. This decision was taken despite the then widespread acceptance that 'the balance of evidence suggests a discernible human influence on global climate' (*Contribution of Working Group I to the Second Assessment Report of the Intergovernmental Panel on Climate Change*, IPCC, 1995).

Over a decade later and after two more reviews by the Intergovernmental Panel on Climate Change (IPCC) of a much greater volume of climate change science it seemed appropriate to include climate change in this volume, despite some continuing controversy. The evidence that human activities are having a dangerous impact on the climate has strengthened since 1995. By 2007, the IPCC was able to conclude with 'very high confidence that the global net effect of human activities since 1750 has been one of warming'. Given the size and irreversibility (on human time scales) of many of the harmful effects of human-induced climate change, there is an urgent need for action to reduce CO_2 emissions and other greenhouse gases. Some contrarian views persist, however, as the authors illustrate.

This chapter summarises the history of growing knowledge about human-induced climate change and of the main actions, or inactions that accompanied it. Like many other chapters, it reflects the lifelong commitment of both authors to trying to understand and mitigate the effects of human-induced climate change. It concludes with some lessons and insights that are relevant to many other environmental and health issues.

Also included is a panel text describing how the IPCC's approach to assessing uncertainty evolved between its first to its fifth assessment reports.

15 Floods: lessons about early warning systems

Zbigniew W. Kundzewicz

Floods are an increasingly acute problem. Intense precipitation has become more frequent and more intense, growing manmade pressure has increased the magnitude of floods that result from any level of precipitation, and flawed decisions about the location of human infrastructure have increased the flood loss potential.

Unlike most other case studies presented in this report, this chapter focuses on flooding as a phenomenon and the requirements for effective early warning systems, rather than addressing a particular event and the lessons that can be learned.

Flooding cannot be wholly prevented. The occurrence of a flood need not be considered a 'failure' and, conversely, minimisation of losses may constitute a 'success'. There are lessons to be learned from every flood and it is important to use them in preparing for the next flood. Once we accept that no flood protection measures can guarantee complete safety, a general change of paradigm is needed to reduce human vulnerability to floods. The attitude of 'living with floods' and accommodating them in planning seems more sustainable than hopelessly striving to eradicate them.

Flood forecasting and warning systems fail because links in the chain perform poorly or fail completely. A single weak point in a system that otherwise contains excellent components may render the overall system performance unsatisfactory. A successful system requires sufficient integration of components and collaboration and coordination between multiple institutions.

The chapter deals primarily with the challenges of fluvial (river) floods. It is complemented by three short supplementary texts. The first highlights the complex, dynamic and diverse ecosystems of river floodplains, which are often degraded during construction of flood defences. Despite their huge economic value, near-natural floodplains are among the most threatened ecosystems globally.

The second discusses uncertainties in anticipating rainfall patterns and intensity, and their relationship to flood levels during extreme flows. Such uncertainties present challenges for scientists and decision-makers alike.

The third addresses the increasing risks of coastal flooding due to factors such as climate change and sea-level rise, and reviews European experience with precautionary action.

16 Seed-dressing systemic insecticides and honeybees

Laura Maxim and Jeroen van der Sluijs

In 1994 French beekeepers began to report alarming signs. During summer, many honeybees did not return to the hives. Honeybees gathered close together in small groups on the ground or hovered, disoriented, in front of the hive and displayed abnormal foraging behaviour. These signs were accompanied by winter losses.

Evidence pointed to Bayer's seed-dressing systemic insecticide Gaucho®, which contains the active substance imidacloprid. This chapter presents the historical evolution of evidence on the risks of Gaucho® to honeybees in sunflower and maize seed-dressing in France, and analyses the actions in response to the accumulating evidence regarding these risks.

The social processes that ultimately lead to application of the precautionary principle for the ban of Gaucho® in sunflower and maize seed-dressing are described, with a focus on the ways in which scientific findings were used by stakeholders and decision-makers to influence policy during the controversy.

Public scientists were in a difficult position in this case. The results of their work were central to a social debate with high economic and political stakes. In certain cases their work was not judged according to its scientific merit but based on whether or not it supported the positions of some stakeholders. This situation tested the ability and courage of researchers to withstand pressure and continue working on imidacloprid.

Other European countries also suspended neonicotinoid seed-dressing insecticides. Evidence of the toxicity of neonicotinoids present in the dust emitted during sowing of coated seeds supported such decisions. Most important, the French case highlighted the major weaknesses of regulatory risk assessment and marketing authorisation of pesticides, and particularly neonicotinoids. These insights were recently confirmed by work by the European Food Safety Authority.

From this case study eight lessons are drawn about governance of controversies related to chemical risks. The study is followed by two additional texts. A first panel presents Bayer Crop Science's comments on the analysis in this chapter. A second contains the authors' response to the Bayer comments.

17 Ecosystems and managing the dynamics of change

Jacqueline McGlade and Sybille van den Hove

A decade after Rachel Carson's *Silent Spring* was published, describing the toxic legacy of the twentieth century, Annie Dillard in her Pulitzer prize winning book *Pilgrim at Tinker Creek*, opened up a different way of looking at the world. It presaged a twenty first century in which the global economy would be based on a more thorough understanding of nature, its functioning and material wealth. Wholly descriptive, yet increasingly relevant, her book captured the very essence of what this chapter is about: that amongst the observations which routinely help to predict the evolution of the natural world are the seeds of surprise — surprise of the unusual and surprise as a portent of future change. Our systemic failure to anticipate such surprises forms the core of this chapter. A series of case studies from fisheries, forests, savannah and aquatic systems are used to underline how early warnings about changes in these natural systems emerged but were not used.

The chapter highlights how the division of knowledge into political, disciplinary and geographic silos has led to the 'recurring nightmares' of short-term interests outcompeting long-term vision; situations where competition replaces co-operation; fragmentation of values and interest; fragmentation of authority and responsibility; and fragmentation of information and knowledge leading to inadequate solutions or even additional problems. In addition, the lack of institutional fit has often confounded the effectiveness of the stewardship of ecosystem services, and led to unexpected surprises, excessive rent seeking and high transaction costs.

Using counterfactual thinking (i.e. the dependence of *whether, when* and *how* one event occurs on *whether, when* and *how* another event occurs and the possible alteration of events), built around the four interconnected concepts of *planetary boundaries, tipping points, panarchy* and *resilience*, the chapter provides an analytical lens through which to explore why many of the warning signals were not seen. The chapter concludes by suggesting why ecosystems are likely to be even more at risk in the future and why we will need to observe and interpret the dynamics of both nature and institutions ever more closely if we are to avoid sudden irreversible ecological changes.

18 Late lessons from Chernobyl, early warnings from Fukushima

Paul Dorfman, Aleksandra Fucic and Stephen Thomas

The nuclear accident at Fukushima in Japan occurred almost exactly 25 years after the Chernobyl nuclear accident in 1986. Analysis of each provides valuable late and early lessons that could prove helpful to decision-makers and the public as plans are made to meet the energy demands of the coming decades while responding to the growing environmental costs of climate change and the need to ensure energy security in a politically unstable world.

This chapter explores some key aspects of the Chernobyl and Fukushima accidents, the radiation releases, their effects and their implications for any construction of new nuclear plants in Europe. There are also lessons to be learned about nuclear construction costs, liabilities, future investments and risk assessment of foreseeable and unexpected events that affect people and the environment.

Since health consequences may start to arise from the Fukushima accident and be documented over the next 5–40 years, a key lesson to be learned concerns the multifactorial nature of the event. In planning future radiation protection, preventive measures and bio-monitoring of exposed populations, it will be of great importance to integrate the available data on both cancer and non-cancer diseases following overexposure to ionising radiation; adopt a complex approach to interpreting data, considering the impacts of age, gender and geographical dispersion of affected individuals; and integrate the evaluation of latency periods between exposure and disease diagnosis development for each cancer type.

Given the degree of uncertainty and complexity attached to even the most tightly framed and rigorous nuclear risk assessment, attempts to weight the magnitude of accident by the expected probability of occurrence have proven problematic, since these essentially theoretical calculations can only be based on sets of pre-conditioning assumptions. This is not an arcane philosophical point but rather a very practical issue with significant implications for the proper management of nuclear risk. With its failure to plan for the cascade of unexpected beyond design-base accidents, the regulatory emphasis on risk-based probabilistic assessment has proven very limited. An urgent reappraisal of this approach and its real-life application seems overdue.

Whatever one's view of the risks and benefits of nuclear energy, it is clear that the possibility of catastrophic accidents and consequent economic liabilities must be factored into the policy and regulatory decision-making process. In the context of current collective knowledge on nuclear risks, planned pan-European liability regimes will need significant re-evaluation.

19 Hungry for innovation: from GM crops to agroecology

David A. Quist, Jack A. Heinemann, Anne I. Myhr, Iulie Aslaksen and Silvio Funtowicz

Innovation's potential to deliver food security and solve other agriculture-related problems is high on the agenda of virtually all nations. This chapter looks at two different examples of food and agricultural innovation: genetically modified (GM) crops and agroecological methods, which illustrate how different innovation strategies affect future agricultural and social options.

GM crops are well suited to high-input monoculture agricultural systems that are highly productive but largely unsustainable in their reliance on external, non-renewable inputs. Intellectual property rights granted for GM crops often close down, rather than open up further innovation potential, and stifle investment into a broader diversity of innovations allowing a greater distribution of their benefits.

Science-based agroecological methods are participatory in nature and designed to fit within the dynamics underpinning the multifunctional role of agriculture in producing food, enhancing biodiversity and ecoystem services, and providing security to communities. They are better suited to agricultural systems that aim to deliver sustainable food security than high external input approaches. They do, however, require a broader range of incentives and supportive frameworks to succeed. Both approaches raise the issue of the governance of innovation within agriculture and more generally within societies.

The chapter explores the consequences of a 'top-down transfer of technology' approach in addressing the needs of poor farmers. Here innovation is often framed in terms of economic growth in a competitive global economy, a focus that may conflict with efforts to reduce or reverse environmental damage caused by existing models of agriculture, or even deter investment into socially responsible innovation.

Another option explored is a 'bottom-up' approach, using and building upon resources already available: local people, their knowledge, needs, aspirations and indigenous natural resources. The bottom-up approach may also involve the public as a key actor in decisions about the design of food systems, particularly as it relates to food quality, health, and social and environmental sustainability.

Options are presented for how best to answer consumer calls for food quality, sustainability and social equity in a wide sense, while responding to health and environmental concerns and securing livelihoods in local small-scale agriculture. If we fail to address the governance of innovation in food, fibre and fuel production now, then current indications are that we will design agriculture to fail.

20 Invasive alien species: a growing but neglected threat?

Sarah Brunel, Eladio Fernández-Galiano, Piero Genovesi, Vernon H. Heywood, Christoph Kueffer and David M. Richardson

Biological invasions are one of the five major causes of biodiversity loss as global human travel and trade have moved, and continue to move, thousands of species between and across continents. Some species of alien origin have a high probability of unrestrained growth which can ultimately lead to environmental damage.

An alien species — animal, plant or microorganism — is one that has been introduced, as a result of human activity, either accidentally or deliberately, to an area it could not have reached on its own. A common definition of the term 'invasive' focuses on its (negative) impact, while other definitions consider only rate of spread and exclude considerations of impact.

Despite the growing amount of legislation being adopted at the global scale, biological invasions continue to grow at a rapid rate, with no indication yet of any saturation effect. Decision-making in this area is very challenging. The overall complexity of the problem, its interdisciplinarity, the scientific uncertainties and the large number of stakeholders that need to be informed and involved, together demand governance actions that are difficult to see emerging at the regional scale (as in the EU), let alone globally.

It is widely agreed that preventing biological invasions or tackling them at a very early stage is the most efficient and cost-effective approach. Harmless species can be confused with harmful invasive species, however, leading to a waste of resources. Even more seriously, harmful invaders can be mistaken for innocuous species — so-called 'invaders in disguise' — and no appropriate action may be taken to counter the threats they pose.

Even with a very good risk assessment system, new outbreaks of invasive alien species could still occur, necessitating a system of rapid early warning and effective eradication response. The decision on where to draw the line on the acceptable environmental risks versus the introduction of new species or new communities that may carry invasive alien species then becomes a value judgement.

There is lively debate within the scientific community regarding the most appropriate strategies for managing invasive alien species. Governments and institutions charged with making decisions have access to considerable knowledge on the topic, but the lack of rules of interactions between multiple parties regularly thwarts effective decision-making.

21 Mobile phones and brain tumour risk: early warnings, early actions?

Lennart Hardell, Michael Carlberg and David Gee

In 2011 the World Health Organization's International Agency for Research on Cancer (IARC) categorised the radiation fields from mobile phones and other devices that emit similar non-ionizing electromagnetic fields (EMFs), as a Group 2B i.e. 'possible' human carcinogen. Nine years earlier IARC gave the same classification to the magnetic fields from overhead electric power lines.

The IARC decision on mobile phones was principally based on two sets of case-control human studies of possible links between mobile phone use and brain tumours: the IARC Interphone study and the Hardell group studies from Sweden. Both provided complementary and generally mutually supportive results. This chapter gives an account of the studies by these two groups — and others coming to different conclusions — as well as reviews and discussions leading up to the IARC decision in 2011. The chapter also describes how different groups have interpreted the authoritative IARC evaluation very differently.

There are by now several meta-analyses and reviews on mobile phones and brain tumours, which describe the challenges of doing epidemiology on this issue, the methodological limitations of the major studies published so far and the difficulties of interpreting their results.

It has been suggested that national incidence data on brain tumours could be used to qualify or disqualify the association between mobile phones and brain tumours observed in the case-control studies. However, in addition to methodological shortcomings, there might be other factors that influence the overall incidence rate such as changes in exposure to other risk factors for brain tumours that are unknown in descriptive studies. Cancer incidence depends on initiation, promotion and progression of the disease. As the mechanism for radiofrequency electromagnetic fields carcinogenesis is unclear, it supports the view that descriptive data on brain tumour incidence is of limited value.

The chapter points to mobile phone industry inertia in considering the various studies and taking the IARC carcinogenic classification into account and a failings from the media in providing the public with robust and consistent information on potential health risks. The IARC carcinogenic classification also appears not to have had any significant impact on governments' perceptions of their responsibilities to protect public health from this widespread source of radiation.

The benefits of mobile telecommunications are many but such benefits need to be accompanied by consideration of the possibility of widespread harms. Precautionary actions now to reduce head exposures would limit the size and seriousness of any brain tumour risk that may exist. Reducing exposures may also help to reduce the other possible harms that are not considered in this case study.

Evidence is increasing that workers with heavy long-term use of wireless phones who develop glioma or acoustic neuroma should be compensated. The first case in the world was established on 12 October 2012. The Italian Supreme Court affirmed a previous ruling that the Insurance Body for Work (INAIL) must grant worker's compensation to a businessman who had used wireless phones for 12 years and developed a neuroma in the brain.

22 Nanotechnology — early lessons from early warnings

Steffen Foss Hansen, Andrew Maynard, Anders Baun, Joel A. Tickner and Diana M. Bowman

Nanotechnology is the latest in a long series of technologies heralded as ushering in a new era of technology-driven prosperity. Current and future applications of nanotechnology are expected to lead to substantial societal and environmental benefits, increasing economic development and employment, generating better materials at lower environmental costs, and offering new ways to diagnose and treat medical conditions. Nevertheless, as new materials based on nanoscale engineering move from the lab to the marketplace, have we learnt the lessons of past 'wonder technologies' or are we destined to repeat past mistakes?

This chapter first introduces nanotechnology, clarifies the terminology of nanomaterials and describes current uses of these unique materials. Some of the early warning signs of possible adverse impacts of some nanomaterials are summarised, along with regulatory responses of some governments. Inspired by the EEA's first volume of *Late lessons from early warnings*, the chapter looks critically at what lessons can already be learned, notwithstanding nanotechnology's immaturity.

Nanotechnology development has occurred in the absence of clear design rules for chemists and materials developers on how to integrate health, safety and environmental concerns into design. The emerging area of 'green nanotechnology' offers promise for the future with its focus on preventive design. To gain traction, however, it is important that research on the sustainability of materials is funded at levels significant enough to identify early warnings, and that regulatory systems provide incentives for safer and sustainable materials.

Political decision-makers have yet to address many of the shortcomings in legislation, research and development, and limitations in risk assessment, management and governance of nanotechnologies and other emerging technologies. As a result, there remains a developmental environment that hinders the adoption of precautionary yet socially and economically responsive strategies in the field of nanotechnology. If left unresolved, this could hamper society's ability to ensure responsible development of nanotechnologies.

23 Understanding and accounting for the costs of inaction

Mikael Skou Andersen and David Owain Clubb

In political decision-making processes, the burden of proof is often distributed such that policymakers only respond to early warning signals from environmental hazards once the costs of inaction have been estimated.

This chapter revisits some key environmental issues for which estimates of costs of inaction have been carefully developed over many years of research. The aim is to consider the methodological challenges involved in producing estimates that are credible and appropriate rather than present specific estimates for these costs.

The case studies also provide insights into how early warning signals might provide a basis for estimating the costs of inaction, when the science base is less consolidated. For example, the case of nitrates in drinking water illustrates that a precautionary approach to the costs of inaction is quite conceivable. The phase-out of ozone-depleting substances, where early-warning scientists successfully alerted the world to the damaging effects of chlorofluorocarbons (CFCs), provides another important case because additional impacts for global warming actually cause the costs of inaction to be considerably higher than initially believed. This is a reminder that figures for the costs of inaction have often been grossly underestimated.

Finally, in the case of air pollution, making use of different estimates for mortality risk avoidance will help decision-makers to see that there are higher- and lower-bound estimates for the costs of inaction. Even if the lower-bound estimates are perhaps too conservative, with a bias towards health effects, they will in many situations encourage more rather than less abatement effort. Reducing emission loads will also tend to bring relief for the intangible assets of biodiversity and nature.

Making the best use of environmental science and modelling helps to make environmental protection and precaution a priority. Producing cost estimates should not be left to economists alone, but should rather be seen as a starting point for a broader discussion, featuring also the relevant expertise in health, ecology, demography, modelling and science. Well researched estimates, based on interdisciplinary collaboration, can strengthen some of those scattered and diffuse interests, which during the ordinary processes of policy-making have difficulty making their voices heard.

24 Protecting early warners and late victims

Carl Cranor

Many *Late lessons from early warnings* chapters provide examples of early warning scientists who were harassed for bringing inconvenient truths about impending harm to the attention of the public and regulators. There is also some evidence that young scientists are being discouraged from entering controversial fields for fear of such harassment. In addition, where warnings have been ignored and damage has ensued, it has often proven difficult in the past to achieve prompt and fair compensation for the victims. Some ideas for reform, building on some current institutional models are explored here.

This chapter first explores the idea of extending whistleblowing laws to help encourage and protect early-warning scientists and others who identify evidence of impending harm. Complementary measures, such as greater involvement of professional societies and the use of recognition awards, as for example in Germany, could also be helpful.

Next, the chapter explores improved mechanisms for compensating victims of pollution and contamination. The chapter on the Minamata Bay disaster provides an extreme example of long delays in getting adequate compensation for the victims of methylmercury poisoning. It was almost fifty years, between 1956 and 2004, before the victims attained equitable levels of compensation and legal recognition of responsibility. Other case studies illustrate similar examples of long delays in receiving adequate compensation.

Options are examined for providing justice to any future victims of those emerging technologies such as nanotechnology, genetically modified crops and mobile phone use, which currently can provide broad public benefits but potentially at a cost to small groups of victims. The potential for widespread exposure and uncertain science could justify 'no-fault' administrative schemes that provide more efficient and equitable redress in situations where the benefit of scientific doubt would be given to victims. The use of anticipatory assurance bonds to help minimise and meet the costs of future environmental damage from large scale technologies is also explored.

A supplementary panel text describes cases of asbestos and mesothelioma, where the senior courts in the United Kingdom have developed innovative ways of dealing with both joint and several liability, and the foreseeability of subsequent asbestos cancers, after the initial recognition of the respiratory disease, asbestosis. Such legal developments in the field of personal injury could illustrate the future direction of long-tail liability in both environmental damage and personal injury.

25 Why did business not react with precaution to early warnings?

Marc Le Menestrel and Julian Rode

In the past, companies have frequently neglected early warning signals about potential hazards for human health or the environment associated with their products or operations. This chapter reviews and analyses relevant interdisciplinary literature and prominent case studies — in particular those documented in both volumes of *Late lessons from early warnings* — and identifies main factors responsible for the disregard of early warning signals.

The chapter shows how economic motives often drive non-precautionary business decisions. In virtually all reviewed cases it was perceived to be profitable for industries to continue using potentially harmful products or operations. However, decisions are also influenced by a complex mix of epistemological, regulatory, cultural and psychological aspects. For instance, characteristics of the research environment and the regulatory context can provide business actors with opportunities to enter into 'political actions' to deny or even suppress early warning signals. Also, business decision-makers face psychological barriers to awareness and acceptance of the conflicts of values and interests entailed by early warning signals. Cultural business context may further contribute to the denial of conflicts of values.

The chapter concludes with a set of reflections on how to support more precautionary business decision making. A prominent policy response to the conflicting interests of business and society is introducing regulations that attempt to steer business rationality towards internalising external effects. Innovative solutions such as assurance bonding should be considered.

There is a need to better understand and expose why business actors do not respond voluntarily to early warning signals with precautionary actions. Blaming business, in particular with hindsight, tends to be common reaction that may not always be constructive. It often misses the complex or even contradictory set of motives and drivers that business actors face.

Public institutions could support progressive business by analysing and publically disclosing the dilemmas and temptations entailed by early warning signals, for example for different industries and for the specific societal and regulatory context of decisions. Rigorous and explicit exposition of the dilemmas will create further incentives for responsible actors to share and communicate their precautionary responses.

An additional reflection centres on the role of political actions of business actors, in particular those actions aimed at suppressing early warning signals. Regulatory efforts that make the political actions of business more transparent can help to sustain a sound balance of power, thereby maintaining our ability to benefit from early warning signals and reducing the likelihood of health and environmental hazards.

26 Science for precautionary decision-making

Philippe Grandjean

The goals of academic researchers may differ from those of regulatory agencies responsible for protecting the environment. Thus, research must take into account issues such as feasibility, merit and institutional agendas, which may lead to inflexibility and inertia.

A large proportion of academic research on environmental hazards therefore seems to focus on a small number of well studied environmental chemicals, such as metals. Research on environmental hazards should therefore to a greater extent consider poorly known problems, especially the potential hazards about which new information is in particular need.

Misinterpretation may occur when results published in scientific journals are expressed in hedged language. For example, a study that fails to document with statistical significance the presence of a hazard is often said to be negative, and the results may be misinterpreted as evidence that a hazard is absent. Such erroneous conclusions are inspired by science traditions, which demand meticulous and repeated examination before a hypothesis can be said to be substantiated.

For prioritising needs for action, research should instead focus on identifying the possible magnitude of potential hazards. Research is always affected by uncertainties and many of them can blur a real association between an environmental hazard and its adverse effects, thereby resulting in an underestimated risk. Environmental health research therefore needs to address the following question: are we sufficiently confident that this exposure to a potential hazard leads to adverse effects serious enough to initiate transparent and democratic procedures to decide on appropriate intervention?

The choice of research topics must consider societal needs for information on poorly known and potentially dangerous risks. The research should be complementary and extend current knowledge, rather than being repetitive for verification purposes, as required by the traditional science paradigm. Research findings should be openly available and reported so that they inform judgments concerning the possible magnitude of suspected environmental hazards, thereby facilitating precautionary and timely decision-making.

27 More or less precaution?

David Gee

Despite its presence in a growing body of EU and national legislation and case law, the application of the precautionary principle has been strongly opposed by vested interests who perceive short term economic costs from its use. There is also intellectual resistance from scientists who fail to acknowledge that scientific ignorance and uncertainty, are excessively attached to conventional scientific paradigms, and who wait for very high strengths of evidence before accepting causal links between exposure to stressors and harm.

The chapter focuses on some of the key issues that are relevant to a more common understanding of the precautionary principle and to its wider application. These include different and confusing definitions of the precautionary principle and of related concepts such as prevention, risk, uncertainty, variability and ignorance; common myths about the meaning of the precautionary principle; different approaches to the handling of scientific complexity and uncertainty; and the use of different strengths of evidence for different purposes.

The context for applying the precautionary principle also involves considering the 'knowledge to ignorance' ratio for the agent in focus: the precautionary principle is particularly relevant where the ratio of knowledge to ignorance is low, as with emerging technologies.

A working definition of the precautionary principle is presented that aims to overcome some of the difficulties with other definitions, such as their use of triple negatives; a failure to address the context of use of the precautionary principle; no reference to the need for case specific strengths of evidence to justify precaution; and overly narrow interpretations of the pros and cons of action or inaction.

The chapter also points to the need for greater public engagement in the process of framing and decision-making about both upstream innovations and their downstream hazards, including the specification of the 'high level of protection' required by the EU treaty. A precautionary and participatory framework for risk analysis is proposed, along with some 'criteria for action' to complement criteria for causation.

The capacity to foresee and forestall disasters, especially when such action is opposed by powerful economic and political interests, appears to be limited, as the case studies in *Late lesson from early warnings* illustrate. The chapter argues that with more humility in the face of uncertainty, ignorance and complexity, and wider public engagement, societies could heed the lessons of past experience and use the precautionary principle, to anticipate and minimise many future hazards, whilst stimulating innovation. Such an approach would also encourage more participatory risk analysis; more realistic and transparent systems science; and more socially relevant and diverse innovations designed to meet the needs of people and ecosystems.

28 In conclusion

The first volume of *Late lessons from early warnings* highlighted the difficulties of balancing precaution with technological innovation and ended with a call to action for policymakers. How much progress has been made since then?

First, there is growing evidence that precautionary measures do not stifle innovation, but instead can encourage it, in particular when supported by smart regulation or well-designed tax changes. Not only has the body of knowledge become richer since 2001, but also the number of stakeholders involved in decision-making has become larger and more diverse. There has also been increasing attention to communicating scientific uncertainty, especially in the fields of climate change, food safety, and emerging risks.

However, there has been less progress in other areas: for example, many of the political and scientific 'bureaucratic silos' still remain, despite frequent calls for policy integration and inter-departmental coordination. This has led to the unintended destruction of stocks of natural capital in some parts of the world and in other instances, the global spread of technologies, despite warnings of impending hazards. The result has been widespread damage, with most polluters still not paying the full costs of pollution.

Yet, more encouragingly, new transformative approaches are emerging to manage the systemic and interconnected challenges the world faces e.g. economic/financial, climate/energy, ecosystems/food. These relate, inter alia, to the increasing use of digital communications and networking by consumers, citizens and shareholders to demand and foster increased participation, more social responsibility, greater levels of accountability and higher transparency, especially in determining future pathways for energy and food production. There is a greater understanding of the complexity of the environment, of scientific ignorance and uncertainties, the irreversibility of many harmful impacts and on the broader risks to the long term interests of society if political and financial institutions remain unchanged. Also some corporations are fundamentally embracing sustainable development objectives in their business models and activities.

The case studies across both volumes of *Late lessons from early warnings* cover a diverse range of chemical and technological innovations, and highlight a number of systemic problems. These include a lack of institutional and other mechanisms to respond to early warning signals; a lack of ways to correct market failures either caused by misleading market prices or where costs and risks to society and nature are not properly internalised; and the fact that key decisions on innovation pathways are made by those with vested interests and/or by a limited number of people on behalf of many. The insights and lessons drawn from the case histories certainly provide the seeds for some of the answers. They also provide knowledge for a series of key actions that are outlined below.

Of course, many questions remain. For example: how can the precautionary principle be used further to support decision-making in the face of uncertainties and the inevitable surprises that come from complex systems?; how can societies avoid a lack of 'perfect' knowledge being used as a justification for inaction in the face of 'plausible' evidence of serious harm?; how can conflicting interests be balanced during the phases of development and use?; and how can the benefits of products and technologies be more equitably distributed?

Reduce delays between early warnings and actions

The majority of the case studies in *Late lessons from early warnings* Volumes 1 and 2 illustrate that if the precautionary principle had been applied on the basis of early warnings, justified by 'reasonable grounds for concern' many lives would have been saved and much damage to ecosystems avoided. It is therefore very important that large scale emerging technologies, such as biotechnologies, nanotechnologies and information

and communication technologies, apply the precautionary principle based on the experiences and lessons learned from these and other case studies.

Precautionary actions can be seen to stimulate rather than hinder innovation; they certainly do not lead to excessive false alarms. As the analysis in Volume 2 shows, of 88 cases of claimed 'false positives', where hazards were wrongly regulated as potential risks, only four were genuine false alarms. The frequency and scale of harm from the mainly 'false negative' case studies indicate that shifting public policy towards avoiding harm, even at the cost of some false alarms, would seem to be worthwhile, given the asymmetrical costs of being wrong in terms of acting or not acting based on credible early warnings.

However, the speed and scale of today's technological innovations can inhibit timely action. This is often because by the time clear evidence of harm has been established, the technology has been modified, thereby allowing claims of safety to be subsequently re-asserted. Even where the technological change has been marginal, the large, often global, scale of investment can lead to widespread technological lock-in, which is then difficult and expensive to alter.

These features of current technological innovation strengthen the case for taking early warning signals more seriously and acting on lower strengths of evidence than those normally used to reach 'scientific causality'. Most of the historical case studies show that by the time such strong evidence of causality becomes available, the harm to people and ecosystems has become more diverse and widespread than when first identified, and may even have been caused by much lower exposures than those initially considered dangerous.

The case studies have also shown that there are many barriers to precautionary action, including: the short-term nature of most political and financial horizons; the existence of technological monopolies; the conservative nature of the sciences involved, including the separate 'silos' within which they operate; the power of some stakeholders; and the cultural and institutional circumstances of public policymaking that often favour the status quo.

Acknowledge complexity when dealing with multiple effects and thresholds

Increasing scientific knowledge has shown that the causal links between stressors and harm are more complex than was previously thought and this has practical consequences for minimising harm. Much of the harm described in Volumes 1 and 2, such as cancers or species decline, is caused by several co-causal factors acting either independently or together. For example, the reduction of intelligence in children can be linked to lead in petrol, mercury and polychlorinated biphenyls (PCBs) as well as to socio-economic factors; bee colony collapse can be linked to viruses, climate change and nicotinoid pesticides; and climate change itself is caused by many complex and inter-linked chemical and physical processes.

In some cases, such as foetal or fish exposures, it is the timing of the exposure to a stressor that causes the harm, not necessarily the amount; the harm may also be caused or exacerbated by other stressors acting in a particular timed sequence. In other cases, such as radiation and some chemicals such as bisphenol A (BPA), low exposures can be more harmful than high exposures; and in others, such as asbestos with tobacco, and some endocrine disrupting substances, the harmful effects of mixtures can be greater than from each separate stressor. There are also varying susceptibilities to the same stressors in different people, species and ecosystems, depending on pre-existing stress levels, genetics and epigenetics. This variation can lead to differences in thresholds or tipping point exposures, above which harm becomes apparent in some exposed groups or ecosystems but not others. Indeed there are some harmful effects which occur only at the level of the system, such as a bee colony, which cannot be predicted from analysing a single part of the system, such as an individual bee.

Our increased knowledge of complex biological and ecological systems has also revealed that certain harmful substances, such as polychlorinated biphenyls (PCBs) and dichlorodiphenyltrichlorethane (DDT) can move around the world via a range of biogeochemical and physical processes and then accumulate in organisms and ecosystems many thousands of kilometres away.

The practical implications of these observations are threefold. First, it is very difficult to establish very strong evidence that a single substance or stressor 'causes' harm to justify timely actions to avoid harm; in many cases only reasonable evidence of co-causality will be available. Second, a lack of consistency between research results is not a strong reason for dismissing possible causal links: inconsistency is to be expected from complexity. Third, while reducing harmful exposure to one co-causal factor may not necessarily lead to a large reduction in the overall harm caused by many other

factors, in some cases the removal of just one link in the chain of multi-causality could reduce much harm.

A more holistic and multi-disciplinary systems science is needed to analyse and manage the causal complexity of the systems in which we live.

Rethink and enrich environment and health research

Environment and health research overly focuses on well-known rather than unknown hazards at the expense of emerging issues and their potential impacts. For example the ten most well-known substances, such as lead and mercury, account for about half of all articles on chemical substances published in the main environmental journals over the last decade. Over the past decade, public research funding in the European Union on nanotechnology, biotechnology as well as Information and Communications Technology (ICT) is heavily biased towards product development with about 1 % being spent on their potential hazards. A more equal division of funding between known and emerging issues, and between products and their hazards, would enrich science and help avoid future harm to people and ecosystems and to the long term economic success of those technologies.

Funding more holistic systems science would also help achieve a greater integration among the different branches of science and counteract problems such as: peer review predominantly within and not across disciplines; short-term interests outcompeting long-term vision; competition replacing cooperation because of conflicts of interest; contradictions amongst paradigms; fragmentation of values and authority; as well as fragmentation of information and knowledge. These can all lead to inferior solutions and provide increased opportunities for those with vested interests to manufacture doubt.

Scientific methods can also be improved. For example, much higher strengths of evidence are required overall before causality is accepted, compared to the evidence being used to assert safety. The assertion that there is *no evidence of harm* is then often assumed to be *evidence of no harm*, even though the relevant research is missing. Historically there has been an over-reliance on the statistical significance of point estimates compared to confidence limits based on multiple sampling. There has also been a bias towards using models that grossly simplify reality rather than using long-term observations and trend data of biological and ecological systems. These approaches have sometimes led to the production of false positives. More importantly the governance of scientific ignorance and unknown unknowns has been neglected.

Finally, many case studies highlight the problems faced by early warning scientists who have been harassed for their pioneering work, including bans on speaking out or publishing, loss of funding, legal or other threats, and demotion. One obvious conclusion is that scientists in these situations should receive better protection either via an extension of 'whistle blowing' and discrimination laws, or by independent acknowledgement of the value of their work.

Improve the quality and value of risk assessments

The majority of the case studies in *Late lessons from early warnings* indicate that risk assessment approaches need to better embrace the realities of causal and systems complexity (rather than use a narrow conception of 'risk') with the inevitable features of ignorance, indeterminacy and contingency. In a number of case studies, for example BPA, where low doses are more harmful than high doses, or tributyltin antifoulants (TBT) and synthetic oestrogen diethylstilboestrol (DES) where the timing of the dose is what makes it harmful, simplistic assumptions are inadequate. Variability in exposures and varying susceptibilities in populations and species exposed also need to be more realistically factored into risk assessments.

This is equally true for technological risk assessments. As the Fukushima Investigation Committee concluded in 2011:

> '…the accidents present us with crucial lessons on how we should be prepared for 'incidents beyond assumptions'. With its failure to plan for the cascade effects beyond design–base accidents 'the regulatory emphasis on risk based probabilistic risk assessment has proven very limited'.

In other words, narrow risk assessment approaches are now outstripped by the realities which they cannot address, recognise and communicate. Too often this contributes to the effective denial of those risks that do not fit the risk assessment frame. It is therefore urgent that risk assessment practices

be transformed to make them broader-based, more inclusive, transparent and accountable. There should also be more communication on the diversity of scientific views, especially on emerging issues where ignorance and uncertainties are high and genuine differences of scientific interpretations are likely, desirable, and defensible. In this sense, recognising the pedigree of knowledge, i.e. the consistency of views amongst peers and the level of convergence coming from different branches of research, is essential for effective decision making and action to support the wellbeing of people and the environment.

