RESPONSUM

om

hvorvidt det vil være i strid med menneske- og miljøretlige regler at etablere 5G-systemet i Danmark

ENDELIG UDGAVE

Rachel Santini, leder af forskernetværket "Dansk Institut for Folkesundhed", Rådet for Helbredssikker Telekommunikation, EHS-foreningen og Oplysningsforbundet May Day har bedt mig udarbejde et responsum om ovennævnte problemstilling.

Responsummet baseres på retsreglerne i Den Europæiske Menneskerettighedskonvention, FN's børnekonvention, EU's habitatdirektiv, fuglebeskyttelsesdirektiv og forsigtighedsprincip, samt Bern- og Bonn-konventionerne om beskyttelse af dyr og planter.

Besvarelsen er opdelt i et pkt. 1, som vedrører faktum (om 5G-systemet samt forskning i skadevirkninger ved radiofrekvent elektromagnetisk stråling), og et pkt. 2, der sammenholder faktum med ovennævnte retsregler. Pkt. 3 indeholder en overordnet konklusion.

Indholdsfortegnelse

1. Faktum.

1.1. Hvad er 5G?

"5G" er en samlebetegnelse for den næste (femte) generation af kommunikationssystem til mobiltelefoner og internetbrug. Det har ikke nogen lovbaseret definition og er tilsyneladende hverken fuldstændigt fastlagt eller standardiseret.

Den tilgængelige information om det påtænkte system kommer primært til udtryk via de tiltænkte opgaver og formål, som 5G skal varetage, jf. f.eks. Europa-Kommissionens "Working document" af 14. september 2016, pkt. 3, og teleindustriens 5G-manifest[1] af 7. juli 2016.

5G-systemet er bl.a. beskrevet således i den videnskabelige litteratur, jf. Neufeld og Kuster (2018), p. 705:

"THE FIFTH generation of wireless communication technology (5G) promises to facilitate transmission at data rates up to a factor of 100 times higher than 4G. For that purpose, higher frequencies (including millimeter-wave bands), broadband modulation schemes, and thus faster signals with steeper rise and fall times will be employed, potentially in combination with pulsed operation for time domain multiple access. 5G is designed as a ubiquitous communication system spanning applications such as high-bandwidth mobile data and telephony, real-time machine-to-machine communication (e.g., autonomous mobility), and the Internet of Things (IoT)."

Det er bl.a. ikke endnu fastlagt, hvilke frekvensbånd 5G-systemet ville benytte, og det fremgår af følgende tabel, at de frekvenser, der bl.a. overvejes, er de samme, som hidtil har været udnyttet til tidligere generationer[2]:

Table 1: The Main Frequency Bands for 5G Standards Taken up Globally

Frequency Band	Frequency Range	Countries/Regions	Comments
Low Band	<1 GHz (UHF) usually 600/700 MHz	EU, USA, India	Current favourite as longer range, so less costly infrastructure and more familiar technology
Mid Band	3-5 GHz (above UHF)	EU, Korea, Rep., China, India with USA at 2 GHz; China and Japan in 2020	More spectrum available, with compromise on range and performance
High Band	20-100 GHz	EU, USA, Korea, Rep.; in 2020 - China, Japan, India	Short range (10-150m), high speed, low latency

Source: Bertenyi, 2017; authors.

Det hedder i et svar af 1. april 2019 fra Energi-, Forsynings- og Klimaministeren til folketingets udvalg om samme om systemets påtænkte implementering i Danmark bl.a.:

"De grænseværdier, der bliver anvendt i Danmark, har baggrund i anbefalinger fra EU, der er baseret på værdier fastlagt af den Internationale Kommission for Ikke-ioniserende Stråling

1 http://ec.europa.eu/newsroom/dae/document.cfm?action=display&doc_id=16579

2 Tabellen er anvendt i Europa-Parlamentets rapport af april 2019 om "5G Deployment – State of play in Europe, USA and Asia", s. 10.

(ICNIRP).

Teleselskaberne skal sikre overholdelse af grænseværdierne, som er 2 W/kg, hvor folk opholder sig og færdes. Disse grænseværdier er teknologineutrale og det betyder, at grænseværdierne gælder, uanset hvilken teknologi der er tale om fx 2G, 3G, 4G eller 5G.

Teleselskaberne har oplyst, at de forventer, at antallet af antennepositioner vil blive forøget med 15-25 % frem mod 2025 som følge af udrulningen af 5G. Det er teleselskabernes forventning, at den samlede elektromagnetiske eksponering (stråling) vil blive øget med 10-20 % i forhold til i dag.

Teleselskaberne forventer, at eksponeringen fra mobilnettene fortsat vil ligge langt under grænseværdierne, også når 5G-nettene er fuldt udbyggede.

5G-nettet vil være baseret på højere frekvenser end de øvrige teknologier, og mobilsignalerne vil derfor række kortere. Det betyder, at der vil være behov for at lave et mere fintmasket net med flere basestationer (small cells). Disse basestationer vil sende med en lavere effekt end fx de antenner, som sender på 2G, 3G og 4G. Strålingen vil derfor også være tilsvarende mindre."[3]

1.2. Forskningen.

I hvert fald siden 1966 har der været videnskabelig forskning, som dokumenterede helbredsmæssige skadevirkninger ved elektromagnetiske felter.[4]

Det er denne forskning, som skal sammenholdes med det påtænkte 5G-systems kendte karakteristika, jf. pkt. 1.1. ovenfor, og de "grænseværdier" (maksima for udledning af en bestemt form for miljøpåvirkning), der p.t. anvendes i EU og Danmark, jf. pkt. 2.1. nedenfor.

Det har ikke været praktisk muligt at gennemgå det fulde tilgængelige videnskabelige materiale, som underbygger de ovenfor beskrevne skadevirkninger på menneskers og dyrs helbred ved eksponering for radiofrekvent elektromagnetisk stråling, da dette materiale tæller flere tusinder artikler.

Det gennemgåede materiale er dels fremfundet af undertegnede selv, dels fremsendt af bestiller, herunder efter anmodning fra undertegnede.

1.2.1. Fokus i nærværende responsum.

Opmærksomheden er centreret omkring de resultater, der positivt dokumenterer enten egentlige skadevirkninger eller risici herfor på mennesker, dyr og planter.

I det omfang sådanne dokumenterbare forskningsresultater foreligger, er disse i sagens natur af langt større betydning end undersøgelser, der ikke har været i stand til at identificere en skadevirkning eller risiko herfor, al den stund sidstnævnte gruppering ikke i sig selv udelukker, at der rent faktisk er skadevirkninger eller risici.

Er det én gang lødigt videnskabeligt bevist, at der er enten skadevirkning eller risiko for skade, er det ikke relevant, om der ti andre gange er gennemført lødige forsøg, som ikke kunne påvise en sådan skadevirkning eller risiko. Det er blot op til videnskaben at afklare, hvorfor de ti øvrige lødige forsøg ikke påviste det, der nu foreligger videnskabeligt bevist, for på denne

3 Se i øvrigt pkt. 2.1 nedenfor om de i Danmark anvendte grænseværdier.

4 Jf. Pall 2018 p. 9, der henviser til Marha K. 1966, artiklen: *"Biological effects of high-frequency electromagnetic fields (translation)"*.

måde bedre at kunne forstå, hvorfor og hvordan skaderne opstår eller kan opstå.[5]

Dette kan muligvis illustreres med undersøgelse af bestanden af svaner: Konstateres det ved én undersøgelse, at der findes sorte svaner, er det ikke relevant, at der ved ti andre undersøgelser ikke er fundet nogen svaner, der var sorte. Det er nu engang påvist, at den sorte svane eksisterer, og det kan muligvis være nyttigt at afklare, hvorfor de ti andre undersøgelser ikke konstaterede det samme.[6]

Det ville være misvisende, om man forsøgte sig med en "statistisk gennemsnitsbetragtning", og på den måde f.eks. konkluderede, at der kun er 1/11 sandsynlighed for, at den sorte svane rent faktisk findes, fordi dette kun er bevist ved én undersøgelse, mens ti andre ikke fandt noget bevis herfor.

1.2.2. Mennesker: Helbredsmæssige skader og risici.

1.2.2.1. DNA-skader.

I 2015 foretoges en videnskabelig gennemgang af de dengang mere end 100 tilgængelige peer-reviewed studier, som vedrørte undersøgelsen af såkaldt "oxidative effekter" af lavintensitets-radiofrekvent stråling (herefter forkortet: RFR).

Undersøgelsen (Yakymenko et al 2015[7]) viste bl.a., at det var plausibelt, at EHS-lignende[8] tilstande i hvert fald til dels forårsages af eksponering over for lav-intensitets RFR (p. 195), og at eksponeringen kunne medføre kræft (p. 196), begge fremkaldt af "oxidativt stress". Det konstateredes således, at 93% af undersøgelser viste at strålingen medførte dannelsen af reaktive oxidative forbindelser og oxidativt stress i alle undersøgte levende organismer fra celler, planter, insekter, forsøgsdyr til mennesker (sædceller), jf. ibid. p. 186.

Yakymenko et al 2015, p. 186:

"All above mentioned studies dealt with the effects of low-intensity RFR. This means that the intensity of radiation was far below observable thermal effects in biological tissues, and far below safety limits of the International Commissions on Non-Ionizing Radiation Protection (ICNIRP) (ICNIRP, 1998)."[9]

Ibid., p. 187:

"Low-intensity RFR is referred to as radiation with intensities which do not induce significant thermal effects in biological tissues. Accordingly, any intensity of RFR under the ICNIRP limits can be referred to as low-intensity. In this paper we will analyze only the effects of low-intensity RFR."

Ibid., p. 196 (konklusion):

"...a broad biological potential of ROS and other free radicals, including both their mutagenic effects and their signaling regulatory potential, makes RFR a potentially hazardous factor for

5 Se i samme retning Philips et al (2009), *"Electromagnetic fields and DNA damage."*, offentliggjort i det videnskabelige tidsskrift "Pathophysiology" nr. 16 (2009), pp. 79–88, pp. 84 – 85. P. 85 anføres: *"Each study to investigate RFR-induced DNA damage must be evaluated on its own merits, and then studies that both show effects and do not show effects must be carefully evaluated to define the relationship of experimental variables to experimental outcomes and to assess the value of experimental methodologies to detect and measure these outcomes (see Section 2)."*

6 Eksemplet er bl.a. anvendt af videnskabsfilosoffen Karl Popper.

7 Offentliggjort i det videnskabelige tidsskrift "Electromagnetic Biology and Medicine", nr. 35 2016, pp. 186 – 202.

8 EHS står for Elektro Hyper Sensitivitet, og er en fysisk lidelse, hvorefter personen får en række symptomer af ophold i nærheden af udstyr, der afgiver elektromagnetisk stråling. Kaldes ofte "el-overfølsomhed".

9 Disse grænseværdier omtales nærmere i pkt. 2.1 nedenfor.

human health. We suggest minimizing the intensity and time of RFR exposures, and taking a precautionary approach towards wireless technologies in everyday human life."

Det amerikansk baserede, forskerdrevne "BioInitiative 2012 - A Rationale for Biologically-based Exposure Standard for Low-Intensity Electromagnetic Radiation" har d. 15. november 2017 offentliggjort en gennemgang af 200 da foreliggende undersøgelser af radiofrekvent elektromagnetisk strålings påvirkning af frie radikaler (*"free radicals"*), som fremkalder såkaldt "oxidativt stress", jf. omtalen af Yakymenko (2015) ovenfor.

Gennemgangen viste, at der i 180 af de 200 undersøgelser (90 %) var konstateret statistisk signifikante effekter, medens der i de sidste 20 (10 %) ikke var reporteret nogen statistisk signifikant effekt.

Martin Pall 2018[10] konstaterede maj 2018, at der på det tidspunkt eksisterede minimum 21 videnskabelige undersøgelser (siden 1971), som dokumenterede DNA-skader ved radiofrekvent elektromagnetisk stråling, og at disse førte til kromosomskader og andre mutationer.

Endvidere konstaterede han, at der var minimum 19 studier (siden 1981), som dokumenterede, at denne stråling fremkaldte frie radikaler og oxidativt stress[11].

REFLEX-studiet (2004) blev gennemført af 12 forskningsinstitutioner på vegne af EU med et budget på 3 mio. euro. Blandt resultaterne var, at der ved en stråleabsorptionsrate (herefter forkortet "SAR") på 1,3 W/kg (dvs. under de af ICNIRP anbefalede grænseværdier på 2,0 W/kg for krop og hoved, jf. pkt. 2.1. nedenfor) skete en betydelig forøgelse af DNA-skader (p. 109):

"RF-EMF exposure at a SAR of 1.0 W/kg and below had no effect on Comet formation in HL-60 cells (expressed as Olive Tail Moment OTM) as compared to control and sham-exposed cells. On the other hand RF-EMF at SAR of 1.3 W/kg and above caused a significant increase in DNA strand breaks. The maximum of this effect was observed at SAR 1.3 W/kg (OTM = 2.20 ± 0.16) and 1.6 W/kg (2.24 ± 0.10)."

Endvidere var denne strålingsstyrke den, som producerede den største effekt på DNA (p. 119, gentaget p. 222):

"...were applied following RF-field exposure of HL-60 cells at that exposure condition with the most significant effect on DNA integrity (1800 MHz, continuous wave, 1.3 W/kg, 24h)."

Ibid., p. 223, afsnit 5.2.1., laboratoriedeltager 2, konklusion 9:

"Within the investigated SAR energy ranges RF-EMF under the in-vitro conditions used are genotoxic in HL-60 cells without affecting cell-cycle distribution cell proliferation or cell progression."

Ibid., konklusion 10:

"The partial-body SAR for any 10-gram tissue like for example the head as exposed region to

10 PhD, prof.emeritus i biokemi og Basic Medical Sciences, Martin L. Pall - *"5G: Great risk for EU, U.S. and International Health! Compelling Evidence for Eight Distinct Types of Great Harm Caused by Electromagnetic Field (EMF) Exposures and the Mechanism that Causes Them"*, pp. 6 – 8.

11 Ibid., pp. 11 – 12.

mobile phone electromagnetic fields should not exceed 2 W/kg according to the Radio-Radiation Protection Guidelines. Notably, our findings on genotoxic effects of RF-fields in HL-60 cells have been shown for SAR levels below these acceptable partial-body SAR levels."

Ibid., p. 223, afsnit 5.2.2., laboratoriedeltager 3:

"Our results imply a genotoxic action of RF-EMFs below proposed radiation safety levels."

Det blev dog tillige samlet set konkluderet (p. 226), at eftersom der "alene" var tale om laboriatorieforsøg, var REFLEX-studiet ikke i sig selv nok til at konkludere, at de (fortsat) gældende grænseværdier medførte fare for menneskers helbred, men at forsøget gjorde en sådan konklusion mere nærliggende. Endvidere konkluderedes, at:

"Furthermore, there exists no justification anymore to claim, that we are not aware of any pathophysiological mechanisms which could be the basis for the development of functional disturbances and any kind of chronic diseases in animal and man."

Udover REFLEX-studiet har der ifølge i øvrigt tilgængelige oplysninger været udført mere end 40 studier, som viser DNA-skader ved eksponering for radiofrekvent elektromagnetisk stråling[12].

Disse omfatter bl.a.:

Burlaka et al (2013), *"Overproduction of free radical species in embryonal cells exposed to low intensity radiofrequency radiation."*[13], p. 223:

"In conclusion,the exposure of developing quail[14] *embryos in ovo to extremely low intensity RF-EMR of GSM 900MHz during at least one hundred and fifty-eight hours discontinuously leads to the significantly increased rates of superoxide and nitrogen oxide generation in embryo cells. This was accompanied by a significantly increased level of lipid peroxidation,a depression of key antioxidant enzymes activity,and significantly,2–3-fold,increased level of oxidative damage of DNA in embryo cells."*

Blank og Goodman (2011), *"DNA is a fractal antenna in electromagnetic fields."*[15], p. 411:

"Since DNA can interact with EMF over a wide range of frequencies, and does not appear to be limited to an optimal frequency, it has the functional properties of a fractal antenna.
…
From the above analysis of the effect of EMF on the stress response, DNA strand breaks and cancer epidemiology, the fractal property of DNA is apparent in the ELF and RF ranges.
…
Electron transfer is a plausible mechanism for EMF interactions with DNA at higher frequencies where higher energies are involved. The damage due to DNA strand breaks that occur at

12 Dokumentationsliste vedhæftes responsummet som **bilag 1**.

13 Offentliggjort i det videnskabelige tidsskrift "International Journal of Radiation Biology" vol. 87, no. 4, 2011, pp. 409-15.