The case studies show that evaluations of evidence in risk assessments can be improved by including a wide range of stakeholders when framing the risks and options agenda; broadening the scope and membership of evaluation committees; increasing the transparency of committee approaches and methods, particularly in identifying uncertainties and ignorance; and ensuring their independence from undue influence through using appropriate funding sources and applying robust policies on conflicts of interest.

Public confidence would be increased if all the evidence used in risk assessments was made publicly accessible and open to independent verification, including data submitted by industries to authorities.

As experiences from mercury, nuclear accidents, leaded petrol, mobile phones, BPA, and bees show, there can be a significant divergence in the evaluations of the same, or very similar, scientific evidence by different risk assessment committees. In such instances, differences in the choice of paradigm, assumptions, criteria for accepting evidence, weights placed on different types of evidence, and how uncertainties were handled, all need to be explained. Risk assessors and decision makers also need to be aware that complexity and uncertainty have sometimes been misused to shift the focus away from precautionary actions by 'manufacturing doubt' and by waiting for 'sound science' approaches that were originally developed by the tobacco industry to delay action.

Foster cooperation between business, government and citizens

Policy formulation should start from a broad concept of technological innovation to include non-technological, social, institutional, organisational and behavioural innovation. In this framework, governments have at least three roles: providing direction by putting in place smart regulations and consistent market signals; ensuring that the distributional consequences of innovations are balanced between risks and rewards across society, fostering a diversity of innovations so that the wider interests of society; and take precedence over narrower interests.

Numerous case studies show that decisions to act without precaution often come from businesses. There are, however, several impediments to businesses acting in a precautionary manner, including a focus on short-term economic value for shareholders alongside psychological factors that lead to a so-called 'ethical blindness' or a 'self-serving bias' whereby people largely interpret ambiguous situations in their own interests. Governments and businesses could collaborate more with citizens on publicly disclosing the potential value conflicts entailed in acting on early warning signals. A culture of transparency can in turn promote positive business attitudes and innovations.

Involving the public can also help in choosing between those innovation pathways to the future; on prioritising relevant public research; on providing data and information in support of monitoring and early warnings; improving risk assessments; on striking appropriate trade-offs between innovations and plausible health and environmental harms; and, making decisions about risk-risk trade-offs.

Correcting market failures using the polluter pays and prevention principles

When evidence of initial harm emerges, the costs should be internalised retroactively into the prices of polluting products, via taxes and charges, in line with the polluter pays principle and emerging practice across the world. The revenues could then be devoted partly to stimulating research into less hazardous alternatives, and partly to reform tax systems by reducing taxes and charges on 'societal goods' like employment.

The pollution taxes/charges would rise or fall in line with new scientific knowledge about increasing/decreasing harm, and this would help to level the playing field for less-polluting alternative products. Tax shifts from employment to pollution and the inefficient use of resources can bring multiple benefits such as increased employment, a stimulus to innovation, a more stable tax base in the light of expected demographic changes, and a more efficient tax collection system.

More broadly, firms and governments need to extend their economic accounting systems to incorporate the full impacts of their activities on people's health and on ecosystems. Governments need to anticipate this in their policies, by providing the right blend of fiscal instruments to both protect the public and ensure that firms internalise the true costs of potential harm.

A number of case studies also demonstrate the long time lags between evidence of harm and the additional injustice and time of forcing victims to pursue their cases through civil compensation claims. Prompt and anticipatory no-fault compensation schemes and assurance bonds, could be set up and financed in advance of potential harm by the industries that are producing novel and large-scale technologies, thereby helping to offset any potential market failure. Such schemes can also be designed to increase the incentives for innovating companies to carry out more *a priori* research into the identification and elimination of hazards.

Governance of innovation and innovation in governance

The *Late lessons from early warnings* reports demonstrate the complexities of developing not only the right kind of science and knowledge but also handling the interactions between the many actors and institutions involved — governments, policymakers, businesses, entrepreneurs, scientists, civil society representatives, citizens and the media.

Alongside many other analyses produced across the world today, the reports also stress the need to act to transform our ways of thinking and of doing, and urgently so in the face of unprecedented global changes, challenges and opportunities. Many lessons have been learnt, yet have not been acted upon. Any calls for action will need to reflect on today's global socio-economic setting and support, among other things, the drive to:

- rebalance the prioritisation of economic and financial capital over social, human and natural capitals through the broader application of the policy principles of precaution, prevention and polluter-pays, and environmental accounting;

- broaden the nature of evidence and public engagement in choices about key innovation pathways by directing scientific efforts more towards dealing with complex, systemic challenges and unknowns and complementing this with professional, lay, local and traditional knowledge; and,

- build greater adaptability and resilience in governance systems to deal with multiple systemic threats and surprises, through strengthening institutional structures and deploying information technologies in support of the concept of responsible information and dialogues.

The governance of innovation will remain at the level of good intentions unless it is translated into innovations in science practices, institutional arrangements and public engagements as well as transformations in prevailing business attitudes, practice and influence. These are the tasks that lie ahead.

In memory of Masazumi Harada, 1935–2012

Masazumi Harada, a physician involved for many years in the study of the mercury poisoning Minamata disease, died in June 2012 of acute myelocytic leukemia at his home in Kumamoto City. He was 77.

Harada conducted medical examinations on the disease's sufferers for the first time in the summer of 1961 in Minamata city in Kumamoto Prefecture while he was a student at Kumamoto University's graduate school.

Shocked by their miserable lives, Harada devoted himself to the study of the disease from that time. Harada published a thesis on congenital Minamata disease in 1964. The work had a significant impact as it disproved the conventional belief at the time that the placenta does not pass poisons. He received an award from the Japanese Society of Psychiatry and Neurology for the thesis in 1965.

He then established the Open Research Center for Minamata Studies at the university in 2005, becoming the center's head. He continued to lead the disease's research from non-medical perspectives as well. Harada visited Brazil, China and native Indian communities in Canada to discover those suspected of suffering from the disease.

Author of many books, Harada wrote 'Minamata Byo' (Minamata Disease), which raised awareness on the issue around the world.

Dr. Masazumi Harada first came to Asubpeeschoseewagong (Grassy Narrows) and Wabaseemoong (White Dog) First Nations in Canada in the early 1970s. Harada's death comes at the end of River Run 2012, five days of actions by members and supporters of Grassy Narrows in Toronto, who are seeking to have Minamata disease recognized in Canada and Ontario. Harada's final report for the Grassy Narrows community was released on 4 June 2012 after 30 years of research, showing mercury deposited in the river by the Dryden paper mill in the 1970s is impacting those who were not yet born when the dumping ceased.

In memory of Poul Harremoës, 1934–2003

Poul Harremoës was a key player in environmental issues in Denmark and internationally for more than 30 years until his death, at 69, in 2003. In that time, those who worked closely with him benefited from a continuous, almost daily flow of excellent ideas for new research projects.

He was a member of the Danish Pollution Council, which prepared the first framework national law on environmental protection and advised on the establishment of a Ministry of Environment from 1971. He was a key participant in numerous settings, including the first Scientific Committee of the European Environment Agency from 1995.

He had a civil engineering degree from the Technical University of Denmark. He specialised early on in geo-technics and constructed dams on the Faroe Islands. While teaching geo-technics he wrote a textbook that was used for more than 40 years. However, he was able to quickly change his research direction and develop new areas of excellence. So, for example, he got a grant to study at Berkeley, California, from where he received a M.Sc. degree in environmental engineering.

In 1972, he became professor in environmental engineering at the Technical University of Denmark where he originally worked with wastewater discharge to the sea and the biological processes of wastewater treatment. He became a world leading scientist in the theories of biofilms for removal of organics and nitrogen from wastewater before turning to sewer design and modelling. In 2000, Poul was awarded the *Heineken prize for Environmental Sciences* for his contributions to the theory of biofilm kinetics in relation to biological waste water treatment and for his successful organisation of the international scientific community in water pollution research and control.

As a result of his work with sewers and storm water he went into the area of risk analysis and the role of the precautionary principle. In a short time he became an international expert in this field and was highly demanded for lectures in all parts of the world. A key outcome of his interest was his contributions as chairman of the editorial team for the first volume of *Late lessons from early warnings* published in 2001.

MILJØMINISTERIET

Miljøstyrelsen

Metoder til fastsættelse af kvalitetskriterier for kemiske stoffer i jord, luft og drikkevand med henblik på at beskytte sundheden

Vejledning fra Miljøstyrelsen **Nr. 5** 2006

Indhold

Forord

Principperne for vurdering og fastsættelse af kvalitetskriterier for kemikalier med henblik på at beskytte sundheden er beskrevet tidligere[1]. Men i forbindelse med Miljøministerens redegørelse om jordforureningsloven i 2003, besluttede regeringen at nedsætte en arbejdsgruppe, som fik til opgave at "*vurdere, hvorvidt de sundhedsmæssige kvalitetskriterier ligger på det rigtige niveau i relation til international praksis, samt give forslag til ændringer*.

Arbejdsgruppen udpegede en række politiske valg, der indgår i principperne for fastsættelse af kvalitetskriterier. På den baggrund blev der i december 2005 indgået en aftale mellem Miljøministeren og et bredt udsnit af Folketingets partier, som bl.a. fastlægger følgende generelle principper for fastsættelsen af forebyggende kriterier :

- Hovedparten af befolkningen skal fortsat beskyttes (dvs. hensyntagen til særligt udsatte skal også inddrages).
- Der skal tages specifikt hensyn til børn.
- Det fastholdes, at der højst anvendes en samlet usikkerhedsfaktor på 10.000, når resultater fra dyreforsøg overføres til mennesker.
- Der accepteres fortsat en livstidsrisiko på 10^{-6}.

Denne vejledning indarbejder disse principper og gennemgår de metoder, som skal anvendes ved fastsættelse kvalitetskriterier for jord, luft og drikkevand med henblik på at beskytte sundheden[2].

[2] Principper for fastsættelse af kvalitetskriterier med henblik på at beskytte miljøet er tilsvarende beskrevet i Miljøstyrelsens vejled-

Vejledningen henvender sig til centrale og lokale myndigheder, herunder embedslægeinstitutionerne, konsulenter, rådgivere og virksomheder.

Miljøstyrelsen fastsætter løbende kvalitetskriterier for konkrete kemiske stoffer i jord, luft og drikkevand med henblik på at beskytte sundheden, jf. Miljøbeskyttelsesloven § 14, stk. 1,. Kvalitetskriterierne bliver fastsat på baggrund af videnskabelige rapporter og efter drøftelse i en styregruppe med deltagelse af bl.a. Fødevarestyrelsen, Arbejdstilsynet og Sundhedsstyrelsen.

Denne vejledning og detaljeringsgraden, ikke mindst i den tilhørende faglige rapport[3], skal give grundlag for større forståelse for, hvordan kvalitetskriterier skal udarbejdes.

Kvalitetskriterierne anvendes dels til at vurdere alvoren af en allerede given forurening, og dels når myndighederne stiller krav i forbindelse med udledning af konkrete stoffer til omgivelserne.

ning nr. 4 (2004): Principper for fastsættelse af vandkvalitetskriterier for stoffer i overfladevand.

[3] Miljøprojekt Nr. 974, Miljøstyrelsen (2005). Principper for sundhedsmæssig vurdering af kemiske stoffer med henblik på fastsættelse af kvalitetskriterier for luft, jord og vand. Rapporten er udarbejdet af Institut for Fødevaresikkerhed og Ernæring, Fødevaredirektoratet (nu Danmarks Fødevareforskning) i samarbejde med Miljøstyrelsen.

1 Indledning

1.1 Hvad er kvalitetskriterier

1.1.1 Formål med fastsættelse af kvalitetskriterier for kemikalier

Denne vejledning beskriver den administrative praksis ved fastsættelse af kvalitetskriterier for kemikalier med henblik på at beskytte sundheden.

Kvalitetskriterier danner basis for en række vurderinger af administrativ karakter, som vedrører både jord, luft og drikkevand.

Målsætningen ved fastsættelsen af kvalitetskriterier for kemikalier er, at de skal medvirke til *at forebygge forurening og skader på sundheden*. Kvalitetskriterierne ses som et element i lovens overordnede politiske målsætning om at oppebære et højt beskyttelsesniveau for befolkningens sundhed og sikre en bæredygtig udvikling, herunder fremme af renere teknologi.

Kvalitetskriterierne angiver et højt beskyttelsesniveau, hvor ingen effekt kan forventes, selv ved udsættelse gennem et helt liv, eller hvis der er tale om et stof uden tærskelværdi, en teoretisk forøget risiko for kræft hos én ud af en million mennesker, som er udsat for stoffer gennem et helt liv på 70 år.

Kvalitetskriterierne bruges af myndighederne i forbindelse med vurdering af alvoren af et givet forureningsniveau. Det kan være relevant, hvis der er tale om en eksisterende forurening (fortidens synder), eller hvis der skal fastsættes kravværdier for udledning af konkrete stoffer i miljøet (forebyggende). For begge situationer kan andre forhold end de sundhedsmæssige spille ind, såsom baggrundsniveauer og tekniske/økonomiske overvejelser. Ved indsatsen i forhold til eksisterende forureninger kan der også være behov for at

vurdere, hvad der er sundhedsmæssigt forsvarligt, når der tages hensyn til overordnede samfundsmæssige prioriteringer. Med udgangspunkt i de sundhedsmæssigt fastsatte kvalitetskriterier udarbejdes således en række administrativt fastsatte kriterier.

Eksempler på administrative kriterier som er baseret på kvalitetskriterier er:

1. Luftkvalitetskriteriet anvendes som udgangspunkt til at fastsætte bidrags værdier (B-værdier), der anvendes i forbindelse med regulering af virksomheders udslip af kemiske stoffer til udeluften.
2. Luftkvalitetskriteriet anvendes til at vurdere afdampning af kemiske stoffer fra jordforureninger. Det anvendes også ved kortlægning og offentlig oprydning af forurenede grunde.
3. Jordkvalitetskriterier anvendes som udgangspunkt ved fastsættelse af administrative kriterier, der anvendes ved de lokale myndigheders kortlægning af forurenede grunde og i forbindelse med vurderinger af arealanvendelse, samt ved offentlig oprydning af forurenede grunde[4].
4. Jordkvalitetskriteriet anvendes endvidere som udgangspunktet for fastsættelse af afskæringskriteriet for visse immobile stoffer. Afskæringskriteriet anvendes ved lettere forurenede områder som skillelinie mellem det niveau, hvor det er nødvendigt at fjerne jorden og det niveau, hvor det er tilstrækkeligt at iværksætte særlige forholdsregler i forbindelse med følsom anvendelse af områderne, som fx private haver eller børneinstitutioner.
5. Drikkevandskvalitetskriteriet anvendes af de centrale og decentrale myndigheder i forbindelse med håndtering af konkrete sager med kemisk forurening af drikkevand, som et supplement til de kravværdier, der er fastsat i bekendtgørelsen om vandkvalitet.
6. Drikkevandskvalitetskriterierne anvendes som udgangspunkt ved fastsættelse af grundvandskvalitetskriterier i tilknytning til nedsivning fra jordforureninger,

[4] Kvalitetskriterierne omfatter normalt ikke en vurdering af om arealer kan anvendes til dyrkning af nytteplanter eller til afgræsning for husdyr.

idet grundvandet skal være af en kvalitet, så de fastsatte drikkevandskrav/ -kvalitetskriterier kan overholdes.

Der eksisterer en række vejledninger og lister, som nærmere beskriver baggrunden for, hvordan et kvalitetskriterium kan anvendes.[5]

1.1.2 Generelle principper for fastsættelse af kvalitetskriterier for kemikalier

Kvalitetskriterierne fastsættes på et niveau, hvor udsættelse gennem et helt liv ikke fører til skadevirkninger i befolkningen. De fastsættes på baggrund af den eksisterende viden og under hensyntagen til de mangler, der ligger i datagrundlaget.

For at minimere risici for skadelig påvirkning af befolkningen indgår beskyttelse af særligt følsomme grupper fx børn, gravide, syge, ældre og svækkede ved fastsættelse af kvalitetskriterier.

Viden om et kemisk stofs sundhedsskadelige egenskaber og om bestemte befolkningsgruppers særlige følsomhed er sjældent så eksakt, at der kan fastsættes et kvalitetskriterium, der præcist definerer skillelinien (hvis en sådan overhovedet findes) mellem et ufarligt og farligt niveau. Kvalitetskriterierne kan således ikke opfattes som en streg i sandet, hvor enhver overskridelse er farlig. Ved fastsættelse af kvalitetskriterier for kemikalier skal anvendes en forsigtighedstilgang, da målet er at sikre et højt beskyttelsesniveau for alle ved udsættelse over et helt liv.

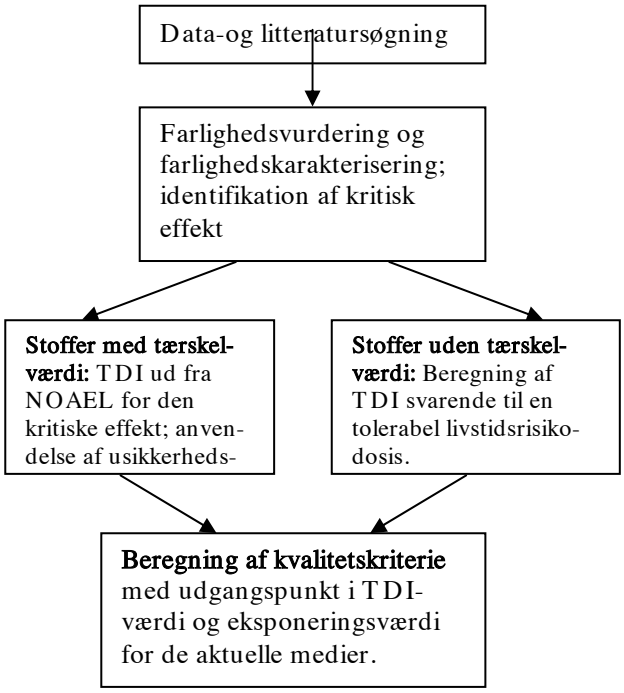
Et kvalitetskriterium skal således opfattes som en sikkerhedsgrænse og ikke en faregrænse. En overskridelse er "det gule lys", som advarer om, at her er noget, som måske kan blive et reelt problem.

---

[5] Luftvejledningen, Miljøstyrelsens Vejledning nr. 2, 2001; Oprydning på forurenede lokaliteter

1.2 Vejledningens opbygning og indhold

Vejledningen udstikker retningslinier for den faglige risikovurdering og for de metoder/ principper der anvendes. Dernæst beskrives proceduren for beregning af kvalitetskriterierne (se figur 1).



Figur 1.
Fremgangsmåden ved beregning af kvalitetskriterium (TDI=Tolerabel Dagligt Indtag)

Det videnskabelige grundlag for fastsættelse af sundhedsmæssigt baserede kvalitetskriterier for kemiske stoffer i jord, luft og drikkevand består af en farlighedsvurdering, en dosis-respons (effekt) vurdering (farlighedskarakterisering), samt en eksponeringsvurdering. Farlighedsvurderingen og farlighedskarakteriseringen tager udgangspunkt i undersøgelser af det pågældende stofs toksikologiske effekter i mennesker og i dyr.

I kapitel 2 omtales *Datagrundlaget* som anvendes som udgangspunkt for arbejdet. Data hentes primært fra internationale og nationale dokumenter, via litteratursøgning i internationale databaser, samt fra originalartikler.

Kapitel 3 behandler de faglige metoder, der anvendes i forbindelse med farlighedsvurderingen og farlighedskarakteriseringen. Dosis-effekt og dosis-responssammenhænge og udpegning af NOAEL (No Observed Adverse Effect Level) og LOAEL (Lowest Observed Adverse Effect Level) beskrives.

I kapitel 4 beskrives hvordan farlighedskarakteriseringen udmunder i udpegning af en kritisk effekt, som danner udgangspunkt for fastsættelse af en *tolerabel daglig indtagelse, TDI*. Her omtales, hvordan anvendelsen af usikkerhedsfaktorer indgår i beregningerne.

I kapitel 5 omtales, hvordan TDI beregnes for kræftfremkaldende stoffer uden tærskelværdi. Risikoniveauet for TDI-værdien defineres, og der gives retningslinier med hensyn til valg af metode til, hvordan beregningen af dette risikoniveau foretages.

Kapitel 6 beskriver, hvordan den videre beregning af kvalitetskriterier for kemiske stoffer i jord, luft og drikkevand foretages ud fra de fastsatte TDI-værdier. I bilag 2 til vejledningen omtales rationalet for at anvende konkrete standardbetragtninger m.h.t. personers udsættelse for forureninger gennem jord, luft og drikkevand. Endvidere omtales hvilke andre faktorer (fx hensyntagen til lugt eller smag) end de rent sundhedsmæssige, der i visse tilfælde kan have indflydelse på kvalitetskriteriet.

1.3 Ændringer i forhold til tidligere praksis

Ved fastsættelsen af kvalitetskriterier anvendes der internationalt anerkendte principper. I denne forbindelse skal fremhæves de principper og metoder, der er beskrevet i to publikationer af WHO/ IPCS[6,7] om udarbejdelsen af vejledende grænseværdier og risikovurdering af kemisk udsættelse. WHO´s publikationer[8,9] omhandlende risikovurdering og fastsættelse af vejledende grænseværdier for en række kemiske stoffer i drikkevand og luft har også indgået i arbejdet. På tilsvarende vis er der en tæt sammenhæng med de principper og metoder, der anvendes i forbindelse med EU´s risikovurderingsprogram for kemiske stoffer[10].

På visse områder indebærer denne vejledning, at den hidtidige praksis for fastsættelse af kvalitetskriterier justeres. Dette gælder fx for beregning af kvalitetskriterier for kemikalier i luft og drikkevand, idet der nu som udgangspunkt anvendes standardværdier for børns udsættelse (se kapitel 6 og bilag 2).

I forbindelse med ekstrapolering af tolerabelt risikoniveau for genotoksiske kræftfremkaldende stoffer (dvs. kræftfremkaldende stoffer hvor der ikke anses at være en tærskelværdi for effekt), anvendes lineær ekstrapolation ud fra den så-

Technical Guidance Document in support of Commission Directive 93/67/EEC on risk assessment for new notified substances and Commission Regulation (EC) No. 1488/94 on risk assessment for existing substances and Directive 98/8/EC of the European Parliament and of the Council concerning the placing of biocidal products on the market.

kaldte T25- metode udviklet i forbindelse med EU´s risikovurderingsprogram (kapitel 5).

Hvis datagrundlaget er til stede, anbefales det at anvende benchmark-metoden ved fastsættelse af TDI (kapitel 3).

Det skal bemærkes, at denne vejledning anvender begrebet usikkerhedsfaktorer, hvor man tidligere anvendte begrebet sikkerhedsfaktorer. Dels beskriver ordet *usikkerhed* i højere grad faktorernes anvendelse, idet de netop tager højde for usikkerheder. Dels imødegås den misforståelse, at en stor sikkerhedsfaktor for et stof medfører større sikkerhed for dette stof i forhold til en lille anvendt sikkerhedsfaktor for et andet stof. Faktorerne anvendes derimod for at opnå et ensartet beskyttelsesniveau, og størrelsen af faktorerne afspejler usikkerheder som følge af usikker viden og manglende datagrundlag.

De angivne metoder i vejledningen anvendes fremover ved fastsættelse af kvalitetskriterier.

De ændringer der er sket i forhold til tidligere praksis betyder ikke, at de eksisterende kvalitetskriterier skal "laves om", idet anvendelse af de nye metoder ikke vurderes at påvirke beskyttesesniveauet væsentligt. Når et kvalitetskriterium tages op til revurdering bør dette ske både m.h.t. til revurdering af de sundhedsmæssige data og af de eksponeringsmæssige forhold. En revurdering foretages derfor fuldt ud med alle de vurderingsmæssige og beregningsmæssige faser, der er beskrevet i vejledningen.

2 Datagrundlag for vurdering af farlighed

Fastsættelse af kvalitetskriterier for et kemisk stof sker på baggrund af eksisterende viden om stoffets sundhedsskadelige egenskaber.

Kvalitetskriterierne fastsættes med henblik på beskyttelse af menneskers sundhed, og det ideelle datagrundlag for fastsættelse af et kvalitetskriterium er derfor viden, hvor mennesker har været udsat for det konkrete stof. For langt de fleste kemiske stoffer er der kun begrænset viden om veldefineret udsættelse og effekter hos mennesker, og kvalitetetskriterierne vil som oftest være baseret på viden opnået fra dyreforsøg med mere veldefineret udsættelse eller *in vitro* data[11].

For en mere detaljeret beskrivelse af nedenstående afsnit henvises til kapitel 2, Miljøprojekt Nr. 974 (2005).

2.1 Data fra mennesker

Fordelen ved at anvende data, hvor mennesker har været udsat for et kemisk stof, er, at man undgår at skulle overføre data fra dyreforsøg, og estimere hvad en tilsvarende udsættelse betyder hos mennesker. Erfaringer med menneskers udsættelse kan stamme fra en række forskellige typer undersøgelser og afrapporteringer, der groft kan deles op på følgende måde:

- *case reports og kliniske undersøgelser*
- *befolkningsundersøgelser (fx arbejdsmiljø eller udvalgte dele af befolkningen)*
- *undersøgelser af frivillige forsøgspersoner*

[11] Data fra reagensglasforsøg.

Ved *case reports og kliniske undersøgelser* opnås data fra forgiftningstilfælde eller erfaringer fra undersøgelser i klinikken, hvor personer fx i behandlingsøjemed udsættes for stoffer for at vurdere eventuelle allergiske reaktioner. Fordelen ved disse typer data er, at man her umiddelbart kan se en sammenhæng mellem udsættelse og (akutte) effekter.

I *befolkningsundersøgelser* vurderes en større gruppe af mennesker mere systematisk med hensyn til sammenhængen mellem udsættelse og sundhedsskader. Disse undersøgelser kan fx omfatte sundhedsovervågning af særlige grupper i arbejdsmiljøet, hvor personerne er karakteriseret ved en særlig udsættelse, eller man kan undersøge, om der hos personer, der har udviklet nogle konkrete sygdomme, er nogle fælles karakteristika med hensyn til kemiske påvirkninger. Fordelen ved at anvende data fra denne type undersøgelser er, at man er meget tæt på den målgruppe, man ønsker at beskytte med kvalitetskriterierne. Samtidig ses effekterne i sammenhæng med den dagligdag, som mennesker nu engang fungerer i, hvor man udsættes for en kompleks blanding af livsstilsfaktorer og miljøfaktorer. Ulempen er, at det ofte er vanskeligt at vurdere omfanget af udsættelsen af en given komponent, og at det pga. mange andre samvirkende faktorer kan være svært at påvise sammenhænge, som kan være sløret af al "støjen" fra andre faktorer. Ligesom undersøgelserne kun sjældent kan dokumentere en årsagsvirkningssammenhæng, vil de også kun uhyre sjældent kunne anvendes til at dokumentere manglende sammenhæng, dvs. frikende stoffer.

I *undersøgelser med frivillige forsøgspersoner* udsætter man i reglen forsøgspersonerne i en kortere varighed for et konkret stof for at vurdere effekterne. Disse undersøgelser er meget sammenlignelige med dyreforsøg, hvor man tilsvarende har en meget veldefineret udsættelse. De naturlige og etiske begrænsninger ved disse undersøgelser betyder, at der hos mennesker kun kan undersøges for lettere grader af akutte effekter og i sammenhæng med kortere tids forsøgsudsættelse. Endvidere er forsøgspersonerne sjældent særligt følsomme, som visse undergrupper i befolkningen kan være.

Man skal være meget opmærksom på det etiske aspekt m.h.t. anvendelse af frivillige forsøgspersoner. I forbindelse

med vurdering af konkrete humane undersøgelser i risikovurderingssammenhæng, bør anvendelsen af disse data vurderes nøje såvel ud fra etiske som kvalitetsmæssige hensyn. Især ældre undersøgelser kan være udført under stærkt kritisable forhold og med store undersøgelsesmæssige mangler.

Kvalitetskriterier for kemikalier fastsættes ud fra eksisterende data, og det frarådes generelt at igangsætte humanforsøg for at opnå øget viden om konkrete stoffers skadelige effekter.

2.2 Dyreeksperimentelle undersøgelser

For de fleste kemiske stoffer foreligger der ikke data fra menneskers udsættelse, hvorfor kvalitetskriterier hyppigst baseres på data fra dyreeksperimentelle undersøgelser. Resultaterne fra dyreforsøgene anvendes således som model og anvendes til at forudsige hvilke effekter, der kan forventes hos mennesker. Dyreeksperimentelle data kan også benyttes som supplement til humane data, der ikke er entydige, eller til at udpege de aktive stoffer, når mennesker har været udsat og reageret over for blandinger af stoffer.

Fordelene ved dyreforsøg er, at der er tale om standardiserede forsøgsbetingelser, og at der er mulighed for at afsløre væsentlig flere effekter hos forsøgsdyr end hos mennesker, da organer og væv kan undersøges efter forsøgets afslutning. Der er også mulighed for at undersøge virkningsmekanismer og detaljerede dosis-effekt og dosis-responssammenhænge for enkeltstoffer.

Ideelt set ønskes der ved fastsættelsen af kvalitetskriterier for et kemikalie et fuldt datasæt bestående af dyreeksperimentelle undersøgelser til vurdering af en række toksikologiske egenskaber: Toksikokinetik (optagelse og udskillelse), akut toksicitet, irritation, sensibilisering (allergi), toksicitet ved gentagen administration af stoffet, mutagenicitet og genotoksicitet (påvirkning af arvematerialet), kræftfremkaldende effekter, samt effekter på reproduktion og fosterudvikling.

Dyreforsøg har imidlertid også begrænsninger, da nogle effekter kan være vanskelige at afsløre fx lettere grader af slimhindeirritation i øjne og luftveje, lettere grader af påvirkning af centralnervesystemet og visse typer nerveskader.

Endelig kan nogle dyrearter udvikle artspecifikke effekter over for visse stoffer, hvor relevansen i forhold til udsættelse af mennesker er meget omdiskuteret (se afsnit 3).

Det er endvidere vigtigt at vurdere kvaliteten af de dyreeksperimentelle undersøgelser, der anvendes som udgangspunkt for fastsættelse af kvalitetskriterier. Undersøgelser af høj kvalitet, som er udført efter eller på niveau med OECD´s eller EU´s retningslinier for forsøgsdyrstestning, bør foretrækkes. Ved risikovurderingen i forbindelse med fastsættelse af kvalitetskriterier er der dog ikke nogle formelle kvalitetskrav til undersøgelserne, idet en lang række undersøgelser i den videnskabelige litteratur ofte vil være udført i forskningsøjemed uden at undersøgelserne er udført efter en officiel forsøgsguideline eller i overensstemmelse med GLP-reglerne.[12] Sådanne undersøgelser, der ofte er kvalitetssikret i peer-reviewede tidsskrifter, kan indeholde væsentlig information. Forsøgets kvalitet og validitet må i de aktuelle tilfælde vurderes, og der tages stilling til om forsøget kan være af betydning ved fastsættelse af et kvalitetskriterium.

På baggrund af de etiske aspekter ved dyreforsøg arbejdes der internationalt med at udvikle alternative *in vitro* metoder.

2.3 Andre typer data

Ud over forsøg på levende dyr foreligger der ofte undersøgelser der er udført på udtagne organer, væv eller isolerede celler. Disse *in vitro* metoder finder især anvendelse til vurdering af stoffers toksiske effekt på organ-/celleniveau særligt m.h.t. mutagene og genotoksiske effekter.

[12] GLP står for Good Laboratory Practice, og er et regelsæt udviklet af OECD for at sikre kvaliteteten af undersøgelserne.

Normalt kan *in vitro* forsøg ikke anvendes til at fastlægge tærskel for effekt (NOAEL e.l.), men de vil indgå i bedømmelsen af stoffets farlighed. In vitro-data kan således styrke mistanken om skadeeffekter og derved påvirke valget af usikkerhedsfaktorer (se afsnit 4).

Ved mangel på data for et konkret stof kan data fra nært beslægtede stoffer indgå i vurderingen ud fra betragtninger om kemisk strukturlighed og sammenfaldende effekter. Sådanne data kan have indflydelse på den rent kvalitative, men også i visse tilfælde i den kvantitative vurdering, hvis det konkret vurderes, at der er grundlag for meget snævert koblede analogislutninger.

Endvidere kan der udføres en mere systematisk analyse vedrørende kvantitative struktur-aktivitets relationer (engelsk: Quantitative Structure Activity Relationships – QSARs). Anvendelse af denne form for computerbaserede modeller har i en række tilfælde vist sig som et alternativ til dyreforsøg med henblik på forudsigelse af toksikologiske egenskaber (MST 2001[13]). Vurderingerne kan sjældent anvendes som udgangspunkt for beregning af kvalitetskriteriet, men vil i visse tilfælde kunne anvendes til styrkelse af mistanken om konkrete effekter. QSAR vil således kunne påvirke valget af usikkerhedsfaktorer ved beregning af kvalitetskriteriet.

2.4 Indhentning af data

Som udgangspunkt for udarbejdelse af kvalitetskriterier anvendes i udstrakt grad internationalt anerkendte stofmonografier og dokumenter, hvor det aktuelle stof er vurderet og beskrevet m.h.t. dets sundhedsskadelige effekter. En række af disse værker (kilder) er nævnt i afsnit 2.5.1 i Miljøprojekt Nr. 974 (2005) . Sådanne dokumenter, der ofte er baseret på en grundig faglig vurdering ved en særlig nedsat ekspertgruppe, vil typisk kunne anvendes til at udpege de relevante undersøgelser og data, der skal anvendes til den videre beregning af kvalitetetskriteriet. Det anbefales gene-

[13] Miljøstyrelsen (2001). Report on the advisory list for selfclassification of dangerous substances. Environmental Project No. 636 2001. http://www.mst.dk/udgiv/publications/2001/87-7944-694-9/html/

relt, at data, der skal danne udgangspunkt for beregning af kvalitetskriteriet, altid hjemskaffes som originallitteratur til vurdering af den konkrete undersøgelses kvalitet og relevans.

Endvidere søges i en række relevante databaser (se afsnit 2.5.2 i den faglige rapport). Sådanne søgninger er især relevante, hvis en international stofmonografi for det konkrete stof ikke foreligger, eller hvis vurderingen ligger nogle år tilbage.
For visse stoffer kan man komme ud for at datasøgning giver så ringe resultat, at der ikke er tilstrækkeligt datagrundlag til at foretage en vurdering af stoffet. For eksempel hvis der kun er akutte studier til rådighed, eller ingen studier fastlægger NO(A)EL/LO(A)EL.