14 Det er almindeligt at anvende dyr til at evaluere helbredsrisici for mennesker, og at anvende sådanne undersøgelser som basis for retningslinjer og grænseværdier, jf. f.eks. Engels et al (2014), *"Anthropogenic electromagnetic noise disrupts magnetic compass orientation in a migratory bird"* (Nature 2014, vol. 509), p. 354:*"...animal studies are commonly used to evaluate human health risks and have contributed to guidelines for human exposures..."* Det foreligger oplyst, at Miljøstyrelsen i skriftligt svar af 20. februar 2019 har oplyst tilsvarende og henvist til European Chemicals Agency med linket https://echa.europa.eu/da/information-on-chemicals/biocidal-active-substances

15 Offentliggjort i det videnskabelige tidsskrift "Experimental Oncology", vol. 35, no. 3, pp. 219 – 225.

higher frequencies, including ionising radiation, is generally attributed to oxidation, another chemical name for electron transfer. Because of the greater energy at higher frequencies, reactive oxygen species, such as peroxides, contribute to the DNA damage. However, DNA strand breaks occur over a wide range of frequencies, and do not demonstrate frequency optima related to molecular reaction kinetics." (understreget her)

Det hedder videre om de p.t. anvendte grænseværdier for menneskers eksponering over for radiofrekvent elektromagnetisk stråling (jf. pkt. 2.1 nedenfor) p. 413:

"...The existing 100 mT ELF exposure limit set by ICNIRP (International Commission for Non-Ionizing Radiation Protection) is many times higher than the 0.4 mT where a doubling of childhood leukemia risk is widely acknowledged. It has also been pointed out that the specific absorption rate (SAR), the widely used thermal standard for EMF safety, does not relate at all to the biological thresholds of the stress response in the ELF and RF ranges, and that the threshold for the same biological process differs by many orders of magnitude in the two ranges (Blank and Goodman 2004)."

Philips et al (2009), *"Electromagnetic fields and DNA damage."*[16], p. 85:

"RFR exposure does indeed appear to affect DNA damage and repair, and the total body of available data contains clues as to conditions producing effects and methodologies to detect them.

…

The lack of a causal or proven mechanism(s) to explain RFR-induced effects on DNA damage and repair does not decrease the credibility of studies in the scientific literature that report effects of RFR exposure, because there are several plausible mechanisms of action that can account for the observed effects. The relationship between cigarette smoking and lung cancer was accepted long before a mechanism was established. ..."

Panagopoulos (2019), *"Comparing DNA damage induced by mobile telephony and other types of* man-made electromagnetic fields*"*[17], p. 53 (resumé):

"The number of studies showing adverse effects on living organisms induced by different types of man-made Electromagnetic Fields (EMFs) has increased tremendously. Hundreds of peer reviewed published studies show a variety of effects, the most important being DNA damage which is linked to cancer, neurodegenerative diseases, reproductive declines etc. Those studies that are far more effective in showing effects employ real-life Mobile Telephony (MT) exposures emitted by commercially available mobile phones...." (understreget her)

Undersøgelsen konstaterer videre, at andre egenskaber end udelukkende signalstyrken er væsentlige årsager til skadevirkningerne, jf. ibid.:

"...The crucial parameter for the intense bioactivity seems to be the extreme variability of the polarized MT signals, mainly due to the large unpredictable intensity changes."

Tilsvarende fra konklusionen, ibid. p. 60:

"The importance of exposure variability shown in the present study implies the need to define EMF-exposures not only by frequency components and average intensity values, but by reporting maximum and minimum intensity as well, frequency variations, pulsing or

16 Offentliggjort i det videnskabelige tidsskrift "Pathophysiology" nr. 16 (2009), pp. 79–88.

17 Offentliggjort i det videnskabelige tidsskrift *"Mutation Research-Reviews in Mutation Research"* nr. 781, 2019, pp. 53–62.

continuous wave, modulation, and - of course - polarization."

Ibid., p. 59 – 60 (konklusion):

"It comes that variability in the EMF exposure is an extremely important factor in order for the specific type of polarized EMF to be able to induce biological/health effects.
…
The extreme and unpredictable variability of the real-life MT signals that apparently seems to be the reason for the corresponding intense bioactivity, does not concern only the 2nd generation (GSM) MT signals tested in our experiments and in the present review, but all existing types of digital MT signals (2nd, 3rd, 4th generation), and all types of modern digital microwave telecommunication signals/EMFs (DECT phones, Wi-Fi routers, etc.), since they all operate under the same principles combining RF carrier signals with ELF pulsing and modulation of similar frequency bands, emitting variable information each moment which in turn makes the emission variable in intensity, frequency, waveform etc. In fact, with every new generation of telecommunication devices (e.g. 3rd, 4th, 5th generation mobile phones or base antennas) the amount of information transmitted each moment (speech, text, images, video, internet, etc.) is increased, resulting in higher variability and complexity of the signals with the living cells/ organisms even more unable to adapt. The result of the recent study that found a real 3rd generation (UMTS) MT EMF to be more bioactive than real 2nd generation (GSM) MT EMF emitted by the same device [36] is in line with this fact." (understreget her)

Studiet D'Silva et al (2017)[18], omtalt som reference [36] i ovennævnte undersøgelse, rummer følgende beskrivelse af sine resultater og konklusion, jf. det tilhørende resumé:

*"**Results:** In our study, the exposure of developing chick embryos to 2G and 3G cell phone radiations caused structural changes in liver in the form of dilated sinusoidal spaces with haemorrhage, increased vacuolations in cytoplasm, increased nuclear diameter and karyorrhexis and significantly increased DNA damage.*
***Conclusion:** The chronic exposure of chick embryo liver to RFR emitted from 2G and 3G cell phone resulted in various structural changes and DNA damage. The changes were more pronounced in 3G experimental group. Based on these findings it is necessary to create awareness among public about the possible ill effects of RFR exposure from cell phone."*

Om den anvendte metode er bl.a. oplyst følgende, ibid. p. 6:

"A popular brand cell phone hand set and a service provider were used for network connection for both 2G and 3G exposure. For exposure activation, the cell phone was rung from another cell phone for duration of three minutes each, every half an hour, with the first exposure given at 12th hour of incubation (4.30 am-4.30 pm). The total exposure for a 12 hour period was 75 minutes followed by 12 hour of exposure-free period. This was repeated daily up to 12th day of incubation."

Studiet refererede endvidere, at:

"Non-thermal stress is more deleterious than thermal stress and is known to cause oxidative stress [5], production of free radicals [6], structural changes in plasma membrane [7], changes in ionic transport [8] and also increased DNA damage [9]."

1.2.2.1.1. Delkonklusion.

Der foreligger klar videnskabelig dokumentation for, at radiofrekvent elektromagnetisk stråling, også under de i Danmark anvendte grænseværdier, jf. pkt. 2.1 nedenfor, forårsager DNA-skader på både mennesker og dyr.

18 Offentliggjort i det videnskabelige tidsskrift *"Journal of Clinical and Diagnostic Research"*, 2017 Jul, Vol-11(7), pp. 5 – 9.

Panagopoulos (2019) dokumenterer, at det ikke alene er strålestyrken, der har betydning for den forventelige skadevirkning. Derudover dokumenteres, at fundene pga. teknologifællesskabet mellem generationerne også vil være gældende for 5G.

1.2.2.2. Kræft.

1.2.2.2.1. Klassificering.

IARC (International Agency for Research on Cancer) er WHOs agentur for kræftforskning.

Agenturet har i 2011 klassificeret elektromagnetisk stråling som "muligvis kræftfremkaldende for mennesker".[19]

En senere videnskabelig undersøgelse offentliggjort november 2018 konkluderede, at der i henhold til IARCs kriterier er grundlag for at klassificere elektromagnetisk stråling som "kræftfremkaldende for mennesker"[20], hvilken var begrundet således, med henvisning til gennemgang af en række undersøgelser foretaget forud herfor:

Miller et al november 2018[21], p. 674:

"...Analysis of a subset of cases (58% of all cases) based on operator-recorded information showed significant brain cancer risks for children with a significant trend of increase in risk with increasing years of use. Based on children's memory of both ipsilateral and contralateral use there were significant increased risk of brain cancer along with a marginal increase of risk with an increasing number of calls..."

Ibid., p. 675:

"Carlberg and Hardell (2013) also reported that persons diagnosed with a glioblastoma multiforme (GBM) exposed to RFR[22] emanating from WTDs[23] had a significantly shorter survival period than those without such exposures."

Ibid., p. 676:

"Coureau et al. (2014) reported on a French national study of mobile phone use and brain tumors (glioma and meningioma) between 2004 and 2006.
…
There was a marginal increase in risk with increasing hours of use (p_{trend}=0.07). A small number of urban users showed a significant 8-fold increased risk for brain tumors excluding temporal or frontal lobes (OR[24] 8.2. 1.37–49.07). The authors commented: 'Finally, we observed increased OR for urban use for gliomas, a result inconsistent with the hypothesis of a higher RF power output during calls in rural areas, documented by some Swedish study. However, our results are consistent with a recent international study showing no difference between rural and urban exposition in most countries except in Sweden, and a Hardell study when considering gliomas separately.'"

Ibid., p. 676:

"Momoli et al. (2017) undertook a re-analysis of the Canadian data from the 13-country case-control Interphone Study (2001–2004).

19 Jf. IARC monograph vol. 102 (2013), p. 419, pkt. 6.3.
20 En såkaldt "klasse 1-klassifikation" i IARC's system.
21 Offentliggjort i det videnskabelige tidsskrift "Environmental Research", 2018 nr. 167, pp. 673 – 683.
22 Radiofrequency radiation, jf. ibid. p. 673.
23 Wireless Transmitter Devices, jf. ibid. p. 673.
24 Odds ratio, jf. ibid. p. 674.

…
For glioma, when comparing those in the highest quartile of use (> 558 lifetime hours) to those who were not regular users, the odds ratio was 2.0 (95% confidence interval: 1.2, 3.4). After adjustment for selection and recall biases, the odds ratio was 2.2 (95% limits: 1.3, 4.1), thus allaying concerns that bias could explain the positive findings in the Interphone study."

Ibid., p. 676:

"Akhavan-Sigari et al. (2014) reported that patients with glioblastoma multiforme who had used cellphones≤3 h per day had better survival than those with cellphone use of ≥3 h per day.
…
This study shows that genetic changes, compatible with carcinogenic effects, result from higher exposure to RFR."[25]

Ibid., p. 676:

"Carlberg and Hardell (2015) performed a pooled analysis from 1997 to 2003 and 2007–2009 of the risk of meningioma from cell and cordless phone use. In total, 1625 meningioma cases and 3530 controls were analyzed. Overall no association with use of mobile or cordless phones was found. However, they reported an increased risk among heavy users of both mobile and cordless phones from various wireless phone types (wireless combines all phone types) (Table 11). The risk increased significantly per 100 h of use from four wireless phones categories."

Ibid., p. 677:

"Hardell et al. (2013a) pooled acoustic neuroma results from casecontrol studies conducted in 1997–2003 and 2007–2009, including 316 participating cases and 3530 controls. ... There is some evidence of a dose-response relationship is evident with mobile and cordless phones associated with ORs of 4.5 and 6.5 respectively for 20 or more years of use. There were similar results per cumulative hours of use (Table 12)."

Ibid., p. 677:

"Moon et al. (2014), in a matched case-control study from Korea examining 119 cases of vestibular schwannoma and 238 controls attending for routine examinations in the same institution found no difference between cases and controls in the duration, time of use or cumulative use of mobile phones. However, in a case-case analysis they found that vestibular Schwannoma tumor volume was greater in those with higher use compared to lower use of mobile phones and in those with regular compared to non-regular use (Table 13)."

Ibid., p. 678:

"Zada et al. (2012) examined data from three major U.S. cancer registries: Los Angeles County, California Cancer Registry, and the National Cancer Institute's Surveillance, Epidemiology and End Result for 12 U.S. states (SEER 12) from 1992. The APC for GBM (grade IV glioma) and Glioma was reported by brain region. Table 17 shows APC changes by cancer registry for GBM and for glioma located in three anatomical regions of the brain, showing significant increases compatible with increasing use of mobile phones.
Consistent with the study above, Cardis et al. (2011) reported that the combined percentage of the total radiation absorbed by the frontal lobe (19%), the temporal lobe (50%) and the cerebellum (18%) was 81% at 900 MHz and was 86% at 1800 MHz (frontal lobe 14%, temporal lobe 50%, cerebellum 13%)."

Ibid., p. 679:

25 Patienterne i studiet (63 voksne, heraf 38 M 25 K) blev opereret for kræftsvulster år 2008 – 2011, jf. Akhavan-Sigari et al 2014, p. 117.

"7. Case series

West et al. (2013) reported multiple[26] primary breast cancers in young women who had regularly placed a cellphone in their bras (Table 20). Tumors were reported to have occurred subcutaneously directly under the antennas of the phones. Subsequently, a number of other such cases have come to light with unusually located breast tumors relative to reported cell phone storage in the bra.
Peleg (2012) discussed a cancer cluster among young workers at an Israeli Antenna Range Facility. It was believed that significant RFR exposures took place as a result of workplace conditions. Five of about 30 workers were diagnosed with cancer. This was regarded as significantly greater than the expectation. Peleg et al. (2018) extended this analysis to 47 patients with cancer previously exposed to whole-body prolonged RFR, mainly from communication equipment and radar. They found that the percentage frequency of haemo-lymphatic (HL) cancers in the case series was very high, at 40% with only 23% expected for the series age and gender profile, 95% confidence interval: 26–56%, $p < 0.01$; 19 out of the 47 patients had HL cancers.
Stein et al. (2011) studied 56 cancers among 49 military personnel (47 male, 7 females) exposed to intense prolonged RFR between 1992 and 2011. Based on exposure information reconstructed from reported histories, it was assumed that significant RFR exposures took place as a result of workplace conditions. The average duration of exposure was 13 years; the average age at diagnoses was 43. There appeared to be an excess of both haemolymphatic and testicular cancers."

Ibid., p. 680 (diskussion af resultater):

"Nevertheless[27], recent case-control studies from Sweden and France corroborate findings of earlier studies in providing support for making a causal connection between cell phone use and brain cancer, as well as acoustic neuroma, also called Vestibular Schwannoma. Hardell and Carlberg (2013) concluded that the Bradford Hill criteria for causality have now been fulfilled. It is notable that three recent meta-analyses all confirm significant increased risk of glioma after 10 or more years of use of cell phones (Bortkiewicz et al., 2017; Prasad et al., 2017; Yang et al., 2017). The Aydin et al. (2011) data that relied on billing records along with children's recall of their uses of phones approaches and in some instances met conventional tests of statistical significance and indicated that four years or more of heavy cell phone radiation causes glioma in children. This finding is consistent with that of Hardell and Carlberg (2015) who showed that those who began using cell phones and/or cordless phones regularly as children had between 4 and 8-fold increased risk of glioma as adults."

Ibid., p. 680 (diskussion af resultater):

"Potential cancer sites and other outcomes for consideration in new studies include... Other sites than brain and acoustic neuroma could potentially increase in incidence when untested whole-body exposure occurs, this may be the case with several evolving technologies....other possible sources of exposures that have not been evaluated include areas close to cellular base station antennas, the yet-to-be introduced 5 G communication systems, and rapidly evolving occupational exposure and novel systems for Wi-Fi (Peleg, 2009)."

Ibid., p. 681 (diskussion af resultater):

"There are indications particularly from the Ramazzini animal studies that other environmental exposures might make people more susceptible to a combination of exposures (Falcioni et al., 2018). This combinatorial issue been noted in studies of occupational exposure to chemicals, metals and electromagnetic fields (Navas-Acien et al., 2002). Separately, no effects were

26 Der var tale om 4 patienter i alderen 21, 21, 33 og 39, jf. ibid. tabel 20.

27 Citatet er i artiklen efterstillet en gennemgang af sædvanlige forbehold i forbindelse med anvendelse af de forskellige, gængse forskningsmetoder, som ligeledes har været anvendt i de i artiklen omhandlede studier.

observed but when combined with EMF strong results were found. In the Ramazzini studies finding a synergistic interaction between RFR and ionizing radiation, RFR served as a promoter while in the NTP animal studies RFR served as a direct carcinogen and genotoxic agent (National Toxicology Program, a, b, 2018.).”

Ibid., p. 681 (diskussion af resultater):

”Individual hypersensitivity to electric and radiofrequency fields (EHS) is a relatively newly reported phenomenon in the west, although cases of radiation sickness have been found in the former Soviet literature from the 1960s and 1970s. Case studies and individual reports together identify a population which would benefit from RFR exposure reduction (Davis et al., 2017). Because of serious methodological difficulties in operationalizing the concept and a lack of investment in research, definitive epidemiological studies of EHS have not yet been conducted.”

Ibid., p. 681 (diskussion af resultater):

”However, non-cancer outcomes such as sperm damage, hearing loss and loss of visual acuity are likely to be more commonly linked to mobile phone use.”

Ibid., p. 681 (konklusioner):

”The Epidemiological studies reported since the 2011 IARC Working Group meeting are adequate to consider RFR as a probable human carcinogen (Group 2 A). However, they must be supplemented with the recently reported animal data as performed at the Ramazzini Institute and the US National Toxicology Program as well as by mechanistic studies. <u>These experimental findings together with the epidemiology reviewed here are sufficient in our opinion, to upgrade the IARC categorization of RFR to Group 1, carcinogenic to humans.</u>
…
In light of the evolving science concerning mobile phone and screen time exposures and the longer-term risk of cancer established by both epidemiological and toxicological studies, current evidence is strong enough to go from precaution concerning possible risk to prevention of known risks.
…
The precautionary principle should be applied now and suitable warning messages provided to adults and critically to children and their parents.
…
experimental evaluations and modeling are essential before distributing newer systems (e.g. 5 G) for which no safety data have been obtained. The absence of systematic testing of such technologies should not be confused with proof of safety.
…
In the meantime, the evidence amassed thus far from epidemiology strengthens the case for instituting the precautionary principle with respect to exposures to RFR, especially to young children and men and women that wish to reproduce. … Where studies have been carried out on human sperm quantity and quality there are increasing indications of serious human health impacts. To ignore those findings and subject humans to unevaluated novel RFR frequencies places current and future generations at risk.” (understreget her)

<u>1.2.2.2.2. Øvrigt.</u>

En lang række øvrige videnskabelige studier bekræfter, at udsættelse for radiofrekvent elektromagnetisk stråling (også under de p.t. i Danmark anvendte grænseværdier, jf. pkt. 2.1 nedenfor) kan være kræftfremkaldende. En række af dem er:

<u>Blank og Goodman (2011)</u>, *”DNA is a fractal antenna in electromagnetic fields.”*[28], p. 411:

28 Offentliggjort i det videnskabelige tidsskrift ”Experimental Oncology”, vol. 35, no. 3, pp. 219 – 225.

"Regarding the connection between EMF and the incidence of cancer, the different EMF energy levels in the non-ionising and ionising ranges all involve interaction with and activation of DNA and induction of protein synthesis. The ability of EMF to cause DNA strand breaks and damage to proteins in the non-ionising range is similar to the destructive effects on DNA of the much more energetic X-rays and gamma rays in the ionising ranges, where it is generally acknowledged that the cancers are due to DNA damage. The recent epidemiology studies in the non-ionising range link EMF-caused changes in DNA with cancer. Additional support comes from the study showing that the absence of DNA repair genes is associated with a greater incidence of leukemia from exposure to low frequency EMF (Yang et al. 2008)." (understreget her)

Lerchl et al (2015), *"Tumor promotion by exposure to radiofrequency electromagnetic fields below exposure limits for humans"*, p. 585 (resumé):

"...Since many of the tumor-promoting effects in our study were seen at low to moderate exposure levels (0.04 and 0.4 W/kg SAR), thus well below exposure limits for the users of mobile phones, further studies are warranted to investigate the underlying mechanisms. Our findings may help to understand the repeatedly reported increased incidences of brain tumors in heavy users of mobile phones."

Yakymenko et al 2015, jf. pkt. 1.2.1. ovenfor, viste bl.a., at lav-intensitets RFR kunne medføre kræft (p. 196).

Prasad et al (2017), *"Mobile phone use and risk of brain tumours: a systematic review of association between study quality, source of funding, and research outcomes."*[29], p. 808 (konklusion):

"In our review of the literature and meta-analysis of case–control studies, we found evidence linking mobile phone use and risk of brain tumours especially in long-term users (>10 years). We also found a significantly positive correlation between study quality and outcome in the form of risk of brain tumour associated with use of mobile phones. Higher quality studies show a statistically significant association between mobile phone use and risk of brain tumour. Even the source of funding was found to affect the quality of results produced by the studies."

Der er tale om et systematisk, videnskabeligt review af den foreliggende forskning, som altså fandt klar basis for at kæde brugen af mobiltelefoner sammen med kræftsvulster i hjernen.

Endvidere fandt det pågældende review, at de studier, der havde den bedste videnskabelige kvalitet, var de samme, som dem, der fandt den pågældende sammenhæng, og at finansieringskilden også havde spillet en rolle i studiernes kvalitet.

Det amerikanske National Institute of Health udgav november 2018 rapporten *"TOXICOLOGY AND CARCINOGENESIS STUDIES IN Hsd:SPRAGUE DAWLEY SD RATS EXPOSED TO WHOLE-BODY RADIO FREQUENCY RADIATION AT A FREQUENCY (900 MHz) AND MODULATIONS (GSM AND CDMA) USED BY CELL PHONES"*, hvoraf fremgår p. 125 - 126 (konklusioner):

"GSM-Modulated RFR

29 Offentliggjort i det videnskabelige tidsskrift "Neurological Sciences", 2017, vol. 38, pp. 797 – 810.

Under the conditions of this 2-year whole-body exposure study, there was clear evidence of carcinogenic activity[30] of GSM-modulated cell phone RFR at 900 MHz in male Hsd:Sprague Dawley SD rats based on the incidences of malignant schwannoma of the heart. The incidences of malignant glioma of the brain and benign, malignant, or complex pheochromocytoma (combined) of the adrenal medulla were also related to RFR exposure. The incidences of benign or malignant granular cell tumors of the brain, adenoma or carcinoma (combined) of the prostate gland, adenoma of the pars distalis of the pituitary gland, and pancreatic islet cell adenoma or carcinoma (com-bined) may have been related to RFR exposure. There was equivocal evidence of carcinogenic activity of GSM-modulated cell phone RFR at 900 MHz in female Hsd:Sprague Dawley SD rats based on the incidences of schwannomas of the heart.*

…

CDMA-Modulated RFR

Under the conditions of this 2-year whole-body exposure study, there was clear evidence of carcinogenic activity of CDMA-modulated cell phone RFR at 900 MHz in male Hsd:Sprague Dawley SD rats based on the incidences of malignant schwannoma of the heart. The incidences of malignant glioma of the brain were also related to RFR exposure. The incidences of adenoma of the pars distalis of the pituitary gland and adenoma or carcinoma (combined) of the liver may have been related to RFR exposure. There was equivocal evidence of carcinogenic activity of CDMA-modulated cell phone RFR at 900 MHz in female Hsd:Sprague Dawley SD rats based on the incidences of malignant schwannoma of the heart, malignant glioma of the brain, and benign, malignant, or complex pheochromocytoma (combined) of the adrenal medulla. Increases in nonneoplastic lesions of the heart, brain, and prostate gland in male rats, and of the brain in female rats occurred with exposures to CDMA-modulated RFR at 900 Mhz." (understreget her)

Om den umiddelbare overførbarhed af disse resultater på mennesker hedder det, ibid. p. 125:

"The malignant schwannomas of the heart observed in male rats in the current studies and the malignant gliomas observed in the brain of male rats, arise from the same cell type as the acoustic neuromas (vestibular schwannomas) observed in humans, though in a different location. This lends credence to the possible association of these tumors with cellular phone use. The cellular origin of malignant gliomas in the rat brain is unclear, but they do arise from glial cells (support cells in the brain), as do human glioblastomas, so it is possible that such an association exists for these tumors as well. However, the interpretation of these findings with respect to specific risks to humans from cellular telephone use is beyond the scope of the current studies. Further efforts to characterize the molecular basis by which RFR elicits its effects in rats, and a more complete assessment of the exposure conditions in the current studies in relation to exposures to humans from cellular telephone technologies should provide con-text to aid understanding of the implications of the current findings to human health." (understreget her)

Falcioni et al. (2018), *"Report of final results regarding brain and heart tumors in Sprague-Dawley rats exposed from prenatal life until natural death to mobile phone radiofrequency field representative of a 1.8 GHz GSM base station environmental emission"*[31], p. 496 (resumé):

"The RI[32] findings on far field exposure[33] to RFR are consistent with and reinforce the results of

30 Asterisken refererer til undersøgelsens p. 16, hvor de forskellige bevisstandarder er nærmere defineret. "Clear evidence" er defineret som: *"...studies that are interpreted as showing a dose-related (i) increase of malignant neoplasms, (ii) increase of a combination of malignant and benign neoplasms, or (iii) marked increase of benign neoplasms if there is an indication from this or other studies of the ability of such tumors to progress to malignancy."*

31 Offentliggjort i det videnskabelige tidsskrift "Environmental Research", 2018, vol. 165, pp. 496 – 503.

32 RI står for "Ramazzini Institute", som var det forskningsinstitut, hvor undersøgelsen blev foretaget.

33 Far field exposure indebærer i dette tilfælde, at undersøgelsen genskabte forholdene for bestråling med en 1.8 GHz mobilmast, jf. ibid. p. 497, pkt. 2.1.

the NTP study[34] on near field exposure, as both reported an increase in the incidence of tumors of the brain and heart in RFR-exposed Sprague-Dawley rats. These tumors are of the same histotype of those observed in some epidemiological studies on cell phone users. These experimental studies provide sufficient evidence to call for the reevaluation of IARC conclusions regarding the carcinogenic potential of RFR in humans." (understreget her)

Uddybende er konstateret, jf. ibid. p. 501:

"...The statistically significant increase in the incidence of heart Schwannomas observed in male rats in the late part of their life, both in the RI and NTP studies, are consistent with the epidemiological findings, where the highest increase in risk of vestibular Schwannoma among humans exposed to RFR was observed in men over 50 years of age with the highest cumulative exposure (Hardell et al., 2013, 2003)."

Forsøget blev gennemført således, at de eksponerede dyr blev udsat for en stråleabsorption på estimeret 0,001 til 0,3 W/kg (jf. p. 499), hvilket er betydeligt lavere end den anvendte grænseværdi i Danmark på 2 W/kg, jf. pkt. 2.1 nedenfor.

De statistisk signifikante resultater fremkom i den gruppe af rotter, som var blevet udsat for en feltstyrke på 50 V/m. Dette er under grænseværdien på 58,34 V/m, som anvendes i Danmark for en frekvens på 1,8 GHz, jf. pkt. 2.1 nedenfor.

Martin Pall 2018[35] konstaterede maj 2018, at der på det tidspunkt eksisterede minimum 35 videnskabelige undersøgelser (siden 1978), som dokumenterede, at radiofrekvent elektromagnetisk stråling var kræftfremkaldende.

Panagopoulos (2019), jf. pkt. 1.2.1. ovenfor, henviste ligeledes til "hundreder af peer reviewed-artikler", som viste en række effekter fra elektromagnetiske felter, inkl. kræft (p. 53).

Sundhedsministeren har i sin besvarelse af 12. april 2019 af spørgsmål 693 i Folketingets Sundheds- og Ældreudvalg fremlagt en opgørelse fra Sundhedsdatastyrelsens cancerregister, som viser en klar stigning i registrerede tilfælde af kræft i form af glioblastom inden for de sidste 20 år.

Stigningen er særligt markant fra 2005 til 2006 i aldersgruppen >30 år, og viser gennemsnitligt set en fordobling af tilfældene i denne aldersgruppe i perioden 2006 til 2017, set i forhold til den forudgående periode 1995 til 2006.

Samlet ses en stigning på op mod 80 % i forekomsten i de senere år 2015 – 2017, sammenlignet med det generelle niveau før 2006.

34 "NTP-studiet" er det umiddelbart ovenfor omtalte fra det amerikanske National Health Institute.

35 PhD, prof.emeritus i biokemi og Basic Medical Sciences, Martin L. Pall - *"5G: Great risk for EU, U.S. and International Health! Compelling Evidence for Eight Distinct Types of Great Harm Caused by Electromagnetic Field (EMF) Exposures and the Mechanism that Causes Them"*, pp. 15 – 16.

Den samme fordoblingstendens er dokumenteret i England, jf. Philips et al (2018), *"Brain Tumours: Rise in Glioblastoma Multiforme Incidence in England 1995–2015 Suggests an Adverse Environmental or Lifestyle Factor"*[36], hvoraf fremgår følgende (p. 1, resumé):

*"*Results. *We report a sustained and highly statistically significant ASR*[37] *rise in glioblastomamultiforme (GBM) across all ages.The ASR for GBM more than doubled from 2.4 to 5.0, with annual case numbers rising from 983 to 2531. Overall, this rise is mostly hidden in the overall data by a reduced incidence of lower-grade tumours.* Conclusions. *The rise is of importance for clinical resources and brain tumour aetiology. The rise cannot be fully accounted for by promotion of lower–grade tumours, random chance or improvement in diagnostic techniques as it affects specific areas of the brain and only one type of brain tumour. Despite the large variation in case numbers by age, the percentage rise is similar across the age groups, which suggests widespread environmental or lifestyle factors may be responsible."* (understreget her)

I Holland er dokumenteret en stigning på 20 % over en 21-årig periode fra 1989 til 2010, jf. Vincent et al (2014), *"Changing incidence and improved survival of gliomas"*[38], p. 2311:

"The incidence rate of glioma increased from 4.9 per 100,000 inhabitants in 1989 to 5.9 in 2010..."