3 Farlighedsvurdering og farlighedskarakterisering

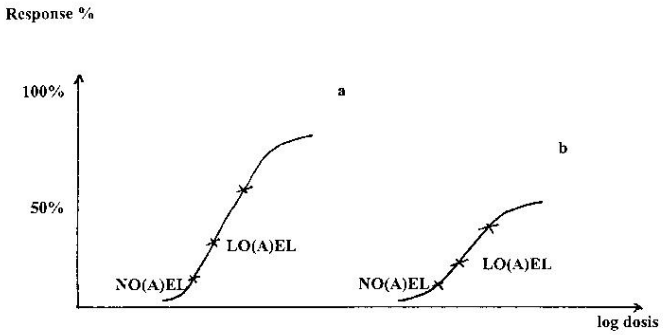
Farlighedsvurderingen og farlighedskarakteriseringen har til formål at beskrive stoffets farlige egenskaber. Der opstilles i videst muligt omfang dosis-effekt og dosis-respons sammenhænge, der danner baggrund for identifikation af den kritiske effekt. Den kritiske effekt er den effekt, der anses for at være den afgørende ved den sundhedsmæssige vurdering. Nuleffekt niveauet (evt. laveste effektniveau) for denne effekt anvendes til beregning af TDI (tolerabelt dagligt indtag/ tolerabelt daglig eksponering), som i den videre proces benyttes til beregning af kvalitetskriteriet.

3.1 Dosis-effekt og dosis-respons sammenhænge

Udsættelse for et kemisk stof kan medføre forskellige typer effekter afhængig af eksponeringsvej, eksponeringens størrelse og varighed. Lettere grader af effekter kan være forbigående genevirkninger i form af fx slimhindeirritation, mens alvorlige effekter kan være dødeligt forløbende akutte forgiftninger eller udvikling af kroniske sygdomme som kræft.

En længerevarende dyreeksperimentel undersøgelse vil således kunne give viden om forskellige typer effekter ved forskellige eksponeringsniveauer (dosis-effekt), og om hvor lang tid det tager, før de optræder i forhold til eksponeringen.

Yderligere vil man fra undersøgelsen kunne se, hvor stor en andel af de doserede dyr der er ramt af effekten (dosis-respons). Visse effekter kan være opdelt i forskellige sværhedsgrader eller stadier, hvor der så for hver af disse kan foreligge dosis-responssammenhænge.



Figur 1 Eksempler på dosisrespons-sammenhænge

Ovenstående figur viser, hvordan dosisrepons-kurver for forskellige effekter kan optegnes ud fra konkrete forsøgsdata med forskellige eksponeringsniveauer og observerede effekter ved disse (markeret med krydser). Kurve a angiver fx dosis-respons forløbet for luftvejsirritation hos forsøgsdyrene, og er her karakteriseret ved at være meget stejl (alle dyr påvirkes inden for et forholdsvist lille dosisinterval, dvs. lille spredning i følsomhed). Kurve b angiver forekomsten af kræftsvulster og viser en dosisrespons sammenhæng ved højere eksponeringsniveauer, og beskriver en noget fladere dosis-respons sammenhæng (dvs. dyrenes følsomhed over for udvikling af kræft er mere spredt). NOAEL-markeringerne på figuren repræsenterer eksponeringsniveauer, hvor der ikke blev fundet statistisk signifikant flere dyr i eksponeringsgruppen end i kontrolgruppen, der udvikler den pågældende effekt, mens LOAEL-værdierne repræsenterer det laveste eksponeringsniveau, der har medført en signifikant forøget forekomst af effekten.

Den faglige baggrundsrapport (Miljøprojekt Nr. 974 (2005)) angiver i afsnit 3.1 mere detaljerede beskrivelser og tolkningen af forskellige dosis-respons forløb.

3.2 Fastsættelse af nul-effektniveau og laveste effektniveau

For langt de fleste typer effekter vurderes der at være en tærskelværdi, der adskiller effektniveauer fra ikke-

effektniveauer, dvs. eksponeringen skal overskride en vis tærskelværdi før dosis er tilstrækkelig til at udløse effekt. Niveauet umiddelbart under denne teoretiske tærskelværdi betegnes nuleffektniveauet, der er den højeste dosis, der ikke medfører effekt. Dosisniveauet umiddelbart over tærskelværdien betegnes laveste effektniveau, da dette er det laveste dosisniveau, der lige netop udløser effekten.

I praksis anvendes for nuleffektniveauet det såkaldte *no observed adverse effect level*, *NOAEL*, der er den højeste af de i forsøget anvendte doser, hvor der i et konkret forsøg ikke er *observeret* den givne effekt. For laveste effekt-niveau anvendes det såkaldte *lowest observed adverse effect level, LOAEL*, der er den laveste dosis i forsøget hvor der er observeret den givne effekt.

I litteraturen anvendes betegnelserne NOAEL og NOEL (*no observed effect level)* samt LOAEL og LOEL (*lowest observed effect level).* Når betegnelserne anvendes korrekt, er det for at sondre mellem om de effektniveauer eller nuleffektniveauer der beskrives, er i forhold til *skadelige (adverse)* effekter eller effekter generelt, hvor også lettere grader af effekter som påvirkning af enzymniveauer og andre effekter af ikke direkte skadelig karakter er omfattet.

Man må dog være opmærksom på, at denne skelnen mellem skadelige og ikke-skadelige effekter i mange tilfælde ikke er gjort konsekvent i litteraturen, og at betegnelserne ofte benyttes i flæng. Det kan således i konkrete tilfælde være vanskeligt at afgøre, hvor grænsen går for, om en effekt skal tolkes som skadelig eller ej, og dermed om et LOEL snarere skal tolkes som et LOAEL.

Se endvidere afsnit 3.2 i den faglige rapport (1).

3.3 Benchmark-metoden

NO(A)EL/ LO(A)EL metoden til udpegning af et eksponeringsniveau er afhængig af, hvilke eksponeringsniveauer man har valgt ved udførelse af et forsøg, og i nogle tilfælde har man måske ikke engang fundet et NO(A)EL. Dette har medført, at en nyere metode, benchmark-metoden, visse

steder har vundet indpas i forbindelse med risikovurderinger, idet der ikke anvendes en NO(A)EL eller LO(A)EL men en benchmark-dosis for den videre beregning af TDI. Ved denne metode foretages en computerbaseret modellering af dosis-responskurven ud fra de tilgængelige data. På dosis-respons kurven findes ED_5 – eller ED_{10}-niveauet (dvs. det eksponeringsniveau, der medfører respons hos 5% eller 10% af de eksponerede). Denne dosis vælges derpå som udgangspunkt (benchmark-dosis, BMD_5 eller BMD_{10}) for den videre beregning på tilsvarende måde som man anvender en NO(A)EL- eller LO(A)EL-værdi.

Metoden anvendes af de canadiske miljømyndigheder og af US EPA, og også af WHO i forbindelse med "Air quality Guidelines for Europe" (2). WHO angiver i denne forbindelse, at en BMD_5 ud fra en gennemsnitsbetragtning kan sammenlignes med et NO(A)EL, mens en BMD_{10} kan sammenlignes med et LO(A)EL.

WHO omtaler også anvendelsen af benchmark-metoden som en alternativ metode i forbindelse med publikation om risikovurdering fra 1999 (3) og i forbindelse med publikation om fastsættelse af vejledende grænseværdier fra 1994 (4).

På nuværende tidspunkt haves der kun sparsom erfaring med anvendelsen af metoden herhjemme. Som det faglige miljøprojekt anfører, kan benchmark-metoden ikke umiddelbart anvendes for alle typer data, og metoden kræver for de relevante effektområder, hvor den kan anvendes, ofte flere dosis-niveauer end der sædvanligvis haves.

Benchmark-metoden er, når der foreligger tilstrækkelige data, et supplement til den traditionelle NO(A)EL/ LO(A)EL metode i forbindelse med fastsættelse af kvalitetskriterier. Uanset hvilken metode man vælger, bør man vurdere og begrunde den fra gang til gang, dvs. man bør referere til og begrunde de anvendte beregningsmetoder eller henvise til de originalreferencer, hvor den benyttede benchmark-dosis er beregnet.

3.4 Udpegning af kritisk effekt

Ved den samlede vurdering af dosis-effekt og dosis-respons sammenhænge foretages udpegning af den kritiske effekt samt udpegning af den NO(A)EL/ LO(A)EL værdi (evt. benchmarkdosis), der vurderes som mest relevant ved fastsættelse af kvalitetskriteriet. Ofte, men ikke nødvendigvis, vil dette være den laveste NO(A)EL/ LO(A)EL værdi, der er rapporteret vedrørende en skadelig effekt eller potentielt skadelig effekt.

Ved udpegning af den kritiske effekt vurderes relevansen af eksponeringsmåden (eksponeringsvejen i en given undersøgelse) i forhold til eksponeringsvejen for det medie (jord, luft eller vand) kvalitetskriteriet skal udarbejdes for. Alvorligheden af forskellige effekter sammenholdes i forhold til, hvor langt de ligger fra hinanden i eksponeringsniveau. Det vurderes fx om en alvorlig effekt kan være en følge af mindre alvorlige effekter, som således kan ses som en forløber og indikator for udvikling af en egentlig skadeeffekt. Endvidere vurderes i det konkrete tilfælde, om der optræder visse artsspecifikke effekter hos forsøgsdyrene, og om dokumentationen er tilstrækkelig til, at disse fund kan vurderes at være irrelevante i forhold til mennesker (se afsnit 3.5).

Ved tvivlstilfælde om udpegning af kritisk effekt og NO(A)EL/LO(A)EL værdi kan det være nødvendigt at udpege flere NO(A)ELs/LO(A)ELs for de potentielt kritiske effekter og anvende disse sideløbende ved den efterfølgende beregning af TDI/ kvalitetskriterier. Dette er for at vurdere, hvordan anvendelse af usikkerhedsfaktorer og andre beregningsmæssige forhold får indflydelse på kvalitetskriteriet, når der anvendes forskellige udgangspunkter m.h.t. kritisk effekt og NO(A)EL/LO(A)EL.

3.5 Relevans af visse effekter i forsøgsdyr

Som udgangspunkt anvendes dyremodeller som troværdige modeller ved forudsigelse af stoffets egenskaber hos mennesker. Visse effekter, der optræder i forsøgsdyr, har vist sig at være tæt knyttet til bestemte dyrearter. I tilfælde, hvor der foreligger dokumentation for at effekterne alene er forårsa-

get af en sådan artsspecifik virkningsmåde, anses disse for at være af meget begrænset relevans ved den videre vurdering af stoffet.

Især inden for kræftområdet har man fundet flere typer svulster (tumorer), hvor relevansen i forhold til mennesker i de enkelte tilfælde bør vurderes nøjere. I Miljøprojekt Nr. 974 (2005) er en række af disse beskrevet i afsnit 3.7.

4 Beregning af TDI for stoffer med tærskelværdi

4.1 TDI-begrebet

Det sidste trin i farlighedskarakteriseringen er beregning af tolerabelt dagligt indtag, *TDI (*eller tolerabel koncentration, *TK)*. Ved beregning for stoffer, hvor der anses at være en nedre tærskel for effekt anvendes usikkerhedsfaktorer:

$$TDI\,(TK) = \frac{NO(A)EL^{a}}{UF_{I} \times UF_{II} \times UF_{III}}$$

[a] *Alternativt kan et LO(A)EL eller en Benchmark-dosis* BMD_{x} *anvendes, se afsnit 3.3.*

Den tolerable daglige indtagelse (TDI) er et udtryk for den daglige gennemsnitsdosis (fra alle kilder), som befolkningen vurderes at kunne udsættes for (tolerere) gennem et helt livsforløb, uden at der forventes at opstå sundhedsskadelige effekter.
TDI angives sædvanligvis i enheden mg/kg legemsvægt per dag.

Analogt til TDI kan betegnelsen tolerabel koncentration (TK) defineres som den koncentration af et stof i jord, luft eller drikkevand som befolkningen vurderes at kunne udsættes for (tolerere) gennem et helt livsforløb, uden at der forventes at opstå sundhedsskadelige effekter. TK angives fx i enheden mg/m^3 (luft), mg/l (drikkevand), eller i mg/kg (jord).

For nogle stoffer er det nødvendigt at fastsætte en PTWI – værdi (Provisional Tolerable Weekly Intake – PTWI), der angiver det tolerable ugentlige indtag, i stedet for TDI. PTWI benyttes sædvanligvis over for stoffer, hvor det er

vigtigt at understrege, at det er den samlede eksponering over længere tid, der er af betydning for forekomst af effekter (fx bly og cadmium).

Begrundelse for anvendelse af usikkerhedsfaktorer omtales kort nedenfor, idet en mere detaljeret beskrivelse er givet i Miljøprojekt Nr. 974 (2005) afsnit 4.4

4.2 Anvendelse af usikkerhedsfaktorer

I kommentarerne til Miljøbeskyttelsesloven angives at "Miljøministeriet ved udstedelse af regler og vejledninger kan operere med fx sikkerhedsfaktorer ved fastsættelse af grænseværdier eller retningslinier for forureningsmæssige beregninger på de områder, hvor der ikke foreligger et tilstrækkeligt eksakt vidensgrundlag"

Tidligere har man anvendt begrebet sikkerhedsfaktorer. Det har imidlertid vist sig, at denne betegnelse kan misforstås, således at man forventer større sikkerhed, jo større sikkerhedsfaktor der anvendes. Dette er ikke i overensstemmelse med, hvordan faktorerne anvendes, idet de benyttes for at tage hensyn til usikkerheder og manglende viden i datagrundlaget, dvs. jo større usikkerhed jo større faktor. Ved brugen af disse faktorer tilstræbes det, at der opnås et ensartet beskyttelsesniveau udtrykt ved TDI-værdien. På denne baggrund er det derfor mere korrekt at anvende betegnelsen usikkerhedsfaktorer.

Også i udenlandsk litteratur anvendes forskellige termer for denne faktor fx: safety factor, uncertainty factor, Sicherheitsfaktor, assessment factor, bedömningsfaktor.

Nedenfor angives hvilke elementer og hensyn, der indgår i de tre usikkerhedsfaktorer.

4.2.1 Usikkerhedsfaktor I

Usikkerhedsfaktor I (UF_I) anvendes for at tage højde for, at mennesker kan være mere følsomme over for et givent stof end forsøgsdyr. Denne faktor har historisk været sat til 10.

Ekstrapolation af data fra dyr til mennesker kan opfattes som omhandlende to forskellige aspekter:

1) korrektion af dosis for forskelle i kropsstørrelse mellem forsøgsdyr og mennesker, såkaldt allometrisk skalering, og
2) andre former for forskelle mellem forsøgsdyr og mennesker, som ikke nødvendigvis afspejles i forskellene i kropsstørrelse.

Miljøprojekt Nr. 974 (2005) har gennemgået den eksisterende viden og understøtter, at der fortsat som udgangspunkt anvendes en standardværdi på 10 for UF_I, hvilket også er i overensstemmelse med international praksis, når dosis hos dyr omsættes til human dosis med samme enhed.

Hvis der foreligger veldokumenteret viden om toksikokinetiske og/eller toksikodynamiske forskelle mellem det givne forsøgsdyr og mennesker, anbefales det at tage udgangspunkt i denne viden med henblik på fastsættelse af en dataspecifik faktor i stedet for anvendelse af en standardværdi på 10. I den forbindelse kan 10-faktoren evt. opdeles i underfaktorer, hvor størrelsen af disse "delfaktorer" må vurderes konkret fra gang til gang.

Ved beregning af tolerabel koncentration (TK), hvor udgangspunktet er dyreforsøg, hvor eksponeringen foregår via inhalation, bør ekstrapolering til humaneksponering ved inhalation foretages direkte ud fra eksponeringsniveauet angivet i mg stof /m^3 (omregnet til kontinuerlig gennemsnitskoncentration per dag), frem for at foretage omregning fra indåndet dosis til mg/kg lgv/d for forsøgsdyrene. Ved at anvende indåndingskoncentrationen direkte svarer dette til at doseringen foretages i forhold til stofskiftet, hvilket anses for at være den mest relevante metode, når der skal korrigeres for forskelle i kropsstørrelse. Anvendelse af en UF_I skal ses i lyset heraf og bør derfor i denne situation ligge lavere end 10. En værdi på en halv tierpotens ($10^{0,5}$) kan som udgangspunkt anvendes til resterende forskelle m.h.t. artsforskelle i kinetik og dynamik, medmindre konkrete data tilsiger højere eller lavere værdi.

Der bør i videst muligt omfang tages hensyn til en række mætningsfænomener (fx mætning af absorption, metabolisme eller udskillelse), der kan forekomme i dyreforsøg ved høj dosering, idet disse mætningsfænomener ofte ikke vil være relevante ved lavere miljømæssigt relevante niveauer. I sådanne tilfælde bør der om muligt omregnes til "effektiv" dosis/ koncentration som dyrene har været udsat for.

4.2.2 Usikkerhedsfaktor II

Usikkerhedsfaktor II (UF_{II}) anvendes for at tage højde for, at nogle individer i befolkningen kan være mere følsomme over for et givent stof end den generelle befolkning (for eksempel børn, gravide, ældre, svækkede, kronisk syge). Denne faktor har oftest været sat til 10. Forskellene i følsomhed skyldes den biologiske variation, der findes mellem mennesker. Faktorer som alder, køn, graviditet, genotype, helbred, og livsstil kan være medvirkende til en øget biologisk følsomhed, som afspejler dels forskelle i toksikokinetik og dels i toksikodynamik.

Miljøprojekt Nr. 974 (2005) henviser til en række analyser, der har vurderet variationen mellem mennesker og dermed størrelsen af UF_{II}. Sammenfattende understøtter disse analyser anvendelse af en standardværdi på 10 for denne variation.

Denne usikkerhedsfaktor skal derfor som udgangpunkt sættes til 10. En alternativ værdi kan anvendes, hvis udgangspunktet for NO(A)EL/LO/A)EL værdien specifikt er relateret til data for særligt følsomme personer eller den kritiske effekt er en effekt, hvor man har særligt kendskab til variationsbredden i følsomhed.

4.2.3 Usikkerhedsfaktor III

Usikkerhedsfaktor III (UF_{III}) anvendes for at tage højde for manglende kvalitet og relevans af de tilgængelige data. I relation til fastsættelse af kvalitetskriterier i jord, luft og drikkevand har denne faktor typisk varieret fra 1 til 100 afhængigt af datagrundlaget for de pågældende stoffer.

I UF_{III} indgår bl.a. følgende elementer :

- kvaliteten af datasættet (fx ekstrapolation fra subkronisk nuleffektniveau til kronisk nuleffektniveau),,
- ekstrapolation fra en eksponeringsvej til en anden ("route to route" ekstrapolation fx omregning fra oral dosis til inhalationsdosis),
- ekstrapolation fra LO(A)EL til NO(A)EL,
- og alvorligheden af effekterne (fx kræftfremkaldende effekter).

Det er ikke muligt at pege på en specifik størrelsesorden for en standardværdi, hverken for de enkelte delelementer af UF_{III} eller for den samlede UF_{III}.

Der henvises til Miljøprojekt Nr. 974 (2005) for en nærmere beskrivelse af UF_{III} i rapportens afsnit 4.4.3.

Nedenfor anføres mere kortfattet retningslinierne for fastsættelse af UF_{III}.

Kvalitet og relevans af data

UF_{III} skal tage højde for, om der er kvalitetsmæssige eller datamæssige mangler. Vurdering af kvalitet, omfatter vurdering af om de enkelte undersøgelser (og især undersøgelserne der refererer til de kritiske effekter og effektniveauer) er udført og afrapporteret på en måde, så resultaterne anses for relevante og pålidelige. Selve omfanget af datasættet vurderes for data vedrørende alle relevante effektområder i relation til kortvarig og langvarig eksponering, og det vurderes om der i datasættet er væsentlige mangler i forhold til vurdering af kritisk effekt og estimering af TDI. En faktor på 1 anvendes ved datasæt, som vurderes at være fuldt tilstrækkeligt for det givne stof, mens der ved mindre eller større mangler har været anbefalet faktorer i størrelsesordenen 3-10. I visse tilfælde med store mangler kan en faktor på helt op til 100 komme på tale. Fastlæggelse af UF_{III} må ofte baseres på en ekspertvurdering og foretages under hensyntagen til det enkelte stofs toksikologiske profil.

Et særligt aspekt, er manglende viden om børn og ufødtes følsomhed for konkrete kemiske påvirkninger. For at beskyt-

te børn og ufødte er det vigtigt ved fastsættelse af UF_{III} at vurdere om der er tilstrækkelig viden om disse forhold ud fra reproduktionsforsøg og flergenerationsforsøg. Er disse forhold ikke tilstrækkeligt belyst bør mangel på data have indflydelse på valget af UF_{III}. Størrelsen af en sådan delfaktor må ses i sammenhæng med stoffets toksikologiske profil og hvilke øvrige data, der haves.

Ekstrapolation fra en eksponeringsvej til en anden

Ved mangel på data for den relevante eksponeringsvej kan det blive nødvendigt at foretage en "route-to-route" ekstrapolation. De analyser, der er foretaget med hensyn til ekstrapolation fra oralt NO(A)EL til et NO(A)EC ved inhalation, peger generelt på, at en ekstrapoleret værdi ofte vil være væsentligt højere end en observeret værdi (dvs toksiciteten undervurderes). Det modsatte gør sig generelt gældende når der ekstrapoleres fra oralt NO(A)EL til NO(A)EL ved hudkontakt, hvor den ekstrapolerede værdi ofte vil være lavere end en observeret værdi (dvs. toksiciteten overvurderes). Der kan imidlertid ikke peges på en konkret størrelse for usikkerhedsfaktor III ved disse ekstrapolationer, der hviler på et meget usikkert grundlag. Vurderingen af om en "route-to route" ekstrapolation skal foretages, og i hvilken udstrækning der skal anvendes en usikkerhedsfaktor i tilknytning hertil, må bero på en ekspertvurdering i det konkrete tilfælde.

For stoffer, hvor der kun findes subakutte eller subkroniske undersøgelser, er det ikke muligt at fastsætte et NO(A)EL for livstidseksponering, som generelt må forventes at ligge lavere. Der har været foretaget flere analyser af forholdet mellem NOAELs og LOAELs opnået i studier af forskellige eksponeringsvarigheder. Med baggrund i disse synes der at være belæg for en usikkerhedsfaktor af størrelsesorden minimum 10. En af de nyere analyser har således vist, at en faktor på 10 vil være tilstrækkelig i knap 90% af tilfældene, når der var tale om ekstrapolation fra subkroniske data, mens der ved ekstrapolation fra subakutte data skulle anvendes en væsentlig højere faktor (>20).

Ved ekstrapolation fra LO(A)EL til NO(A)EL kan der ikke peges på en generel faktorstørrelse, som afspejler en generel

usikkerhed. Praksis inden for området og de tilgængelige analyser af problemstillingen peger på, at en værdi omkring en faktor 10 i langt de fleste tilfælde er tilstrækkelig. Vurderingen må imidlertid bero på en ekspertvurdering i hvert enkelt tilfælde.

Med baggrund i vægtning af ovenstående aspekter anvendes en UF_{III} på 10 som udgangspunkt. Denne værdi kan så korrigeres, når der er grundlag for dette i konkrete tilfælde.

Denne problemstilling kan i visse situationer omgås, når det ud fra data er muligt at beregne en benchmark-dosis, således at denne anvendes i stedet for LO(A)EL-værdien.

Alvorligheden af effekter

Det har været praksis ved fastsættelse af kvalitetskriterier, at særligt alvorlige effekter (fx kræftfremkaldende effekt eller fosterbeskadigende effekter) afspejles i usikkerhedsfaktor III. Det gælder især i de tilfælde, hvor den alvorlige effekt optræder ved lave dosisniveauer. Her kan anvendes *en ekstra faktor* på op til 10 for at tage hensyn til dette. For at få den endelige værdi for UF_{III} ganger man de enkelte værdier sammen.

Sammenfattende kan det konkluderes, at det ikke er muligt at sætte en standardværdi for en samlet UF_{III}. Usikkerhederne inden for de forskellige områder må vægtes, når der tages stilling til en samlet faktor for UF_{III}, da en multiplikation af mange delfaktorer i UF_{III} kan give en meget høj værdi, og i visse tilfælde give et skævt billede af det samlede videngrundlag og kvaliteten heraf. Fastsættelse af UF_{III} bør således i høj grad bero på en ekspertvurdering, hvor valget af faktoren og elementerne heri tydeligt begrundes.

4.2.4 Samlet usikkerhedsfaktor

Ved beregning af TDI divideres NO(A)EL evt. LO(A)EL med de tre usikkerhedsfaktorer, der således ganges sammen.

Ved multiplikation af UF_I, UF_{II} og UF_{III} bør der imidlertid tages stilling til størrelsen af den samlede usikkerhedsfaktor,

og der bør foretages en overordnet vurdering i forhold til det givne datasæt.

En meget stor usikkerhedsfaktor, der kan medføre en meget lille TDI-værdi, betyder ikke nødvendigvis, at stoffet er lige så potent eller farligt som andre, mere velkendte stoffer med tilsvarende lave TDI-værdi. Den beregnede lave værdi må snarere ses som en følge af store usikkerheder i datagrundlaget. En samlet usikkerhedsfaktor på 10.000 og derover, bør derfor ikke anvendes.

5 Beregning af TDI for kræftfremkaldende stoffer

5.1 Kræftfremkaldende stoffer med og uden tærskelværdi

Kræftfremkaldende stoffer anses for at kunne deles op i to grupper grundet deres virkningsmekanisme. Den ene gruppe består af stoffer, der virker kræftfremkaldende som følge af evnen til at påvirke cellernes delings- og differentieringshastighed. Dette kan ske gennem direkte eller indirekte påvirkning af cellernes receptorer. For sådanne stoffer antages der at være en nedre tærskelværdi for denne effekt. Derfor kan TDI beregnes ved hjælp af usikkerhedsfaktorer, som omtalt i forrige afsnit.

Den anden gruppe af kræftfremkaldende stoffer virker gennem kemisk interaktion med cellernes arvemasse, og den kræftfremkaldende effekt vurderes at være en følge af stoffets beskadigelse af cellernes arveanlæg (mutagen/genotoksisk aktivitet). For disse stoffer anses der ikke at være et nedre eksponeringsniveau uden øget risiko for skadevirkninger. For sådanne stoffer anvendes ikke usikkerhedsfaktorer ved beregning af TDI. I stedet beregnes TDI ved hjælp af en matematisk modelberegning, hvor man på forhånd definerer et risikoniveau man vil acceptere, og beregner så hvilken udsættelse, som giver denne risiko.

Ved vurdering af kræftfremkaldende effekt er det således af stor betydning, om det kræftfremkaldende stof falder ind under den ene eller den anden kategori. Der findes stoffer, som både er genotoksiske – dvs. kræftfremkaldende uden tærskel for effekt, og kræftfremkaldende ved andre mekanismer, hvor der anses at være en tærskel. Ved vurdering af denne type stoffer, kræver det en ekspertvurdering at afgøre, om de data der ligger til grund, bedst giver grundlag for at vurdere stoffet som tilhørende den ene eller anden kategori. Der har således i EU været arbejdet på at udvikle

nærmere vejledning i hvordan disse typer stoffer kan vurderes[14].

5.2 Vurdering af kræftfremkaldende effekt

EU, WHO IARC (International Agency for Research on Cancer) og US EPA anvender en række forholdsvis sammenlignelige procedurer/ kriterier ved vurdering af, om et stof skal i kategorien "kræftfremkaldende". Stofferne indplaceres i forskellige underkategorier alt efter dokumentationens omfang, og under hensyntagen til om dokumentationen stammer fra humandata eller dyredata.

Yderligere indgår der i vurderingerne også stillingtagen til virkningsmekanismer, fx om stoffer virker gennem en mutagen/ genotoksisk mekanisme. I EU´s klassificeringssystem for kemiske stoffer er der også kriterier for, hvornår et stof skal kategoriseres som "mutagent".

Principperne for inddeling af kræftfremkaldende stoffer i kategorier er mere udførligt beskrevet i Miljøprojekt Nr. 974 (2005) afsnit 3.6.

Ved vurdering af et stofs kræftfremkaldende effekt i forbindelse med risikokarakterisering og beregning af kvalitetskriterier tages der så vidt muligt udgangspunkt i de ovennævnte vurderinger, idet der suppleres med opdateret viden fra litteraturen. Det vurderes om der er dokumentation for at den kræftfremkaldende effekt er en følge af genotoksisk virkning, og om stoffet derfor skal betragtes som værende uden en nedre tærskel for effekt.

Hvis data taler for, at stoffet virker gennem en ikke-genotoksisk mekanisme, anses stoffet for at besidde en tærskelværdi for skadelig effekt. For en række stoffer vil data og viden vedrørende virkningsmekanisme være meget mangelfuld, og det kan være vanskeligt at sondre, om stoffet skal betragtes som værende enten med eller uden tærskelværdi. Sådanne tvivlstilfælde kan bedst håndteres ved at betragte

[14] European Food Safety Authority (2005). Opinion on a Harmonised Approach for Risk Assessment of Compounds Which are both Genotoxic and Carcinogenic.

stoffet som havende en tærskelværdi, og i den forbindelse anvende en øget usikkerhedsfaktor (UF_{III}) for at tage hensyn til usikkerheden om eksistensen af en tærskelværdi. Der bør således være et vist datagrundlag, der peger hen mod en genotoksisk mekanisme, før stoffet vurderes efter en model uden nedre grænse.

Ved vurderingen af kræftfremkaldende effekt tages stilling til om den er knyttet til bestemte eksponeringsveje, og om disse er relevante i forbindelse med et kvalitetskriterium for stoffet i jord, luft eller drikkevand.

Visse kræftformer kan være forsøgsdyrsspecifikke, og når sådanne kræftfund kan dokumenteres som ikke-relevante i human sammenhæng, tillægges disse fund kun begrænset vægt (se afsnit 3.5).

Ved vurderinger i relation til kvalitetskriterier tages der alene stilling til om stoffet skal betragtes som kræftfremkaldende, og om stoffet ud fra dets virkningsmekanisme skal anses for at have en tærskelværdi eller ej. Der foretages således ikke en mere detaljeret indplacering i forskellige kategorier i forhold til dokumentationens art og omfang, dvs. der inddeles ikke i kategorier for humane og dyreeksperimentelle kræftfremkaldende stoffer.

Et stof, som på baggrund af dokumentationen indplaceres i EU's Carc1 eller Carc 2, i IARC's gruppe 1 eller gruppe 2A/2B, og/eller i US EPA's gruppe A eller B1/B2, vil som udgangspunkt medføre, at stoffet betragtes som kræftfremkaldende, med mindre der er nyere undersøgelser eller velunderbyggede informationer og fortolkninger af data, der taler imod en sådan vurdering.

Tilsvarende gælder stoffer, som er opført på Arbejdstilsynets liste over stoffer, som anses for at være kræftfremkaldende. Det skal dog understreges, at stoffer, som hverken er vurderet af EU, IARC og/eller US EPA eller er indplaceret i en lavere kategori (EU Carc3, IARC gruppe 3 og/eller US EPA gruppe C/D), godt kan blive betragtet som kræftfremkaldende i relation til fastsættelse af kvalitetskriterier for kemikalier i jord, luft og drikkevand, hvis der er velunderbyggede data, der taler for det. Det kan for eksempel være i

tilfælde af, at der er publiceret nye undersøgelser siden en eventuel vurdering er foretaget af EU, IARC og/eller US EPA, eller der kan være stor kemisk strukturlighed med andre kendte kræftfremkaldende stoffer. I sidstnævnte tilfælde kan QSAR-modellering indgå som supplerende støtte for vurderingen.

5.3 Beregning af TDI for kræftfremkaldende stoffer uden tærskelværdi

5.3.1 Tolerabelt risikoniveau

TDI-værdien for kræftfremkaldende stoffer uden tærskelværdi fastsættes til en værdi, der repræsenterer et accepteret risikoniveau for udvikling af kræft. Denne værdi har traditionelt været fastsat til en 10^{-6} livstidsrisiko, og vil også med udsendelse af denne vejledning være det ønskede risikoniveau.

Konkret betyder dette, at man med udgangspunkt i humandata eller dyreforsøg, hvor den kræftfremkaldende effekt er påvist, ved hjælp af matematisk modellering estimerer dosis-respons kurvens forløb så langt ned i lav-eksponeringsområdet, at en eksponering svarende til en 10^{-6} livstidsrisiko kan beregnes. TDI er således den daglige gennemsnitseksponering, der ud fra *teoretiske beregninger* svarer til en forøget risiko for cancer på 1 ud af en million mennesker, som er udsat for stoffet gennem en hel livstid.

5.3.2 Metode til beregning af TDI og livstidsrisiko

Der er udviklet forskellige metoder til beregning af, hvor stor en risiko for udvikling af svulster en given eksponering for et genotoksisk kræftfremkaldende stof udgør. For alle metoder gælder, at der anvendes en eller anden form for matematisk ekstrapolation fra dosisniveauer med de kendte eksperimentelle værdier for forekomsten af svulster til de som regel meget lavere dosisniveauer, der svarer til en forekomst hos 1 ud af en million. Metoderne beskriver relationen mellem den daglige eksponering (udtrykt som dosis

eller koncentration) og den sammenhørende sandsynlighed for udvikling af svulster.

Beskrivelse af forskellige metoder og sammenligning mellem disse fremgår af Miljøprojekt Nr. 974 (2005) afsnit 5.3 og 5.4.

Den foretrukne metode til fastsættelse af TDI er T25-metoden, som også anvendes i EU-regi. Den baserer sig ligesom one-hit metoden på lineær ekstrapolation med udgangspunkt i laveste dosisniveau, hvor der optræder signifikant forøget antal svulster[15].

Metoden er en simplificeret lineær metode med udgangspunkt i en beregnet T25-dosis. T25-dosis defineres i denne sammenhæng som den kroniske eksponering (enhed: mg/kg legemsvægt per dag eller mg/m^3), som vil give 25% af forsøgsdyrene svulster i et specifikt væv, efter korrektion for den spontane hyppighed, indenfor den standardiserede levetid for den pågældende dyreart. Med udgangspunkt i denne T25-dosis foretages lineær ekstrapolation ved simpel forholdsregning ned til en dosis, der svarer til et tolerabelt risikoniveau.

Metoden og dens konkrete anvendelse i forhold til et tolerabelt 10^{-6} livstidsrisikoniveau er nøjere beskrevet i bilag 1.

5.3.3 Anvendelse af risikoestimater angivet i litteraturen

I en række tilfælde vil eksponeringsniveauet svarende til en 10^{-6} livstidsrisiko (eller "unit-risk"-estimater) på forhånd være beregnet af ekspertgrupper under fx WHO eller US EPA. For især nyere vurderinger kan det være relevant at anvende disse værdier som ligeværdigt udgangspunkt på

[15] Miljøstyrelsen har tidligere som administrativ praksis anvendt one-hit metoden. Anvendelse af T25-metoden vil i forhold til den medføre lidt højere værdier (skønsmæssigt en faktor 2-4). Denne forskel skal dog ses i et 10^{-6} perspektiv, og må anses som meget beskeden, og i praksis uden betydning i forbindelse med det tilstræbte beskyttelsesniveau.

linie med T25-metoden ved beregning af TDI og kvalitetskriterier.