1.2.2.3. Andre helbredsskader på mennesker.

Neufeld og Kuster (2018) har i artiklen *"SYSTEMATIC DERIVATION OF SAFETY LIMITS FOR TIME-VARYING 5G RADIOFREQUENCY EXPOSURE BASED ON ANALYTICAL MODELS AND THERMAL DOSE"* konstateret, at selv ved korte eksponeringer over for stråling svarende til den planlagte 5G-stråling med højere frekvenser og/eller ændret modulation, m.v., jf. pkt. 1.1. ovenfor, vil der kunne ske vævsskader på mennesker, jf. p. 705, 706 og 711:

"Extreme broadband wireless devices operating above 10 GHz may transmit data in bursts of a few milliseconds to seconds. …these bursts may lead to short temperature spikes in the skin of exposed people. … To stay consistent with the current safety guidelines, safety factors of 10 for occupational exposure and 50 for the general public were applied. … The results also show that the peak-to-average ratio of 1,000 tolerated by the International Council on Non-Ionizing Radiation Protection guidelines may lead to permanent tissue damage after even short exposures, highlighting the importance of revisiting existing exposure guidelines.
…
THE FIFTH generation of wireless communication technology (5G) promises to facilitate transmission at data rates up to a factor of 100 times higher than 4G. For that purpose, higher frequencies (including millimeter-wave bands), broadband modulation schemes, and thus faster signals with steeper rise and fall times will be employed, potentially in combination with pulsed operation for time domain multiple access. 5G is designed as a ubiquitous communication system spanning applications such as high-bandwidth mobile data and telephony, real-time machine-to-machine communication (e.g., autonomous mobility), and the Internet of Things (IoT). Exposure to radiofrequency (RF) radiation from wireless devices to large radar installations and medical equipment can result in increases in body core temperature or cause localized temperature rises, with the potential for adverse health effects. The thresholds for frequencies above 10 MHz set in current exposure guidelines (ICNIRP 1998; IEEE 2005, 2010) are intended to limit tissue heating.
…
However, short pulses can lead to important temperature oscillations, which may be further exacerbated at high frequencies (>10 GHz, fundamental to 5G), where the shallow penetration depth leads to intense surface heating and a steep, rapid rise in temperature...
…
The recommendations in the ICNIRP guidelines limit the power density during short pulses to 1,000 times the limit for the time-averaged incident power density. The IEEE standard limits the radiant exposure (energy absorption per unit area) during any 100 ms to one-fifth of the total radiant exposure for the whole averaging time. The physical or biological rationales for these limits, however, are not provided.
…
Laakso et al. (2017) … The authors conclude that the current guidelines do not adequately prevent excessive heating from pulsed exposure, as peak temperatures can easily exceed the mean temperature by more than a factor of 3 and suggest that radiant exposure limits be introduced.
Morimoto et al. (2017) … They conclude that the thermal time constants can be as short as 30 s for narrow-beam exposures and that short pulses can carry enough energy to cause injuries;
…
Another conclusion of this study is that the current ICNIRP (1998) and IEEE (2005, 2010) guidelines urgently need to be revised, as the duty cycle of 1,000 currently tolerated can produce unacceptable temperature increases that may result in permanent tissue damage. ..." (understreget her)

Cindy Russell (2018), *"5 G wireless telecommunications expansion: Public health and environmental implications"*, p. 485:

"There are no long term exposure guidelines, nor are there guidelines for low level, non-thermal or biological effects considered in the International Commission on Non-Ionizing

Radiation Protection (ICNIRP) standards which are the basis for standards used worldwide..."

Videre ibid., p. 491:

"Although 5G technology may have many unimagined uses and benefits, it is also increasingly clear that significant negative consequences to human health and ecosystems could occur if it is widely adopted. Current radiofrequency radiation wavelengths we are exposed to appear to act as a toxin to biological systems. A moratorium on the deployment of 5G is warranted, along with development of independent health and environmental advisory boards that include independent scientists who research biological effects and exposure levels of radiofrequency radiation.
…
Public health regulations need to be updated to match appropriate independent science with the adoption of biologically based exposure standards prior to further deployment of 4G or 5G technology."

Martin Pall 2018[39] konstaterede maj 2018, at der kunne påvises følgende yderligere skadevirkninger ved radiofrekvent elektromagnetisk stråling på mennesker:

- nedsat fertilitet og kønsdrift, øgede spontane aborter, m.v. (18 studier siden 1971),
- neurologiske/neorupsykiatriske effekter (25 studier siden 1966),
- apoptose/celledød (13 studier siden 1971),
- hormonelle effekter (12 studier siden 1971), og
- forøget niveau af calciumioner intracellulært, hvilket forårsager en række sygdomme (15 studier siden 1988).

Pall anførte, ibid. p. 1 – 2:

"Each of these effects is produced via the main mechanism of action of microwave/lower frequency EMFs, activation of voltage-gated calcium channels (VGCCs) (Chapter 2). Each of them is produced via what are called downstream effects of VGCC activation. It follows from this that we have a good understanding not only that these effects occur, but also how they can occur. The extraordinary sensitivity of the VGCC voltage sensor to the forces of the EMFs tells us that the current safety guidelines allow us to be exposed to EMF levels that are something like 7.2 milion times too high. That sensitivity is predicted by the physics. Therefore, the physics and the biology are each pointing to the same mechanism of action of non-thermal EMFs. The different effects produced are obviously very deep concerns. They become much deeper and become existential threats when one considers that several of these effects are both cumulative and eventually irreversible.
…
Obviously 4G and 5G will make the situation much worse." (understreget her)

1.2.2.4. Særligt vedr. børn og kræft eller andre helbredsskader.

Der findes en række undersøgelser, hvoraf visse tillige er omtalt ovenfor, som specifikt omtaler skadevirkninger og risici for kræft eller andre helbredsskader for børn, hvoraf fremhæves:

Divan et al (2012), *"Cell phone use and behavioural problems in young children"*[40], p. 524 (resumé):

39 PhD, prof.emeritus i biokemi og Basic Medical Sciences, Martin L. Pall - *"5G: Great risk for EU, U.S. and International Health! Compelling Evidence for Eight Distinct Types of Great Harm Caused by Electromagnetic Field (EMF) Exposures and the Mechanism that Causes Them"*, pp. 8 - 15.

40 Offentliggjort i det videnskabelige tidsskrift "Journal of Epidemiology and Community Health", 2012, vol. 66, nr. 6, pp. 524 – 529.

"The findings of the previous publication were replicated in this separate group of participants demonstrating that cell phone use was associated with behavioural problems at age 7 years in children, and this association was not limited to early users of the technology. Although weaker in the new dataset, even with further control for an extended set of potential confounders, the associations remained."

Denne undersøgelse, som var en gentagelse af en tidligere undersøgelse foretaget af samme forskere, bekræftede, at der var en sammenhæng imellem adfærdsproblemer hos børn i 7-årsalderen og brug af mobiltelefoner hos moderen før fødslen samt børnenes egen brug efter fødslen, uden at det på baggrund af undersøgelsen med sikkerhed kunne lægges til grund, at der var en årsagsforbindelse, jf. p. 529. Undersøgelsen bekræftede således en mulig risiko.

Birks et al (2017), *"Maternal cell phone use during pregnancy and child behavioral problems in five birth cohorts"*[41], p. 1 (resumé, manuskriptudgave):

"Overall, 38.8% of mothers, mostly from the Danish cohort, reported no cell phone use during pregnancy and these mothers were less likely to have a child with overall behavioral, hyperactivity/inattention or emotional problems. Evidence for a trend of increasing risk of child behavioral problems through the maternal cell phone use categories was observed for hyperactivity/inattention problems (OR for problems in the clinical range: 1.11, 95%CI 1.01, 1.22; 1.28, 95%CI 1.12, 1.48, among children of medium and high users, respectively). This association was fairly consistent across cohorts and between cohorts with retrospectively and prospectively collected cell phone use data." (understreget her)

Ibid., p. 13 (konklusion, manuskriptudgave):

"Maternal cell phone use during pregnancy may be associated with an increased risk of behavioral problems, particularly hyperactivity/inattention problems, in the offspring. This is the largest study to date to evaluate these associations and to show mostly consistent results across cohorts with retrospectively and prospectively assessed maternal cell phone use. Still, the interpretation of these results is unclear and should take into consideration that uncontrolled confounding by social factors or maternal hyperactivity may influence both maternal cell phone use and child behavioral problems."

Der er således tale om et forbeholdende, men konsistent, resultat, som bekræfter, at der kan være en øget risiko for helbredsproblemer for børn ved mødres brug af mobiltelefon under graviditeten.

Sudan et al (2018), *"Maternal cell phone use during pregnancy and child cognition at age 5 years in 3 birth cohorts"*[42], p. 155 (resumé):

"We observed patterns of lower mean cognition scores among children in relation to high frequency maternal prenatal cell phone use. The causal nature and mechanism of this relationship remain unknown."

Jing et al (2012), *"The influence of microwave radiation from cellular phone on fetal rat brain"*, p. 64:

"In order to protect human's health from the microwave damage, the relevant radiation limits have been given by many countries. The current limited guidelines for microwave from cellular phone in U.S. and Europe are 1.6 W/kg and 2.0 W/kg, respectively. New lower limits should also be used for children and/or pregnant women.
Due to the proximity of cellular phone antenna to the user's ear and head, the brain is inevitably exposed to EMFs with a relatively high specific absorption ratio (SAR), so the potentially danger from EMFs has been a concern of more and more people, especially by pregnant women.

…

As a whole, the results obtained in the present study indicate that exposure to EMFs of cellular phone (SAR 0.9 W/kg) could induce modifications in the fetal rat brain, not only oxidative stress system but also neurotransmitters. Because of the widespread use of cellular phones, further investigations with complementary techniques will be necessary to understand the mechanism of relation between EMFs of cellular phone and physiological implications."

Det bemærkes, at stråleabsorptionsraten ligger under den p.t. anvendte grænseværdi i Danmark, på 2 W/kg, jf. pkt. 2.1 nedenfor.

Megha et al (2015), *"Low intensity microwave radiation induced oxidative stress, inflammatory response and DNA damage in rat brain"*[43], p. 164 (konklusion):

"In conclusion, prolonged exposure to low intensity microwave radiation at frequencies 900, 1800 and 2450 MHz leads to oxidative stress and inflammatory imbalances which subsequently leads to DNA damage in brain. These findings suggest that microwave radiation induced oxidative stress and inflammatory imbalances may be the causative factors involved in causing DNA strand breaks in brain cells."

Aldad et al (2012), *"Fetal Radiofrequency Radiation Exposure From 800-1900 Mhz-Rated Cellular Telephones Affects Neurodevelopment and Behavior in Mice"*[44], p. 2 og 6:

"Overall, the mice exposed in-utero to radiation were hyperactive, had decreased memory, and decreased anxiety.
…
Our findings indicated significant electrophysiological and behavioral changes in mice exposed in-utero to radiation. The significant trend between the groups treated for 0, 9, 15, and 24 hours/day demonstrates that the effects are directly proportional to usage time, and suggests that safety limits, particularly for pregnant women, can be established. Though it is difficult to translate these findings to human risks and vulnerability, we identify a novel potential contribution to the increased prevalence in hyperactive children, one that is easily prevented. However, it is important to note that hyperactivity and anxiety are closely related and may confound one another.
...
In summary, we demonstrate that fetal radiofrequency radiation exposure led to neurobehavioral disorders in mice. We anticipate these findings will improve our understanding of the etiology of neurobehavioral disorders. The rise in behavioral disorders in developed countries may be, at least in part, due to a contribution from fetal cellular telephone radiation exposure. Further testing is warranted in humans and non-human primates to determine if the risks are similar and to establish safe exposure limits during pregnancy."

44 Offentliggjort i det videnskabelige tidsskrift "Nature Scientific Reports" 2, art.no. 312, 2012. Der er i 2013 udstedt en korrektion til artiklen, som ikke ændrer konklusionerne, der har art.nr.. 1320.

Buchner og Eger (2011), *"Changes of Clinically Important Neurotransmitters under the Influence of Modulated RF Fields—A Long-term Study under Real-life Conditions"*[45], p. 1 (oversat fra tysk):

"Since the 1960s, occupational studies on workers with continuous microwave radiation exposures (radar, manufacturing, communications) in the Soviet Union have shown that RF radiation exposures below current limits represent a considerable risk potential. A comprehensive overview is given in the review of 878 scientific studies by Prof. Hecht, which he conducted on behalf of the German Federal Institute of Telecommunications (contract no. 4231/630402) (2, 3).
As early as the 1980s, US research projects also demonstrated in long-term studies that rats raised under sterile conditions and exposed to "low-level" RF radiation showed signs of stress by increased incidences of endocrine tumors..."

Endvidere p. 9 (summary of results):

"...dopamine levels decrease substantially after the exposure begins. Even after one and a half years, the initial levels are not restored. Six months after the activation of the transmitter, PEA levels decrease continuously over the entire exposure period. Only in the exposure group above 100 µW/m2 is this effect observed immediately. All findings were observed well below current exposure limits (14)." [46]

Tillige p. 12 (epidemiological evidence):

"As part of the German Mobile Telecommunication Research Programme, approximately 3000 children and adolescents were studied in Bavaria for their individual cell phone radiation exposure levels in relation to health problems. Among the various data sets, the data set regarding behavioral problems showed a significant increased risk for both adolescents (OR: 3.7, 95%-CI: 1.6-8.4) and also children (OR: 2.9, 95%-CI: 1.4-5.9) in the highest exposure group (56). For the first time, the "Rimbach Study" provides a model of explanation in biochemical terms. "

Sudan et al (2012), *"Prenatal and Postnatal Cell Phone Exposures and Headaches in Children."* [47], p. 1 (resumé, manuskriptudgave):

"In this study, cell phone exposures were associated with headaches in children, but the associations may not be causal given the potential for uncontrolled confounding and misclassification in observational studies such as this. However, given the widespread use of cell phones, if a causal effect exists it would have great public health impact."

Byun et al (2013), *"Mobile Phone Use, Blood Lead Levels, and Attention Deficit Hyperactivity Symptoms in Children: A Longitudinal Study"* [48], p. 1:

"The results suggest that simultaneous exposure to lead and RF from mobile phone use was associated with increased ADHD symptom risk, although possible reverse causality could not be ruled out."

Herbert og Sage (2013), *"Autism and EMF? Plausibility of a pathophysiological link part II "*, p. 211 (resumé):

"Autism spectrum conditions (ASCs) are defined behaviorally, but they also involve multileveled disturbances of underlying biology that find striking parallels in the physiological impacts of electromagnetic frequency and radiofrequency radiation exposures (EMF/RFR).
…
Brain oxidative stress and inflammation as well as measures consistent with blood–brain barrier and brain perfusion compromise have been documented. Part II of this paper documents how behaviors in ASCs may emerge from alterations of electrophysiological oscillatory synchronization, how EMF/RFR could contribute to these by detuning the organism, and policy implications of these vulnerabilities. It details evidence for mitochondrial dysfunction, immune system dysregulation, neuroinflammation and brain blood flow alterations, altered electrophysiology, disruption of electromagnetic signaling, synchrony, and sensory processing, detuning of the brain and organism, with autistic behaviors as emergent properties emanating from this pathophysiology.
…
All of these phenomena also occur with EMF/RFR exposure that can add to system overload ('allostatic load') in ASCs by increasing risk, and can worsen challenging biological problems and symptoms; conversely, reducing exposure might ameliorate symptoms of ASCs by reducing obstruction of physiological repair.
…
With dramatic increases in reported ASCs that are coincident in time with the deployment of wireless technologies, we need aggressive investigation of potential ASC—EMF/RFR links. The evidence is sufficient to warrant new public exposure standards benchmarked to low-intensity (non-thermal) exposure levels now known to be biologically disruptive, and strong, interim precautionary practices are advocated." (understreget her)

Wiart et al (2008)[49] konstaterede, baseret på modeller af hoveder, at børns hoveder absorberede omkring 2 gange så meget stråling som voksne, jf. p. 3693:

"...The comparisons have also shown that the maximum SAR in 1 g of peripheral brain tissues of child models aged between 8 and 15 is comparable to the maximum SAR in 1 g of peripheral brain tissues of adult models while it is about two times higher for child models aged between 5 and 8. This is certainly due to the smaller thicknesses of pinna, skin and skull. … The results obtained in this study need to be confirmed since they have been derived from data sets of limited size. Nevertheless these results are comparable to those obtained in other studies involving several phantoms (Beard et al 2006, Kainz et al 2005). ..."

Hardell et al (2011), *"Pooled analysis of case-control studies on malignant brain tumours and the use of mobile and cordless phones including living and deceased subjects"* [50], p. 1465 (resumé) fandt:

"...an increased risk was found for glioma and use of mobile or cordless phone. The risk increased with latency time and cumulative use in hours and was highest in subjects with first use before the age of 20."

50 Offentligt i det videnskabelige tidsskrift "International Journal of Oncology" 2011, vol. 38, nr. 5, pp. 1465 – 1474.

Fra Miller et al november 2018, p. 676 – 677:

"In a population-based case-control study of children Li et al. (2012) included 939 leukemia and 394 brain neoplasm[51] *cases newly diagnosed between 2003 and 2007, aged 15 years or less.*

…

They reported that a higher than median averaged APD[52] *was significantly associated with an increased Adjusted Odds Ratio (AOR) for all neoplasms (1.13; 1.01–1.28), and for leukemia (1.23; 0.99–1.52), but not for all brain neoplasms (1.14, 0.83–1.55). They did not specifically analyze data on gliomas."*

Ibid., p. 681 (konklusioner):

"The precautionary principle should be applied now and suitable warning messages provided to adults and critically to children and their parents. Until technology has been devised that substantially lowers exposures, special efforts should be advanced to ensure that the exposures of children are limited to those deemed essential. Children should be encouraged to text to reduce their exposure to RFR, while every attempt should be made to reduce exposure to RFR in schools, as well as homes."

1.2.2.5. Delkonklusion.

Det fremgår klart og videnskabeligt veldokumenteret, at eksponering for radiofrekvent elektromagnetisk stråling (også under de p.t. i Danmark anvendte grænseværdier, jf. pkt. 2.1 nedenfor) kan være kræftfremkaldende, og i så henseende udgør en helbredsfare for mennesker, der kan udvikle sig livstruende.

Dertil kommer den af Pall 2018 opsummerede videnskabelige dokumentation for en række andre skader, inkl. nedsat fertilitet, spontane aborter, neurologiske/neuropsykiatriske effekter, m.v.

Endvidere må det lægges til grund, at børn er særligt sårbare, og adskillige undersøgelser peger på en mulig forbindelse mellem eksponering for radiofrekvent elektromagnetisk stråling og adfærdsvanskeligheder, autisme, forståelsesevner, m.v.

51 Neoplasmer er abnormale væv, som kan udvikle sig til svulster og i værste fald ondartede kræftsvulster.

52 Står for "Average Power Density", jf. ibid. p. 677.

1.2.3. Dyr.

Overordnet kan om dyr henvises til f.eks. Alfonso Balmoris gennemgang af den videnskabelige litteratur i *"Electromagnetic pollution from phone masts. Effects on wildlife"*[53], p. , konklusionerne (der vedrører både fugle, pattedyr og insekter):

"This literature review shows that pulsed telephony microwave radiation can produce effects especially on nervous, cardiovascular, immune and reproductive systems [111]:

- Damage to the nervous system by altering electroencephalogram, changes in neural response or changes of the blood–brain barrier.
- Disruption of circadian rhythms (sleep–wake) by interfering with the pineal gland and hormonal imbalances.
- Changes in heart rate and blood pressure.
- Impairment of health and immunity towards pathogens, weakness, exhaustion, deterioration of plumage and growth problems.
- Problems in building the nest or impaired fertility, number of eggs, embryonic development, hatching percentage and survival of chickens.
- Genetic and developmental problems: problems of locomotion, partial albinism and melanism or promotion of tumors.

In the light of current knowledge there is enough evidence of serious effects from this technology to wildlife. For this reason precautionary measures should be developed, alongside environmental impact assessments prior to installation, and a ban on installation of phone masts in protected natural areas and in places where endangered species are present. Surveys should take place to objectively assess the severity of effects."

1.2.3.1. Fugle.

Der findes en større mængde videnskabelige undersøgelser, som dokumenterer direkte skadevirkning eller risiko herfor på fugle (og følgelig også deres levesteder, hvis f.eks. en mast er placeret tilstrækkeligt nært).

I det følgende gennemgås en række heraf, med fokus på dokumentation for skadevirkninger eller risici:

Balmori (2005), *"Possible Effects of Electromagnetic Fields from Phone Masts on a Population of White Stork (Ciconia ciconia)"*[54], p. 109 og 113 – 114:

"Monitoring of a white stork population in Valladolid (Spain) in the vicinity of Cellular Phone Base Stations was carried out, with the objective of detecting possible effects.
…
Birds are especially sensitive to the magnetic fields [48]. The white stork (Ciconia ciconia) build their nests on pinnacles and other very high places with high electromagnetic contamination (exposed to the microwaves). Also, they usually live inside the urban environment, where the electromagnetic contamination is higher, and remain in the nest a lot of the time, for this reason the decrease on the brood can be a good biological indicator to detect the effects of these radiations. The results indicate a difference in total productivity but not in partial productivity between the near nests and those far from the antennae. This indicate the existence of nests without chicks, or the death of young in their first stages in the nests near cellsites (40% of nest without young, compared to 3.3% in nests further 300 m).
…
The faithfulness of the white stork to nest sites can increase the effects of the microwaves.

53 Offentligt i det videnskabelige tidsskrift *"Pathophysiology"*, 2009, vol. 16.
54 Offentligt i det videnskabelige tidsskrift "*Electromagnetic Biology and Medicine"*, 2005, vol. 24, pp. 109 – 119.

…
Other studies find a decrease of fertility, increase of deaths after the birth in rats and dystrophic changes in their reproductive organs [16]. A recent study shows a statistically significant high mortality rate of chicken embryos subjected to the radiation from a cellphone, compared to the control group [43]. ...”

Den hvide stork er optaget på fuglebeskyttelsesdirektivets ”bilag I” og hører således til de arter, for hvilke der skal træffes ”særlige beskyttelsesforanstaltninger”, jf. pkt. 2.3.2. nedenfor.

Balmori og Hallberg (2007), *”The Urban Decline of the House Sparrow (Passer domesticus): A Possible Link with Electromagnetic Radiation”*[55], p. 141 (resumé):

”During recent decades, there has been a marked decline of the house sparrow (Passer domesticus) population in the United Kingdom and in several western European countries. The aims of this study were to determine whether the population is also declining in Spain and to evaluate the hypothesis that electromagnetic radiation (microwaves) from phone antennae is correlated with the decline in the sparrow population.
Between October 2002 and May 2006, point transect sampling was performed at 30 points during 40 visits to Valladolid, Spain. At each point, we carried out counts of sparrows and measured the mean electric field strength (radiofrequencies and microwaves: 1MHz–3GHz range). Significant declines (P=0.0037) were observed in the mean bird density over time, and significantly low bird density was observed in areas with high electric field strength. The logarithmic regression of the mean bird density vs. field strength groups (considering field strength in 0.1V/m increments) was R = −0 87 P = 0 0001.
The results of this article support the hypothesis that electromagnetic signals are associated with the observed decline in the sparrow population. We conclude that electromagnetic pollution may be responsible, either by itself or in combination with other factors, for the observed decline of the species in European cities during recent years. The appearently strong dependence between bird density and field strength according to this work could be used for a more controlled study to test the hypothesis”

Uddybende i forhold til de fortsat anvendte grænseværdier, jf. pkt. 2.1. nedenfor, konstateredes p. 145 – 146:

”According to this calculation, no sparrows would be expected to be found in an area with field strength >4V/m. ... In monitored Area 14, Plaza de la Libertad, a picocell was installed at the beginning of January 2005 and removed at the end of March 2005. Between January and March 2005, the mean field strength was greater than 3V/m, and the number of sparrows decreased drastically (generally, the number of sparrows increases towards a midwinter peak). In April 2005, after the picocell was removed, the sparrows became abundant again.”

Disse elektriske feltstyrker (V/m) ligger under de af ICNIRP anbefalede og i Danmark anvendte grænseværdier, jf. pkt. 2.1. nedenfor.

Cucurachi et al (2012)[56], *”A review of the ecological effects of radiofrequency electromagnetic fields (RF-EMF)”*, p. 122:

”Balmori (2005) monitored the variation of a population of white storks (Ciconia ciconia) in the vicinity of a GSM base station i.e. 900–1800 MHz with 217 Hz modulation) in search of possible effects from the exposure. Total productivity within 200 m was on average 46% less than that found at a distance greater than 300 m from the emitting station. An analogous significant difference was found in the breeding success: in 40% more of the cases no new-born chicks were found in the nest.
…

55 Offentligt i det videnskabelige tidsskrift ”*Electromagnetic Biology and Medicine”*, 2007, vol. 26, pp. 141 – 151.
56 Offentligt i det videnskabelige tidsskrift ”Environment International”, 2013, vol. 51, pp. 116-140.

Amongst the more recent laboratory studies, evidence of an effect of RF-EMF on mortality and development of embryos was in all cases found at both high and low dosages. In all the five field studies found a significant effect of RF-EMF on breeding density, reproduction or species composition. Field observations give a closer representation of real-life exposure, thus RF-EMF, especially in the 900 MHz GSM band could be a certain factor influencing the ecology of birds."

Burlaka et al (2013), p. 223:

"In conclusion, the exposure of developing quail embryos in ovo to extremely low intensity RF-EMR of GSM 900MHz during at least one hundred and fifty-eight hours discontinuously leads to the significantly increased rates of superoxide and nitrogen oxide generation in embryo cells. This was accompanied by a significantly increased level of lipid peroxidation, a depression of key antioxidant enzymes activity,and significantly, 2–3-fold, increased level of oxidative damage of DNA in embryo cells." (understreget her)

Alfonso Balmori (2015), *"Anthropogenic radiofrequency electromagnetic fields as an emerging threat to wildlife orientation"*[57], p. 59:

Low-voltage electricity current-generated electromagnetic field can produce a significantly negative effect on the breeding success of birds (Ciconia ciconia) nesting directly on electricity lines (Vaitkuvienė and Dagys, 2014) and these same results have been found in nests exposed to radiofrequency radiation near phone masts (Balmori, 2005)."

Yakymenko et al (2015), p. 194:

"We could ascertain the signaling effects of moderate levels of free radicals from our experiments in quail embryos irradiated with the commercial cell phone. Thus, we were able to show that the prolonged exposures of embryos in ovo led to robust repression of their development (Tsybulin et al., 2013), which was concomitant with significant overproduction of superoxide radical and NO radical, increased rates of lipid peroxidation and oxidative damage of DNA (Burlaka et al., 2013; Tsybulin et al., 2012)." (understreget her)

Shende et al (2015), *"Electromagnetic Radiations: A Possible Impact on Population of House Sparrow (Passer Domesticus)"*[58], p. 45:

"By monthly monitoring in urban and rural area, it is found that the population of house sparrow is declining in the urban area, where cell phone towers are more as compared to the rural area in every season."

Et særligt fokusområde i den videnskabelige litteratur udgøres af undersøgelser af radiofrekvent elektromagnetisk strålings virkning på fugles biologisk determinerede muligheder for at orientere sig.

Fugle er – ligesom en række andre dyr, jf. pkt. 1.2.3.2. nedenfor – født med, hvad der kan beskrives som en art indbygget, magnetisk baseret kompas, som indebærer, at de kan finde vej under deres migration.

Der kan bl.a. henvises til Alfonso Balmori (2015), *"Anthropogenic radiofrequency electromagnetic fields as an emerging threat to wildlife orientation"*[59], p. 58 – 59:

"Radio frequency fields in the MHz range disrupt birds' orientation interfering directly with the primary processes of magnetoreception and therefore disable the avian compass as long as

57 Offentligt i det videnskabelige tidsskrift "Science of the Total Environment" 2015, pp. 58 – 60.
58 Offentligt i det videnskabelige tidsskrift "Engineering International", 2015, vol. 3, nr. 1, pp. 45 – 52.
59 Offentligt i det videnskabelige tidsskrift "Science of the Total Environment" 2015, pp. 58 – 60.

they are present (Wiltschko et al., 2014). Ritz et al. (2004 & 2009) reported the sensitivity for orientation of European robins (Erithacus rubecula) to radiofrequency magnetic fields. The orientation of migratory birds is disrupted when very weak high-frequency fields (broadband field of 0.1–10 MHz of 85 nT or a 1.315 MHz field of 480 nT) are added to the static geomagnetic field of 46.000 nT (Thalau et al., 2006). It was convincingly demonstrated that robins are unable to use their magnetic compass in the presence of urban electromagnetic radiofrequency noise in the frequency range of 2 kHz–5 MHz (Engels et al., 2014). Therefore, electrosmog scrambles birds' magnetic sense and this finding could inform policies written to protect the habitats of endangered species.(understreget her)

Balmori (2005), *"Possible Effects of Electromagnetic Fields from Phone Masts on a Population of White Stork (Ciconia ciconia)"*[60], p. 115:

"... The perception to the terrestrial magnetic field can be altered by the electromagnetic radiation from the antennae. The reports of carrier pigeons losing direction in the vicinity of cellsites are numerous, and more investigation is necessary. ..."

Det EU-baserede forskningsprojekt EKLIPSE udgav v/ Malkemper et al i 2018 en rapport med titlen *"The impacts of artificial Electromagnetic Radiation on wildlife (flora and fauna). Current knowledge overview: a background document to the web conference",* hvoraf bl.a. fremgår s. 15:

"...It is established that the magnetic compass of migratory birds can be disrupted by the weak RF background in larger cities (nT-intensities) but it is currently unclear which exact frequencies are most effective. ..."

Ang. denne effekt henvises endvidere til Engels et al (2014), *"Anthropogenic electromagnetic noise disrupts magnetic compass orientation in a migratory bird"*[61], p. 353 (resumé):

"...Here we show that migratory birds are unable to use their magnetic compass in the presence of urban electromagnetic noise. When European robins, Erithacus rubecula, were exposed to the background electromagnetic noise present in unscreened wooden huts at the University of Oldenburg campus, they could not orient using their magnetic compass. Their magnetic orientation capabilities reappeared in electrically grounded, aluminium-screened huts, which attenuated electromagnetic noise in the frequency range from 50 kHz to 5 MHz by approximately two orders of magnitude. When the grounding was removed or when broadband electromagnetic noise was deliberately generated inside the screened and grounded huts, the birds again lost their magnetic orientation capabilities. The disruptive effect of radiofrequency electromagnetic fields is not confined to a narrow frequency band and birds tested far from sources of electromagnetic noise required no screening to orient with their magnetic compass. These fully double-blinded tests document a reproducible effect of anthropogenic electromagnetic noise on the behaviour of an intact vertebrate." (understreget her)

1.2.3.1.1. Delkonklusion.

Ligesom tilfældet er i forhold til helbredsskader og risici herfor på mennesker, forekommer det særdeles videnskabeligt veldokumenteret, at radiofrekvent elektromagnetisk stråling, også den som holder sig inden for de af myndighederne fastlagte grænseværdier, henholdsvis er og kan være helbredsskadeligt for fugle og (in extenso) deres levesteder.

Dertil kommer det særlige forhold ved fugle i forhold til mennesker, at deres evner til at orientere sig til dels er baseret på interaktion med jordens naturligt forekommende magnetfelter. Radiofrekvent elektromagnetisk strålings virkning på fugles biologisk determinerede muligheder for at orientere sig kan være ødelæggende for bevarelsen af arten,

60 Offentligt i det videnskabelige tidsskrift "*Electromagnetic Biology and Medicine"*, 2005, vol. 24, pp. 109 – 119.
61 Offentligt i det videnskabelige tidsskrift "Nature" 2014, nr. 509, pp. 353 – 356.

herunder i de dertil særligt udpegede beskyttede yngleområder. Særligt vedr. dette emne skal dog fremhæves, at dette for indeværende ikke synes at vedrøre 5G-frekvenser, m.v., men det kunne være tilfældet. Studier herom dokumenterer p.t. så vidt ses kun, at fugles biologisk determinerede orienteringssans påvirkes negativt af radiofrekvent elektromagnetisk stråling.

1.2.3.2. Andre dyr.

For så vidt angår insekter kan bl.a. henvises til Alfonso Balmori (2015), *"Anthropogenic radiofrequency electromagnetic fields as an emerging threat to wildlife orientation"*[62], p. 59:

"As with birds, radio frequency magnetic fields disrupt magnetoreception in insects. The geomagnetic field reception in American cockroach is sensitive to weak radio frequency field causing a disruptive effect (Vacha et al., 2009), so these authors suggest that electromagnetic smog will have to be taken more seriously in animal magnetoreception experiments. In an experimentally-generated electromagnetic field of about 1 V/m with a realistic (and even lower) power intensity similar to those surrounding communication masts, the results and observations suggest that GSM (Global System for Mobile communications) 900 MHz radiation might have a severe impact on the nerve cells of exposed ants, especially affecting the visual and olfactory memory, causing the loss of their ability to use visual cues and suggesting that electromagnetic radiation may have an impact on the orientation behaviour and navigation of animals that use magnetic fields to find their way (Cammaerts et al., 2012, 2014). Honeybees are sensitive to pulsed electromagnetic fields generated by mobile phones and observable changes in the bee behaviour could be one explanation for the loss of colonies (Favre, 2011). Magnetoreception system in Monarch butterfly orientation (Guerra et al., 2014) may be also suffering interference with anthropogenic radio frequency magnetic fields and this, together with other factors (Brower et al., 2012), may be a cause of their population decline." (understreget her)

Tilsvarende i Cucurachi et al (2012)[63], p. 116:

"Information was collected from 113 studies from original peer-reviewed publications or from relevant existing reviews… The majority of the studies were conducted in a laboratory setting on birds (embryos or eggs), small rodents and plants. In 65% of the studies, ecological effects of RF-EMF (50% of the animal studies and about 75% of the plant studies) were found both at high as well as at low dosages. ..."