Argumenterne for at vælge et risikoestimat frem for et andet kan dels være rent faglige (fx bero på konkrete virkningsmekanismer) og dels være mere pragmatiske, idet man også bør vurdere nødvendigheden af at foretage selvstændige beregninger af et risikoniveau. For eksempel kan opgaven være meget omfattende for stoffer med stor datarigdom (fx PAH-stoffer), hvor en selvstændig vurdering vil kræve ulige mange resurser og inddragelse af høj faglig ekspertise på området for at kunne leve op til kvaliteten af en international vurdering.

Derfor vil man i konkrete tilfælde kunne basere kvalitetskriterier for kræftfremkaldende stoffer på andre metoder end T25 metoden.

6 Beregning af kvalitetskriterier for kemikalier

Dette kapitel beskriver hvorledes kvalitetskriterierne for kemikalier i jord, luft og drikkevand kan beregnes med udgangspunkt i førnævnte TDI-værdier.
Første led i beregningen er en vurdering af, om hele TDI-værdien eller kun en brøkdel heraf tildeles til beregning af det konkrete kvalitetskriterium. Dette kan dels være begrundet i eksponeringsmæssige overvejelser - den såkaldte allokering, hvor der tages hensyn til evt. andre kilder, der har betydning for eksponeringen. Eller det kan være begrundet i øvrige forhold, der kan være afgørende for, om der anvendes en reduktionsfaktor, så kun en mindre brøkdel af TDI-værdien anvendes ved beregning af kvalitetskriteriet.

Kapitlet angiver hvilke værdier for medieeksponering der anvendes ved beregning af kvalitetskriterierne. En mere uddybet forklaring på valget af disse værdier er givet i bilag 2.

6.1 Generel metode for beregning af et kvalitetskriterium

Et sundhedsmæssigt baseret kvalitetskriterium for et stof i jord, luft eller drikkevand beregnes ud fra den tolerable daglige indtagelse, ved at dividere TDI-værdien med den daglige eksponering for det relevante medie WHO/IPCS[16,17]. Det vil sige, at selve beregningen af kvalitetskriteriet ud fra TDI i princippet er ens for de tre medier, jord, luft og drikkevand

[16] WHO/IPCS (1994). Assessing human health risks of chemicals: Derivation of guidance values for health-based exposure limits. Environmental Health Criteria no. 170. International Programme on Chemical Safety.
[17] WHO/IPCS (1999). Principels for the assessment of risks to human health from exposure to chemicals. Environmental Health Criteria no. 210. International Programme on Chemical Safety.

og for alle stoffer, uanset om der foreligger tærskelværdi for den kritiske effekt eller ej.

Følgende generelle beregningsmetode kan opstilles:

$$KK_{l,j,v} = \frac{TDI \times V \times f}{E_{l,j,v}}$$

hvor

$KK_{l,j,v}$: kvalitetskriterium for jord, luft eller drikkevand
TDI: angives i mg/ kg legemsvægt/ d
V: legemsvægt i kg
f: allokeringsfaktor, brøkdel af TDI som ud fra eksponeringsfordeling anvendes til eksponering fra jord, luft eller drikkevand
$E_{l,j,v}$: daglig udsættelse/ forbrug af luft (m^3/d), jord (kg/d), eller drikkevand (liter/d).
(Hvis $E_{l,j,v}$ angives i (m^3/kg lgv/ d), (kg/kg lgv/d), eller (liter/kg lgv/d) udgår V i ovenstående formel).

6.1.2 Anvendelse af TDI

For stoffer hvor der ikke anses at være en tærskelværdi for effekt, dvs. de genotoksiske kræftfremkaldende stoffer, anvendes TDI-værdien (sv.t til en 10^{-6} livstidsrisikodosis) direkte til beregning af kvalitetskriteriet.
For andre stoffer, hvor der anses at være en tærskelværdi, indgår efterfølgende overvejelser vedrørende anvendelse af en allokeringsfaktor eller reduktionsfaktor.

Allokering

Allokeringsfaktoren "*f*" angiver den brøkdel af TDI som tildeles udsættelsen via det enkelte medie. Ofte tildeles mindre end 100% af et kemisk stof til beregning af et kvalitetskriterium, da der for en række kemiske stoffer vil være udsættelse gennem andre medier end det enkelte medie jord, luft og vand. I en række tilfælde vil bidrag gennem forurening af fødevarer eller gennem påvirkning fra indeklimaet udgøre hovedkilden for en persons udsættelse, og vil dermed "lægge beslag på" en betydelig del af TDI-værdien, hvorfor der kun tildeles en mindre andel til kvalitetskriteriet.

I de tilfælde hvor bidrag fra andre medier ikke forventes, fastsættes kvalitetskriterierne som udgangspunkt ved, at hele TDI allokeres til det pågældende medie. Når det vurderes, at der foreligger øvrige betydende kilder allokeres som udgangspunkt 10% af TDI til det pågældende medie, med mindre der er konkret viden om øvrige kilders bidrag, der siger noget andet. For visse stoffer, hvor langt de største bidrag kommer fra øvrige kilder, kan der således allokeres helt ned til kun 1% af TDI (dette er for eksempel gjort for visse plastblødgørere i forbindelse med et kvalitetskriterium for drikkevand).

Reduktionsfaktor

I særlige tilfælde kan andre forhold end de rent eksponeringsmæssige betragtninger medføre, at der anvendes en reduktionsfaktor, således at der kun anvendes en vis brøkdel af TDI til beregning af kvalitetskriteriet. En sådan faktor kan efter individuel vurdering komme på tale fx :

- ved særligt kritiske forhold som persistens og bioakkumulering af stoffet,
- i tilfælde, hvor kvalitetskriteriet er udarbejdet ud fra et enkelt stofs effekter, men hvor stoffet repræsenterer en hel stofgruppe, og hvor eksponeringen typisk vil være karakteriseret ved en blandingseksponering med denne stofgruppe,
- i tilfælde hvor der samtidig kan optræde eksponering fra flere stoffer, og hvor der er formodning om, at der ved de relevante niveauer vil kunne optræde kombinationseffekter (fx samvirkende effekter) fra denne blandingseksponering.

6.1.3 Eksponeringsbetragtninger

Målet for eksponeringen i nævneren i brøken til kvalitetskriterie-beregningen baseres på standardbetragtninger for daglig udsættelse.

I afsnit 6 i Miljøprojekt Nr. 974 (2005) er der foretaget en opdateret gennemgang af viden om befolkningens udsættelse for jord, luft og vand, samt angivet hvilke standardbe-

tragtninger der anvendes inden for WHO, US EPA og i EU.

Ud fra hensigten om specifikt at tage hensyn til børns eksponering er der foretaget en revision af den hidtidige praksis. Grundlaget for den reviderede praksis er anført i bilag 2.

6.2 Beregning af luftkvalitetskriteriet

Følgende fremgangsmåde anvendes til beregning af luftkvalitetskriteriet (KK_{luft}), når TDI for de(n) kritiske effekt(er) er fra studier hvor stoffet er givet via munden og angivet i enheden mg/kg legemsvægt/dag:

$$KK_{luft} = \frac{TDI \times f}{E_{luft}} \quad \text{hvor}$$

TDI: tolerabel daglig indtagelse (mg/ kg lgv/d)
f: brøkdel af TDI, der allokeres til udeluften
E_{luft}: eksponering luft, standardværdi for dagligt indåndingsvolumen: 0,5 m^3/kg lgv/d for 1-5 årige børn.

Følgende fremgangsmåde anvendes, når (nul)effektniveauer NO(A)EL eller LO(A)EL) for de(n) kritiske effekt(er) er fra studier hvor stoffet er inhaleret og angivet som en koncentration i enheden mg/m^3:

$$KK_{luft} = TK \times f$$

f: allokeringsfaktor
TK: tolerabel koncentration

$$\text{hvor} \quad TK = \frac{NO(A)EC \text{ eller } LO(A)EC}{UF_I \times UF_{II} \times UF_{III}}$$

For de fleste typer af systemiske effekter anses det at være den samlede dosis og ikke stoffets koncentration i luften, der er af betydning for udvikling af disse effekter. Ved fastsæt-

telse af luftkvalitetskriteriet i disse tilfælde foretages en omregning af det fastlagte (nul)effektniveau til et gennemsnitligt døgnniveau (kontinuert eksponering) ud fra de i studiets aktuelle eksponeringsbetingelser. Det vil sige, at der kompenseres for, at eksponeringen ikke har foregået i alle døgnets timer over en fuld uge. Hvis eksponeringen for eksempel er foretaget 6 timer per dag i 5 dage per uge, korrigeres der med en faktor 6/24 til kontinuert eksponering gennem et helt døgn og en faktor 5/7 til kontinuert eksponering gennem hele ugen.

For visse lokale effekter (effekter, der optræder lokalt i luftvejene samt direkte effekter på hud og øjne) anses det sædvanligvis at være stoffets koncentration i luften og ikke den samlede dosis som sådan, der er af betydning for udvikling af disse effekter. For sådanne stoffer kan omregning til en kontinuert eksponering sædvanligvis udelades fra en konkret vurdering.

Lugt

Nogle kemiske stoffer har en meget kraftig lugt, og hensyntagen til lugt ved fastsættelse af luftkvalitetskriteriet vil for mange stoffer (fx en række organiske opløsningsmidler) medføre lavere luftkvalitetskriterium end det sundhedsbaserede luftkvalitetskriterium, idet luftkvalitetskriteriet fastsættes til 1/3 af 50 %-lugtgrænsen.

Lugtgrænsen for et kemisk stof er generelt defineret som den koncentration i luften, hvor 50 % af et lugtpanel (kontrolleret laboratorieforsøg med bestemmelse af lugtgrænse med frivillige forsøgspersoner) kan registrere lugten.

Som et luftkvalitetskriterium vurderes en sådan 50 % lugtgrænse at kunne medføre gener hos en ikke uvæsentligt del af befolkningen.

I en analyse af en række laboratoriedata, hvor lugtgrænsen er blevet bestemt for kemiske stoffer, viser det sig, at dosis-respons sammenhængen generelt er ret stejl for et lugtpanel (DK-Teknik 2001). For personer, med intakt lugtesans (svarende til personer, der indgår i et lugtpanel), er der ge-

nerelt en forholdsvis lille spredning m.h.t. hvornår en lugt kan opfattes. Ud fra disse data vurderes, at ved et niveau på 1/3 af lugtgrænsen vil maksimalt 1-5% af befolkningen under optimale betingelser kunne fornemme lugt.

Lugtgrænser, der er angivet i litteraturen, kan variere voldsomt (flere størrelsesordner) Dette skyldes, at metoder til bestemmelse af lugtgrænser kan variere meget, alt efter hvor og hvornår de er blevet foretaget, samt at der kan være foretaget undersøgelser af forskellige stofkvaliteter, hvor stofferne ikke er entydigt definerede.

Medmindre lugtgrænsen er bestemt ud fra nye og meget velbeskrevne metoder, hvor kvalitet og pålidelighed af undersøgelsen kan vurderes, anbefales det at fastsætte luftkvalitetskriterier på baggrund af lugt fra bestemmelse af lugtgrænse foretaget af et akkrediteret laboratorium.

6.3 Beregning af jordkvalitetskriteriet

Følgende fremgangsmåde anvendes ved beregning af jordkvalitetskriteriet, når de(n) kritiske effekt(er) er en følge af gentagen udsættelse:

$$KK_{jord} = \frac{TDI \times V \times f}{E_{I,jord} \text{ (eller } E_{H,jord})} \quad \text{hvor}$$

f: procentdel af TDI, der allokeres til indtagelse af jord
V: legemsvægt, 1-3 årigt barn: 13 kg
$E_{I,jord}$: daglig eksponering (indtagelse) for jord, standardværdi:

1) 0,0002 kg/d (sv.t. 95-percentilgrænsen) i tilfælde hvor hele TDI-værdien eller hovedparten af denne anvendes til beregning af kvalitetskriteriet
2) 0,0001 kg/d (sv.t. medianudsættelse) i tilfælde hvor TDI er en 10^{-6} livstidsrisikodosis for et kræftfremkaldende stof, eller i tilfælde, hvor der anvendes en mindre del af TDI til jordkvalitetskriteriet

$E_{H,jord}$: daglig eksponering (hudkontakt) for jord, standardværdi: 0,001 kg/d for barn.

$E_{H,jord}$ anvendes i forbindelse med særligt hudgennemtrængelige stoffer, hvor systemisk bidrag fra hudoptag summeres med det orale bidrag. $E_{H,jord}$ anvendes separat hvis den kritiske effekt er relateret til den direkte hudpåvirkning af forureningskomponenten.

Følgende fremgangsmåde anvendes ved beregning af jordkvalitetskriteriet, når den kritiske effekt er akut toksicitet:

$$KK_{jord} = \frac{TD \times V}{E_{I,jord} \text{ (eller } E_{H,jord})} \quad \text{hvor}$$

TD: tolerabel enkeltdosis

$$\text{hvor} \quad TD = \frac{NO(A)EL_{akut} \text{ eller } LO(A)EL_{akut}}{UF_I \times UF_{II} \times UF_{III}}$$

V: legemsvægt, 1-3 årigt barn: 13 kg
E_I: maksimum enkeltindtag af jord (0,010 kg)
E_H: maksimal hudkontakt med jord (0,010 kg) (Anvendes for særligt hudgennemtrængende stoffer).

Ved beregning bør data for optagelse fra mave-tarmkanalen (biotilgængelighed[18]) så vidt muligt inkluderes, idet de forurenende stoffer i visse tilfælde kan binde sig kraftigt til jordpartikler og derved medføre en reduceret biotilgængelighed. Hvis data ikke foreligger, regnes med samme biotilgængelighed, som i de forsøg, der ligger til grund for TDI-beregningen (dette kan typisk være forsøg, hvor teststoffet er opblandet i foderet eller i drikkevandet).

[18] "Biotilgængelighed" refererer i denne sammenhæng til det engelske "bioaccessibility". Bioaccessibility beskriver den pool af stoffet, som jorden kan frigive, og den indeholder således også let bundne former.

Lugt, udseende

Ud over rent sundhedsmæssige aspekter tages der ved fastsættelse af jordkvalitetskriteriet hensyn til, at jorden ikke må lugte eller syne forurenet. Det vil sige, at jorden ikke ved inspektion må afgive lugt fra forureningen eller se forurenet ud (klumper af stof(fer) eller misfarvning. Der foreligger ikke nøjere retningslinier for en sådan subjektiv vurdering. Med hensyn til lugt i forbindelse med afdampning henvises til Miljøprojekt Nr. 974 (2005) afsnit 7.4.3, der beskriver anvendelsen af luftkvalitetskriteriet i forbindelse med afdampning af forurenende stoffer fra jord.

6.4 Beregning af drikkevandskvalitetskriteriet

Følgende fremgangsmåde anvendes ved beregning af drikkevandskvalitetskriteriet:

$$KK_{drikkevand} = \frac{TDI \times f}{E_{drikkevand}} \quad \text{hvor}$$

TDI: tolerabelt dagligt indtagelse (mg/ kg lgv/d)
f: er den procentdel af TDI, der allokeres til indtagelse af drikkevand
$E_{drikkevand}$: daglig eksponering for drikkevand, standardværdi:

1) 0,08 liter/ kg lgv/d (sv.t. 95-percentilen) for 1-10 årige børn. Anvendes i forbindelse med akutvirkende stoffer eller når hovedparten af TDI-værdien benyttes til beregning af drikkevandskvalitetskriteriet.
2) 0,03 liter/ kg lgv/d (sv.t. medianværdi for 1-10 årige børn) i tilfælde hvor TDI er en 10^{-6} livstidsrisikodosis for et kræftfremkaldende stof, eller i tilfælde hvor kun en mindre andel af TDI-værdien benyttes til beregning af drikkevandskvalitetskriteriet.

Kemiske stoffer, der er særligt hudoptagelige, vil kunne optages i en ikke uvæsentlig mængde i forbindelse med badning, og stoffer, der let fordamper (for eksempel mange opløsningsmidler), kan især ved brusebadning indåndes som dampe/aerosoler. Omfanget af disse eksponeringsformer via brusebadning og karbadning afhænger af, hvor letoptageligt stoffet er gennem huden, og i hvor stor udstrækning stoffet frigives ved fordampning fra vandet. Der bør derfor i konkrete tilfælde (stoffer med høj hudgennemtrængelighed og stoffer med høj flygtighed fra vandfasen), tages højde for disse bidrag ved fastsættelse af drikkevandskvalitetskriteriet, således at den samlede optagelse via drikkevand og badevand ikke overskrider den del af TDI, som er allokeret til drikkevand.

Der er ikke opstillet konkrete modeller for beregningen af sådanne bidrag, hvorfor bidragene må vurderes fra sag til sag under inddragelse af de data og de vurderinger, der er foretaget for det konkrete stof.

Lugt, smag, udseende

Drikkevandet må ikke lugte, smage eller syne forurenet og smag, lugt og udseende af drikkevandet har en væsentlig betydning, også selv om det ikke udgør en sundhedsfare i relation til indtagelse af drikkevand.

Det vil i nogle tilfælde være lugt, smag, eller udseende, og ikke stoffets sundhedsmæssige effekter, der er bestemmende for værdien af drikkevandskvalitetskriteriet.

Lugt- og smagsgrænser, der findes opgivet i litteraturen, kan variere voldsomt selvom de forskellige undersøgelser er udført med samme stof. Dette skyldes, at metoder kan variere meget alt efter hvor, og hvornår de er blevet foretaget.

Medmindre lugt- og smagsgrænsen er bestemt ud fra nye og meget velbeskrevne metoder, hvor kvalitet og pålidelighed af undersøgelsen kan vurderes, anbefales det, at fastsættelse af drikkevandskvalitetskriterier på baggrund af lugt og smag foretages ud fra bestemmelse af lugt- og smagsgrænse foretaget af et akkrediteret laboratorium.

Udgangspunktet for fastsættelse af et lugt- og smagsbaseret kvalitetskriterium bør være et nul-effekt-niveau (NOEL) i testpanelet, dvs. den koncentration hvor testpanelet som helhed ikke kan lugte eller smage stoffet.

Ofte angives lugt- og smagsgrænser i vand på tilsvarende måde som lugtgrænse i luft, dvs. det niveau, hvor 50 % af et testpanelet kan lugte/smage stoffet. Angives således lugtgrænsen i den tilgængelige litteratur som 50 %-grænsen ganges denne værdi med 1/3 (som beskrevet under luftkvalitetskriteriet), idet anvendelse af en sådan faktor skønnes at sikre, at kun en mindre andel af befolkningen vil kunne fornemme stoffet ved dette niveau.

Bilag 1

Kvantitativ vurdering ved benyttelse af T25 ekstrapolationsmetoden.

Anbefaling af T25-metoden

Der er udviklet forskellige metoder til beregning af, hvor stor en risiko for udvikling af svulster en given eksponering for et genotoksisk kræftfremkaldende stof udgør. Ens for dem alle er at der anvendes en form for statistisk ekstrapolation fra dosisniveauer med kendte eksperimentelle værdier til de som regel meget lavere dosisniveauer, der oftest er relevante i relation til den generelle befolknings eksponering for kemiske stoffer i miljøet. Metoderne beskriver relationen mellem den administrerede daglige dosis (eller koncentration) og den resulterende hyppighed af svulster.

Som anført i afsnit 5.3.2. anbefales det at anvende T25-ekstrapolering som beskrevet i en baggrundsrapport udarbejdet af en arbejdsgruppe i forbindelse med EU´s risikovurderingsarbejde (EU-Commission 1999).

T25-metoden er blevet evalueret ved at sammenligne resultater opnået ved denne metode med resultater opnået ved anvendelse af US EPA´s LMS-metode (Linearised Multistage Model) og ved LED_{10} metoden, hvor der foretages lineær ekstrapolation ned i lavdosisområdet ud fra en benchmark-dosis på 10 % effektniveau (se afsnittene 5.3.2-4 i Miljøprojekt Nr. 974 (2005)). Ved gennemgang af resultaterne for lavdosis-estimaterne vurderede man at de er sammenlignelige.

Ved sammenligning af one-hit metoden og T25-metoden vurderes de at medføre sammenlignelige værdier, idet udgangspunktet for begge vurderingerne i princippet er at anvende laveste dosis med signifikant respons, og herfra

foretage lineær ekstrapolation ned i lavdosisområdet. I T25-metoden divideres med en skaleringsfaktor fra dyr til menneske opløftet i ¼ (sv.t. skalering i forhold til stofskiftet), mens tilsvarende skaleringsfaktor i one-hit metoden er opløftet til 1/3 (sv.t. skalering i forhold til overfladeareal). Dette forhold alene vil maksimalt bevirke en forskel på de to metoder på ca. en faktor 2.

Anvendelse af T25-metoden

T25 defineres som den kroniske dosis (enhed: mg/kg legemsvægt per dag), som vil give 25 % af forsøgsdyrene svulster i et specifikt væv, efter korrektion for den spontane hyppighed, inden for den standardiserede levetid af den pågældende art.

T25 beregnes med udgangspunkt i et langtidscancerstudie, hvor den laveste dosis, der giver en signifikant forøgelse af forsøgsdyr med svulster i et specifikt væv, som udgangspunkt anvendes ved beregningen af T25. Forekomsten af ondartede og godartede svulster sammenlægges, når de godartede svulster må mistænkes for at kunne udvikles til ondartede. Hvis der er en højere hyppighed ved en højere dosis, der giver en lavere T25, anvendes sidstnævnte, med mindre der er særlige begrundelser for ikke at tage udgangspunkt i denne. Hvis der er flere data- sæt, beregnes T25 for det mest relevante datasæt. Hvis forskellige datasæt giver T25-værdier, som ligger inden for et relativt snævert interval, anvendes gennemsnittet af disse T25-værdier. Hvis sidstnævnte procedure ikke anvendes, skal rationalet for anvendelse af en anden procedure begrundes nøje.

Beregning af T25 foretages ved at gange dosis D (mg/kg lgv/dag), hvor signifikant forøget antal svulster forekommer med faktoren 0,25/p, hvor p er den aktuelle hyppighed af svulster: $T25 = D \times 0{,}25/p$.

Ud fra denne T25 foretages lineær ekstrapolation ned i lavdosisområdet, idet dosis svarende til et givent risikoniveau beregnes ved simpel forholdsregning. En gennemsnitlig daglig dosis svarende til en øget livstidsrisiko på 10^{-6} kan således beregnes på følgende måde:

$$Dosis_{(10\text{-}6\ livstidsrisiko)} = 10^{-6} / 0{,}25 \times T25\text{-dosis}$$

Imidlertid indgår der i beregningerne også dosiskorrektion med baggrund i en skaleringsfaktor mellem dyr og mennesker, og en faktor som angiver andelen af dyrenes levetid, hvor eksponeringen har fundet sted.

Konkret kan TDI svarende til en 10^{-6} livstidsrisiko beregnes ud fra følgende formel, når T25 er beregnet ud fra forsøg med oral eller dermal eksponering hos dyr:

$$TDI = \frac{I_t \times [L_e / L]^2 \times [(T25 \times l_e) / L_e]}{0{,}25 \times [W_h / W_a]^{0,25}}$$

I_t: Den tolerable livstidsrisiko (10^{-6}).
L_e: Den aktuelle levetid for dyrene.
L: Den teoretiske gennemsnitslængde af levetiden for dyrene.
T25: Beregnet daglig dosis (mg/kg legemsvægt per dag), der medfører en 25% forøget forekomst af tumorer hos forsøgsdyrene.
l_e: Eksponeringstid.
$[W_h / W_a]^{0,25}$: Dosiskorrektion på basis af stofskifte
hvor
W_h: Menneskets vægt i kg (sættes oftest til 70 kg).
W_a: Gennemsnitsvægt af det pågældende forsøgsdyr (kg).

L, L_e l_e:
Hvis eksponeringsvarigheden er kortere end standardlevetiden for den pågældende art, eller hvis studiet afsluttes inden standardlevetiden, foretages dosiskorrektion, som beskrevet i den anførte formel. Standardlevetiden for mus, rotter og hamstre sættes med mindre andet er angivet for den specifikke stamme til 24 måneder.

Dosis (T25)
Når konkrete data ikke specifikt angiver dyrenes legemsvægt, og dosis i mg/kg lgv/d i forbindelse med dosering gennem foder eller drikkevand, anvendes følgende værdier i beregningen:

Dyreart	Legemsvægt (kg)	Indtagelse af foder (g/kg/dag)	Indtagelse af drikkevand (ml/kg/dag)
Rotte	0,10 (ung) 0,40 (ældre)	100 50	 75
Mus	0,020	150	-
Marsvin	0,75	40	-
Kanin	2,0	30	-
Hund	10,0	25	-
Abe	5,0	50	-

$(W_h/W_a)^{0,25}$

Er stoffet givet oralt eller dermalt , foretages der en dosiskorrektion for forskelle i kropsstørrelse mellem dyr og mennesker ved at omregne T25 til den tilsvarende humane dosis i mg/kg lgv./dag ved allometrisk skalering på basis af stofskiftet (afsnit 4.4.1.2). Denne skalering opnås ved at dividere T25-dosis med faktoren $(W_h/W_a)^{0,25}$

Ved beregning ud fra inhalationsundersøgelse beregnes den tolerable indåndingskoncentration TC ved anvendelse af formlen:

$$TC = \frac{I_t \times [L_e / L]^2 \times [(T25 \times l_e) / L_e]}{0{,}25}$$

I_t: Den tolerable livstidsrisiko (10^{-6}).
L_e: Den aktuelle levetid for dyrene.
L: Den teoretiske gennemsnitslængde af levetiden for dyrene.
T25: Beregnet daglig dosis (mg/m³ i indåndingsluften), der medfører en 25% forøget forekomst af tumorer hos forsøgsdyrene.
l_e: Eksponeringstid.

Ved indsættelse af T25 anvendes koncentration i indåndingsluften og der foretages sædvanligvis omregning til en gennemsnitligt indåndingskoncentration , hvis forsøget ikke er udført med kontinuerlig eksponering. Dette gøres ved at korrigere for antal timer pr. dag og antal dage pr. uge hvor eksponeringen har fundet sted.

Bilag 2

Baggrund for anvendte eksponeringsværdier ved beregning af kvalitetskriterier

I denne vejledning ændres praksis med hensyn til de eksponeringsværdier, der anvendes ved beregning af kvalitetskriterierne for kemikalier.

Tidligere har man i forbindelse med beregning af jordkvalitetskriterier som udgangspunkt antaget, at et barn dagligt indtager 0,2 g jord/d (0,0002 kg/d), mens man ved beregning af luftkvalitetskriterier har anvendt et scenarie, hvor en voksen person dagligt indånder 20 m^3 luft. Ved beregning af kvalitetskriterier for kemikalier i drikkevand har udgangspunktet været et dagligt indtag på 2 liter vand for en voksen.

Børn
Beskyttelse af børn er de senere år i stigende grad kommet i fokus, og det har i den forbindelse været debateret i hvilken udstrækning kvalitetskriterier beregnet ud fra voksnes udsættelse i tilstrækkeligt omfang beskytter børn, da børn i forhold til deres legemsvægt generelt indtager/ indånder en større mængde drikkevand/ luft.

I miljøprojekt nr. 589 "Children and the unborn child – exposure and susceptibility to chemical subtances-" fra 2001, blev der foretaget en detaljeret gennemgang af børns særlige følsomhed og udsættelsesmønster i forbindelse med miljøforureninger og kemiske stoffer. I miljøprojektet konkluderes, at der ved fremtidig fastsættelse af kvalitetskriterier for kemikalier bør tages udgangspunkt i eksponeringsværdier for børn, for at opnå at børn er fuldt omfattet af det beskyttelsesniveau, kvalitetskriteriet repræsenterer. Denne vejledning indarbejder således ønsket om, at principperne for fastsættelse af kvalitetskriterier tager hensyn til børns særlige udsættelse.

Børns udsættelse vil således være udgangspunktet for de fremtidige standardværdier for eksponering i forbindelse med jord, luft og drikkevand.

Standardværdien for børns legemsvægt vil i fremtiden være 13 kg.

Særligt udsatte undergrupper
Almindelig biologisk variation og forskellige former for adfærd vil betyde, at nogle grupper vil være mere udsatte end andre for en given påvirkning via miljøet. Der er således også med denne vejledning taget stilling til, i hvilken udstrækning kvalitetskriterier/grænseværdier for kemikalier skal tage hensyn til de mere udsatte grupper i befolkningen.

Når kvalitetskriterier for kemikalier beregnes ved at anvende eksponeringsværdier, der svarer til befolkningsvægtede gennemsnitsværdier eller medianværdier, betyder dette, at ca. halvdelen af den befolkning, som kvalitetskriteriet skal søge at beskytte, vil kunne blive udsat for *større* eksponering end udgangspunktet for beregningen (fx en TDI-værdi). Hvis sigtet med et kvalitetskriterium er, at størstedelen af befolkningen skal være omfattet at det ønskede beskyttelsesniveau, vil det således være nødvendigt at anvende en øvre fraktilværdi for befolkningens udsættelse.

Det skal nævnes, at de standardværdier der hidtil har været anvendt for børn (jord) og voksne (luft og drikkevand) jf. beskrivelsen af eksponeringsværdier, svarer til sådanne øvre percentilgrænser.

Kvalitetskriterier for kemikalier skal fortsat sigte mod at beskytte flertallet af befolkningen, dvs. også de mere udsatte undergrupper. I de tilfælde hvor befolkningsfordelingen af eksponeringerne kendes, vil valg af øvre eksponeringsværdier typisk kunne foretages ved at tage udgangspunkt i værdier svarende til 90- eller 95-percentilerne.

For at sikre særligt udsatte grupper anvendes følgende principper :

a) I situationer, hvor man ved beregning af kvalitetskriteriet har tildelt hele TDI-værdien, hovedparten eller der er eksakt

viden om størrelsen af udsættelsen via det aktuelle medie, vil det være nødvendigt at anvende øvre percentilgrænser for eksponering. Herved sikres at kun en mindre andel af befolkningen vil blive eksponeret over TDI-niveau.

b) *I andre tilfælde, hvor der anvendes en reduceret TDI-værdi som følge af anvendelse af en allokeringsfaktor (evt. en særlig reduktionsfaktor), anvendes derimod medianværdier for udsættelse med mediet. Dette forhold begrundes med, at anvendelse af en allokeringsfaktor eller reduktionsfaktor sædvanligvs betyder anvendelse af runde værdier (10 % eller 1% af TDI), som ofte vil være på "den sikre side". I sådanne tilfælde, hvor der i forvejen er indbygget en øget grad af sikkerhed, vil det ikke være påkrævet også at anvende en øvre percentilværdi for eksponering. Anvendelse af en medianværdi vurderes her, at kunne opfylde målet om at beskytte størstedelen af befolkningen.*

c) *For kræftremkaldende stoffer uden tærskelværdi for effekt foretages som tidligere nævnt ingen allokering af TDI. I disse tilfælde anvendes medianværdier for eksponering ved beregning af kvalitetskriteriet, idet TDI-værdien repræsenterer en daglig dosis for en befolkningsvægtet gennemsnitlig livstidsrisikoforøgelse (en ekstrarisiko på 1 ud af 1 million udsatte over livstid), hvorfor en gennemsnits-/medianværdi for befolkningens udsættelse må være udgangspunktet.*

Luft, daglig standardeksponering

I forbindelse med valg af standardeksponering for luft tages der udgangspunkt i afsnit 6.1.1 i Miljøprojekt Nr. 974 (2005). I dette afsnit vurderes US EPA´s eksponeringsvurderinger at udgøre det bedste grundlag. I EU´s risikovurderingprogram for kemiske stoffer henvises ligeledes til de amerikanske værdier.

Uddrag af tabel 6.1.1

Alder	Legemsvægt (kg)	V_R – gennemsnit (m^3/dag)	V_R – inaktiv[a] (m^3/dag)	V_R - aktiv (m^3/dag)
Børn:				
Under 1 år	7.6	4.5	2.35	6.35
1 – 2 år	13	6.8	4.16	9.15

3 – 5 år	18	8.3	4.98	10.96
6 – 8 år	26	10	5.95	13.09

V_R = Respirations Volumen som henholdsvis gennemsnit, inaktivitet og aktivitet.

Værdierne er alders- og kønsopdelte, men angivelserne omfatter ikke spredningen (fordelingen) i de enkelte aldersgrupper. Det er således ikke ud fra de forliggende data muligt at aflæse en 90- eller 95 percentilværdi for eksponeringen af de forskellige aldersgrupper.

Som ovenfor nævnt vil der ved fastsættelsen af luftkvalitetskriterier blive taget hensyn til eksponeringen af børn.

Fra tabellen ses, at børn under 1 år i gennemsnit over et døgn indånder 4,5 m^3 svarende til 0,59 m^3/kg lgv/dag, mens børn i aldersgruppen 1-2 år og 3-5 år indånder henholdsvis 6,8 m^3 og 8,3 m^3 (svarende til henholdsvis 0,52 og 0,46 m^3/kg lgv/dag). Især de 1-5 årige må anses at være udeaktive.

På denne baggrund vil der ved beregning af luftkvalitetskriterier fremover blive anvendt en standardværdi for 1-5 årige børn på 0,5 m^3 luft/ kg lgv.

Til sammenligning kan nævnes at luftkvalitetskriteriet hidtil er blevet beregnet ud fra et dagligt indåndingsvolumen på 0,3 m^3/ kg lgv., idet udgangspunktet her var en voksen person (70 kg), der dagligt indåndede 20 m^3 luft.

Jord, daglig standardeksponering

Miljøprojekt Nr. 974 (2005) sammenfatter i afsnit 6.1.2 den seneste viden med hensyn til børns udsættelse for jord samt anfører forskellige organisationers vurdering.

Ud fra en sammenfattende vurdering kan følgende eksponeringsværdier for børn opstilles:

Eksponeringsvej	Eksponeringsværdi
Oralt, maksimum enkeltindtag	10 g

Oralt, dagligt gennemsnit	0,1 g/d
Oralt, 95-percentil	0,2 g/d
Hudkontakt, dagligt gennemsnit	1 g/d
Hudkontakt, maksimum	10 g/d

For børns indtag gennem munden fastsættes jordkvalitetskriteriet for akut toksiske stoffer ud fra et enkeltindtag på 10 g jord.

I tilfælde, hvor hele TDI eller hovedparten af TDI anvendes til beregning af jordkvalitetskriteriet, tages der specifikt hensyn til særligt udsatte børn, idet der ved beregning af jordkvalitetskriteriet tages udgangspunkt i 95-percentilen for udsættelse dvs. 0,2 g jord/d for herved at minimere risikoen for at overskride TDI-værdien.

I andre tilfælde, hvor der kun anvendes en mindre del af TDI-værdien til jordkvalitetskriteriet, anvendes ved beregningen af jordkvalitetskriteriet 0,1 g jord/d som et gennemsitligt standardindtag.

For kræftfremkaldende stoffer, hvor TDI svarer til en gennemsnitlig 10^{-6} livstidsrisikodosis blandt børn, anvendes 0,1 g jord/dag som udgangspunkt for beregning af jordkvalitetskriteriet.

Drikkevand, daglig standardeksponering

I Miljøprojekt Nr. 974 (2005) i afsnit 6.1.3 gennemgås viden om forskellige aldersgruppers indtagelse af drikkevand, idet indtagelse både opgives for forskellige aldersgrupper og fordelingen inden for disse (gennemsnitsværdier og 90-/95 percentiler). Beskrivelse i baggrundsrapporten omfatter vurdering og anbefalingerne fra US EPA´s Exposure Factors Handbook.

Baggrundsrapporten henviser i forbindelse med børns indtag af drikkevand til tabel 6.1.3 D, der angiver US EPA´s anbefalede værdier:

Alder	Gennemsnit (mean)	50 Percentil	90 Percentil	95 percentil

Under 1 år	0,30 liter/dag 44 ml/kg/dag	0,24 liter/dag 35 ml/kg/dag	0,65 liter/dag 102 ml/kg/dag	0,76 liter/dag 127 ml/kg/dag
Under 3 år	0,61 liter/dag		1,5 liter/dag	
3 – 5 år	0,87 liter/dag		1,5 liter/dag	
1 – 10 år	0,74 liter/dag 35 ml/kg/dag	0,66 liter/dag 31 ml/kg/dag	1,3 liter/dag 64 ml/kg/dag	1,5 liter/dag 79,4 ml/kg/dag

For spædbørn angives medianindtaget at være 35 ml/ kg lgv/d mens 95-percentilen angives at være på 127 ml/ kg lgv/d. For børn i aldersgruppen 1-10 år anføres tilsvarende en medianværdi på 31 ml/kg lgv./d og en 95-percentil på 79,4 ml/kg lgv./d.

Som standardværdi vurderes det mest relevant at anvende værdien for 1-10 årige børn, idet evt. forskelle i vaner m.h.t. amning i USA og Danmark kan have stor indflydelse på drikkevandsindtagelse for spædbørn. Endelig dækker TDI-begrebet alene moderens direkte eksponering og derved barnets indirekte udsættelse gennem modermælken, og TDI er således ikke formelt set beregnet til at dække spædbarnets direkte udsættelse. Gennemsnitligt er indtagene dog direkte sammenlignelige.

Ved beregning af drikkevandskvalitetskriteriet, hvor der ved en given forureningskomponent er foretaget en allokering på 100 % eller hovedparten af TDI til drikkevandet, eller i situationer hvor den kritiske effekt er en akut toksisk effekt, anvendes 95-percentilværdien for 1-10 årige børns indtag, dvs. et dagligt indtag på 0,08 liter/ kg lgv/d. I disse situationer, vil drikkevandskvalitetskriteriet således også omfatte spædbørns direkte udsættelse, idet dette også afspejler indtaget for børn under 1 år, som har en høj direkte udsættelse.

Ved beregning i andre situationer, hvor der er foretaget en allokering på en mindre del af TDI til drikkevandskvalitetskriteriet (eller der er anvendt en reduktionsfaktor) anvendes medianværdien for 1-10-åriges forbrug af drikkevand sv.t. 0,03 liter/ kg lgv/d. Allokeringen vil også betyde at spædbørns direkte udsættelse er omfattet af kvalitetskriteriet.

For kræftfremkaldende stoffer, hvor TDI svarer til en gennemsnitlig 10^{-6} livstidsrisikodosis blandt børn, anvendes

0,03 liter/ kg lgv/d som udgangspunkt for beregning af drikkevandskvalitetskriteriet.

Generelt

Et helt grundlæggende princip i risikovurdering af miljøtoksiner er adskillelse af risikovurdering og risikohåndtering.

Et grundlæggende princip er endvidere at Risikovurderingen skal foretages foretages stricte på videnskabeligt grundlag, uden indflydelse af fra politiske eller økonomiske interesser. På EU-niveau er dette bagrunden for oprettelsen af de Europæiske argenturer, herunder EFSA og EEA.

EFSA og EEA foretager vurderinger uden indflydelse fra de politiske lag i EU, og der er strenge krav til de eksterne eksperter argenturerne anvender for at sikre mod inhabilitet, i form af politiske eller økonomiske interesser. Således indgår eksempelvis ingen eksperter med relationer til industri-interessenter.

Når EU kommisionen støtter sig til vurdering fra en lille NGO (ICNIRP), frem for vurderinger foretaget af EEA, bryder de herved med den normale praksis i EU. Endvidere er størstedelen af medlemmerne i ICNIRP fysikere, og derfor ikke fageksperter i forhold til biologiske effekter. Endelig er der ikke en tilsvarende sikkerhed for inhabilitet, som normalt sikres i argenturernes vurderinger.

EEA har blandt andet i rapporten Late lessons fra 2013 anbefalet at forsigtighedsprincippet tages i anvendelse i forhold til Radiofrekvent Elektromagnetisk stråling. Citat (s. 38-39): It is therefore very important that large scale emerging technologies, such as biotechnologies, nanotechnologies and information and communication technologies, apply the precautionary principle based on the experiences and lessons learned from these and other case studies.

Dette dokument beskriver hvordan EFSA mener den videnskabelige evidens bør vurderes:
https://efsa.onlinelibrary.wiley.com/doi/epdf/10.2903/j.efsa.2017.4971

https://efsa.onlinelibrary.wiley.com/doi/epdf/10.2903/sp.efsa.2020.EN-1843
(inhabilitet=impartiality)

I forhold til risikovurdering vil der altid være data gaps, og der vil altid være modstridende videnskabelige resultater.
http://www.efsa.europa.eu/en/methodology/guidance

Som det fremgår af EFSAs dokumenter, er det en alvorlig fejl hvis der kræves absolut bevis for effekt, herunder når ICNIRP eksempelvis afviser den meget omfattende forskning som viser non-thermale biologiske effekter, med den begrundelse mekanismen bag ikke fuldstændig forstået.

Som det fremgår af EFSAs dokumenter, er det derfor afgørende at den gruppe forskere der udvælges til at vurdere evidensen er habile, og eventuelle inhabilitet tages meget alvorlig. Dette er en af Agenturernes hovedopgaver.

Nationale vurderinger og myndighedernes håndtering

De nationale myndigheder (i DK SSI, FVST og MST) kan foretage risikovurdering dels på vurderinger fra de Europæiske Argenturer, men kan også tage risikovurderinger foretaget af nationale eksperter i betragtning. De nationale risikovurderinger skal igen foretages af forskere, som ikke har økonomiske eller politiske interesser, og der vil normalt være tale om eksperter på danske universiteter. På Fødevareområdet foretages sådanne risikovurderinger af Fødevareinstituttet DTU, mens Miljøstyrelsen får vurderinger fra flere af universiteterne.

Ligesom i EU, blev risikovurdering og risikohåndtering adskilt i Danmark ved udgangen af 2006, hvor sektorforskningsinstitutionerne (under ministerierne) blev adskilt fra myndighederne og langt ind under universiteterne. Forskerne har siden ikke været underlagt de myndigheder de rådgiver (med undtagelse af SSI).

EEA

The European Environment Agency (EEA) is an agency of the European Union, whose task is to provide sound, independent information on the environment. The EEA aims to support sustainable development by helping to achieve significant and measurable improvement in Europe's environment, through the provision of timely, targeted, relevant and reliable information to policymaking agents and the public.

The European environment information and observation network (Eionet) is a partnership network of the EEA and its member and cooperating countries. Through Eionet, the EEA brings together environmental information from individual countries concentrating on the delivery of timely, nationally validated, high-quality data.

This knowledge is made widely available through the EEA website and forms the basis of both thematic and integrated environmental assessments. This information serves to support environmental management processes, environmental policymaking and assessment, as well as citizen participation.

Kilde: https://mst.dk/kemi/kemikalier/graensevaerdier-og-kvalitetskriterier/

Grænseværdier og kvalitetskriterier

Hver dag bliver vi mennesker udsat for et stort antal kemiske stoffer. Det kan for eksempel ske gennem maden vi spiser, luften vi indånder, eller vandet vi drikker. For at beskytte mennesker og miljø mod uacceptable mængder af kemikalier, fastsætter Miljøstyrelsen grænseværdier - i form af de såkaldte kvalitetskriterier - for mange stoffer.

Sundheds-kvalitetskriterier

Sundhedskvalitetskriteriene bliver brugt til at beskytte mennesker mod forurening fra de mange kemikalier, som vi bruger og bliver udsat for i hverdagen. Se bl.a. grænseværdier for luft, jord og vand, datablade samt baggrundsrapporter.

Miljø-kvalitetskriterier for forurenende stoffer i vandmiljøet

Miljøstyrelsen fastsætter kvalitetskriterier for forurenende stoffer i vandmiljøet (søer, vandløb og havet). Kvalitetskriterierne bliver fastsat på baggrund af kemiske stoffers effekter på de dyr og planter, der lever i vandet. Få digital adgang til information om pt. 164 stoffer fordelt på 148 datablade.

https://mst.dk/kemi/kemikalier/graensevaerdier-og-kvalitetskriterier/sundhedskvalitetskriterier/

Sundhedskvalitetskriterier

Vi bruger mange kemikalier i vores hverdag. Derfor er det nødvendigt at beskytte mennesker og miljø mod forurening fra disse. Til det formål bliver der fastsat grænseværdier - de såkaldte kvalitetskriterier - for, hvilke koncentrationer af kemikalier, der må være i jord, luft, spildevand og drikkevand.

Om grænseværdier

Grænseværdier bliver brugt til at beskytte mennesker og miljø mod forurening fra de mange kemikalier, som vi bruger og bliver udsat for i hverdagen.

Grænseværdier for luft

Grænseværdier for kemikalier i luft bliver brugt til at begrænse og forebygge luftforurening fra virksomheder, energiproduktion og affaldsforbrænding.

Grænseværdier for jord

Grænseværdier for kemikalier i jord bliver brugt, når man skal vurdere forurenet jord, rydde op på forurenede grunde, og når man skal rådgive personer, der bor på lettere forurenede grunde.

Grænseværdier for vand

Grænseværdier for kemikalier i grundvand og drikkevand bliver fastsat, så vores drikkevand er sundhedsmæssigt forsvarligt at drikke, ser rent ud og er uden farve, smag eller lugt.

Datablade for stoffer med luftkvalitetskriterier og B-værdier
Her finder du en liste over stoffer, hvor der i forbindelse med fastsættelsen af kvalitetskriterier for luft og deraf følgende B-værdier er udarbejdet et datablad over stoffets sundhedseffekter mv.

Baggrundsrapporter (kriteriedokumenter) for stoffer med luftkvalitetskriterier
Her finder du en liste over stoffer, hvor der i forbindelse med fastsættelsen af kvalitetskriterier for luft er udarbejdet en baggrundsrapport.

Datablade for stoffer med jord- og drikkevandskvalitetskriterier
Her finder du en liste over stoffer, hvor der i forbindelse med fastsættelsen af kvalitetskriterier for jord og/eller drikkevand er udarbejdet et datablad over stoffets sundhedseffekter mv.

Baggrundsrapporter (kriteriedokumenter) for stoffer med jord- eller drikkevandskvalitetskriterier
Her finder du en liste over stoffer, hvor der i forbindelse med fastsættelsen af kvalitetskriterier for jord eller drikkevand er udarbejdet en baggrundsrapport.

https://mst.dk/kemi/kemikalier/graensevaerdier-og-kvalitetskriterier/sundhedskvalitetskriterier/baggrundsrapporter-for-stoffer-med-jord-eller-drikkevandskvalitetskriterier/

Kvalitetskriterier for miljøfarlige forurenende stoffer i vandmiljøet

Miljøstyrelsen fastsætter kvalitetskriterier for forurenende stoffer i vandmiljøet (søer, vandløb og havet). Kvalitetskriterierne bliver fastsat på baggrund af kemiske stoffers effekter på de dyr og planter, der lever i vandet.

Miljøkvalitetskriterierne udgør den højeste koncentration af et forurenende stof, hvor myndighederne vurderer, at det ikke giver skader på vandmiljøet. Kvalitetskriterierne for vandmiljøet er baggrund for de lovmæssigt fastsatte miljøkvalitetskrav, som ligger til grund for at begrænse spildevandsudledninger til vandmiljøet.

De lovfastsatte miljøkvalitetskrav fremgår af bekendtgørelse nr. 1625 af 19. december 2017 om fastlæggelse af miljømål for vandløb, søer, overgangsvande, kystvande og grundvand, se den på retsinformations hjemmeside.

Nedenfor findes en liste over stoffer, hvor der i forbindelse med fastsættelsen af kvalitetskriterier for vand og/eller sediment og biota, er udarbejdet et datablad over stoffets miljøeffekter mv.

Databladene fremstår med varierende layout, forord og logo grundet tidspunktet for udarbejdelsen, og alle indeholder relevante informationer om kemikaliets fysisk-kemiske egenskaber, giftighed og fastsættelse af miljøkvalitetskriterier.

I databladene henvises til det vejledningsmateriale, som ligger til grund for udarbejdelsen. Det drejer sig om relevant vejledning fra Miljøstyrelsen samt EU-kommissionens vejledning ”Guidance document No. 27 Technical Guidance for Deriving Environmetal Quality Standards”, som har gennemgået opdateringer, hvilket afspejles i databladene i forhold til miljøkvalitetskriteriernes udarbejdelse, samt for hvilke matricer (vand, sediment og biota), der er fastsat miljøkvalitetskriterier for.

Acknowledgements

This report has been prepared by the European Environment Agency (EEA) with substantial contributions from many external authors. The EEA is particularly grateful to those authors who wrote the case study chapters.

Originator of the *Late lessons from early warnings* project at the EEA was David Gee.

Acknowledgement is given to the editorial team: David Gee, Philippe Grandjean, Steffen Foss Hansen, Sybille van den Hove, Malcolm MacGarvin, Jock Martin, Gitte Nielsen, David Quist and David Stanners.

The EEA also thanks advisory board members who have contributed their experience to the project over many years: Joan Martinez Alier, Philippe Bourdeau, Sylvaine Cordier, Sven Dammann, Michael Depledge, Frans Evers, Silvio Funtowicz, Thomas Jakl, Martin Krayer von Krauss, Owen McIntyre, Jerome Ravetz, Nicolas de Sadeleer, László Somlyódy, Sofia Vaz and Theo Vermeire.

Production support: Mike Asquith, John James O'Doherty, Peter Saunders, Pia Schmidt and Bart Ullstein.

Contributing authors**:** Jeroen Aerts, Maria Albin, Mikael Skou Andersen, Iulie Aslaksen, Anders Baun, Constança Belchior, Henk van den Berg, Lisa A. Bero, Keith Beven, Eula Bingham, Riana Bornman, Henk Bouwman, Diana M. Bowman, Sarah Brunel, Michael Carlberg, Argelia Castaño, Barry Castleman, David Owain Clubb, Charlie Clutterbuck, Carl Cranor, Paul Dorfman, Eladio Fernández-Galiano, Gary Fooks, Aleksandra Fucic, Silvio Funtowicz, David Gee, Piero Genovesi, Andreas Gies, Anna Gilmore, Philippe Grandjean, Hartmut Grassl, Tee L. Guidotti, Nigel Haigh, Steffen Foss Hansen, Mazazumi Harada, Lennart Hardell, Jack A. Heinemann, Vernon H. Heywood, Sybille van den Hove, James Huff, Susan Jobling, Bill Kovarik, Christoph Kueffer, Zbigniew W. Kundzewicz, Henrik Kylin, Malcolm MacGarvin, Laura Maxim, Andrew Maynard, Jacqueline McGlade, Owen McIntyre, Marc Le Menestrel, Bert Metz, David Michaels, Erik Millstone, Celeste Monforton, Anne I. Myhr, Herbert Needleman, Joy Onasch, Richard Owen, David Ozonoff, Andrew R.G. Price, David Quist, James W. Readman, Johnny Reker, David M. Richardson, Julian Rode, Christina Rudén, Jennifer Beth Sass, Richard Schmuck, Noelle E. Selin, Jeroen van der Sluijs, Katherine Smith, Morando Soffritti, Ana M. Soto, Hans von Storch, Stephen Thomas, Joel A. Tickner, Klement Tockner, Toshihide Tsuda, Pier Vellinga and Takashi Yorifuji.

Case study chapters have been peer reviewed from a broad range of perspectives. The EEA would like to thank all institutions and experts who have given so generously of their time and knowledge during the peer review process.

The EEA would also like to thank Domingo Jiménez Beltrán, Philippe Bourdeau, Jane Keys, Malcolm MacGarvin, Andy Stirling and Brian Wynne for being continuing sources of inspiration and ideas throughout the process of producing both volumes of *Late lessons from early warnings.*

The EEA would like to remember, with great appreciation Poul Harremöes, chairman of the editorial team for *Late lessons from early warnings* Volume 1, and Masazumi Harada, co-author of Chapter 5 on Minamata disease, who worked throughout his career on mercury pollution.

Preface

An investment in knowledge pays the best interest
— Benjamin Franklin '*The Way to Wealth*' (1758).

There is something profoundly wrong with the way we are living today. There are corrosive pathologies of inequality all around us — be they access to a safe environment, healthcare, education or clean water. These are reinforced by short-term political actions and a socially divisive language based on the adulation of wealth. A progressive response will require not only greater knowledge about the state of the planet and its resources, but also an awareness that many aspects will remain unknown. We will need a more ethical form of public decision-making based on a language in which our moral instincts and concerns can be better expressed. These are the overall aims of Volume 2 of *Late lessons from early warnings*.

Volume 1 of *Late lessons from early warnings* was published at a time when the world was experiencing an economic slowdown, China had joined the World Trade Organization and western Europe was still a 15-member Union. Global grain production had declined for the third time in four years due mainly to droughts in North America and Australia, and the world saw major recalls of contaminated meat, foot and mouth disease and bovine spongiform encephalopathy (mad cow disease). Global temperatures continued to climb and many bird populations were in decline, but the United States of America had rejected the Kyoto Protocol. We were seeing ourselves through the lens of the first human genome sequence, yet we were trying to manage chemicals known to be harmful to humans and ecosystems, through international conventions and treaties such as the Basel Convention to deal with toxic waste dumping in the developing world; the OSPAR/HELCOM Conventions to reduce the discharges, emissions and the loss of hazardous substances into the sea and the Montreal Protocol, to phase out ozone-depleting substances. The destruction of the World Trade Center had just happened.

Since then, we have witnessed a period of extraordinary hubris. Most visibly, the financial profligacy of the first decade of the century led inexorably to the crises of 2007–2009 whereby the major components of the international financial system were weakened to the extreme by indebtedness, mispriced products, lax monetary policies and mis-engineered protection against risks and uncertainty. The world experienced more not less volatility. Political systems became silted up by vested interests and a determination by citizens to protect assets accumulated in easier times, and beneath it all lay a deeper environmental crisis epitomised by climate change and biodiversity loss.

There was also a collapse of trust, not only in financial institutions but in big companies, as they abandoned staff, pensions and health care schemes. Recent evidence from social psychology has shown that despite rising levels of education and innovation in products and services, people trust only those they know and not strangers. As Stephen Green said in *Good value: reflections on money, morality, and an uncertain world* in 2009:

> 'There has been a massive breakdown of trust: trust in the financial system, trust in bankers, trust in business and business leaders, trust in politicians, trust in the media, trust in the whole process of globalisation — all have been severely damaged, in rich countries and poor countries alike'.

The scientific elites have also been slowly losing public support. This is in part because of the growing number of instances of misplaced certainty about the absence of harm, which has delayed preventive actions to reduce risks to human health, despite evidence to the contrary.

Suddenly, our problems have grown into what Charles W. Churchman in 1967 termed *wicked problems* — difficult or impossible to solve because of incomplete, contradictory and changing requirements, difficult to recognize, resistant to resolution because of the complexity of their interdependencies and needing to be tackled not by one but via many forms of social power. Solving

them requires a new combination of hierarchical power, solidarity and individualism.

What could this mean, for example, for the 100 thousand chemicals currently in commercial use?

To begin with we have more conventions and treaties in place than a decade ago: the 2004 Rotterdam Convention on the Prior Informed Consent (PIC) Procedure covering international trade of 24 pesticides, four severely hazardous pesticide formulations and 11 industrial chemicals; the 2004 Stockholm Convention on Persistent Organic Pollutants to protect human health and the environment from substances which are highly toxic, persistent, bio-accumulative and move long distances in the environment, such as DDT, PCBs, various industrial chemicals, and a set of unintentional chemical by-products such as dioxin. But these conventions only address the top-down hierarchical approach to power.

At the same time Europe has put in place legislation to achieve a global regulatory influence including the EU Cosmetic Directive banning the use of chemicals known or strongly suspected of being carcinogens, reproductive toxins, or mutagens causing cancer, mutation or birth defects; the EU Restriction of Hazardous Substances Directive, which restricts the use of hazardous materials in the manufacture of various types of electronic and electrical equipment including lead, mercury, cadmium, hexavalent chromium, the flame retardents polybrominated biphenyls and polybrominated diphenyl ethers, and which encourages the substitution to safe/or safer alternatives in the electric and electronic equipment industry; the closely linked 2006 EU Waste Electrical and Electronic Equipment Directive for collection, recycling and recovery of electrical goods; the 2006 Strategic Approach to International Chemicals Management (SAICM); and the 2007 EU Registration, Evaluation and Authorisation of Chemicals, widely known as REACH, to assign greater responsibility to industry to manage the risks from chemicals and to provide safety information on substances. The effects of these regulatory tools are described in different chapters, but once again point to the main economic actors rather than communities or individuals.

One thing that has become clearer over the past decade is that certain chemical substances are highly stable in nature and can have long-lasting and wide ranging effects before being broken down into a harmless form. The risk of a stable compound is that it can be bio-accumulated in fatty tissues at concentrations many times higher than in the surrounding environment. Predators, such as polar bears, fish and seals, are known to bio-magnify certain chemicals in even higher concentrations with devastating consequences for both humans and ecosystems. So exposure to toxic chemicals and certain foodstuffs are at risk of causing harm, especially to vulnerable groups such as foetuses in the womb or during childhood when the endocrine system is being actively built. Even with small dose exposures, the consequences can in some instances be devastating with problems ranging from cancer, serious impacts on human development, chronic diseases and learning disabilities. Here the power to act could be more properly set by well-informed individuals and communities.

The relationship between knowledge and power lies at the heart of Volume 2. In many chapters, the implicit links between the sources of scientific knowledge about pollutants, changes in the environment and new technologies, and strong vested interests, both economic and paradigmatic, are exposed. A number of authors also explore in greater depth, the short-sightedness of regulatory science and its role in the identification, evaluation and governance of natural resources, physical and chemical hazards. By creating a better understanding of these normally invisible aspects, it is hoped that this volume will enable communities and people to become more effective stakeholders and participants in the governance of innovation and economic activities in relation to the associated risks to humans and the planet.

Much of what we are able to learn from the histories of past environmental and public health mistakes is also directly applicable to the better regulation and governance of global institutions and financial and economic risks. Robin G. Collingwood argued in his *Autobiography* (1939), that:

> 'History can offer something altogether different from [scientific] rules, namely insight. The true function of insight is to inform people about the present…we study history in order to see more clearly into the situation in which we are called upon to act… the plane on which, ultimately, all problems arise is the plane of 'real' life: that to which they are referred for their solution is history.'

In this volume, we go further. Whilst still drawing lessons from such widely accepted tragedies as leaded petrol, mercury poisoning in Japan's

Minamata Bay and older pesticides which sterilised many men who used it, we have ventured into the uncertainties of potential yet contested harm, from genetically modified products; nanotechnologies; chemicals such as Bisphenol A; new pesticides and mobile phones. There is also an examination of the 80 or so potential 'false positives' where there had been indications of harm but where it was subsequently claimed that there were in fact no risks to prevent: these cases too can provide information that can help to improve future decision-making about innovation and emerging technologies.

A major part of effective decision-making lies in the way issues are framed. In the case of climate change, the first order question is whether it is worth worrying about at all. US Vice President Al Gore chose to make the question a matter of choice between believers and sceptics. However, problems arose when the public was asked to make a scientific decision when too few people had the qualifications to make any kind of reasoned judgement. They were in fact asked to make a false choice. Instead the question should have been framed around which areas should people and governments make decisions and which should be delegated to experts.

In the end there are few certain and enduring truths in the ecological and biological sciences, nor in the economics, psychologies, sociologies and politics that we use to govern them. One, however, comes from the work of Elinor Ostrom, a late and widely missed colleague, who showed from her work on managing fisheries and ecosystems that complex problems can be solved if communication is transparent and open, visions are shared, trust is high and communities are activated to work from the bottom-up as well as from the top down.

As we navigate the Anthropocene, the epoch named in recognition of our impact on the planet, we will need to encourage more people to become involved in solving the wicked problems of our times. Whether through gathering local information or becoming more aware of the many uncertainties and unpredictabilities in our surroundings, the power structures of knowledge will need to change. And if we are to respond more responsibly to the early warning signals of change, we will need to re-design our style of governance to one which reflects a future defined by the local and specific rather than only the global and the average. We hope that Volume 2 of *Late lessons from early warnings* with its many lessons and insights can help us all meet such a challenge.

Professor Jacqueline McGlade,
Executive Director

1 Introduction

Why further late lessons from early warnings?

The 2013 *Late lessons from early warnings* report is the second of its type produced by the European Environment Agency (EEA) in collaboration with a broad range of external authors and peer reviewers.

Volume 1 of *Late lessons from early warnings: the precautionary principle 1896–2000* published in 2001, looked at the history of a selection of occupational, public health and environmental hazards and asked whether we could have been better at taking action early enough to prevent harm. Twelve key lessons for better decision-making were drawn from cases where public policy was formulated against a background of scientific uncertainty and 'surprises' — and where clear evidence of hazards to people and the environment was often ignored (see box on page 11).

The 14 case studies and 12 key lessons from the 2001 report remain highly pertinent today, and underline four main reasons for a second report. The first relates to expanding the late lessons approach to consider long-known, important additional issues with broad societal implications such as lead in petrol, mercury, environmental tobacco smoke and DDT, as well as issues from which lessons have emerged more recently such as the effects of the contraceptive pill on feminisation of fish and the impacts of insecticides on honeybees.

The second concerns filling an acknowledged gap in the 2001 report, by analysing the issue of false positives where government regulation was undertaken based on precaution but later turned out to be unnecessary. Most of the cases examined in the *Late lessons from early warnings* reports are 'false negatives' — instances where early warnings existed but no preventive actions were taken.

The third reason is to address the rapid emergence of new society-wide challenges such as radiation from mobile phones, genetically-modified products, nanotechnologies and invasive alien species as well as if, how and where precautionary actions can play a role.

The final reason relates to how precautionary approaches can help manage the fast-changing, multiple, systemic challenges the world faces today, what new insights can be drawn in this context and how these can underpin opportunities for sustainable innovations and, supported by information technologies, greater public participation in their selection.

Overall approach

As for Volume 1, the approach in Volume 2 has been to include a wide range of relevant case studies produced by external authors along with chapters written by members of the report's editorial team (see acknowledgements section for details). The relevant topics for case study treatment were selected on the basis of advice from the editor, in collaboration with the editorial team and an advisory board, members of the EEA Scientific Committee and the Collegium Ramazzini ([1]).

The chapters in Volume 2 are grouped into five parts: A. Lessons from health hazards; B. Emerging lessons from ecosystems; C. Emerging issues; D. Costs, justice and innovation; and E. Implications for science and governance.

The chapters have been written by authors who, to varying degrees, have had substantial involvement in the subject area being addressed. Indeed they would not have been approached if

([1]) The Collegium Ramazzini is an independent, international academy founded in 1982 by Irving J. Selikoff, Cesare Maltoni and other eminent scientists. Its mission is to advance the study of occupational and environmental health issues and to be a bridge between the world of scientific discovery and the social and political centers, which must act on the discoveries of science to protect public health.

they had not already extensively studied the case that they were asked to write about. All of them, as respected experts in their fields and in line with their professional scientific training, were expected to be as objective as possible in answering the questions put to them by EEA. To support this, and to develop consistency between chapters, the authors were provided with seven structuring questions to be followed when building their chapter.

The case studies have been peer-reviewed by recognised experts in the respective fields who gave of their time freely and provided their feedback within a set of editorial guidelines provided by the EEA.

Scope

The report has been designed, structured and written in order to, inter alia, help politicians, policymakers and the public to:

i understand better the ways in which **scientific knowledge** is financed, created, evaluated, ignored, used and misused in taking timely and precautionary decisions about how to reduce harms, whilst stimulating benign innovations and generating useful employment;

ii learn from some **very expensive 'mistakes' in the past** so as to help societies make fewer mistakes now, and in the future, especially with some of the relatively new, largely unknown, yet already widespread technologies like nanotechnology and mobile phones;

iii be aware of less visible, important factors such as the skewed ways in which the **costs of actions and inactions** for hazardous technologies have been estimated, and the role that **some businesses** have played in ignoring early warnings and in manufacturing doubt about the science supporting such warnings;

iv consider how the law, or administrative arrangements, could be better used to deliver **justice, to those people (and ecosystems) that have been, or could be, harmed** by poorly designed, or badly deployed, innovations;

v explore how best to **engage the public** in helping to make **strategic choices over innovations**, and their technological and social pathways, as well as their involvement in **ecosystems management** and in long term monitoring through **citizen science**.

Part A of the report commences with an analysis of 'false positives' showing that these are few and far between as compared to false negatives and that carefully designed precautionary actions can stimulate innovation, even if the risk turns out not to be real or as serious as initially feared. The remaining nine chapters address false negatives — lead in petrol, perchlorethylene contaminated water, Minamata disease, occupational beryllium disease, environmental tobacco smoke, vinyl chloride, dibromochloropropane (DBCP), Bisphenol A and dichlorodiphenyltrichlorethane (DDT) — from which three common themes emerge: there was more than sufficient evidence for much earlier action; slow and sometimes obstructive behaviour by businesses whose products endangered workers, the public and the environment; and the value of independent scientific research and risk assessments.

Part B focuses on emerging lessons from the degradation of natural systems and their wider implications for society — booster biocides, the pill and the feminisation of fish, climate change, floods, insecticides and honeybees as well as ecosystem resilience more broadly. It considers, like its predecessor, the issues of scientific evidence as the basis for action/inaction, the multiple, often complex factors and feedback loops in play, many of which are not fully understood, as well as the interfaces between science, policy and society and how all actors can move together towards necessary actions in the context of heightened systemic risks, and substantial unknowns.

Part C analyses some newly emerging and large-scale products, technologies and trends, which potentially offer many benefits but also potentially much harm to people and ecosystems and thereby ultimately economic development. Cases addressed include the Chernobyl and Fukushima nuclear accidents; genetically modified agricultural crops and agroecology; the growing threat of invasive alien species; mobile phones and the risk of brain tumours; and nanotechnologies. There is often little science, and very little direct hindsight, to assist in the management of these emerging technologies but the lessons from the historical case studies need to be applied if hazards are to be avoided.

The evidence from the chapters in Part C is that, by and large, societies are not making the most use of the costly lessons that can be gleaned from their histories. A key question is how this can be improved given the many reasons identified from the case studies why taking actions have been delayed including: the novel

and challenging nature of the issues themselves; poorly or inconsistently evaluated information; strong opposition by the corporate and scientific establishments of the day; and the tendency by the decision making institutions, practices and cultures to favour the status quo and the short term perspective. This section also illustrates the value of bottom up as well as top down approaches to innovations in ensuring that the directions of technological pathways, the equitable distributions of benefits, costs and knowledge ownership, and the diversity of locally sensitive technological options are relevant to the food, energy and ecosystems crises.

The historical chapters illustrate numerous harms which for the most part have been caused by irresponsible corporations. This fact, coupled with shortcomings in how decisions are made by governments on when to act on early warnings, and in the law when it comes to compensating victims of harm, are analysed in three chapters in Part D of the report. Each chapter analyses the reasons behind prevailing practice and then goes on to offer insights, for example, on how cost calculation methods can be improved; on how insurance schemes could be used to compensate future victims of harm; and on the reasons why businesses frequently ignore early warnings.

The cases in Parts A–D form the basis for considering in Part E the governance implications for science, public policy and public engagement, and how current practices could be improved to enable society to maximise the benefits of innovations while minimising harms. The main insights are that science could be more relevant for precautionary decision-making; that the wider use of the precautionary principle can avert harm and stimulate innovation; and that the late lessons of history and precautionary approaches are highly pertinent to today's multiple and inter-connected crises — such as those arising from finance, economics, the use of ecosystems, climate change, and the use and supply of energy and food.

Finally, many of the historical and recent case studies illustrate the value of engaging the public in broadening the knowledge base and stimulating robust innovations.

Twelve late lessons

Based on the case studies of Volume 1 of *Late lessons from early warnings* (EEA, 2001), twelve key lessons for better decision-making were drawn:

1	Acknowledge and respond to ignorance, as well as uncertainty and risk, in technology appraisal and public policymaking
2	Provide adequate long-term environmental and health monitoring and research into early warnings
3	Identify and work to reduce 'blind spots' and gaps in scientific knowledge
4	Identify and reduce interdisciplinary obstacles to learning
5	Ensure that real world conditions are adequately accounted for in regulatory appraisal
6	Systematically scrutinise the claimed justifications and benefits alongside the potential risks
7	Evaluate a range of alternative options for meeting needs alongside the option under appraisal, and promote more robust, diverse and adaptable technologies so as to minimise the costs of surprises and maximise the benefits of innovation
8	Ensure use of 'lay' and local knowledge, as well as relevant specialist expertise in the appraisal
9	Take full account of the assumptions and values of different social groups
10	Maintain the regulatory independence of interested parties while retaining an inclusive approach to information and opinion gathering
11	Identify and reduce institutional obstacles to learning and action
12	Avoid 'paralysis by analysis' by acting to reduce potential harm when there are reasonable grounds for concern

2 The precautionary principle and false alarms — lessons learned

Steffen Foss Hansen and Joel A. Tickner

Most of the cases examined in the *Late lessons from early warnings* reports are 'false negatives' — instances where early warnings existed but no preventive actions were taken. In debates surrounding the precautionary principle it is often claimed that widespread application of the principle will lead to a large number of regulatory false positives — over-regulation of minor risks and regulation of non-existent risks, often due to unwarranted public 'fears'. Understanding and learning from past false positives as well as false negatives is essential for improving decision-making about public health and the environment.

This chapter reviews incidents of 'false positives', where government regulation was undertaken based on precaution but later turned out to be unnecessary. In total 88 cases were identified to be alleged false positives, however, following a detailed analysis most of them turned out to be either real risks, or cases where 'the jury is still out', or unregulated alarms, or risk-risk trade-offs, rather than false positives.

The analysis revealed four regulatory false positives: US swine flu, saccharin, food irradiation, and Southern leaf corn blight. Numerous important lessons can be learned from each, although there are few parallels between them in terms of when and why each risk was falsely believed to be real. This is a lesson in itself: each risk is unique, as is the science and politics behind it and hence a flexible approach is therefore needed, adapted to the nature of the problem. The costs of the false positives identified were mainly economic, although the actions taken to address swine flu in 1976 did lead to some unintended deaths and human suffering, and diverted resources from other potentially serious health risks. Determining the net costs of mistaken regulatory action, however, requires a complete assessment of the impacts of the regulation, including the costs and benefits of using alternative technologies and approaches.

Overall, the analysis shows that fear of false positives is misplaced and should not be a rationale for avoiding precautionary actions where warranted. False positives are few and far between as compared to false negatives and carefully designed precautionary actions can stimulate innovation, even if the risk turns out not to be real or as serious as initially feared. There is a need for new approaches to characterising and preventing complex risks that move debate from the 'problem' sphere to the 'solutions' sphere. By learning from the lessons in this chapter, more effective preventive decisions can be made in the future.