Ibid., p. 122 – 123:

"It has been demonstrated that insects can sense magnetic fields as a means for navigation and orientation (Abraçado et al., 2005; Kirschvink et al., 2001; Liedvogel and Mouritsen, 2010; Wajnberg et al., 2010; Winklhofer, 2010). Magneto-reception has been associated with the use of ferromagnetic iron oxide particles embedded in tissue or through pairs of molecules with unpaired electrons (known as radical pairs) that are associated with a light sensitive photoreceptor (Ritz et al., 2002; Knight, 2009; Vácha et al. 2009). The exposure to RF-EMF might disrupt this magneto-reception mechanism, which could in turn affect the survival of insects. The most commonly studied species are the honey bee (A. mellifera) and the fruit fly (Drosophila melanogaster)."

Og p. 129:

"The studies analysing the effects of RF-EMF on fruit flies found in all cases a significant effect. Results of one study show an increased reproductive success after exposure. The remaining studies, which were conducted by the same research institute in Greece, found in all cases a significant depression of growth and reproduction at both 900 and 1800 MHz. Two studies on

63 Offentligt i det videnskabelige tidsskrift "Environment International", 2013, vol. 51, pp. 116-140.

the American cockroach and a species of ant analysed the effects of exposure to RF-EMF on the magneto-reception and orientation of the insects. The behaviour of target systems was disrupted by the exposure to RF-EMF."

Samt p. 136 (konklusioner):

"...The effects of RF-EMF on different biological groups were investigated. With reference to the groups under investigations in the selected studies (i.e. birds, honeybees, mammals, plants, Drosophila and others) there is ecologically relevant evidence that the RF-EMF caused an effect in about 50% of the animal studies and about 90% of the plant studies. ..."

Kumar et al (2011), *"Exposure to cell phone radiations produces biochemical changes in worker honey bees"*[64], (resumé, resultater og diskussion):

"The present study was carried out to find the effect of cell phone radiations on various biomolecules in the adult workers of Apis mellifera L. The results of the treated adults were analyzed and compared with the control. Radiation from the cell phone influences honey bees' behavior and physiology. There was reduced motor activity of the worker bees on the comb initially, followed by en masse migration and movement toward "talk mode" cell phone. The initial quiet period was characterized by rise in concentration of biomolecules including proteins, carbohydrates and lipids, perhaps due to stimulation of body mechanism to fight the stressful condition created by the radiations.
At later stages of exposure, there was a slight decline in the concentration of biomolecules probably because the body had adapted to the stimulus.
…
Very little work has been done on biochemical, metabolic and physiological influences of cell phone radiations pertaining to health risk in man.[8] Therefore, the present investigations on the influence of cell phone radiations on some biochemical and physiological aspects of honeybee biology were undertaken. That the behavior of honeybee is altered to some extent by high or low energy fields or electromagnetic radiations has been known for quite some time.[9]
During the present investigation, it was observed that there was an increase in concentration of total carbohydrates in the bees exposed to cell phone radiation for 10 min as compared to unexposed or control bees. Increasing the exposure time to 20 min resulted in further increase in the concentration, while an exposure of 40 min had a reverse effect and there was a decline in carbohydrate concentration, though it was still higher as compared to control. Hemolymph glycogen and glucose content also showed the same trend, i.e., there was increase in content up to 20 min exposure after which there was a slight decline in the concentration which remained more than the control. Sharma[10] had also reported increase in glycogen and glucose levels in the exposed pupa of A. mellifera.
Lipids are the major energy reserves of insects. Certain lipid classes are structure components of membranes while others are raw materials for a variety of hormones and pheromones. Estimation of total lipids and cholesterol during the present study showed that the trend was similar to that of carbohydrates. After an initial increase in concentration at the 10 and 20 min exposure period, a decline was observed in the concentration of total lipids and cholesterol at 40 min exposure.
It was interesting to note that during the present study as the exposure time increased, it appeared that the bees having assessed the source of the disturbance decided to move and a large scale movement of the workers toward the talk-mode (not toward the listening mobile) was observed. Also, the bees became slightly aggressive and started beating their wings in agitation. This mobility of the bees could be responsible for increase utilization of energy sources and consequent decrease in concentration of carbohydrates and lipids in the 40 min exposed sample." (understreget her)

Margaritis et al (2014), *"Drosophila oogenesis as a bio-marker responding to EMF sources"*[65], p. 165 (resumé):

"A total of 280 different experiments were performed using newly emerged flies exposed for short time daily for 3–7 d to various EMF sources including: GSM 900/1800 MHz mobile phone, 1880–1900 MHz DECT wireless base, DECT wireless handset, mobile phone-DECT handset combination, 2.44 GHz wireless network (Wi-Fi), 2.44 GHz blue tooth, 92.8 MHz FM generator, 27.15 MHz baby monitor, 900 MHz CW RF generator and microwave oven's 2.44 GHz RF and magnetic field components.
…
All EMF sources used created statistically significant effects regarding fecundity and cell death-apoptosis induction, even at very low intensity levels (0.3 V/m blue tooth radiation), well below ICNIRP's guidelines, suggesting that Drosophila oogenesis system is suitable to be used as a biomarker for exploring potential EMF bioactivity. Also, there is no linear cumulative effect when increasing the duration of exposure or using one EMF source after the other (i.e. mobile phone and DECT handset) at the specific conditions used. ..."

Studiet blev udført på bananfluer, og det blev på baggrund af fundene anbefalet, at dette insekt fremover anvendes som biologisk markør ved undersøgelser af effekter af radiofrekvent elektromagnetisk stråling.

Som det fremgår, opstod der celledød endog ved meget lave intensiteter af stråling, helt ned til 0,3 V/m fra Blue Tooth-produkter.

Undersøgelsen viser, at udstyr som ligger inden for de af ICNIRP anbefalede grænseværdier (f.eks. 61 V/m for udstyr på med et frekvensområde på 2 – 300 GHz), jf. også pkt. 2.1 nedenfor, må forventes at være stærkt skadeligt for insekter.

Visse insekter er omfattet af EU's habitatdirektivbeskyttelse, jf. pkt. 2.3.3. nedenfor.

Dertil kommer, at fugle, der lever af insekter, ligeledes vil få ødelagt deres levesteder. For indholdet EU's fuglebeskyttelsesdirektiv henvises til pkt. 2.3.2. nedenfor.

Cammaerts og Johansson (2014), *"Ants can be used as bio-indicators to reveal biological effects of electromagnetic waves from some wireless apparatus"*[66], p. 286, pkt. 3:

"All radiating sources tested in this study on the ants demonstrated clear and statistically significant effects. It was already known that a mobile phone in standby mode affects living organisms (e.g. see Cammaerts et al.,2011; Favre, 2011; Panagopoulos et al., 2004; Sharma and Kumar, 2010). In this study, we showed that a common mobile phone has an effect while in standby mode and even in off-condition. Of course, when activated, the effect of a mobile phone is stronger. Without its battery, such a phone has no longer an effect. Our ants demonstrated that a modern smartphone and even more so a DECT phone do affect living organisms. Furthermore, the electromagnetic waves generated by a WiFi router impact our ants and such an effect increases during the course of the exposure time. Persons working in rooms provided with wireless equipment should note this result. A modern personal computer also generates electromagnetic waves. This is due to the PC WiFi function, which is automatically activated. Based on these results, we advice users to deactivate the WiFi function of their PC as long as they do not use it. This can also be deduced from the study

related in http://bigbrouser.blog.lemonde.fr/2011/12/01/microonde-le-wi-fi-tueur-de-spermatozoı¨des/." (understreget her)

Særligt for så vidt angår bestøvere skal henvises til Lázaro et al (2016), *"Electromagnetic radiation of mobile telecommunication antennas affects the abundance and composition of wild pollinators"*[67], p. 322 (konklusion):

"Electromagnetic radiation from telecommunication antennas affected the abundance and composition of wild pollinators in natural habitats....Pollinators and their host plants constitute pollination networks. Although the architecture of these mutualistic networks can increase the capacity of pollinator populations to persist under harsh conditions, once a tipping point in human-induced environmental change is reached, pollinator populations may collapse simultaneously (Lever et al. 2014). Therefore, these changes in the composition of pollinator communities associated with electromagnetic smog may have important ecological and economic impacts on the pollination service that could significantly affect the maintenance of wild plant diversity, crop production and human welfare."

Studiet viser således en sammenhæng mellem stråling fra mobilmaster og antallet af (flyvende) insekter.

Sammensætningen af bestøvere må anses for et vigtigt økologisk element og vigtig økonomisk parameter for produktion af afgrøder, menneskets velfærd samt for biodiversiteten generelt.

Vilic et al (2017), *"Effects of short-term exposure to mobile phone radiofrequency (900 MHz) on the oxidative response and genotoxicity in honey bee larvae"*[68], p. 430 (resumé):

"Exposure of different animal species to radiofrequency electromagnetic fields (RF-EMF) could cause various biological effects such as oxidative stress, genotoxic effects and dysfunction of the immune system. However, there are a lack of results on oxidative stress response and genotoxicity in the honey bee (Apis mellifera) after exposure to RF-EMF. This study was performed to investigate the effects of exposure to RF-EMF on the activity of catalase, superoxide dismutase, glutathione S-transferase, lipid peroxidation level and DNA damage in honey bee larvae. Honey bee larvae were exposed to RF-EMF at 900 Mhz and field levels of 10, 23, 41 and 120 V m−1 for 2 h. At a field level of 23 V m−1 the effect of 80% AM 1 kHz sinusoidal and 217 Hz modulation was investigated as well. Catalase activity and the lipid peroxidation level decreased significantly in the honey bee larvae exposed to the unmodulated field at 10 V m−1 compared to the control. Superoxide dismutase and glutathione S-transferase activity in the honey bee larvae exposed to unmodulated fields were not statistically different compared to the control. DNA damage increased significantly in honey bee larvae exposed to modulated (80% AM 1 kHz sinus) field at 23 V m−1 compared to the control and all other exposure groups. These results suggest that RF-EMF effects in honey bee larvae appeared only after exposure to a certain EMF conditions. The increase of the field level did not cause a linear dose-response in any of the measured parameters. Modulated RF-EMF produced more negative effects than the corresponding unmodulated field. Although honey bees in nature would not be exposed to such high field levels as used in our experiments, our results show the need for further intensive research in all stages of honey bee development." (understreget her)

Ibid., p. 437 (konklusion):

"In conclusion, the results of our study showed that effects of RF-EMF at 900 MHz in honey

67 Offentligt i det videnskabelige tidsskrift "Journal of Insect Conservation", 2016, vol. 20, nr. 2, pp. 315 – 324.
68 Offentligt i det videnskabelige tidsskrift "Journal of Apicultural Research", 2017, vol. 56, nr. 4, pp. 430 – 438.

bee larvae appeared only after exposure to the certain EMF conditions. RF-EMF modulated at 1 kHz showed an increase of DNA damage, while unmodulated RF-EMF produced alteration in catalase activity and lipid peroxidation at the lowest field level of 10 V m−1. Evidently, the increase of the field level did not cause a linear dose-response relationship in any of the measured parameters. Although honey bees in nature would not be exposed to such high field levels as used in our experiments, our results show the need for further intensive research in all stages of honey bee development, as well as the intensive research on the possible existence of a "window" effect under natural conditions during the annual cycling of bees."

Thielens et al (2018), *"Exposure of Insects to Radio-Frequency Electromagnetic Fields from 2 to 120 GHz"*, p. 9 (konklusion, manuskriptudgave):

"The insects show a maximum in absorbed radio frequency power at wavelengths that are comparable to their body size. They show a general increase in absorbed radio-frequency power above 6 GHz (until the frequencies where the wavelengths are comparable to their body size), which indicates that if the used power densities do not decrease, but shift (partly) to higher frequencies, the absorption in the studied insects will increase as well. A shift of 10% of the incident power density to frequencies above 6 GHz would lead to an increase in absorbed power between 3–370%. This could lead to changes in insect behaviour, physiology, and morphology over time due to an increase in body temperatures, from dielectric heating. The studied insects that are smaller than 1 cm show a peak in absorption at frequencies (above 6 GHz), which are currently not often used for telecommunication, but are planned to be used in the next generation of wireless telecommunication systems. At frequencies above the peak frequency (smaller wavelengths) the absorbed power decreases slightly."

Som det fremgår af de sidste, understregne linjer, vedrører denne undersøgelse tillige de højere frekvenser over 6 GHz, som vil blive taget i anvendelse ved 5G.

Studier ang. effekt af radiofrekvent elektromagnetisk strålingpå flagermus[69] er gennemført i bl.a. Nicholls og Racey (2009), *"The Aversive Effect of Electromagnetic Radiation on Foraging Bats—A Possible Means of Discouraging Bats from Approaching Wind Turbines",* hvori der bl.a. findes som følger, jf. p. 1 (resumé):

"Large numbers of bats are killed by collisions with wind turbines and there is at present no accepted method of reducing or preventing this mortality. Following our demonstration that bat activity is reduced in the vicinity of large air traffic control and weather radars, we tested the hypothesis that an electromagnetic signal from a small portable radar can act as a deterrent to foraging bats. From June to September 2007 bat activity was compared at 20 foraging sites in northeast Scotland during experimental trials (radar switched on) and control trials (no radar signal). Starting 45 minutes after sunset, bat activity was recorded for a period of 30 minutes during each trial and the order of trials were alternated between nights. From July to September 2008 aerial insects at 16 of these sites were sampled using two miniature light-suction traps. At each site one of the traps was exposed to a radar signal and the other functioned as a control. Bat activity and foraging effort per unit time were significantly reduced during experimental trials when the radar antenna was fixed to produce a unidirectional signal therefore maximising exposure of foraging bats to the radar beam. However, although bat activity was significantly reduced during such trials, the radar had no significant effect on the abundance of insects captured by the traps." (understreget her)

Tilsvarende i Balmori (2009), *"Electromagnetic pollution from phone masts. Effects on*

69 15 arter af flagermus er omfattet af habitatdirektivets bestemmelser om særlige beskyttelsesforanstaltninger, jf. pkt. 2.3.3. nedenfor.

wildlife"[70], p. 4:

"Electromagnetic radiation can exert an aversive behavioral response in bats. Bat activity is significantly reduced in habitats exposed to an electromagnetic field strength greater than 2 V/m [73]. During a study in a free-tailed bat colony (Tadarida teniotis) the number of bats decreased when several phone masts were placed 80m from the colony [74]."