The scarcity of genuine false positives compared to the large number of 'mistaken false positives' could partly be the result of a deliberate strategy in risk communication. Several references and leaked documents have shown that some regulated parties have consciously recruited reputable scientists, media experts and politicians to call on if their products are linked to a possible hazard. Manufacturing doubt, disregarding scientific evidence of risks and claiming over-regulation appear to be a deliberate strategy for some industry groups and think tanks to undermine precautionary decision-making.

3 Lead in petrol 'makes the mind give way'

Herbert Needleman and David Gee

This chapter addresses the widespread use of lead in petrol. It focuses on the period 1925–2005, when leaded petrol was first widely marketed in the US and then spread to the rest of the world before being gradually phased out from the 1970s. In Europe, the Aarhus Protocol (www.unece.org/env/pp/treatytext.html) initiated the phase-out of leaded petrol in the period 1998–2005.

The neurotoxic effects of lead were recognised as far back as Roman times. And in 1925, at the 'one day trial' of leaded petrol in the US, many experts warned of the likely health impacts of adding lead to petrol. Yet, despite the availability of an equally effective alcohol additive which was assessed by experts to be cleaner, the leaded route to fuel efficiency was chosen in the US and then exported to the rest of the world.

For several decades after the introduction of leaded petrol, virtually no independent research was carried out and the main source of information was industry and industry-sponsored researchers. Not until the 1960s and 1970s did independent scientists from outside this group show, for example, that body burdens of lead arising from human activities were not 'normal', as industry claimed, but were hundreds of times higher than before the industrial revolution and were therefore likely to be harmful.

At its peak in the mid-1970s, leaded petrol released about 200 000 tonnes of lead into the atmosphere annually in both the US and Europe. Following the subsequent phase-out, blood lead levels in children (the most sensitive group exposed) quickly fell, in line with the decrease in air concentrations. The lessons nevertheless remain relevant globally today. Although nearly all countries worldwide had phased out leaded petrol by 2012, lead concentrations in soils and sediments remain high. Meanwhile, electronic wastes containing lead and other contaminants also cause elevated blood lead levels.

Supplementary panel texts focus on the events leading up to the US choice of leaded petrol as the primary fuel source in 1925 and more recent accounts of EU policymaking on lead in petrol and the road to phase-outs in Germany and the United Kingdom.

4 Too much to swallow: PCE contamination of mains water

David Ozonoff

PCE (perchlorethylene, also known as 'perc' or tetrachloroethylene), was used in the production of plastic linings for drinking water distribution pipes in the late 1960s and 1970s. This new and relatively untested type of distribution pipe was used in over 700 miles of New England's water distribution systems. Not until 1976 was it discovered that PCE had been leaching into the water from the pipe lining, causing widespread contamination of water supplies that still today require continuous remediation.

Before the pipes were put into production there was a substantial amount of scientific information available about the potential hazards of PCE. This did not include current concerns about PCE's carcinogenicity, teratogenicity and other health consequences of relatively low-level exposure upper most among today's concerns, but many early warnings suggested the need for caution in introducing PCE-based mains pipe linings.

PCE had been used to treat hookworm and data on side effects were in the literature, while later a variety of occupational users were studied, including aircraft workers, small companies in countries where biological monitoring was required, and dry-cleaning firms. Several environmental studies were also conducted to see if drinking water contaminated with PCE or its close relative, TCE (trichloroethylene), was associated with cancer. Results were mixed and the chemical industry consistently denied that PCE was a human carcinogen.

This case study explores the early (pre 1970) history researching the toxicity of the chemical. It also focuses on the failure of one manufacturer, Johns-Manville Corporation, to recognise the warning signals about using a suspected toxic substance. It examines why a new product was deployed without thought to the public health consequences and why evidence of the potential hazard was ignored.

The science has not been hidden. It has been ineffective in guiding and catalysing action. Whether the problem is a failed duty of care or a lack of clarity about what evidence will trigger action, the contemporary argument over how to interpret the scientific evidence is irresolvable within science itself. There are no overarching criteria from the philosophy of science that can dictate a solution.

This chapter also includes two supplementary texts. A panel that analyses the differences between the conclusions of risk assessments based on the same data, focusing in particular on assessments of PCE and TCE. A further panel describes the opportunities to switch to wet-cleaning technologies to reduce the current use of PCE in dry cleaning.

5 Minamata disease: a challenge for democracy and justice

Takashi Yorifuji, Toshihide Tsuda and Masazumi Harada

Minamata disease, which can induce lethal or severely debilitating mental and physical effects, was caused by methylmercury-contaminated effluent released into Minamata Bay by Chisso, Japan's largest chemical manufacturer. It resulted in widespread suffering among those who unknowingly ate the contaminated fish. This chapter documents the story in three phases.

The disease first came to prominence in the 1950s. It was officially identified in 1956 and attributed to factory effluent but the government took no action to stop contamination or prohibit fish consumption. Chisso knew it was discharging methylmercury and could have known that it was the likely active factor but it chose not to collaborate and actively hindered research. The government concurred, prioritising industrial growth over public health. In 1968 Chisso stopped using the process that caused methylmercury pollution and the Japanese government then conceded that methylmercury was the etiologic agent of Minamata disease.

The second part of the story addresses the discovery that methylmercury is transferred across the placenta to affect the development of unborn children, resulting in serious mental and physical problems in later life. Experts missed this at first because of a medical consensus that such transfer across the placenta was impossible.

The third phase focuses on the battle for compensation. Initially, Chisso gave token 'sympathy money' under very limited criteria. In 1971 the Japanese government adopted a more generous approach but after claims and costs soared a more restrictive definition was introduced in 1977, justified by controversial 'expert opinions'. Legal victories for the victims subsequently made the government's position untenable and a political solution was reached in 1995–1996. In 2003, the 'expert opinions' were shown to be flawed and the Supreme Court declared the definition invalid in 2004.

In September 2011 there were 2 273 officially recognised patients. Still, the continuing failure to investigate which areas and communities were affected means that the financial settlement's geographic and temporal scope is still not properly determined. Alongside deep-seated issues with respect to transparency in decision-making and information sharing, this indicates that Japan still faces a fundamental democratic deficit in its handling of manmade disasters.

This chapter is followed by three short updates on the effects of mercury poisoning since Minamata; on attempts to contain it, including the 2009 global agreement to phase mercury out of economic activity; and on the need for better information about contaminant exposures to enable policymakers to make informed choices that balance the benefits of fish consumption against the assumed adverse effects of low-level methylmercury exposures.

6 Beryllium's 'public relations problem'

David Michaels and Celeste Monforton

Scores of workers employed in nuclear weapons production have been diagnosed with chronic beryllium disease (CBD), a progressive and irreversible inflammatory lung disease. This chapter presents a history of knowledge and public policy about preventing beryllium-related disease, focusing primarily on the United States beryllium industry's role in shaping US regulatory policy.

Over several decades increasingly compelling evidence accumulated that CBD was associated with beryllium exposure at levels below the existing regulatory standard. The beryllium industry had a strong financial incentive to challenge the data and decided to be proactive in shaping interpretation of scientific literature on beryllium's health effects. It hired public relations and 'product defence' consulting firms to refute evidence that the standard was inadequate. When the scientific evidence became so great that it was no longer credible to deny that workers developed CBD at permitted exposure levels, the beryllium industry responded with a new rationale to delay promulgation of a new, more protective exposure limit.

This case study underscores the importance of considering the hazards from toxic materials throughout the entire product life cycle. While primary producers of beryllium products may be able to control exposures in their own facilities, it is unlikely that many secondary users and recyclers have the expertise, resources and knowledge necessary to prevent beryllium disease in exposed workers and residents in nearby communities.

The primary lessons of this chapter are widely applicable to many environmental health controversies. In particular, it illustrates the practice of 'manufacturing uncertainty' — a strategy used by some polluters and manufacturers of hazardous products to prevent or delay regulation or victim compensation.

This chapter is followed by an analysis of the rationale for corporate behaviour in the regulation of beryllium. It is argued that the availability of occasional and limited opportunities for companies to change course without suffering onerous consequences would encourage them to rethink their position and create an obligation on shareholders to take the responsible course. Although this may be perceived as letting them 'get away with it', the end result may be better public policy and corporate responsibility.

7 Tobacco industry manipulation of research

Lisa A. Bero

This chapter differs in some ways from the others in Volume 2 of *Late lessons from early warnings*. The history of 'second hand', 'passive' or 'environmental tobacco smoke' (ETS), to which non-smokers are exposed overlaps with the history of active smoking. Those affected include the partners and children of smokers, and the bartenders and other workers who have to work in smoky environments.

The focus in this chapter is on the strategies used by the tobacco industry to deny, downplay, distort and dismiss the growing evidence that, like active smoking, ETS causes lung cancer and other effects in non-smokers. It does not address the history of scientific knowledge about tobacco and how it was used or not used to reduce lung cancer and other harmful effects of tobacco smoke. There is much literature on this and a table at the end of the chapter summarises the main dates in the evolution of knowledge in this area.

The chapter concentrates on the 'argumentation' that was used to accept, or reject, the growing scientific evidence of harm. Who generated and financed the science used to refute data on adverse health effects? What were the motivations? What kind of science and information, tools and assumptions were used to refute data on the adverse health of tobacco?

The release of millions of internal tobacco industry documents due to law suits in the US has given insights into the inner workings of the tobacco industry and revealed their previously hidden involvement in manipulating research. However, this insight is not available for most corporate sectors. The chapter discusses the possibilities of 'full disclosure' of funding sources and special interests in research and risk assessment in order to secure independence and prevent bias towards particular viewpoints.

While smoking bans are now being introduced in more and more countries, other industries are drawing inspiration from tobacco company strategies, seeking to maintain doubt about harm in order to keep hazardous products in the marketplace.

The chapter also includes a summary of the tobacco industry's role in shaping risk assessment in the US and Europe to serve its own interests.

8 Vinyl chloride: a saga of secrecy

Morando Soffritti, Jennifer Beth Sass, Barry Castleman and David Gee

This chapter is about how early warnings in the 1950s and 1960s concerning the short-term harm of vinyl chloride (VC) to the skin and bones of workers, and to the livers of laboratory animals, were initially hidden from other workers and regulators. This was despite some early misgivings by company experts whose advice was initially ignored by their employers. This pattern was repeated when the later, more devastating news of a rare liver cancer in workers was revealed by long-term animal studies and by an attentive and concerned company physician.

Unlike many other histories, however, this story features a very prompt response from the global chemical industry to the publication of the liver cancer evidence, a response that included funding cancer testing and later compliance with a large reduction in the permissible exposure limits. The case also provides early evidence of reproductive effects of vinyl chloride monomer (VCM).

Other features of this story presage the later and common responses of the corporate world to heightened public awareness and pressure from non-governmental organisations (NGOs) and trade unions, including greatly exaggerated estimates of the likely costs of complying with tighter pollution controls; a frequent mismatch between the position of the trade association and that of many, more progressive companies within the association; but also some relatively quick corporate responses to public, NGO and regulatory pressure.

The chapter also features two legal aspects, which, though more common in the US, are also valuable for Europeans. First, the potentially positive role that judicial review of regulatory proposals can play in providing a societal judgement about the behaviour of corporations. This can embrace not just moral judgements but also judgements about the state of the science and what society should do with it.

Second, the role that document discovery in legal compensation cases can play in revealing the real and until then secret activities of corporations. Any proposals to promote justice for victims of environmental and health harms via no fault administrative arrangements need to be accompanied by other measures to extract information about corporate behaviour.

The chapter is followed by a panel analysing the value of animal testing for identifying carcinogens.

9 The pesticide DBCP and male infertility

Eula Bingham and Celeste Monforton

Dibromochloropropane (DBCP) is a pesticide used against nematodes (roundworms or threadworms) that damage pineapples, bananas and other tropical fruits. It was introduced into US agriculture in 1955 and approved for use as a fumigant in 1964. By 1961 laboratory experiments had shown that it made the testicles of rodents shrink and significantly reduced the quantity and quality of sperm. Nonetheless, the compound was widely marketed and became a commercial success.

In 1977, workers at a production plant became worried that they were unable to father children. An emergency study by a US government agency discovered that in many cases the workers were suffering from deficient or absent sperm. While controls were improved at US facilities, the product continued to be marketed and sprayed in Latin America, the Philippines, some African countries, and elsewhere.

By the 1990s, tens of thousands of plantation workers in these countries had allegedly suffered adverse reproductive effects from DBCP use.

The story continues today with contentious legal claims for compensation, contamination of drinking water and industry attempts to prevent a Swedish documentary on the issue from being screened.

This chapter looks at the knowledge available about the hazards and the actions taken, or not taken, to avert them. The DBCP story is significant as it is the first clear example of reproductive damage to workers who manufactured and used a synthetic chemical. This is one of many examples supporting the growing concerns about increasing rates of reproductive and developmental disease, and about the endocrine disrupting chemicals that seem to be playing a role in these disorders.

Protecting production workers, users, consumers and the environment from chemicals that may damage reproduction demands closer integration of scientific disciplines, as well as government action. The lessons of DBCP may help in ensuring timely protection from harm, based on precautionary approaches to scientific evidence.

10 Bisphenol A: contested science, divergent safety evaluations

Andreas Gies and Ana M. Soto

Bisphenol A (BPA) is currently one of the world's best-selling chemicals and primarily used to make polycarbonate plastics. It is widely used in common products such as baby bottles, household electronics, medical devices and coatings on food containers. BPA is known to mimic the female hormone oestrogen and has been found to leach from the materials where it is used.

Studies have suggested that even exposure to low doses of BPA may cause endocrine disrupting effects. As with other hormones, it appears that an organism is most sensitive during development but that effects are often not observed until much later in the lifecycle. This means that at the time when the effects become detectable, the chemical exposure has vanished. This makes it extremely difficult to link exposure to effects in humans.

This chapter maps some of the findings in studies of rodents and humans. It also discusses the challenges of evaluating scientific findings in a field where industry-sponsored studies and independent scientific research seem to deviate strongly. The authors offer suggestions for ways to uncouple financial interests from scientific research and testing.

A widely used and dispersed industrial chemical like Bisphenol A is a controversial example of an endocrine disrupting substance that has implications for policymakers. Different approaches to risk assessment for BPA by US and European authorities are presented. It throws light on the ways in which similar evidence is evaluated differently in different risk assessments and presents challenges for applying the precautionary principle.

The intense discussion and scientific work on BPA have slowly contributed to a process of improving test strategies. While traditional toxicology has relied on a monotonic increasing dose-response relationship as evidence that the effect is caused by the test agent, studies on BPA and other endocrine disruptor chemicals (EDCs) have demonstrated the limitations of this approach and adjustments have been made in some cases.

It has also been widely accepted that effects cannot be predicted by simply thinking of BPA as a weak oestrogen and extrapolating from what is observed for more potent endogenous oestrogens. This lesson is particularly evident in the intense pharmaceutical interest in selective oestrogen response modifiers (SERMs).

The chapter is followed by a panel analysing the value of animal testing for identifying carcinogens.

11 DDT: fifty years since *Silent Spring*

Henk Bouwman, Riana Bornman, Henk van den Berg and Henrik Kylin

'There was a strange stillness. The birds for example — where had they gone? Many people spoke about them, puzzled and disturbed. The feeding stations in the backyards were deserted. The few birds seen anywhere were moribund: they trembled violently and could not fly. It was a spring without voices ... only silence lay over the fields and woods and marsh.'

The book *Silent Spring* by Rachel Carson is mainly about the impacts of chemicals (in particular dichlorodiphenyltrichlorethane also known as DDT) on the environment and human health. Indeed, the close association between humans and birds remains very apt. Representing the only two warm-blooded groups of life on Earth, mammals and birds share the same environments and threats.

Carson's claim that she lived in 'an era dominated by industry, in which the right to make a dollar at whatever cost is seldom challenged' still resonates strongly with the problems that societies face all over the world. One chapter heading, 'The obligation to endure', derived from the French biologist and philosopher Jean Rostand's famous observation that, 'the obligation to endure gives us the right to know'. United States President John F. Kennedy responded to the challenge posed by Carson by investigating DDT, leading to its complete ban in the US. The ban was followed by a range of institutions and regulations concerned with environmental issues in the US and elsewhere, driven by public demand for knowledge and protection.

DDT was the primary tool used in the first global malaria eradication programme during the 1950s and 1960s. The insecticide is sprayed on the inner walls and ceilings of houses. Malaria has been successfully eliminated from many regions but remains endemic in large parts of the world. DDT remains one of the 12 insecticides — and the only organochlorine compound — currently recommended by the World Health Organization (WHO), and under the Stockholm Convention on Persistent Organic Pollutants, countries may continue to use DDT. Global annual use of DDT for disease vector control is estimated at more than 5 000 tonnes.

It is clear that the social conscience awakened by Rachel Carson 50 years ago gave momentum to a groundswell of actions and interventions that are slowly but steadily making inroads at myriad levels. Chapter 17 of her book, 'The other road' reminds the reader of the opportunities that should have been seized much earlier. With more than 10 % of bird species worldwide now threatened in one way or another, it is clear that we missed early warnings or failed to act on them. Will we continue to miss signposts to 'other roads'? Are our obligations to endure met by our rights to know? As Carson said 50 years ago: 'The choice, after all, is ours to make.'

12 Booster biocide antifoulants: is history repeating itself?

Andrew R. G. Price and James W. Readman

Tributyltin (TBT) was widely used as an effective antifouling agent in paints for ships and boats until the European Community restricted its use in 1989 because of its proven harm to the environment and shellfisheries. Thereafter, booster biocides were introduced to enhance the performance of antifouling paints. They were believed to be less damaging to aquatic life than TBT. Subsequently, however, it has been established that booster biocides can also create significant environmental risks.

This chapter outlines the background to booster biocide use, the early warnings about their potential physiological and ecological impacts on non-target species, and the actions taken in response. The science that set some alarm bells ringing is described, along with lessons that could influence the future of an industry still searching for less environmentally invasive solutions.

Booster biocide antifouling agents threaten a variety of habitats — from coral reefs and seagrass beds to open moorings — within the EU and globally. Their primarily herbicidal properties mean that coral zooxanthellae, phytoplankton and periphyton are particularly vulnerable. Compared to TBT, an antifouling agent with a quite specific action, booster biocides have more broad-spectrum impacts. The wider ecological effect of shifting to booster biocides remain poorly understood but of considerable concern because they may affect the base of marine food chains.

From a toxicological viewpoint, booster biocides do not threaten to have endocrine disrupting properties similar to TBTs. At current environmental concentrations, however, some can damage primary producers and some are persistent. While legislation has been introduced to control their use, the rigour of regulations varies between countries. These geographical disparities need to be addressed, and future biocidal products and novel approaches to antifouling should be better appraised.

For policymakers, the challenge is to protect non-target biological communities from selective change resulting from booster biocide use. Persistence, bioaccumulative and toxic (PBT) criteria can be used to evaluate the relative potential impact from the available biocides, and consequently target appropriate legislation. Nevertheless, lateral thinking, aiming to identify novel materials and strategies to address antifouling, could pay dividends in the future.

13 Ethinyl oestradiol in the aquatic environment

Susan Jobling and Richard Owen

Many decades of research have shown that when released to the environment, a group of hormones known as oestrogens, both synthetic and naturally occurring, can have serious impacts on wildlife. This includes the development of intersex characteristics in male fish, which diminishes fertility and fecundity. Although often sublethal, such impacts may be permanent and irreversible.

This chapter describes the scientific evidence and regulatory debates concerning one of these oestrogens, ethinyloestradiol (EE2), an active ingredient in the birth control pill. First developed in 1938, it is released to the aquatic environment via wastewater treatment plants. Although it is now clear that wildlife species are exposed to and impacted by a cocktail of endocrine disrupting chemicals, there is also reasonable scientific certainty that EE2 plays a significant role, and at vanishingly low levels in the environment.

In 2004 the Environment Agency of England and Wales accepted this, judging the evidence sufficient to warrant consideration of risk management. In 2012, nearly 75 years after its synthesis, the European Commission proposed to regulate EE2 as a EU-wide 'priority substance' under the Water Framework Directive (the primary legislation for protecting and conserving European water bodies). This proposal was subsequently amended, delaying any decision on a regulatory 'environmental quality standard' until at least 2016.

This is in part because control of EE2 will come at a significant price. Complying with proposed regulatory limits in the environment means removing very low (part per trillion) levels of EE2 from wastewater effluents at considerable expense.

Is this a price we are willing to pay? Or will the price of precautionary action be simply too high — a pill too bitter to swallow? To what extent is society, which has enjoyed decades of flexible fertility and will also ultimately pay for the control and management of its unintended consequences, involved in this decision? And what could this mean for the many thousands of other pharmaceuticals that ubiquitously infiltrate our environment and which could have sublethal effects on aquatic animals at similarly low levels?

14 Climate change: science and the precautionary principle

Hartmut Grassl and Bert Metz

The first scientifically credible early warning about the possible dangers of climate change due to carbon dioxide (CO_2) emissions from burning fossil fuels came in 1897. While the basic physical principles of global warming are simple, however, the more detailed science of climate change is exceedingly complicated. Even now, more than a hundred years since the first early warning, many important details of climate change cannot be predicted with certainty. It is therefore unsurprising that the science of climate change and questions about the true value of burning fossil fuels have fostered sustained scientific and political controversy.

When the first volume of *Late lessons from early warnings* was drafted there appeared to be too much legitimate controversy about climate change for the issue to be included. A case study could have led to arguments that distracted attention from the valuable and robust lessons from more established issues such as asbestos, polychlorinated biphenyls (PCBs), chlorofluorocarbons (CFCs) and the ozone-hole, X-rays and acid rain. This decision was taken despite the then widespread acceptance that 'the balance of evidence suggests a discernible human influence on global climate' (*Contribution of Working Group I to the Second Assessment Report of the Intergovernmental Panel on Climate Change*, IPCC, 1995).

Over a decade later and after two more reviews by the Intergovernmental Panel on Climate Change (IPCC) of a much greater volume of climate change science it seemed appropriate to include climate change in this volume, despite some continuing controversy. The evidence that human activities are having a dangerous impact on the climate has strengthened since 1995. By 2007, the IPCC was able to conclude with 'very high confidence that the global net effect of human activities since 1750 has been one of warming'. Given the size and irreversibility (on human time scales) of many of the harmful effects of human-induced climate change, there is an urgent need for action to reduce CO_2 emissions and other greenhouse gases. Some contrarian views persist, however, as the authors illustrate.

This chapter summarises the history of growing knowledge about human-induced climate change and of the main actions, or inactions that accompanied it. Like many other chapters, it reflects the lifelong commitment of both authors to trying to understand and mitigate the effects of human-induced climate change. It concludes with some lessons and insights that are relevant to many other environmental and health issues.

Also included is a panel text describing how the IPCC's approach to assessing uncertainty evolved between its first to its fifth assessment reports.

15 Floods: lessons about early warning systems

Zbigniew W. Kundzewicz

Floods are an increasingly acute problem. Intense precipitation has become more frequent and more intense, growing manmade pressure has increased the magnitude of floods that result from any level of precipitation, and flawed decisions about the location of human infrastructure have increased the flood loss potential.

Unlike most other case studies presented in this report, this chapter focuses on flooding as a phenomenon and the requirements for effective early warning systems, rather than addressing a particular event and the lessons that can be learned.

Flooding cannot be wholly prevented. The occurrence of a flood need not be considered a 'failure' and, conversely, minimisation of losses may constitute a 'success'. There are lessons to be learned from every flood and it is important to use them in preparing for the next flood. Once we accept that no flood protection measures can guarantee complete safety, a general change of paradigm is needed to reduce human vulnerability to floods. The attitude of 'living with floods' and accommodating them in planning seems more sustainable than hopelessly striving to eradicate them.

Flood forecasting and warning systems fail because links in the chain perform poorly or fail completely. A single weak point in a system that otherwise contains excellent components may render the overall system performance unsatisfactory. A successful system requires sufficient integration of components and collaboration and coordination between multiple institutions.

The chapter deals primarily with the challenges of fluvial (river) floods. It is complemented by three short supplementary texts. The first highlights the complex, dynamic and diverse ecosystems of river floodplains, which are often degraded during construction of flood defences. Despite their huge economic value, near-natural floodplains are among the most threatened ecosystems globally.

The second discusses uncertainties in anticipating rainfall patterns and intensity, and their relationship to flood levels during extreme flows. Such uncertainties present challenges for scientists and decision-makers alike.

The third addresses the increasing risks of coastal flooding due to factors such as climate change and sea-level rise, and reviews European experience with precautionary action.

16 Seed-dressing systemic insecticides and honeybees

Laura Maxim and Jeroen van der Sluijs

In 1994 French beekeepers began to report alarming signs. During summer, many honeybees did not return to the hives. Honeybees gathered close together in small groups on the ground or hovered, disoriented, in front of the hive and displayed abnormal foraging behaviour. These signs were accompanied by winter losses.

Evidence pointed to Bayer's seed-dressing systemic insecticide Gaucho®, which contains the active substance imidacloprid. This chapter presents the historical evolution of evidence on the risks of Gaucho® to honeybees in sunflower and maize seed-dressing in France, and analyses the actions in response to the accumulating evidence regarding these risks.

The social processes that ultimately lead to application of the precautionary principle for the ban of Gaucho® in sunflower and maize seed-dressing are described, with a focus on the ways in which scientific findings were used by stakeholders and decision-makers to influence policy during the controversy.

Public scientists were in a difficult position in this case. The results of their work were central to a social debate with high economic and political stakes. In certain cases their work was not judged according to its scientific merit but based on whether or not it supported the positions of some stakeholders. This situation tested the ability and courage of researchers to withstand pressure and continue working on imidacloprid.

Other European countries also suspended neonicotinoid seed-dressing insecticides. Evidence of the toxicity of neonicotinoids present in the dust emitted during sowing of coated seeds supported such decisions. Most important, the French case highlighted the major weaknesses of regulatory risk assessment and marketing authorisation of pesticides, and particularly neonicotinoids. These insights were recently confirmed by work by the European Food Safety Authority.

From this case study eight lessons are drawn about governance of controversies related to chemical risks. The study is followed by two additional texts. A first panel presents Bayer Crop Science's comments on the analysis in this chapter. A second contains the authors' response to the Bayer comments.

17 Ecosystems and managing the dynamics of change

Jacqueline McGlade and Sybille van den Hove

A decade after Rachel Carson's *Silent Spring* was published, describing the toxic legacy of the twentieth century, Annie Dillard in her Pulitzer prize winning book *Pilgrim at Tinker Creek*, opened up a different way of looking at the world. It presaged a twenty first century in which the global economy would be based on a more thorough understanding of nature, its functioning and material wealth. Wholly descriptive, yet increasingly relevant, her book captured the very essence of what this chapter is about: that amongst the observations which routinely help to predict the evolution of the natural world are the seeds of surprise — surprise of the unusual and surprise as a portent of future change. Our systemic failure to anticipate such surprises forms the core of this chapter. A series of case studies from fisheries, forests, savannah and aquatic systems are used to underline how early warnings about changes in these natural systems emerged but were not used.

The chapter highlights how the division of knowledge into political, disciplinary and geographic silos has led to the 'recurring nightmares' of short-term interests outcompeting long-term vision; situations where competition replaces co-operation; fragmentation of values and interest; fragmentation of authority and responsibility; and fragmentation of information and knowledge leading to inadequate solutions or even additional problems. In addition, the lack of institutional fit has often confounded the effectiveness of the stewardship of ecosystem services, and led to unexpected surprises, excessive rent seeking and high transaction costs.

Using counterfactual thinking (i.e. the dependence of *whether, when* and *how* one event occurs on *whether, when* and *how* another event occurs and the possible alteration of events), built around the four interconnected concepts of *planetary boundaries, tipping points, panarchy* and *resilience*, the chapter provides an analytical lens through which to explore why many of the warning signals were not seen. The chapter concludes by suggesting why ecosystems are likely to be even more at risk in the future and why we will need to observe and interpret the dynamics of both nature and institutions ever more closely if we are to avoid sudden irreversible ecological changes.

18 Late lessons from Chernobyl, early warnings from Fukushima

Paul Dorfman, Aleksandra Fucic and Stephen Thomas

The nuclear accident at Fukushima in Japan occurred almost exactly 25 years after the Chernobyl nuclear accident in 1986. Analysis of each provides valuable late and early lessons that could prove helpful to decision-makers and the public as plans are made to meet the energy demands of the coming decades while responding to the growing environmental costs of climate change and the need to ensure energy security in a politically unstable world.

This chapter explores some key aspects of the Chernobyl and Fukushima accidents, the radiation releases, their effects and their implications for any construction of new nuclear plants in Europe. There are also lessons to be learned about nuclear construction costs, liabilities, future investments and risk assessment of foreseeable and unexpected events that affect people and the environment.

Since health consequences may start to arise from the Fukushima accident and be documented over the next 5–40 years, a key lesson to be learned concerns the multifactorial nature of the event. In planning future radiation protection, preventive measures and bio-monitoring of exposed populations, it will be of great importance to integrate the available data on both cancer and non-cancer diseases following overexposure to ionising radiation; adopt a complex approach to interpreting data, considering the impacts of age, gender and geographical dispersion of affected individuals; and integrate the evaluation of latency periods between exposure and disease diagnosis development for each cancer type.

Given the degree of uncertainty and complexity attached to even the most tightly framed and rigorous nuclear risk assessment, attempts to weight the magnitude of accident by the expected probability of occurrence have proven problematic, since these essentially theoretical calculations can only be based on sets of pre-conditioning assumptions. This is not an arcane philosophical point but rather a very practical issue with significant implications for the proper management of nuclear risk. With its failure to plan for the cascade of unexpected beyond design-base accidents, the regulatory emphasis on risk-based probabilistic assessment has proven very limited. An urgent reappraisal of this approach and its real-life application seems overdue.

Whatever one's view of the risks and benefits of nuclear energy, it is clear that the possibility of catastrophic accidents and consequent economic liabilities must be factored into the policy and regulatory decision-making process. In the context of current collective knowledge on nuclear risks, planned pan-European liability regimes will need significant re-evaluation.

19 Hungry for innovation: from GM crops to agroecology

David A. Quist, Jack A. Heinemann, Anne I. Myhr, Iulie Aslaksen and Silvio Funtowicz

Innovation's potential to deliver food security and solve other agriculture-related problems is high on the agenda of virtually all nations. This chapter looks at two different examples of food and agricultural innovation: genetically modified (GM) crops and agroecological methods, which illustrate how different innovation strategies affect future agricultural and social options.

GM crops are well suited to high-input monoculture agricultural systems that are highly productive but largely unsustainable in their reliance on external, non-renewable inputs. Intellectual property rights granted for GM crops often close down, rather than open up further innovation potential, and stifle investment into a broader diversity of innovations allowing a greater distribution of their benefits.

Science-based agroecological methods are participatory in nature and designed to fit within the dynamics underpinning the multifunctional role of agriculture in producing food, enhancing biodiversity and ecoystem services, and providing security to communities. They are better suited to agricultural systems that aim to deliver sustainable food security than high external input approaches. They do, however, require a broader range of incentives and supportive frameworks to succeed. Both approaches raise the issue of the governance of innovation within agriculture and more generally within societies.

The chapter explores the consequences of a 'top-down transfer of technology' approach in addressing the needs of poor farmers. Here innovation is often framed in terms of economic growth in a competitive global economy, a focus that may conflict with efforts to reduce or reverse environmental damage caused by existing models of agriculture, or even deter investment into socially responsible innovation.

Another option explored is a 'bottom-up' approach, using and building upon resources already available: local people, their knowledge, needs, aspirations and indigenous natural resources. The bottom-up approach may also involve the public as a key actor in decisions about the design of food systems, particularly as it relates to food quality, health, and social and environmental sustainability.

Options are presented for how best to answer consumer calls for food quality, sustainability and social equity in a wide sense, while responding to health and environmental concerns and securing livelihoods in local small-scale agriculture. If we fail to address the governance of innovation in food, fibre and fuel production now, then current indications are that we will design agriculture to fail.

20 Invasive alien species: a growing but neglected threat?

Sarah Brunel, Eladio Fernández-Galiano, Piero Genovesi, Vernon H. Heywood, Christoph Kueffer and David M. Richardson

Biological invasions are one of the five major causes of biodiversity loss as global human travel and trade have moved, and continue to move, thousands of species between and across continents. Some species of alien origin have a high probability of unrestrained growth which can ultimately lead to environmental damage.

An alien species — animal, plant or microorganism — is one that has been introduced, as a result of human activity, either accidentally or deliberately, to an area it could not have reached on its own. A common definition of the term 'invasive' focuses on its (negative) impact, while other definitions consider only rate of spread and exclude considerations of impact.

Despite the growing amount of legislation being adopted at the global scale, biological invasions continue to grow at a rapid rate, with no indication yet of any saturation effect. Decision-making in this area is very challenging. The overall complexity of the problem, its interdisciplinarity, the scientific uncertainties and the large number of stakeholders that need to be informed and involved, together demand governance actions that are difficult to see emerging at the regional scale (as in the EU), let alone globally.

It is widely agreed that preventing biological invasions or tackling them at a very early stage is the most efficient and cost-effective approach. Harmless species can be confused with harmful invasive species, however, leading to a waste of resources. Even more seriously, harmful invaders can be mistaken for innocuous species — so-called 'invaders in disguise' — and no appropriate action may be taken to counter the threats they pose.

Even with a very good risk assessment system, new outbreaks of invasive alien species could still occur, necessitating a system of rapid early warning and effective eradication response. The decision on where to draw the line on the acceptable environmental risks versus the introduction of new species or new communities that may carry invasive alien species then becomes a value judgement.

There is lively debate within the scientific community regarding the most appropriate strategies for managing invasive alien species. Governments and institutions charged with making decisions have access to considerable knowledge on the topic, but the lack of rules of interactions between multiple parties regularly thwarts effective decision-making.

21 Mobile phones and brain tumour risk: early warnings, early actions?

Lennart Hardell, Michael Carlberg and David Gee

In 2011 the World Health Organization's International Agency for Research on Cancer (IARC) categorised the radiation fields from mobile phones and other devices that emit similar non-ionizing electromagnetic fields (EMFs), as a Group 2B i.e. 'possible' human carcinogen. Nine years earlier IARC gave the same classification to the magnetic fields from overhead electric power lines.

The IARC decision on mobile phones was principally based on two sets of case-control human studies of possible links between mobile phone use and brain tumours: the IARC Interphone study and the Hardell group studies from Sweden. Both provided complementary and generally mutually supportive results. This chapter gives an account of the studies by these two groups — and others coming to different conclusions — as well as reviews and discussions leading up to the IARC decision in 2011. The chapter also describes how different groups have interpreted the authoritative IARC evaluation very differently.

There are by now several meta-analyses and reviews on mobile phones and brain tumours, which describe the challenges of doing epidemiology on this issue, the methodological limitations of the major studies published so far and the difficulties of interpreting their results.