Ang. padder kan bl.a. henvises til Alfonso Balmori (2010), *"Mobile Phone Mast Effects on Common Frog (Rana temporaria) Tadpoles: The City Turned into a Laboratory"*[71], p. 35:

"...Most prevailing hypotheses suggest that a field acts to directionally guide the growth and migration of some embryonic cells (Hotary and Robinson, 1992).
Strong magnetic fields (1.74–16.7T) disrupt cell division of exposed frog eggs (Xenopus laevis) (Denegre et al., 1998). Valles (2002) proposed a model to explain their influence.
Several studies on effects of electromagnetic fields on amphibians have been conducted in laboratories. When amphibian eggs and embryos of Ambystoma maculatum and Rana sylvatica were exposed to high magnetic fields (6.3 103 G), a brief treatment of early embryos produced several types of abnormalities, incuding microcephaly, retarded (abnormal) growth, edema, and scoliosis (Levengood, 1969).
Adult newts (Notophthalmus viridescens) exposed to a pulsed electromagnetic field (1 T and 0.15 V/m, approx.) for the first 30 days post forelimbs were amputated and produced more abnormalities in their skeletal patterns than the native limbs or the normal regenerates. Twelve percent exhibited unique abnormalities not observed in either the native or regenerate limb population. These forelimbs demonstrated one or more of the following gross defects: acheiria (lack of carpus and digits), aphalangia, or oligodactylia (loss of digits) as well as carpal bone and long bone (radius and ulna) abnormalities (Landesman and Douglas, 1990).
Exposed frog tadpoles (Rana temporaria) developed under electromagnetic field (50Hz, 260A/m) show an increase in mortality. Exposed tadpoles developed more slowly and less synchronously than control tadpoles and remained at the early stages for longer. Tadpoles developed allergies and EMF caused changes in their blood counts (Grefner et al., 1998). These results are consistent with the observations of this work.
Deformities and disappearance of amphibians and other organisms is part of the global biodiversity crisis (Blaustein and Johnson, 2003). Some authors consider that the electromagnetic pollution is destroying nature (Warnke, 2007; Firstenberg, 1997).
Balmori (2006) proposed that electromagnetic pollution (in the microwave and radiofrequency range) along with other environmental factors is a possible cause for decline and deformations of some wild amphibian populations exposed. The results of this experiment conducted in a real situation in the city of Valladolid (Spain) indicate that the tadpoles that live near such facilities, exposed to relatively low levels of environmental electromagnetic fields (1.8–3.5V/m) may suffer adverse effects (low coordination of movements, asynchronous growth, and high mortality), and this may be a cause (together with other environmental factors) of decline of amphibian populations." (understreget her)

Studiet er således udført på, hvad der måske er Danmarks mest almindelige frø, butsnudet frø. Dyret er optaget på bilag II til EU's habitatdirektiv, og er således omfattet af særlige beskyttelsesforanstaltninger, jf. pkt. 2.3.3. nedenfor.

Undersøgelsen påpeger, udover indikation for mutationer og en lang række sundhedsskader på padder, at den elektromagnetiske forurening fra selv relativt svage elektromagnetiske felter, miljøet udsættes for, er en mulig årsag (sammen med andre miljømæssige faktorer) til tabet af krybdyrspopulationer.

På mus kan bl.a. henvises til følgende, udover de i øvrigt i responsummet omtalte artikler:

Magras og Xenos (1997), *"RF Radiation–Induced Changes in the Prenatal Development of*

70 Offentligt i det videnskabelige tidsskrift "Pathopsyiology", 2009,
71 Offentligt i det videnskabelige tidsskrift "Electromagnetic Biology and Medicine", 2010, vol. 29, pp. 31 – 35.

Mice", p. 455:

"The possible effects of radiofrequency (RF) radiation on prenatal development has been investigated in mice. This study consisted of RF level measurements and in vivo experiments at several places around an "antenna park." At these locations RF power densities between 168 nW/cm2 and 1053 nW/cm2 were measured. Twelve pairs of mice, divided in two groups, were placed in locations of different power densities and were repeatedly mated five times. One hundred eighteen newborns were collected. They were measured, weighed, and examined macro- and microscopically. A progressive decrease in the number of newborns per dam was observed, which ended in irreversible infertility. The prenatal development of the newborns, however, evaluated by the crown-rump length, the body weight, and the number of the lumbar, sacral, and coccygeal vertebrae, was improved." (understreget her)

Mekanismen for den observerede sterilitet hos musene er forklaret således i Shahin et al (2017), *"Mobile phone (1800 MHz) radiation impairs female reproduction in mice, Mus musculus, through stress induced inhibition of ovarian anduterine activity"*, p. 41 (resumé):

"Present study investigated the long-term effects of mobile phone (1800 MHz) radiation in stand-by, dialing and receiving modes on the female reproductive function (ovarian and uterine histo-architecture, andsteroidogenesis) and stress responses (oxidative and nitrosative stress). We observed that mobile phone radiation induces significant elevation in ROS, NO, lipid peroxidation, total carbonyl content and serumcorticosterone coupled with significant decrease in antioxidant enzymes in hypothalamus, ovary anduterus of mice. Compared to control group, exposed mice exhibited reduced number of developing and mature follicles as well as corpus lutea. Significantly decreased serum levels of pituitary gonadotrophins(LH, FSH), sex steroids (E2 and P4) and expression of SF-1, StAR, P-450scc, 3 -HSD, 17 -HSD, cytochrome P-450 aromatase, ER- and ER- were observed in all the exposed groups of mice, compared to control. These findings suggest that mobile phone radiation induces oxidative and nitrosative stress, which affects the reproductive performance of female mice." (understreget her)

Videre hedder det ibid., p. 57:

"...Mobile phone radiation may result in ovarian and uterine dysfunction by increasing ROS and RNS production and disturbing antioxidant status. Oxidative and nitrosative stress created at the hypothalamus and peripheral level (ovary and uterus) as a consequence of long-term mobile phone exposure may severely reduce both steroidogenesis and folliculogenesis in the ovary as well as the structural and functional status of the uterus. These results led us to conclude that chronic exposure to long-term mobile phone radiation may severely affect the ovarian and uterine activity of female mice and thus may lead to infertility. ..."

1.2.3.2.1. Delkonklusion.

Det forekommer videnskabeligt veldokumenteret, at radiofrekvent elektromagnetisk stråling, også den som holder sig inden for de af myndighederne fastlagte grænseværdier, henholdsvis er og kan være helbredsskadeligt for insekter.

Dertil kommer det særlige forhold, at også insekternes evne til at orientere sig til dels er baseret på interaktion med naturligt forekommende felter i f.eks. de blomster, som skal bestøves. Virkningen af radiofrekvent elektromagnetisk stråling på insekters biologisk determinerede muligheder for at orientere sig kan være ødelæggende for bevarelsen af arten.

Dertil kommer, at insekters forsvinden fra et område kan have afgørende betydning for insektædende fugles muligheder for at overleve som arter.

1.2.4. Yderligere om leveområder samt planter.

En del af den i pkt. 1.2.3. ovenfor omtalte forskning omhandler leveområder (habitatområder), idet den angår undersøgelser af strålings påvirkning af dyr i de områder, hvor de har deres reder, jagtområder, osv., eller belyser, hvad effekten er i også disse områder.

Dertil kan føjes videnskabelige undersøgelser foretaget af radiofrekvent elektromagnetisk stråling på planter, herunder træer:

Magone (1996), *"The effect of electromagnetic radiation from the Skrunda Radio Location Station on Spirodela polyrhiza (L.) Schleiden cultures"*[72], p. 75 (resumé):

"The effect of electromagnetic radiation from the Skrunda Radio Location Station was studied on the vegetative growth and morphology of the duckweed Spirodela polyrhiza (L.) Schleiden plant in the next generation. The impact of plant development stage and length of the exposure period were examined. The effect of short-term (5-day) exposures of Spirodela cultures depended on the stage of development at the time of exposure. Generally, the vegetative reproduction rate was accelerated in the first 20 days after the end of exposure. Exposure of plants just beginning formation lowered the vegetative growth rate. Eighty-eight-hour exposure caused the appearance of some abnormal individuals after 30 days of growth. At 55 days, various morphological and developmental abnormalities appeared in 6–10 daughter plants from 10 exposed mother plants, compared with 0.1 plants per 10 in the control condition. Plants developed completely to daughter fronds under exposure from the electromagnetic field had a shorter life-span (67 days compared to 87 days in the control) and fewer subsequent daughters (total eight compared to 10 in the control group)." (understreget her)

Undersøgelsen vedrørte andemad.

Katie Haggerty (2010), *"Adverse Influence of Radio Frequency Background on Trembling Aspen Seedlings: Preliminary Observations"*[73], p. :

"The results of this preliminary experiment indicate that the RF background may be adversely affecting leaf and shoot growth and inhibiting fall production of anthocyanins associated with leaf senescence in trembling aspen seedlings. These effects suggest that exposure to the RF background may be an underlying factor in the recent rapid decline of aspen populations. Further studies are underway to test this hypothesis in a more rigorous way."

Undersøgelsen vedrørte poppeltræer.

Waldman et al (2016), *"Radiofrequency radiation injures trees around mobile phone base stations"*, p. 554 – 555 (resumé):

"...detailed long-term (2006–2015) field monitoring study was performed in the cities of Bamberg and Hallstadt (Germany). During monitoring, observations and photographic recordings of unusual or unexplainable tree damage were taken, alongside the measurement of electromagnetic radiation. In 2015 measurements of RF-EMF (Radiofrequency Electromagnetic Fields) were carried out. A polygon spanning both cities was chosen as the study site, where 144 measurements of the radiofrequency of electromagnetic fields were taken at a height of 1.5 m in streets and parks at different locations.

72 Offentligt i det videnskabelige tidsskrift "Science of The Total Environment", 1996, vol. 180, nr. 1, pp. 75 – 80.
73 Offentligt i det videnskabelige tidsskrift "International Journal of Forestry Research" 2010, Article ID 836278.

...
The measurements of all trees revealed significant differences between the damaged side facing a phone mast and the opposite side, as well as differences between the exposed side of damaged trees and all other groups of trees in both sides. Thus, we found that side differences in measured values of power flux density corresponded to side differences in damage. The 30 selected trees in low radiation areas (no visual contact to any phonemast and power flux density under 50 μW/m2) showed no damage. Statistical analysis demonstrated that electromagnetic radiation from mobile phone masts is harmful for trees. These results are consistent with the fact that damage afflicted on trees by mobile phone towers usually start on one side, extending to the whole tree over time." (understreget her)

Malka Halgamuge (2017), *"Review: Weak radiofrequency radiation exposure from mobile phone radiation on plants"*[74], p. 213 (resumé):

"Subject and methods: In this study, we performed an analysis of the data extracted from the 45 peer-reviewed scientific publications (1996–2016) describing 169 experimental observations to detect the physiological and morphological changes in plants due to the non-thermal RF-EMF effects from mobile phone radiation. Twenty-nine different species of plants were considered in this work. Results: Our analysis demonstrates that the data from a substantial amount of the studies on RF-EMFs from mobile phones show physiological and/or morphological effects (89.9%, p < 0.001). Additionally, our analysis of the results from these reported studies demonstrates that the maize, roselle, pea, fenugreek, duckweeds, tomato, onions and mungbean plants seem to be very sensitive to RF-EMFs. Our findings also suggest that plants seem to be more responsive to certain frequencies, especially the frequencies between (i) 800 and 1500 MHz (p < 0.0001), (ii) 1500 and 2400 MHz (p < 0.0001) and (iii) 3500[75] *and 8000 MHz (p = 0.0161)."* (understreget her)

1.2.4.1. Delkonklusion.

Det forekommer videnskabeligt veldokumenteret, at radiofrekvent elektromagnetisk stråling, også den som holder sig inden for de af myndighederne fastlagte grænseværdier, henholdsvis er og kan være skadelig for planter.

Dertil kommer, at planters forsvinden fra et område kan have afgørende betydning for fugles og insekters muligheder for at overleve som arter.

74 Offentligt i det videnskabelige tidsskrift "ELECTROMAGNETIC BIOLOGY AND MEDICINE", 2017, vol. 36, nr. 2, pp. 213 – 235.

75 3,5 GHz er blandt de frekvenser, der ifølge Energistyrelsens handlingsplan af februar 2019 for 5G er afsat til dette system, jf. https://ens.dk/sites/ens.dk/files/Tele/5g-handlingsplan_for_danmark.pdf, s. 10.

1.3. Overordnet delkonklusion.

Det ovenfor gennemgåede forskningsmateriale dokumenterer efter min opfattelse en klar og bastant underbygget årsagssammenhæng imellem udsættelse af mennesker og dyr for radiofrekvent elektromagnetisk stråling på den ene side og en række skadevirkninger samt mulige skadevirkninger på begge grupper, herunder livstruende.

Der foreligger tillige en velunderbygget årsagssammenhæng for så vidt angår skader på planter.

Dette gør sig også gældende under de p.t. fastsatte grænseværdier, jf. også pkt. 2.1. nedenfor.

2. Jus.

2.1. De i Danmark anvendte grænseværdier for eksponering for radiofrekvent elektromagnetisk stråling.

Sundhedsstyrelsen anvender grænseværdier som anbefalet i 1998[76] (gentaget i 2009[77]) af organisationen ICNIRP (International Commission on Non-Ionizing Radiation Protection). Tillige opereres med en SAR-grænseværdi på 2 W/kg for producenter af trådløst udstyr. Disse grænseværdier vil ligeledes blive anvendt i forhold til 5G[78]. En særlig grænseværdi for fuldkropsbestråling er på gennemsnitligt 0,08 W/kg.

Grænseværdierne er baseret på termisk opvarmning o.l. kortsigtede og umiddelbare effekter, medens en række af de i pkt. 1.2 ovennævnte forskningsresultater dokumenterer, at radiofrekvent elektromagnetisk stråling er skadeligt uden termisk opvarmning[79], medens andre sandsynliggør dette. Det hedder i ICNIRPs retningslinjer, p. 496:

*"**BASIS FOR LIMITING EXPOSURE***
These guidelines for limiting exposure have been developed following a thorough review of all published scientific literature. The criteria applied in the course of the review were designed to evaluate the credibility of the various reported findings (Repacholi and Stolwijk 1991; Repacholi and Cardis 1997); only established effects were used as the basis for the proposed exposure restrictions. Induction of cancer from long-term EMF exposure was not considered to be established, and so these guidelines are based on short-term, immediate health effects such as stimulation of peripheral nerves and muscles, shocks and burns caused by touching conducting objects, and elevated tissue temperatures resulting from absorption of energy during exposure to EMF. In the case of potential long-term effects of exposure, such as an increased risk of cancer, ICNIRP concluded that available data are insufficient to provide a basis for setting exposure restrictions, although epidemiological research has provided suggestive, but unconvincing, evidence of an association between possible carcinogenic effects and exposure at levels of 50/60 Hz magnetic flux densities substantially lower than those recommended in these guidelines.
..." (understreget her)

Sundhedsstyrelsen anfører nærmere om 5G på sin hjemmeside bl.a.:

"...Helt overordnet er det Sundhedsstyrelsens vurdering, at der ikke er grund til at være bekymret for, at der skulle være en sundhedsrisiko forbundet med 5G. Målinger viser, at den samlede stråling fra mobiltelefoner, wifi og andet apparatur, som i dag udsender ikke-ioniserende stråling, er svag, og ligger langt under grænseværdierne for, hvad der er sundhedsskadeligt. Baseret på den tilgængelige viden har vi ingen grund til at tro, at 5G vil ændre på det.
I lovgivningen om radioudstyr er der fastsat regler om, at radioudstyr skal være konstrueret, så det sikrer menneskers sundhed. Det betyder, at antenner mv. til 5G skal følge de samme fælleseuropæiske grænseværdier som alt andet nuværende udstyr til telekommunikation. ..."

Ved sammenholdelsen mellem den i pkt. 1.2. ovenfor omtalte forskning og de af Sundhedsstyrelsen anvendte grænseværdier er beregningerne i følgende skema lagt til grund[80]:

76 "ICNIRP guidelines for limiting exposure to time-varying electric, magnetic and electromagnetic fields (up to 300 Ghz)", offentliggjort i det videnskabelige tidsskrift "Health Physics" (1998) nr. 74, pp. 494 – 522.

77 "ICNIRP statement on the 'guidelines for limiting exposure to time-varying electric, magnetic and electromagnetic fields (up to 300 Ghz)'", offentliggjort i det videnskabelige tidsskrift "Health Physics" (2009) nr. 97, p. 257 – 258.