It has been suggested that national incidence data on brain tumours could be used to qualify or disqualify the association between mobile phones and brain tumours observed in the case-control studies. However, in addition to methodological shortcomings, there might be other factors that influence the overall incidence rate such as changes in exposure to other risk factors for brain tumours that are unknown in descriptive studies. Cancer incidence depends on initiation, promotion and progression of the disease. As the mechanism for radiofrequency electromagnetic fields carcinogenesis is unclear, it supports the view that descriptive data on brain tumour incidence is of limited value.

The chapter points to mobile phone industry inertia in considering the various studies and taking the IARC carcinogenic classification into account and a failings from the media in providing the public with robust and consistent information on potential health risks. The IARC carcinogenic classification also appears not to have had any significant impact on governments' perceptions of their responsibilities to protect public health from this widespread source of radiation.

The benefits of mobile telecommunications are many but such benefits need to be accompanied by consideration of the possibility of widespread harms. Precautionary actions now to reduce head exposures would limit the size and seriousness of any brain tumour risk that may exist. Reducing exposures may also help to reduce the other possible harms that are not considered in this case study.

Evidence is increasing that workers with heavy long-term use of wireless phones who develop glioma or acoustic neuroma should be compensated. The first case in the world was established on 12 October 2012. The Italian Supreme Court affirmed a previous ruling that the Insurance Body for Work (INAIL) must grant worker's compensation to a businessman who had used wireless phones for 12 years and developed a neuroma in the brain.

22 Nanotechnology — early lessons from early warnings

Steffen Foss Hansen, Andrew Maynard, Anders Baun, Joel A. Tickner and Diana M. Bowman

Nanotechnology is the latest in a long series of technologies heralded as ushering in a new era of technology-driven prosperity. Current and future applications of nanotechnology are expected to lead to substantial societal and environmental benefits, increasing economic development and employment, generating better materials at lower environmental costs, and offering new ways to diagnose and treat medical conditions. Nevertheless, as new materials based on nanoscale engineering move from the lab to the marketplace, have we learnt the lessons of past 'wonder technologies' or are we destined to repeat past mistakes?

This chapter first introduces nanotechnology, clarifies the terminology of nanomaterials and describes current uses of these unique materials. Some of the early warning signs of possible adverse impacts of some nanomaterials are summarised, along with regulatory responses of some governments. Inspired by the EEA's first volume of *Late lessons from early warnings*, the chapter looks critically at what lessons can already be learned, notwithstanding nanotechnology's immaturity.

Nanotechnology development has occurred in the absence of clear design rules for chemists and materials developers on how to integrate health, safety and environmental concerns into design. The emerging area of 'green nanotechnology' offers promise for the future with its focus on preventive design. To gain traction, however, it is important that research on the sustainability of materials is funded at levels significant enough to identify early warnings, and that regulatory systems provide incentives for safer and sustainable materials.

Political decision-makers have yet to address many of the shortcomings in legislation, research and development, and limitations in risk assessment, management and governance of nanotechnologies and other emerging technologies. As a result, there remains a developmental environment that hinders the adoption of precautionary yet socially and economically responsive strategies in the field of nanotechnology. If left unresolved, this could hamper society's ability to ensure responsible development of nanotechnologies.

23 Understanding and accounting for the costs of inaction

Mikael Skou Andersen and David Owain Clubb

In political decision-making processes, the burden of proof is often distributed such that policymakers only respond to early warning signals from environmental hazards once the costs of inaction have been estimated.

This chapter revisits some key environmental issues for which estimates of costs of inaction have been carefully developed over many years of research. The aim is to consider the methodological challenges involved in producing estimates that are credible and appropriate rather than present specific estimates for these costs.

The case studies also provide insights into how early warning signals might provide a basis for estimating the costs of inaction, when the science base is less consolidated. For example, the case of nitrates in drinking water illustrates that a precautionary approach to the costs of inaction is quite conceivable. The phase-out of ozone-depleting substances, where early-warning scientists successfully alerted the world to the damaging effects of chlorofluorocarbons (CFCs), provides another important case because additional impacts for global warming actually cause the costs of inaction to be considerably higher than initially believed. This is a reminder that figures for the costs of inaction have often been grossly underestimated.

Finally, in the case of air pollution, making use of different estimates for mortality risk avoidance will help decision-makers to see that there are higher- and lower-bound estimates for the costs of inaction. Even if the lower-bound estimates are perhaps too conservative, with a bias towards health effects, they will in many situations encourage more rather than less abatement effort. Reducing emission loads will also tend to bring relief for the intangible assets of biodiversity and nature.

Making the best use of environmental science and modelling helps to make environmental protection and precaution a priority. Producing cost estimates should not be left to economists alone, but should rather be seen as a starting point for a broader discussion, featuring also the relevant expertise in health, ecology, demography, modelling and science. Well researched estimates, based on interdisciplinary collaboration, can strengthen some of those scattered and diffuse interests, which during the ordinary processes of policy-making have difficulty making their voices heard.

24 Protecting early warners and late victims

Carl Cranor

Many *Late lessons from early warnings* chapters provide examples of early warning scientists who were harassed for bringing inconvenient truths about impending harm to the attention of the public and regulators. There is also some evidence that young scientists are being discouraged from entering controversial fields for fear of such harassment. In addition, where warnings have been ignored and damage has ensued, it has often proven difficult in the past to achieve prompt and fair compensation for the victims. Some ideas for reform, building on some current institutional models are explored here.

This chapter first explores the idea of extending whistleblowing laws to help encourage and protect early-warning scientists and others who identify evidence of impending harm. Complementary measures, such as greater involvement of professional societies and the use of recognition awards, as for example in Germany, could also be helpful.

Next, the chapter explores improved mechanisms for compensating victims of pollution and contamination. The chapter on the Minamata Bay disaster provides an extreme example of long delays in getting adequate compensation for the victims of methylmercury poisoning. It was almost fifty years, between 1956 and 2004, before the victims attained equitable levels of compensation and legal recognition of responsibility. Other case studies illustrate similar examples of long delays in receiving adequate compensation.

Options are examined for providing justice to any future victims of those emerging technologies such as nanotechnology, genetically modified crops and mobile phone use, which currently can provide broad public benefits but potentially at a cost to small groups of victims. The potential for widespread exposure and uncertain science could justify 'no-fault' administrative schemes that provide more efficient and equitable redress in situations where the benefit of scientific doubt would be given to victims. The use of anticipatory assurance bonds to help minimise and meet the costs of future environmental damage from large scale technologies is also explored.

A supplementary panel text describes cases of asbestos and mesothelioma, where the senior courts in the United Kingdom have developed innovative ways of dealing with both joint and several liability, and the foreseeability of subsequent asbestos cancers, after the initial recognition of the respiratory disease, asbestosis. Such legal developments in the field of personal injury could illustrate the future direction of long-tail liability in both environmental damage and personal injury.

25 Why did business not react with precaution to early warnings?

Marc Le Menestrel and Julian Rode

In the past, companies have frequently neglected early warning signals about potential hazards for human health or the environment associated with their products or operations. This chapter reviews and analyses relevant interdisciplinary literature and prominent case studies — in particular those documented in both volumes of *Late lessons from early warnings* — and identifies main factors responsible for the disregard of early warning signals.

The chapter shows how economic motives often drive non-precautionary business decisions. In virtually all reviewed cases it was perceived to be profitable for industries to continue using potentially harmful products or operations. However, decisions are also influenced by a complex mix of epistemological, regulatory, cultural and psychological aspects. For instance, characteristics of the research environment and the regulatory context can provide business actors with opportunities to enter into 'political actions' to deny or even suppress early warning signals. Also, business decision-makers face psychological barriers to awareness and acceptance of the conflicts of values and interests entailed by early warning signals. Cultural business context may further contribute to the denial of conflicts of values.

The chapter concludes with a set of reflections on how to support more precautionary business decision making. A prominent policy response to the conflicting interests of business and society is introducing regulations that attempt to steer business rationality towards internalising external effects. Innovative solutions such as assurance bonding should be considered.

There is a need to better understand and expose why business actors do not respond voluntarily to early warning signals with precautionary actions. Blaming business, in particular with hindsight, tends to be common reaction that may not always be constructive. It often misses the complex or even contradictory set of motives and drivers that business actors face.

Public institutions could support progressive business by analysing and publically disclosing the dilemmas and temptations entailed by early warning signals, for example for different industries and for the specific societal and regulatory context of decisions. Rigorous and explicit exposition of the dilemmas will create further incentives for responsible actors to share and communicate their precautionary responses.

An additional reflection centres on the role of political actions of business actors, in particular those actions aimed at suppressing early warning signals. Regulatory efforts that make the political actions of business more transparent can help to sustain a sound balance of power, thereby maintaining our ability to benefit from early warning signals and reducing the likelihood of health and environmental hazards.

26 Science for precautionary decision-making

Philippe Grandjean

The goals of academic researchers may differ from those of regulatory agencies responsible for protecting the environment. Thus, research must take into account issues such as feasibility, merit and institutional agendas, which may lead to inflexibility and inertia.

A large proportion of academic research on environmental hazards therefore seems to focus on a small number of well studied environmental chemicals, such as metals. Research on environmental hazards should therefore to a greater extent consider poorly known problems, especially the potential hazards about which new information is in particular need.

Misinterpretation may occur when results published in scientific journals are expressed in hedged language. For example, a study that fails to document with statistical significance the presence of a hazard is often said to be negative, and the results may be misinterpreted as evidence that a hazard is absent. Such erroneous conclusions are inspired by science traditions, which demand meticulous and repeated examination before a hypothesis can be said to be substantiated.

For prioritising needs for action, research should instead focus on identifying the possible magnitude of potential hazards. Research is always affected by uncertainties and many of them can blur a real association between an environmental hazard and its adverse effects, thereby resulting in an underestimated risk. Environmental health research therefore needs to address the following question: are we sufficiently confident that this exposure to a potential hazard leads to adverse effects serious enough to initiate transparent and democratic procedures to decide on appropriate intervention?

The choice of research topics must consider societal needs for information on poorly known and potentially dangerous risks. The research should be complementary and extend current knowledge, rather than being repetitive for verification purposes, as required by the traditional science paradigm. Research findings should be openly available and reported so that they inform judgments concerning the possible magnitude of suspected environmental hazards, thereby facilitating precautionary and timely decision-making.

27 More or less precaution?

David Gee

Despite its presence in a growing body of EU and national legislation and case law, the application of the precautionary principle has been strongly opposed by vested interests who perceive short term economic costs from its use. There is also intellectual resistance from scientists who fail to acknowledge that scientific ignorance and uncertainty, are excessively attached to conventional scientific paradigms, and who wait for very high strengths of evidence before accepting causal links between exposure to stressors and harm.

The chapter focuses on some of the key issues that are relevant to a more common understanding of the precautionary principle and to its wider application. These include different and confusing definitions of the precautionary principle and of related concepts such as prevention, risk, uncertainty, variability and ignorance; common myths about the meaning of the precautionary principle; different approaches to the handling of scientific complexity and uncertainty; and the use of different strengths of evidence for different purposes.

The context for applying the precautionary principle also involves considering the 'knowledge to ignorance' ratio for the agent in focus: the precautionary principle is particularly relevant where the ratio of knowledge to ignorance is low, as with emerging technologies.

A working definition of the precautionary principle is presented that aims to overcome some of the difficulties with other definitions, such as their use of triple negatives; a failure to address the context of use of the precautionary principle; no reference to the need for case specific strengths of evidence to justify precaution; and overly narrow interpretations of the pros and cons of action or inaction.

The chapter also points to the need for greater public engagement in the process of framing and decision-making about both upstream innovations and their downstream hazards, including the specification of the 'high level of protection' required by the EU treaty. A precautionary and participatory framework for risk analysis is proposed, along with some 'criteria for action' to complement criteria for causation.

The capacity to foresee and forestall disasters, especially when such action is opposed by powerful economic and political interests, appears to be limited, as the case studies in *Late lesson from early warnings* illustrate. The chapter argues that with more humility in the face of uncertainty, ignorance and complexity, and wider public engagement, societies could heed the lessons of past experience and use the precautionary principle, to anticipate and minimise many future hazards, whilst stimulating innovation. Such an approach would also encourage more participatory risk analysis; more realistic and transparent systems science; and more socially relevant and diverse innovations designed to meet the needs of people and ecosystems.

28 In conclusion

The first volume of *Late lessons from early warnings* highlighted the difficulties of balancing precaution with technological innovation and ended with a call to action for policymakers. How much progress has been made since then?

First, there is growing evidence that precautionary measures do not stifle innovation, but instead can encourage it, in particular when supported by smart regulation or well-designed tax changes. Not only has the body of knowledge become richer since 2001, but also the number of stakeholders involved in decision-making has become larger and more diverse. There has also been increasing attention to communicating scientific uncertainty, especially in the fields of climate change, food safety, and emerging risks.

However, there has been less progress in other areas: for example, many of the political and scientific 'bureaucratic silos' still remain, despite frequent calls for policy integration and inter-departmental coordination. This has led to the unintended destruction of stocks of natural capital in some parts of the world and in other instances, the global spread of technologies, despite warnings of impending hazards. The result has been widespread damage, with most polluters still not paying the full costs of pollution.

Yet, more encouragingly, new transformative approaches are emerging to manage the systemic and interconnected challenges the world faces e.g. economic/financial, climate/energy, ecosystems/food. These relate, inter alia, to the increasing use of digital communications and networking by consumers, citizens and shareholders to demand and foster increased participation, more social responsibility, greater levels of accountability and higher transparency, especially in determining future pathways for energy and food production. There is a greater understanding of the complexity of the environment, of scientific ignorance and uncertainties, the irreversibility of many harmful impacts and on the broader risks to the long term interests of society if political and financial institutions remain unchanged. Also some corporations are fundamentally embracing sustainable development objectives in their business models and activities.

The case studies across both volumes of *Late lessons from early warnings* cover a diverse range of chemical and technological innovations, and highlight a number of systemic problems. These include a lack of institutional and other mechanisms to respond to early warning signals; a lack of ways to correct market failures either caused by misleading market prices or where costs and risks to society and nature are not properly internalised; and the fact that key decisions on innovation pathways are made by those with vested interests and/or by a limited number of people on behalf of many. The insights and lessons drawn from the case histories certainly provide the seeds for some of the answers. They also provide knowledge for a series of key actions that are outlined below.

Of course, many questions remain. For example: how can the precautionary principle be used further to support decision-making in the face of uncertainties and the inevitable surprises that come from complex systems?; how can societies avoid a lack of 'perfect' knowledge being used as a justification for inaction in the face of 'plausible' evidence of serious harm?; how can conflicting interests be balanced during the phases of development and use?; and how can the benefits of products and technologies be more equitably distributed?

Reduce delays between early warnings and actions

The majority of the case studies in *Late lessons from early warnings* Volumes 1 and 2 illustrate that if the precautionary principle had been applied on the basis of early warnings, justified by 'reasonable grounds for concern' many lives would have been saved and much damage to ecosystems avoided. It is therefore very important that large scale emerging technologies, such as biotechnologies, nanotechnologies and information

and communication technologies, apply the precautionary principle based on the experiences and lessons learned from these and other case studies.

Precautionary actions can be seen to stimulate rather than hinder innovation; they certainly do not lead to excessive false alarms. As the analysis in Volume 2 shows, of 88 cases of claimed 'false positives', where hazards were wrongly regulated as potential risks, only four were genuine false alarms. The frequency and scale of harm from the mainly 'false negative' case studies indicate that shifting public policy towards avoiding harm, even at the cost of some false alarms, would seem to be worthwhile, given the asymmetrical costs of being wrong in terms of acting or not acting based on credible early warnings.

However, the speed and scale of today's technological innovations can inhibit timely action. This is often because by the time clear evidence of harm has been established, the technology has been modified, thereby allowing claims of safety to be subsequently re-asserted. Even where the technological change has been marginal, the large, often global, scale of investment can lead to widespread technological lock-in, which is then difficult and expensive to alter.

These features of current technological innovation strengthen the case for taking early warning signals more seriously and acting on lower strengths of evidence than those normally used to reach 'scientific causality'. Most of the historical case studies show that by the time such strong evidence of causality becomes available, the harm to people and ecosystems has become more diverse and widespread than when first identified, and may even have been caused by much lower exposures than those initially considered dangerous.

The case studies have also shown that there are many barriers to precautionary action, including: the short-term nature of most political and financial horizons; the existence of technological monopolies; the conservative nature of the sciences involved, including the separate 'silos' within which they operate; the power of some stakeholders; and the cultural and institutional circumstances of public policymaking that often favour the status quo.

Acknowledge complexity when dealing with multiple effects and thresholds

Increasing scientific knowledge has shown that the causal links between stressors and harm are more complex than was previously thought and this has practical consequences for minimising harm. Much of the harm described in Volumes 1 and 2, such as cancers or species decline, is caused by several co-causal factors acting either independently or together. For example, the reduction of intelligence in children can be linked to lead in petrol, mercury and polychlorinated biphenyls (PCBs) as well as to socio-economic factors; bee colony collapse can be linked to viruses, climate change and nicotinoid pesticides; and climate change itself is caused by many complex and inter-linked chemical and physical processes.

In some cases, such as foetal or fish exposures, it is the timing of the exposure to a stressor that causes the harm, not necessarily the amount; the harm may also be caused or exacerbated by other stressors acting in a particular timed sequence. In other cases, such as radiation and some chemicals such as bisphenol A (BPA), low exposures can be more harmful than high exposures; and in others, such as asbestos with tobacco, and some endocrine disrupting substances, the harmful effects of mixtures can be greater than from each separate stressor. There are also varying susceptibilities to the same stressors in different people, species and ecosystems, depending on pre-existing stress levels, genetics and epigenetics. This variation can lead to differences in thresholds or tipping point exposures, above which harm becomes apparent in some exposed groups or ecosystems but not others. Indeed there are some harmful effects which occur only at the level of the system, such as a bee colony, which cannot be predicted from analysing a single part of the system, such as an individual bee.

Our increased knowledge of complex biological and ecological systems has also revealed that certain harmful substances, such as polychlorinated biphenyls (PCBs) and dichlorodiphenyltrichlorethane (DDT) can move around the world via a range of biogeochemical and physical processes and then accumulate in organisms and ecosystems many thousands of kilometres away.

The practical implications of these observations are threefold. First, it is very difficult to establish very strong evidence that a single substance or stressor 'causes' harm to justify timely actions to avoid harm; in many cases only reasonable evidence of co-causality will be available. Second, a lack of consistency between research results is not a strong reason for dismissing possible causal links: inconsistency is to be expected from complexity. Third, while reducing harmful exposure to one co-causal factor may not necessarily lead to a large reduction in the overall harm caused by many other

factors, in some cases the removal of just one link in the chain of multi-causality could reduce much harm.

A more holistic and multi-disciplinary systems science is needed to analyse and manage the causal complexity of the systems in which we live.

Rethink and enrich environment and health research

Environment and health research overly focuses on well-known rather than unknown hazards at the expense of emerging issues and their potential impacts. For example the ten most well-known substances, such as lead and mercury, account for about half of all articles on chemical substances published in the main environmental journals over the last decade. Over the past decade, public research funding in the European Union on nanotechnology, biotechnology as well as Information and Communications Technology (ICT) is heavily biased towards product development with about 1 % being spent on their potential hazards. A more equal division of funding between known and emerging issues, and between products and their hazards, would enrich science and help avoid future harm to people and ecosystems and to the long term economic success of those technologies.

Funding more holistic systems science would also help achieve a greater integration among the different branches of science and counteract problems such as: peer review predominantly within and not across disciplines; short-term interests outcompeting long-term vision; competition replacing cooperation because of conflicts of interest; contradictions amongst paradigms; fragmentation of values and authority; as well as fragmentation of information and knowledge. These can all lead to inferior solutions and provide increased opportunities for those with vested interests to manufacture doubt.

Scientific methods can also be improved. For example, much higher strengths of evidence are required overall before causality is accepted, compared to the evidence being used to assert safety. The assertion that there is *no evidence of harm* is then often assumed to be *evidence of no harm*, even though the relevant research is missing. Historically there has been an over-reliance on the statistical significance of point estimates compared to confidence limits based on multiple sampling. There has also been a bias towards using models that grossly simplify reality rather than using long-term observations and trend data of biological and ecological systems. These approaches have sometimes led to the production of false positives. More importantly the governance of scientific ignorance and unknown unknowns has been neglected.

Finally, many case studies highlight the problems faced by early warning scientists who have been harassed for their pioneering work, including bans on speaking out or publishing, loss of funding, legal or other threats, and demotion. One obvious conclusion is that scientists in these situations should receive better protection either via an extension of 'whistle blowing' and discrimination laws, or by independent acknowledgement of the value of their work.

Improve the quality and value of risk assessments

The majority of the case studies in *Late lessons from early warnings* indicate that risk assessment approaches need to better embrace the realities of causal and systems complexity (rather than use a narrow conception of 'risk') with the inevitable features of ignorance, indeterminacy and contingency. In a number of case studies, for example BPA, where low doses are more harmful than high doses, or tributyltin antifoulants (TBT) and synthetic oestrogen diethylstilboestrol (DES) where the timing of the dose is what makes it harmful, simplistic assumptions are inadequate. Variability in exposures and varying susceptibilities in populations and species exposed also need to be more realistically factored into risk assessments.

This is equally true for technological risk assessments. As the Fukushima Investigation Committee concluded in 2011:

> '…the accidents present us with crucial lessons on how we should be prepared for 'incidents beyond assumptions'. With its failure to plan for the cascade effects beyond design–base accidents 'the regulatory emphasis on risk based probabilistic risk assessment has proven very limited'.

In other words, narrow risk assessment approaches are now outstripped by the realities which they cannot address, recognise and communicate. Too often this contributes to the effective denial of those risks that do not fit the risk assessment frame. It is therefore urgent that risk assessment practices

be transformed to make them broader-based, more inclusive, transparent and accountable. There should also be more communication on the diversity of scientific views, especially on emerging issues where ignorance and uncertainties are high and genuine differences of scientific interpretations are likely, desirable, and defensible. In this sense, recognising the pedigree of knowledge, i.e. the consistency of views amongst peers and the level of convergence coming from different branches of research, is essential for effective decision making and action to support the wellbeing of people and the environment.

The case studies show that evaluations of evidence in risk assessments can be improved by including a wide range of stakeholders when framing the risks and options agenda; broadening the scope and membership of evaluation committees; increasing the transparency of committee approaches and methods, particularly in identifying uncertainties and ignorance; and ensuring their independence from undue influence through using appropriate funding sources and applying robust policies on conflicts of interest.

Public confidence would be increased if all the evidence used in risk assessments was made publicly accessible and open to independent verification, including data submitted by industries to authorities.

As experiences from mercury, nuclear accidents, leaded petrol, mobile phones, BPA, and bees show, there can be a significant divergence in the evaluations of the same, or very similar, scientific evidence by different risk assessment committees. In such instances, differences in the choice of paradigm, assumptions, criteria for accepting evidence, weights placed on different types of evidence, and how uncertainties were handled, all need to be explained. Risk assessors and decision makers also need to be aware that complexity and uncertainty have sometimes been misused to shift the focus away from precautionary actions by 'manufacturing doubt' and by waiting for 'sound science' approaches that were originally developed by the tobacco industry to delay action.

Foster cooperation between business, government and citizens

Policy formulation should start from a broad concept of technological innovation to include non-technological, social, institutional, organisational and behavioural innovation. In this framework, governments have at least three roles: providing direction by putting in place smart regulations and consistent market signals; ensuring that the distributional consequences of innovations are balanced between risks and rewards across society, fostering a diversity of innovations so that the wider interests of society; and take precedence over narrower interests.

Numerous case studies show that decisions to act without precaution often come from businesses. There are, however, several impediments to businesses acting in a precautionary manner, including a focus on short-term economic value for shareholders alongside psychological factors that lead to a so-called 'ethical blindness' or a 'self-serving bias' whereby people largely interpret ambiguous situations in their own interests. Governments and businesses could collaborate more with citizens on publicly disclosing the potential value conflicts entailed in acting on early warning signals. A culture of transparency can in turn promote positive business attitudes and innovations.

Involving the public can also help in choosing between those innovation pathways to the future; on prioritising relevant public research; on providing data and information in support of monitoring and early warnings; improving risk assessments; on striking appropriate trade-offs between innovations and plausible health and environmental harms; and, making decisions about risk-risk trade-offs.

Correcting market failures using the polluter pays and prevention principles

When evidence of initial harm emerges, the costs should be internalised retroactively into the prices of polluting products, via taxes and charges, in line with the polluter pays principle and emerging practice across the world. The revenues could then be devoted partly to stimulating research into less hazardous alternatives, and partly to reform tax systems by reducing taxes and charges on 'societal goods' like employment.

The pollution taxes/charges would rise or fall in line with new scientific knowledge about increasing/decreasing harm, and this would help to level the playing field for less-polluting alternative products. Tax shifts from employment to pollution and the inefficient use of resources can bring multiple benefits such as increased employment, a stimulus to innovation, a more stable tax base in the light of expected demographic changes, and a more efficient tax collection system.

More broadly, firms and governments need to extend their economic accounting systems to incorporate the full impacts of their activities on people's health and on ecosystems. Governments need to anticipate this in their policies, by providing the right blend of fiscal instruments to both protect the public and ensure that firms internalise the true costs of potential harm.

A number of case studies also demonstrate the long time lags between evidence of harm and the additional injustice and time of forcing victims to pursue their cases through civil compensation claims. Prompt and anticipatory no-fault compensation schemes and assurance bonds, could be set up and financed in advance of potential harm by the industries that are producing novel and large-scale technologies, thereby helping to offset any potential market failure. Such schemes can also be designed to increase the incentives for innovating companies to carry out more *a priori* research into the identification and elimination of hazards.

Governance of innovation and innovation in governance

The *Late lessons from early warnings* reports demonstrate the complexities of developing not only the right kind of science and knowledge but also handling the interactions between the many actors and institutions involved — governments, policymakers, businesses, entrepreneurs, scientists, civil society representatives, citizens and the media.

Alongside many other analyses produced across the world today, the reports also stress the need to act to transform our ways of thinking and of doing, and urgently so in the face of unprecedented global changes, challenges and opportunities. Many lessons have been learnt, yet have not been acted upon. Any calls for action will need to reflect on today's global socio-economic setting and support, among other things, the drive to:

- rebalance the prioritisation of economic and financial capital over social, human and natural capitals through the broader application of the policy principles of precaution, prevention and polluter-pays, and environmental accounting;

- broaden the nature of evidence and public engagement in choices about key innovation pathways by directing scientific efforts more towards dealing with complex, systemic challenges and unknowns and complementing this with professional, lay, local and traditional knowledge; and,

- build greater adaptability and resilience in governance systems to deal with multiple systemic threats and surprises, through strengthening institutional structures and deploying information technologies in support of the concept of responsible information and dialogues.

The governance of innovation will remain at the level of good intentions unless it is translated into innovations in science practices, institutional arrangements and public engagements as well as transformations in prevailing business attitudes, practice and influence. These are the tasks that lie ahead.

In memory of Masazumi Harada, 1935–2012

Masazumi Harada, a physician involved for many years in the study of the mercury poisoning Minamata disease, died in June 2012 of acute myelocytic leukemia at his home in Kumamoto City. He was 77.

Harada conducted medical examinations on the disease's sufferers for the first time in the summer of 1961 in Minamata city in Kumamoto Prefecture while he was a student at Kumamoto University's graduate school.

Shocked by their miserable lives, Harada devoted himself to the study of the disease from that time. Harada published a thesis on congenital Minamata disease in 1964. The work had a significant impact as it disproved the conventional belief at the time that the placenta does not pass poisons. He received an award from the Japanese Society of Psychiatry and Neurology for the thesis in 1965.

He then established the Open Research Center for Minamata Studies at the university in 2005, becoming the center's head. He continued to lead the disease's research from non-medical perspectives as well. Harada visited Brazil, China and native Indian communities in Canada to discover those suspected of suffering from the disease.

Author of many books, Harada wrote 'Minamata Byo' (Minamata Disease), which raised awareness on the issue around the world.

Dr. Masazumi Harada first came to Asubpeeschoseewagong (Grassy Narrows) and Wabaseemoong (White Dog) First Nations in Canada in the early 1970s. Harada's death comes at the end of River Run 2012, five days of actions by members and supporters of Grassy Narrows in Toronto, who are seeking to have Minamata disease recognized in Canada and Ontario. Harada's final report for the Grassy Narrows community was released on 4 June 2012 after 30 years of research, showing mercury deposited in the river by the Dryden paper mill in the 1970s is impacting those who were not yet born when the dumping ceased.

In memory of Poul Harremoës, 1934–2003

Poul Harremoës was a key player in environmental issues in Denmark and internationally for more than 30 years until his death, at 69, in 2003. In that time, those who worked closely with him benefited from a continuous, almost daily flow of excellent ideas for new research projects.

He was a member of the Danish Pollution Council, which prepared the first framework national law on environmental protection and advised on the establishment of a Ministry of Environment from 1971. He was a key participant in numerous settings, including the first Scientific Committee of the European Environment Agency from 1995.

He had a civil engineering degree from the Technical University of Denmark. He specialised early on in geo-technics and constructed dams on the Faroe Islands. While teaching geo-technics he wrote a textbook that was used for more than 40 years. However, he was able to quickly change his research direction and develop new areas of excellence. So, for example, he got a grant to study at Berkeley, California, from where he received a M.Sc. degree in environmental engineering.

In 1972, he became professor in environmental engineering at the Technical University of Denmark where he originally worked with wastewater discharge to the sea and the biological processes of wastewater treatment. He became a world leading scientist in the theories of biofilms for removal of organics and nitrogen from wastewater before turning to sewer design and modelling. In 2000, Poul was awarded the *Heineken prize for Environmental Sciences* for his contributions to the theory of biofilm kinetics in relation to biological waste water treatment and for his successful organisation of the international scientific community in water pollution research and control.

As a result of his work with sewers and storm water he went into the area of risk analysis and the role of the precautionary principle. In a short time he became an international expert in this field and was highly demanded for lectures in all parts of the world. A key outcome of his interest was his contributions as chairman of the editorial team for the first volume of *Late lessons from early warnings* published in 2001.

Scientific Committee on Health, Environmental and Emerging Risks

SCHEER

Statement on emerging health and environmental issues (2018)

The SCHEER adopted this statement by written procedure on 20 December 2018.

ABSTRACT

The purpose of this SCHEER statement is to draw the EU Commission Services' attention to emerging issues in the non-food area that SCHEER members have identified as having the potential to impact human health and /or on the environment in the future. The Secretariat will use this list when discussing potential new mandates with relevant Commission services.

Keywords: SCHEER, emerging issues, emerging risks, newly identified health risks, health, environment, impacts

Opinion to be cited as:

SCHEER (Scientific Committee on Health, Environmental and Emerging Risks) Statement on emerging health and environmental issues (2018), 20 December 2018.

ACKNOWLEDGMENTS

Members of the Working Group are acknowledged for their valuable contribution to this Opinion. The members of the Working Group are:

The SCHEER members:

Roberto Bertollini
Teresa Borges
Wim de Jong
Pim de Voogt
Raquel Duarte-Davidson
Peter Hoet
Rodica Mariana Ion
Renate Krätke
Demosthenes Panagiotakos
Ana Proykova
Theodoros Samaras
Marian Scott (Rapporteur)
Remy Slama
Emanuela Testai
Theo Vermeire (Chair)
Marco Vighi
Sergey Zacharov

All declarations by Working Group members are available at the following webpage: https://ec.europa.eu/health/scientific_committees/experts/declarations/scheer_en

About the Scientific Committees (2016-2021)

Two independent non-food Scientific Committees provide the Commission with the scientific advice it needs when preparing policy and proposals relating to consumer safety, public health and the environment. The Committees also draw the Commission's attention to the new or emerging problems which may pose an actual or potential threat.

The Scientific Committee on Consumer Safety (SCCS) and the Scientific Committee on Health, Environmental and Emerging Risks (SCHEER) review and evaluate relevant scientific data and assess potential risks. Each committee includes top independent scientists from all over the world who are committed to working in the public interest.

In the formulation of its policies and proposals, the Commission also relies on other Union bodies, such as the European Food Safety Authority (EFSA), the European Medicines Agency (EMA), the European Centre for Disease prevention and Control (ECDC) and the European Chemicals Agency (ECHA).

SCHEER

This Committee, on request of Commission services, provides Opinions on questions concerning health, environmental and emerging risks. The Committee addresses questions on:

- health and environmental risks related to pollutants in the environmental media and other biological and physical factors in relation to air quality, water, waste and soils.

- complex or multidisciplinary issues requiring a comprehensive assessment of risks to consumer safety or public health, for example antimicrobial resistance, nanotechnologies, medical devices and physical hazards such as noise and electromagnetic fields.

TABLE OF CONTENTS

1. INTRODUCTION

The primary purpose of this position statement is to draw the attention of the EU Commission Services to emerging issues in the non-food area that have been identified by the SCHEER members as having the potential to significantly impact human health and /or on the environment in the future.

Identifying emerging issues early on may greatly help for ensure a high level of public safety and environmental protection. However, the data available to correctly identify emerging issues and their impacts is inevitably likely to be very limited. It is therefore important that each issue that is identified is regularly reviewed. The SCHEER aims, therefore, to regularly review any relevant new developments and to produce an updated position statement twice during the Scientific Committee term (this term is from 2016-2021). The Committee can also submit an urgent issue to the Commission at any time. In considering emerging issues, the SCHEER would like to work closely with other EU scientific advisory committees whose mandates also include looking at emerging issues.

The SCHEER recognised the need to establish a very flexible framework to aid the correct identification of emerging issues and their potential impacts (see document 'Emerging Issues and the Role of the SCHEER, Position Paper').

SCHEER members have been asked during plenary meetings, in dedicated 'brainstorming sessions', to identify emerging/relevant issues that they think should be flagged for the Commssion Services.

The criteria used to identify an emerging issue were as follows:

- Novelty of the stressor or process
- Scale of possible impacts on man and /or the environment
- Severity of impacts for particular organisms (priority for life threatening)
- Urgency i.e. the temporal nature of the likely changes (priority for rapid increases)
- Not investigated in depth recently by a reputable scientific body
- Anticipated to be increasingly important over time

To aid this, a standardised format has been used and issues have been placed in particular categories. It is acknowledged that further consideration of some of the issues that have been identified should be led by other scientific committees.

2. FORMAT FOR DESCRIBING AN EMERGING ISSUE

A common format was proposed to describe emerging issues. This was in the format of a table in which the committee members have been asked to fill in the following:

- The topic proposed
- The author (name of SCHEER submitter)

- Sources (one or more selected items from the ones mentioned under point 1 between 1-12)
- Causative factors (one or more selected items from the ones mentioned under point 2 between a and h)
- Preliminary ranking of the hazard ((*,1, 2 or 3 where *=uncertain and 3 is high for uniqueness, soundness, severity, spatial scale, urgency, and interactions, respectively)
- Preliminary estimation of importance (*,1, 2 or 3 where *=uncertain and 3 is high)
- Description / background

1) Sources

Risks associated with:

1) Buildings and infrastructure

2) Energy and electronic communications

3) Disease evolution e.g. due to pathogen changes

4) Industrial and related activities

5) Waste processing and utilisation

6) Use of natural resources

7) Transport and storage

8) Human behaviour (socio-economic, lifestyle, perception)

9) Medical developments (technology, pharmaceuticals)

10) Environmental change

11) Product use/misuse

12) Agriculture and food

13) New materials

2) Causes / Contributing factors:

a) Technical advances opening up the prospect of new products and/or processes and/or raising concerns about waste treatment safety

b) A consequence of changes in the natural environment

c) Changes resulting from alterations in price, supply of materials and commodities

d) Changes due to alterations in legislation or public welfare measures

e) Other socio-cultural or demographic elements

f) Outcomes of research

g) Large scale illegal activities

h) Public/political concern

3. NEXT STEPS

The list will be used by the Secretariat when discussing potential new mandates with relevant Commission services.

4. ISSUES

4.1. Personal communication and listening devices

Topic	**Personal communication and listening devices**
Initiator(s)	Theodoros Samaras
Sources **Causative factors** **(see section 2 of this document)**	8, 11 a, c, e
Hazard (Rank features as 1,2,3 or *) **-uniqueness** **-soundness** **-severity** **-scale** **-urgency** **-interactions**	 1 1 * 3 1 2
Parallels with past emerging issues. Potential interactions with other stressors)	It has already been established that driving while using a portable device presents a quantifiable risk for traffic accidents. In addition, texting has been linked in the past to orthopaedic problems of hand and arm joints, as well as to more serious musculoskeletal injuries. More information: Fares *et al.* (2017). The use of personal digital devices adds to the exposure to screen light (this has been dealt with in previous Opinions about artificial light and LED exposure). Moreover, it exacerbates the problems resulting from environmental noise (also assessed in the past), especially by using high volume levels on earphones.
Preliminary Estimation of importance (*,1,2 or 3 where *=uncertain and 3 is high)	1
Background including reliability of data, a key reference if possible any other reasons for concern.	There are mainly two issues associated with personal communication and listening devices, which mostly concern young people since they constitute the main users of such devices and start to use them at an ever earlier age. The first one has to do with pedestrian safety. Distraction due to texting, listening to music or using multimedia apps can compromise cognitive and audiovisual awareness and may pose a risk for the safety of

	pedestrians (e.g. at street crossings). The second issue has to do with nearsightedness (myopia). The increased use of personal digital devices has been mentioned as a risk factor for this trend (especially in the under-40 age group). For more information: **References** 1. Schwebel D.C. *et al.* (2012). 2. Schabrun S.M. *et al.* (2014). 3. Holden B.A. *et al.* (2016).

4.2 Virtual reality

Topic	Virtual reality
Initiator(s)	Ana Proykova
Sources **Causative factors (see section 2 of this document)**	8, 11 a,e,f Virtual reality (VR) and augmented reality (AR) are gaining momentum as promising new technologies. They can potentially expand the field of human knowledge by changing how people learn, work, play and entertain themselves. High-tech VR and AR headsets are popping up everywhere – from the expensive ones from Samsung, Google and Facebook, to the generic cardboard headsets for the lower-end market.
Hazard **(Rank features as 1,2,3 or *)** **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	Health risks: anxiety, nausea, eye strain, radiation exposure. VR can have neurological effects because of its eerily realistic simulated motion. Virtual Reality (VR) sickness can cause intense discomfort, shorten the duration of a VR experience, and create an aversion to further use of VR. 3 * * 3 3 *
Parallels with past emerging issues. Potential interactions with other stressors)	Parallel with Army Aviation - Simulator sickness Environmental Social Stress
Preliminary Estimation of importance (*, 1, 2 or 3 where *=uncertain and 3 is high)	3 Considering the broad usage of Virtual Reality (from games to hospital treatment of anxiety) The hazard and risks are under investigation.
Background including reliability of data, a key reference if possible any other reasons for concern.	**References** 1. Fernandes A.S., Feiner S.K. (2016). 2. Pallavicini F. *et al.* (2013). 3. Veling W. *et al*.. (2016). 4. Jáuregui-Renaud K. (2015). 5. Cobb S.V.G., Nichols S.C., Wilson, J.R. (1995).

4.3 E-cigarette and chronic diseases

Topic	**E-cigarettes and chronic diseases**
Initiator(s)	Demosthenes Panagiotakos
Sources **Causative factors** **(see section 2 of this document)**	9 E-cigarettes, in their modern form, were introduced in the early 2000s as a means for smoking cessation. The e-cigarette liquid contains several chemicals, like nicotine, propylene glycol, glycerin, flavourings and others. Current research suggests that the e-cigarette aerosol contains substances that could be considered as harmful, including flavouring chemicals, metals (like lead), and other cancer-causing chemicals. There is no consistent evidence regarding the effectiveness of e-cigarettes in helping people to quit smoking. Moreover, there is a tendency in people to start vaping (e-cigarettes), instead of smoking. Compared with "regular" cigarettes, e-cigarettes may be less harmful in terms of smoking-related chronic diseases, but regarding their use compared to no smoking, the health effects are not well understood or appreciated. Moreover, taking into account that e-cigarette use is increasingly prevalent and fashionable, especially among adolescents and younger people, it can be regarded as an emerging public health issue.
Hazard **(Rank features as 1,2,3 or *)** **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	 2 1 * 3 3 (due to the increasing frequency of use) 3 (due to the interactions with other lifestyle determinants and psychological stressors)
Parallels with past emerging issues. Potential interactions with other stressors.	The e-cigarette has been described as a possible form of harm reduction. To date, there has been no consistent evidence that e-cigarette can significantly reduce smoking in the population, and there have not been enough studies done on the effect of (active or passive) e-cigarette exposure compared to non-smoking on human health. Moreover, cigarette smoking, in general, is known to interact with a variety of unfavourable lifestyle behaviours, like unhealthy dietary habits and physical inactivity, as well as the presence of chronic stress, leading to increased risk for cardiovascular disease, COPD and types of cancer. Taking into account that the aforementioned synergistic factors are now increasing at alarming rates and the fact that data about the effects of e-cigarette on human health are not well understood yet, the study of e-cigarette on human health is considered more important as ever before, in terms of public health prevention.
Preliminary Estimation of	3

importance (*,1,2 or 3 where *=uncertain and 3 is high)	
Background including reliability of data, a key reference if possible any other reasons for concern.	E-cigarettes have been patented since the 1960s, however, they have been available as a product from the early 2000s. The use of e-cigarettes has risen exponentially over the past 10 years; however, it is difficult to estimate its use at population level. E-cigarettes are now available in Europe and in the majority of countries in the Western world, but with significant differences in use between countries. It is notable that the use of the e-cigarette tends to be a habit by a considerable proportion of young adults and adolescents in many European countries. The health risks of e-cigarettes are uncertain. There are studies suggesting that e-cigarettes may cause, similar to tobacco cigarettes, harm to the cardiovascular and lung system. Although some of the identified harmful components in e-cigarettes were measured in lower quantities than those in cigarettes, recent studies unveiled that the toxic effects of e-cigarettes should not be understated. There is an overlap between tobacco laws and medical drug policies and e-cigarette legislation in many countries. A European Directive of 2016 set standards for liquids, vaporizers, ingredients and child-proof liquid containers while the US FDA extended its regulatory power to include e-cigarettes. In some countries, new legislations are underway to regulate e-cigarette use. **References** 1. Filippidis F.T., Laverty A.A., Vardavas C.I. (2016). 2. Ioakeimidis N., Vlachopoulos C., Tousoulis D. (2016). 3. Makadia L.D., Roper P.J., Andrews J.O., Tingen M.S. (2017). 4. Cai H., Wang C. (2017). 5. Chun L.F., Moazed F., Calfee C.S., Matthay M.A., Gotts J.E. (2017). 6. Benowitz N.L., Burbank A.D. 4.4 Potential effects on wildlife of increases in electromagnetic radiation

Topic	Potential effects on wildlife of increases in electromagnetic radiation
Initiator(s)	Marian Scott
Sources **Causative factors** **(see section 2section 2 of this document)**	2 e "On the horizon, a new generation of even shorter high frequency 5G wavelengths is being proposed to power the Internet of Things (IoT). The IoT promises us convenient and easy lifestyles with a massive 5G interconnected telecommunications network. However, the expansion of broadband with shorter wavelength radiofrequency radiation highlights the concern that health and safety issues remain unknown. Controversy continues with regard to harm from current 2G, 3G and 4G wireless technologies. 5G technologies are far less studied for human or environmental effects" (Russell, 2018).
Hazard (Rank features as 1,2,3 or *) **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	 2 1 * 3 3 3 (due to the interactions with other ecosystems and species)
Parallels with past emerging issues. Potential interactions with other stressors.	This concern is more related to the change to 5G rather than a completely new concern. The effects of electromagnetic radiation have been generally well studied, however low frequency electromagnetic radiation is less well studied, hence the justification for introducing this an emerging issue.
Preliminary Estimation of importance (*,1,2 or 3 where *=uncertain and 3 is high)	3
Background including reliability of data, a key reference if possible any other reasons for concern.	5G networks will soon be rolled out for mobile phone and smart device users. How exposure to electromagnetic fields could affect humans remains a controversial area, and studies have not yielded clear evidence of the impact on mammals, birds or insects. The lack of clear evidence to inform the development of exposure guidelines to 5G technology leaves open the possibility of unintended biological consequences.

4.5 Chemicals in recycled materials, an issue in a circular economy

Topic	Chemicals in recycled materials, an issue in a circular economy
Initiator(s)	Theo Vermeire
Sources **Causative factors** **(see section 2 of this document)**	Many potential sources a, c, g, h
Hazard (Rank features as 1,2,3 or *) **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	 1 3 * 3 3 3
Parallels with past emerging issues. Potential interactions with other stressors)	In view of EU-wide strategies toward a circular economy, the issue of hazardous substances in recycled products is getting more and more attention. Risks can arise for the environment, consumers, workers. Over the last decade interest in the circular economy and therefore in recycling has increased considerably. One of the problems of recycling is that the materials may contain substances that pose a risk to man and the environment. So the possible advantages of recycling, such as more energy-efficient and CO_2-efficient production, should be weighed against the potential effects of these substances. Examples of hazardous substances incorporated into potentially recyclable material: the flame retardant hexabromocyclododecane (HBCDD) in extruded polystyrene, the plasticiser DEHP, cadmium and lead in polyvinyl chloride (PVC), heavy metals and PAHs in rubber crump from tyres.
Preliminary Estimation of importance (*,1,2 or 3 where *=uncertain and 3 is high)	3
Background including reliability of data, a key reference if possible any other reasons for	Examples are: Lead, phthalates, cadmium, organotins, POPs, BDEs, HBCDD, e-waste, hazardous chemicals in rubber crump and toys. **References** 1. EFSA CEF Panel (EFSA Panel on Food Contact Materials,

concern.	Flavourings and Processing Aids) (2015). 2. Grant K., Goldizen F.C., Sly P.D., Brune M.-N., Neira M., van den Berg M., Norman R.E. (2013). 3. Janssen M.P.M. *et al.* (2016). 4. KEMI (2012). 5. Verschoor A.J., Bodar C.W.M., Baumann R.A. (2018).

4.6 Pharmaceuticals (human and veterinary) and illicit drugs in wastewater and surface waters

Topic	**Pharmaceuticals (human and veterinary) and illicit drugs in wastewater and surface waters**
Initiator(s)	Pim de Voogt, Marco Vighi
Sources **Causative factors** **(see section 2 of this document)**	5 Urban waste water. Wastes from pharmaceutical industries and from illegal drugs manufacturing. Animal farm emissions. Agricultural soils treated with WWTP sludge or animal manure. Aquaculture.
Hazard **(Rank features as 1,2,3 or *)**	Pharmaceuticals and illicit drugs loads in wastewater increase as a result of increased use of legal, illicit and counterfeit drugs, aging of the population and also due to fly tipping of waste from illegal drug manufacturing sites (Emke *et al*. 2018). As a result wastewater treatment facilities may become jeopardised. Exposure of aquatic environments (receiving surface waters) because WWTPs don´t (completely) remove residuals (Wang *et al.* 2016; Bijlsma *et al.* 2012). The occurrence of pharmaceuticals in wastewater and surface waters has been object of systematic research since the 1990s (Zuccato *et al*., 2006). Therefore, it might seem as if the issue should not be considered as an emerging risk. However, knowledge on the hazards for aquatic communities is still far from being complete and, in many cases, the possible effects on the aquatic ecosystems are completely unknown. Pharmaceuticals and illicit drugs are, by definition, biologically active compounds. The type of biological effect is highly specific and, in most cases, unwanted for natural populations. At the concentrations likely to occur in surface waters, the possibility of effects that may be studied with tools capable to measure traditional endpoints (e.g. acute or chronic toxicity) or more specific effects (e.g. endocrine disrupting effects) is, in most cases, highly improbable. Nevertheless, other types of direct or indirect effects on the functioning of ecosystems determined by the specific biological activity, are possible and largely unknown. A couple of examples of the most known cases are: • Occurrence and spread of antibiotic resistance (AMR). Determined by the presence of antibiotics in surface water, this may represent a change in ecosystem functioning and a risk for human health (see, for example, Xi *et al*., 2009). • Behavioural changes due to antidepressants. Psychoactive drugs alter the behaviour of aquatic vertebrates, for example reducing the capability to escape from predators, with dramatic changes in

- uniqueness **- soundness** **- severity** **- scale** **- urgency** **- interactions**	ecosystem functioning (see, for example, Brooks, 2014). Other possible effects are fully unknown and difficult to predict. 1 * * 3 3 *
Parallels with past emerging issues. Potential interactions with other stressors)	Interactions among different pharmaceuticals with possibilities of synergisms or antagonisms.
Preliminary Estimation of importance (*,1,2 or 3 where *=uncertain and 3 is high)	3
Background including reliability of data, a key reference if possible any other reasons for concern.	**References** 1. Bijlsma L., Emke E., Hernández F., de Voogt P. (2012) 2. Brooks B. (2014). 3. 4.7 Substance Mobility: a new criterion in chemicals regulation

Topic	**Substance Mobility: a new criterion in chemicals regulation**
Initiator(s)	Pim de Voogt
Sources **Causative factors** **(see section 2 of this document)**	5, 8, 9, 11 d,e Changes in public welfare measures / demographic changes Our society is using increasingly more chemical substances, and among the new emerging pollutants we are finding an increasing number of polar organic compounds. Although the concentration level of total organic contaminants decreases by about 2 orders of magnitude going from WWTP effluents to groundwater used for drinking water production to tapwater. The most polar contaminants in the WWTP effluents remain in the water throughout its passage to groundwater and also withstand traditional drinking water treatment processes. As a result, persistent mobile organic chemicals (PMOCs) may reach drinking water. Examples include trifluoromethanesulfonic acid and its halogenated homologues; 1-naphthalenesulfonic acid; 1,3-di-o-tolylguanidine and GenX (2,3,3,3-Tetrafluoro-2-(heptafluoro-propoxy)propanoic acid; aka FRD-903 or HFPO-DA).
Hazard (Rank features as 1,2,3 or *) **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **-interactions**	PMOC may be of an equivalent level of concern as PBT substances. If emissions of PMOC or very persistent very mobile substances are ongoing and removal during water treatment is incomplete, their environmental concentrations will increase over time as these substances circulate and enrich in the water cycle. 3 3 3 3 3 2
Parallels with past emerging issues. Potential interactions with other stressors)	European legislation on chemical substances (REACH) primarily focuses on substances that do not easily break down and are therefore Persistent (P), accumulate in organisms (Bioaccumulation, B) and have an effect on organisms (Toxicity, T). This PBT legislation pays insufficient attention to the drinking water function of our surface waters and groundwater. After all, there are substances that do not accumulate very much but that are very difficult to remove from water. Due to their great affinity for water such substances are Mobile (M). If substances have PMT properties then they can present an exposure risk for humans via drinking water.

	Potential Interactions: Exposure to (mixtures of) chemicals
Preliminary Estimation of importance (*, 1, 2 or 3 where *=uncertain and 3 is high)	3 -Topic is highly relevant for REACH legislation -German UBA has issued a revised proposal for implementing criteria and an assessment procedure to identify Persistent, Mobile and Toxic (PMT) and very Persistent, very Mobile (vPvM) substances registered under REACH.
Background including reliability of data, a key reference if possible any other reasons for concern.	Whether an organic compound does or does not possess an affinity for water is mainly determined by the polarity of that substance. Polar substances and those that have a permanent charge (ions, such as salts) have an extremely high affinity for water. That high affinity means that polar and charged substances dissolve easily in water and are poorly retained in soils through which the water passes, in riverbanks or by sorptive water treatment processes. Such substances are difficult to remove from water during purification. In other words, the substances move easily with the (moving) water, are transported along with it and can easily reach drinking water: the substance is Mobile (M). Drinking water companies are certainly increasingly confronted with new expenditures necessary to cope with polar substances. **References** 1. Reemtsma T., Berger U., Arp H.P.H., Gallard H., Knepper T.P., Neumann M., Quintana J.B., de Voogt P. (2016). 2. Sjerps R.M.A., Vughs D. van Leerdam J.A., ter Laak T.L., van Wezel A.P. 4.8 Drinking water treatment interactions with compounds and potential health effects

Topic	**Drinking water treatment interactions with compounds and potential health effects**
Initiator(s)	Marian Scott
Sources **Causative factors** **(see section 2 of this document)**	5,6,10 a,b New and modified drinking water treatments are being used to deal with removal of chemical (natural and anthropogenic) contaminants in the source waters. It is anticipated that in the light of climate change, there may be further interactions between such natural contaminants, leading to new (or increased) concentrations of by-products with potential for human health concerns.
Hazard (Rank features as 1,2,3 or *) **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	 2 1 2 3 1 *
Parallels with past emerging issues. Potential interactions with other stressors.	Many disinfection methods are being used in the production of drinking water. Among these, the advanced oxidation processes serve the dual purposes of disinfection and removal of chemical contaminants present in source water. Studies have shown that water containing natural organic matter, when treated with UV for disinfection, generated multiple disinfection byproducts (DBPs). [Bond *et al*. Water Res 45 (2011) 4341-54; Richardson *et al*. Mutat. Res. 636 (2007) 178-242; Ceretti *et al*. J Public Health Res. 2016 Dec 9; 5(3), 769], including Nitrogen-containing mutagenic DBPs [Vughs *et al.* Environ Sci Pollut Res 25 (2018) 3951-64]. Climate change is expected to increase surface run off in river catchments, leading to increased amounts and loads, as well as possible changes in characteristics, of natural organic matter in the source waters [Soh *et al.*, The Environmentalist 28 (2007) 158-165]. used for producing drinking water. This means that there is an increased probability that DBPs are being formed in the treatment processes required for disinfection and purification. Climate change effects may result in the need to modify water treatment processes resulting in potentially new interactions, and lead to the development of new treatment methods which could result in the

	formation of novel disinfection products with health effects including mutagenicity.
Preliminary Estimation of importance (*, 1, 2 or 3 where *=uncertain and 3 is high)	2
Background including reliability of data, a key reference if possible any other reasons for concern.	There are a variety of papers and studies being published concerning interactions between water treatment chemicals, organic material and residues in drinking water, exacerbated by climate change and with potential health effects (including neurological disorders). Aluminium has been implicated in the past, but the treatment interactions with chemical contaminants and the possible effects of climate change mean that this topic is gaining renewed interest. Examples of some of the studies are given below. **References** 1. Lalas S., Athanasiadis V., Dourtoglou V.G. (2018). 2. Glassmeyer S.T., Furlong E.T., Kolpin D.W., Batt A.L., Benson R., Boone J.S., Conerly O., Donohue M.J., King D.N., Kostich M.S., Mash H.E., Pfaller S.L., Schenck K.M., Simmons J.E., Varughese E.A., Vesper S.J., Villegas E.N., Wilson V.S. 4.9 Per- and polyfluorinated organic substances

Topic	**Per- and polyfluorinated alkyl substances (PFAS)**
Initiator(s)	Pim de Voogt
Sources **Causative factors** **see section 2**	4, 11, 13 c, d, h
Hazard (Rank features as 1,2,3 or *) **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	Because of the persistence of PFAS, these compounds constitute potential risks for humans and the environment. 3 3 3 3 3 *
Parallels with past emerging issues. Potential interactions with other stressors)	Parallels: POPs Very few PFAS have been regulated (PFOS Stockholm convention; PFOS in products (EC); TDIs for PFOS and PFOA (EFSA). A new Opinion on PFOS and PFOA in food, by the EFSA Contam panel, has been finalised in Mar 2018. A Scientific Opinion by EFSA on the risk to human health related to the presence of Perfluoroalkylated substances in food, other than Perfluorooctane sulfonate and Perfluorooctanoic acid, is in the process of completion. PFOA is under review by the Stockholm POP convention. Possible interactions: dietary exposure to (mixtures of) chemicals.
Preliminary Estimation of prioritisation (*, 1, 2 or 3 where *=uncertain and 3 is high)	2-3 As a result of new information becoming available on the toxicity of PFAS, the revision of current guideline values (e.g. TDIs, drinking water guidelines) is urgent and for some members of the PFAS group it is underway. For others essential data are still missing. Hence the prioritisation is high.
Background including reliability of data, a key reference if possible any other reasons for concern.	For several members of the PFAS group PBT properties have been demonstrated. Others appear to be persistent and mobile (PM) and cross natural or technological barriers, thus posing risks to public health because of human exposure. Replacements by industry for the major part appear to rely on fluorine chemistry (e.g. GenX) which inherently leads to similarities in persistence. Many more emerging PFAS have been recently found to occur in surface waters (see e.g. Gebbink *et al*., 2017).

4.10 New RNA pesticides and gene editing to reduce/eradicate pest populations

Topic	**New RNA pesticides and gene editing to reduce/eradicate pest populations**
Initiator(s)	Marian Scott
Sources **Causative factors** **(see section 2 of this document)**	6,8,10,12 a,f,h With increasing concerns about the negative impact of the use of chemical pesticides (see recent debates concerning glyphosates and neonicotinoids), on both the environment and humans, there are new developments in the use of gene technology (in the broadest sense) to manage pest populations).
Hazard **(Rank features as 1, 2, 3 or *)** **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	 2 1 2 3 3 3
Parallels with past emerging issues. Potential interactions with other stressors)	Effects of various pesticides including examples such as neonicotinoids and glyphosate have been much contested, and any form of gene editing is likely to be met with concerns particularly given the social and political debates concerning GMO.
Preliminary Estimation of importance (*,1,2 or 3 where *=uncertain and 3 is high)	3
Background including reliability of data, a key reference if possible any other reasons for concern.	Laboratory tests have shown that topical application of RNA could be a new way of controlling plant pests, including viruses and insects, by silencing genes that affect survival and reproduction. It is thought this method could be more publicly acceptable than other forms of genetic modification because its effects will not be passed on to offspring. However, the impact of widespread use of the method as a pesticide on non-target species is not yet known. New gene editing technologies could also be used to control animal populations, including invasive species, within the coming decade. For instance, applications of CRISPR-enabled gene drive technology are

	foreseen for several applications, such as the elimination or suppression of insect vectors and transmitting (plant) diseases. At a cost of more than £3 million a year, New Zealand aims to rid itself of rats, possums and stoats by 2050. These methods raise both ethical and ecological questions, from repercussions on wider ecosystems to the potential for gene traits to spread and wipe-out species in unintended areas. **References** 1. Lundgren J.G., Duan J.J. (2013). 2. Albright *et al*. (2017). 3. Medina R.F. (2018). 4. Royal Society Te Apārangi Gene Editing Panel. (2017). https://royalsociety.org.nz/assets/Uploads/Gene-editing-in-pest-control-technical-paper.pdf

4.11 Do-it-Yourself Synthetic Biology, biohacking

Topic	**Do-it-Yourself Synthetic Biology, biohacking**
Initiator(s)	Theo Vermeire
Sources **Causative factors** **see section 2**	3, 9, 11 a, c, g
Hazard (Rank features as 1,2,3 or *) **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	 2 2 3 3 2 1
Parallels with past emerging issues. Potential interactions with other stressors)	As SynBio advances, its methods, equipment and technologies will be cheaper, simpler and easier to use. The number and complexity of products, new pathways to risk-assessment endpoints, large range of types of products, new actors, including DIY bioengineers (also known as biohackers) and complex alignment of potential future products with agency authorities are likely to change rapidly as biotechnology advances. SynBio will likely foster citizen science, i.e. attracting DIY biologists into a field traditionally reserved for highly trained professionals. The nature of the citizen science community raises concerns that its practitioners will not abide by risk assessment and biosafety practices required by law of the professional SynBio community. The issue is not whether SynBio can be safely practiced; it is a question of whether DIY biologists will practice it safely. Accidental use or misuse of SynBio kits by consumers was identified as a cause of concern in the SCENIHR Opinion on SynBio. There is evidence that this may lead to actual risks, e.g. when a kit is contaminated by pathogenic species or malware is incorporated in DNA-samples.
Preliminary Estimation of importance (*,1,2 or 3 where *=uncertain and 3 is high)	3
Background	**References**

4.12 Micro and nano-plastic in the environment

Topic	**Micro and nano-plastic in the environment**
Initiator(s)	Marco Vighi, Qasim Chaudhry (SCCS)
Sources **Causative factors (see section 2 of this document)**	5 Urban and industrial waste water. Agricultural soils treated with WWTP sludge. Macroplastic debris. Tyre debris. a
Hazard (Rank features as 1,2,3 or *)	The increasing environmental pollution by plastic materials has recently come to the attention of authorities around the world. For example, WHO has recently launched a health review after microplastics were found in 90% of bottled water (www.bbc.co.uk/news/science-environment-43389031). The UK has banned the use of plastic microbeads in cosmetic products (https://chemicalwatch.com/62944/uk-microbeads-ban-enters-into-force). The production, use and disposal of plastic materials is now ubiquitous. The largest area of plastic use is for packaging materials and a wide range of other objects. Plastic polymers have not been considered substances of health concern because they are generally inert in nature, and are unlikely to be absorbed in the body due to large molecular sizes. They are nevertheless highly persistent in the environment where they may end up via a variety of disposal/emission routes. Gradual degradation of plastic materials over time is known to result in microplastics - which in theory could also further degrade to nano-plastics. Some forms of microplastics are also used in cosmetic products which makes their direct emission into the aquatic environment possible. The effects of MPs on living organisms may be direct, mainly physical (damages to respiratory systems or digestive tracts) or behavioural (changes in food intake), or indirect, determined by the uptake of chemicals adsorbed on the plastic. The actual relevance of these effects is dependent on the realistic exposure in soil and water environments, which is still largely unknown.
- uniqueness **- soundness** **- severity** **- scale** **- urgency** **- interactions**	3 * * 3 3 *
Parallels with past emerging issues.	This is a relatively new topic and after decades of ignorance has recently come under the focus of attention of researchers, authorities and the

Potential interactions with other stressors)	general public. Possible interactions between MPs and potentially toxic chemicals.
Preliminary Estimation of importance (*, 1, 2 or 3 where *=uncertain and 3 is high)	* Considering the amount of the emissions, the issue could be of high importance. However the available information on actual exposure in the different environmental compartments as well as on the effects on living organisms is still highly controversial. The sampling methods for microplastic as well the analytical methods are not standardised and different procedures, providing different results, are used in monitoring studies. Therefore, measured data in the aquatic environment reported in the literature are often difficult to compare. As for the effect assessment, microplastic (arbitrarily defined as bigger than 1 μm) should not cross cell membranes and, if ingested, should remain in the digestive system, producing only physical effects. On the contrary, nanoplastics can probably enter the cells and, possibly, interact with cell metabolism. However, to date, these are just hypotheses. There is some evidence in the literature of the cellular uptake of nanoplastic but the threshold below which this may occur is unknown, as well as the type of biological effects. These uncertainties point to the need for a better assessment of hazard and risk. It is opinion of the SCHEER that the standardisation of methods for assessing exposure, as well as the development of methods for assessing the different behaviour in living organisms of micro and nano plastics, represent urgent priorities.
Background including reliability of data, a key reference if possible any other reasons for concern.	The occurrence of micro and macro plastic in the environment is recognised as one of the most serious environmental problems at the global level. In particular, microplastics (MPs) in the marine environment have been extensively studied for a long time (GESAMP, 2015), while, in freshwater, the problem is much less known (Breuninger *et al*., 2017). **References** 1. GESAMP (2015). Joint Group of Experts on the Scientific Aspects of Marine Environmental Protection). 2. 4.13 Nanoparticles released from Building Materials and construction waste to the Environment

Topic	**Nanoparticles released from Building Materials and construction waste to the Environment**
Initiator(s)	Rodica-Mariana Ion
Sources **Causative factors** **(see section 2 of this document)**	1,4,5 a, **Sources:** Nanomaterials are found in construction products, primarily in surface coatings, concrete, window glass, insulation and steel. Not all of them contain nanoparticles. However, some nanomaterials may be hazardous due to the presence of very small particles and the similarities observed between some nanomaterials and asbestos fibres. The involved materials have potential impact on both human health and on the environment. The most used are: TiO_2, SiO_2, ZnO, Ag, CuO, and $CaCO_3$. Also, there are some nanomaterials in cement such as: SiO_2, Al_2O_3, Fe_2O_3, ZrO_2, carbon nanotubes (CNTs) and carbon nanofibers (CNFs). Titanium dioxide particles or antimicrobial silver nanoparticles or even carbon nanotubes (CNTs) provide concrete with self-cleaning properties, or antimicrobials or give it with improved strength and potentially electrical conductivity. **Causative factors:** various nanomaterials used in the building industry and their potential release from paint waste, during the renovation and demolition processes, during recycling, landfilling and incineration technologies. The release of NPs may occur when the coatings are not adequately fixed to the stone or when they are not sufficiently effective to prevent stone degradation and crumbling. Those NPs that end up in the water systems can adversely affect aquatic and marine life and in the soil, essential microbial interactions may be interfered with, affecting functional diversity.
Hazard (Rank features as 1,2,3 or *) **-uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	 3 * * 3 3 *
Parallels with past emerging issues. Potential interactions with other stressors	Several building materials exist from the older building technologies still exist and are used because of their proximity, availability and geographical location. Such material includes mud bricks (adobe), stones, cobs and wood to mention a few. These the traditional building materials are stereotypically binary: earth related material and wood related. There is currently lack of regulations requiring labeling or other listings of

	these materials containing nanomaterials The possible release of nanomaterials into the environment by this route must therefore be taken into consideration, as follows: [i] identify the sources and the flows of released nanomaterials in construction waste, [ii] identify the potential exposure pathways of released nanomaterials for humans and other organisms, [iii] identify the release of released nanomaterials to technical compartments and the environment and [iv] identify the hazard they represent for organisms. After gathering all these elements, a characterisation of risk is plausible.
Preliminary Estimation of importance (*,1,2 or 3 where *=uncertain and 3 is high)	3
Background including reliability of data, a key reference if possible any other reasons for concern.	**References** 1. Christine G., Benjamín O.O.M. (2018). 2. Shandilya N., *et al*. (2015). 3. 4.14 Environmental factors and the Human Microbiome

Topic	Environmental factors and the Human Microbiome
Initiator(s)	Teresa Borges
Sources **Causative factors** **(see Section 2 of this document)**	 b and f *Microbiome* refers to "the entire habitat, including the microorganisms (bacteria, archaea, lower and higher eukaryotes and viruses), their genome (i.e., genes), and surrounding environmental conditions" (Marchesi and Ravel 2015). A key aspect of the human microbiome is the variation in its composition and function observed among populations, over the human life span, and between body sites such as the gut, skin, or respiratory microbiome. Research is showing that the human microbiome has a modulating role between environmental factors and the health status (Fallani 2016; Gibson *et al*. 2016; Yassour *et al.* 2016; Chu *et al*. 2017). On the other hand, microbial changes in the human microbiome are being linked to an array of neurological, gastrointestinal, metabolic, oncologic, hepatic, respiratory and auto immune disorders (Lynch and Pedersen 2016). In this sense, it seems sensible to have a better understanding on the relation between human exposure to environmental stressors, changes occurring in the human microbiome and onset of certain health conditions. Additionally, there is sufficient scientific knowledge on toxicity and risk assessment of a great number of environmental chemicals, generated during the last decades under several regulatory frameworks (WHO, IPCS, EPA, EFSA, ECHA) that can contribute substantially to gaining a better understanding of the underlying critical factors.
Hazard (Rank features as 1,2,3 or *) **- uniqueness** **- soundness** **- severity** **- scale** **- urgency** **- interactions**	 2 2 * 2 2 3
Parallels with past emerging issues. Potential interactions with other stressors	The structure and function of the human microbiome in both disease and healthy states have been benefiting from improvements in high-throughput and accuracy of DNA sequencing of the genomes of microbial communities that are associated with human samples, complemented by OMICS analysis (transcriptomes, proteomes, metabolomes and immunomes) and by mechanistic experiments in model systems. Also, as a result of international projects dedicated to the Human Microbioma, gut microbioma has been subjected to intensive research and quality criteria and standardisations have been developed i.e. reference microbiota strains, in housing protocols, human sampling protocols. Presently, gut

	microbes can be transplanted effectively and under experimental controlled conditions into germ-free mice to recapitulate their associated phenotypes (Blanton *et al*., 2016). Also, Schwarzer *et al.* (2016) showed in mice that strains of *Lactobacillus plantarum* in the gut microbiota sustained growth hormone activity via signalling pathways in the liver, thus overcoming growth hormone resistance. This evidence strengthens the correlation between the changes in children's gut microbiota composition and children's growth factors, therefore showing that beneficial gut microbes can potentially be exploited to resolve undernutrition syndromes in children. It is expected that in the near future, metrics and biomarkers will be identified to set more effective measures and health therapies (Dietert and Silbergeld 2015).
Preliminary Estimation of importance (*,1,2 or 3 where *=uncertain and 3 is high)	2
Background including reliability of data, a key reference if possible any other reasons for concern.	**References** 1. Gilbert J.A., Blaser M.J., Caporaso J.G., Jansson J.K., Lynch S.V., Knight R. (2018). 2. Schwarzer M., *et al* (2016). 3. Blanton L.V*. et al.* (2016). 4. Collado M.C. *et al.* (2016) 5. Fallani 2016; Gibson *et al.* 2016; Yassour *et al*. 2016; Chu et al. 2017. 6. 5. CONCLUSIONS

The SCHEER identified 14 emerging issues to bring to the attention of the Commission services. The overall prioritisation scores (*, 1,2,3 where *=uncertain and 3 is high) are as follows:

4.1	Personal communication and listening devices	1
4.2	Virtual reality	3
4.3	E-cigarette and chronic diseases	3
4.4	Potential effects on wildlife of increases in electromagnetic radiation	3
4.5	Chemicals in recycled materials, an issue in a circular economy	3
4.6	Pharmaceuticals (human and veterinary) and illicit drugs in wastewater and surface waters	3
4.7	Substance Mobility: a new criterion in chemicals regulation	3
4.8	Drinking water treatment interactions with compounds and potential health effects	2
4.9	Per- and polyfluorinated organic substances	2-3
4.10	New RNA pesticides and gene editing to reduce/eradicate pest populations	3
4.11	Do-it-Yourself Synthetic Biology, biohacking	3
4.12	Micro and nano-plastic in the environment	*
4.13	Nanoparticles released from Building Materials and construction waste to the Environment	3
4.14	Environmental factors and the Human Microbiome	2