78 Jf. Energi-, Forsynings- og Klimaministerens svar af 1. april 2019 på spørgsmål 226 i samme folketingsudvalg samt Sundhedsstyrelsens hjemmeside: https://www.sst.dk/da/straalebeskyttelse/mobiltelefoni,-traadloese-netvaerk-med-mere/5g

79 Se f.eks. Philips et al (2009), p. 83, med referencer til to studier.

En række af de i pkt. 1.2 – 1.4 ovennævnte forskningsresultater dokumenterer, at stråling under de pågældende grænseværdier kan være helbredsskadelig for mennesker og/eller dyr, bl.a.:

Balmori og Hallberg 2007, p. 145 – 146.
Blank og Goodman 2011, p. 413.
Jing et al 2012, p. 64.
REFLEX-studiet p. 109 og 223.
Yakymenko et al 2015, p. 186.
Lerchl et al 2015, p. 585.
Falcioni et al. 2018, p. 499.
Russell 2018, p. 485.
Neufeld og Kuster 2018, p. 711.

Dertil kommer, at en række studier er udført med kommercielt tilgængelige produkter inkl. følgende fra pkt. 1.2 – 1.4 ovenfor:

D'Silva et al 2017, p. 6.
Panagopoulos 2019, p. 55 (v.sp., nederst).

Pr. 1. september 2018 havde 244 forskere fra over 40 lande, som tilsammen havde offentliggjort over 2.000 forskningsartikler om elektromagnetiske felter, underskrevet en appel til FN og WHO, hvori de opfordrede til, at der etableres en bedre beskyttelse af menneskers (og dyrs) helbred i forhold til brugen af elektromagnetiske installationer såsom 5G.[81] Disse 244 forskere har i appellens afsnit med overskriften *"Inadequate non-ionizing EMF international guidelines"* anført som deres opfattelse, at:

"The various agencies setting safety standards have failed to impose sufficient guidelines to protect the general public, particularly children who are more vulnerable to the effects of EMF.
...
It is our opinion that, because the ICNIRP guidelines do not cover long-term exposure and low-intensity effects, they are insufficient to protect public health. "

De 244 forskeres *"...opfattelse..."* er spejlet i den i pkt. 1.2 ovenfor nævnte videnskabelige litteratur.

Pall 2018 konkluderede i sin gennemgang bl.a. følgende om ICNIRPs grænseværdier:

"Each of these reviews, typically cite from 5 to over 100 primary literature citations, each showing that non-thermal EMF exposures produce the effect under which they are listed. It follows from this, that there are not only 11 or more reviews documenting each of these effects, but there is also a massive primary literature documenting these effects as well. It follows from this that the ICNIRP, FCC and International Safety Guidelines, which are entirely based only on thermal effects are inadequate and there have been petitions and other statements of international groups of scientists expressing great concern about this. It follows that the ICNIRP, FCC and International safety guidelines are completely unscientific and cannot be relied upon to protect our safety." (understreget her)

Europarådet har i resolution 1815 af 2011, pkt. 8.1.2. anbefalet medlemsstaterne følgende:

"8.1.2. reconsider the scientific basis for the present standards on exposure to electromagnetic fields set by the International Commission on Non-Ionising Radiation Protection, which have serious limitations, and apply ALARA[82] principles, covering both thermal effects and the athermic or biological effects of electromagnetic emissions or radiation;"

81 Jf. https://emfscientist.org/index.php/emf-scientist-appeal
82 Står for "As Low As Reasonably Achievable".

2.2. Retsbeskyttelsen af mennesker (menneskerettigheder).

2.2.1. Den Europæiske Menneskerettighedskonvention (EMRK).

Konventionen blev inkorporeret direkte i dansk ret ved lov nr. 285 af 1992 og er således en del af "almindelig" national ret, som kan påberåbes direkte for de danske domstole.

Dertil kommer, at den ifølge Højesterets praksis anvendes på den måde, at andre lovbestemmelser "fortolkes i lyset af" konventionen og den dertilhørende praksis.

Det er et generelt fortolkningsprincip ved anvendelsen af bestemmelserne i konventionen, at de skal fortolkes således, at rettighederne indeholdt heri er praktisk anvendelige og effektive, jf. f.eks. Storkammerdom af 27. september 1995 i sagen McCann m.fl. mod Storbritannien, præmis 146:

"146. The Court's approach to the interpretation of Article 2 (art. 2) must be guided by the fact that the object and purpose of the Convention as an instrument for the protection of individual human beings requires that its provisions be interpreted and applied so as to make its safeguards practical and effective (see, inter alia, the Soering v. the United Kingdom judgment of 7 July 1989, Series A no. 161, p. 34, para. 87, and the Loizidou v. Turkey (Preliminary Objections) judgment of 23 March 1995, Series A no. 310, p. 27, para. 72)."

2.2.1.1. Art. 2 – retten til livet og statens positive forpligtelser.

EMRK art. 2 lyder:

*"**Artikel 2.** Ethvert menneskes ret til livet skal beskyttes ved lov. Ingen må forsætligt berøves livet undtagen ved fuldbyrdelse af en dødsdom, afsagt af en domstol i tilfælde, hvor der ved lov er fastsat dødsstraf for den pågældende forbrydelse.*
Stk. 2. Berøvelse af livet betragtes ikke som sket i modstrid med denne artikel, når den er en følge af magtanvendelse, der ikke gå ud over det absolut nødvendige:
a) for at forsvare nogen mod ulovlig vold;
b) for at iværksætte en lovlig anholdelse eller forhindre flugt
fra lovlig frihedsberøvelse;
c) for lovligt at undertrykke optøjer eller opstand."

Det er således alene stk. 1, 1. pkt. samt 2. pkt., 1. led, der har betydning for den retlige problemstilling i nærværende responsum.

Den Europæiske Menneskerettighedsdomstol (EMD) har i sin praksis fortolket bestemmelsen således, at den rummer en række materielle, positive forpligtelser (dvs.: handlepligter), bl.a. under visse betingelser at hindre, at mennesker dør som følge af forurening, der har været tilladt eller ikke hindret af staten.

Forpligtelserne i henhold til art. 2 skal – henset til vigtigheden af den rettighed, den skal beskytte – fortolkes strengt, jf. f.eks. Storkammerdom af 27. september 1995 i sagen McCann m.fl. mod Storbritannien, præmis 147:

"147. It must also be borne in mind that, as a provision (art. 2) which not only safeguards the right to life but sets out the circumstances when the deprivation of life may be justified, Article 2 (art. 2) ranks as one of the most fundamental provisions in the Convention - indeed one which, in peacetime, admits of no derogation under Article 15 (art. 15). Together with Article 3 (art. 15+3) of the Convention, it also enshrines one of the basic values of the democratic societies making up the Council of Europe (see the above-mentioned Soering judgment, p. 34, para. 88). As such, its provisions must be strictly construed."

I relation til nærværende responsums emne bør sagen Öneryildiz mod Tyrkiet, Storkammerdom af 30. november 2004, fremhæves[83].

Sagen drejede sig om en dødelig eksplosion på en losseplads, der kostede i alt 39 mennesker livet, inkl. flere af klagerens nære familiemedlemmer.

Det blev bl.a. statueret, at staten har en positiv forpligtelse til at opstille retlige og administrative rammer, som er designet til at medføre et effektivt værn imod livsfare.

Præmis 89 – 90 (med yderligere praksishenvisninger):

*"**(a) General principles applicable in the present case**(i) Principles relating to the prevention of infringements of the right to life as a result of dangerous activities: the substantive aspect of Article 2 of the Convention*

89. The positive obligation to take all appropriate steps to safeguard life for the purposes of Article 2 (see paragraph 71 above) entails above all a primary duty on the State to put in place a legislative and administrative framework designed to provide effective deterrence against threats to the right to life (see, for example, mutatis mutandis, Osman, cited above, p. 3159, § 115; Paul and Audrey Edwards, cited above, § 54; İlhan v. Turkey [GC], no. 22277/93, § 91, ECHR 2000-VII; Kılıç v. Turkey, no. 22492/93, § 62, ECHR 2000-III; and Mahmut Kaya v. Turkey, no. 22535/93, § 85, ECHR 2000-III).

90. This obligation indisputably applies in the particular context of dangerous activities, where, in addition, special emphasis must be placed on regulations geared to the special features of the activity in question, particularly with regard to the level of the potential risk to human lives. They must govern the licensing, setting up, operation, security and supervision of the activity and must make it compulsory for all those concerned to take practical measures to ensure the effective protection of citizens whose lives might be endangered by the inherent risks.

Among these preventive measures, particular emphasis should be placed on the public's right to information, as established in the case-law of the Convention institutions. The Grand Chamber agrees with the Chamber (see paragraph 84 of the Chamber judgment) that this right, which has already been recognised under Article 8 (see Guerra and Others, cited above, p. 228, § 60), may also, in principle, be relied on for the protection of the right to life, particularly as this interpretation is supported by current developments in European standards (see paragraph 62 above).

In any event, the relevant regulations must also provide for appropriate procedures, taking into account the technical aspects of the activity in question, for identifying shortcomings in the processes concerned and any errors committed by those responsible at different levels." (understreget her)

Der skal således være effektive hindringer imod trusler over for retten til livet, inkl. farlige aktiviteter, såsom den i sagen omhandlede drift af losseplads.

Når der er tale om farlige aktiviteter, skal der lægges særligt vægt på regler, som er egnede til de særlige forhold, som den pågældende aktivitet frembyder, og da især under hensyntagen til den potentielle fare for menneskeliv.

Det er således ikke et krav i art. 2s forstand, at der kan påvises en sikker skadevirkning, som kan være eller med sikkerhed er livstruende. Det er tilstrækkeligt, for at den pågældende adfærd falder ind under beskyttelsen af retten til livet, at der kan påvises en risiko for fare for menneskeliv.

Staten skal pålægge aktørerne, og herunder således dem, der måtte ønske at opføre den relevante infrastruktur, at der foretages praktiske foranstaltninger, som effektivt beskytter imod de fareelementer, som kan koste mennesker livet.

83 Der kan tillige henvises til f.eks. Kolyadenko m.fl. mod Rusland, præmis 157 – 161.

Henset til det foreliggende forskningsmateriale, jf. pkt. 1.2. ovenfor, er det min vurdering, at staten klart ikke på nuværende tidspunkt har efterkommet sine forpligtelser til at opstille relevante grænseværdier, endsige forbyde aktiviteter, som indebærer en klart dokumenteret risiko for fare for menneskeliv.

Art. 2 finder ikke kun anvendelse, hvor der er tale om en pludselig hændelse, som resulterer i dødsfald. Udsættelse for forurening over en længere periode er også omfattet.

EMD bringer bestemmelsen i anvendelse, uanset om klager er afgået ved døden eller "blot" er i alvorlig livsfare.[84]

Det er ikke afgørende, om det er en offentlig eller privat forurener.

Hvor det må lægges til grund, at det er denne forurening, der har medført dødsfaldet eller livsfaren, og hvor staten ikke har handlet over for en kendt fare (f.eks. fordi forureningen ikke har været i strid med gældende, national ret, herunder grænseværdier), vil det som udgangspunkt udgøre en krænkelse af retten til livet, jf. i det hele f.eks. dom af 24. juli 2014 i sagen Brincat m.fl. mod Malta, præmis 79 – 81 og 83 (med yderligere praksishenvisninger):

"79. The Court reiterates that Article 2 does not solely concern deaths resulting from the use of unjustified force by agents of the State but also, in the first sentence of its first paragraph, lays down a positive obligation on States to take appropriate steps to safeguard the lives of those within their jurisdiction (see, for example, L.C.B. v. the United Kingdom, 9 June 1998, § 36, Reports 1998-III, and Paul and Audrey Edwards, cited above, § 54).

80. This obligation is construed as applying in the context of any activity, whether public or not, in which the right to life may be at stake, and a fortiori in the case of industrial activities which by their very nature are dangerous, such as the operation of waste-collection sites (see Öneryıldız v. Turkey [GC], no. 48939/99, §71, ECHR 2004-XII) or nuclear testing (see L.C.B. cited above, § 36) or cases concerning toxic emissions from a fertiliser factory (see Guerra and Others v. Italy, 19 February 1998, §§ 60 and 62, Reports 1998-I, although in this case the Court found that it was not necessary to examine the issue under Article 2, it having been examined under Article 8).

81. The Court considers that the same obligations may apply in cases, such as the present one, dealing with exposure to asbestos at a workplace which was run by a public corporation owned and controlled by the Government.

82. The Court reiterates that it has applied Article 2 both where an individual has died (see, for example, Öneryıldız, cited above) and where there was a serious risk of an ensuing death, even if the applicant was alive at the time of the application. Examples include cases where the physical integrity of an applicant was threatened by the action of a third party (see Osman v. the United Kingdom, 28 October 1998, §§ 115-122, Reports 1998-VIII) or as a result of a natural catastrophe which left no doubt as to the existence of a threat to the applicants' physical integrity (see Budayeva and Others v. Russia, nos. 15339/02, 21166/02, 20058/02, 11673/02 and 15343/02, § 146, ECHR 2008 (extracts)). More particularly, the Court has repeatedly examined complaints under Article 2 from persons suffering from serious illnesses. Such cases include G.N. and Others v. Italy (no. 43134/05, 1 December 2009) in which the applicants suffered from the potentially life-threatening disease hepatitis C; L.C.B. v. the United Kingdom (cited above), where the applicant suffered from leukaemia diminishing her chances of survival, Hristozov and Others v. Bulgaria, nos. 47039/11 and 358/12, ECHR 2012

84 Udover Brincat m.fl. mod Malta kan f.eks. henvises til Vilnes m.fl. mod Norge, præmis 219: *"...the applicant was found to be the victim of conduct which by its very nature had put his life at risk, even though he survived. The Court found there that Article 2 was applicable and sees no reason for arriving at a different conclusion in the present case."*

(extracts), concerning applicants suffering from different types of terminal cancer; Karchen and Others v. France ((dec.), no. 5722/04, 4 March 2008) and Oyal v. Turkey (no. 4864/05, 23 March 2010), in which the applicants had been infected with the HIV virus, which endangered their life; Nitecki v. Poland ((dec.), no. 65653/01, 21 March 2002), in which the applicant suffered from amyotrophic lateral sclerosis; Gheorghe v. Romania ((dec.), no. 19215/04, 22 September 2005), in which the applicant suffered from haemophilia; and De Santis and Olanda v. Italy ((dec.), 35887/11, 9 July 2013) in which the applicant – who was severely disabled – suffered a cerebral haemorrhage as a consequence of an infection acquired in hospital.

83. The medical certification indicated that Mr Attard's death was likely to be a result of asbestos exposure; malignant mesothelioma is known to be a rare cancer associated with asbestos exposure. The Court observes that it has not been contested or denied that Mr Attard worked at Malta Drydocks for more than a decade (1959-1974), during which time he was repeatedly exposed to asbestos. Neither has it been shown that Mr Attard could have been contaminated elsewhere or that he was affected by other factors that could have led to the disease. In these circumstances, and given that Mr Attard has died as a result of his cancer, the Court considers that Article 2 is applicable to the complaint brought by the applicants in application no. 62338/11 relating to the death of the said Mr Attard." (understreget her)

2.2.1.1.1. Delkonklusion.

Set på baggrund af de i pkt. 1.2 ovenfor gennemgåede forskningsresultater er der efter min vurdering ikke nogen rimelig tvivl om, at 5G-systemet udgør en industriel aktivitet, som er farlig for mennesker.

Så længe de nuværende grænseværdier (som meddelt af Sundhedsstyrelsen, jf. pkt. 2.1 ovenfor) anvendes, må livstruende helbredstilstande forårsaget af radiofrekvent elektromagnetisk stråling ved iværksættelse af 5G-systemet ganske klart forventes, hvilket vil være i strid med den danske stats positive forpligtelser efter EMRK art. 2.

Da det må lægges til grund, at risikoen er velkendt af den danske stat, er det endvidere oplagt, at der i relation til 5G-systemet[85] vil skulle indtræde ansvar efter EMRK art. 2, senest når de livstruende helbredstilstande viser sig.

2.2.1.2. Art. 8 – retten til respekt for privat- og familieliv.

EMRK art. 8 lyder:

*"**Artikel 8.** Enhver har ret til respekt for sit privatliv og familieliv, sit hjem og sin korrespondance.*

Stk. 2. Ingen offentlig myndighed må gøre indgreb i udøvelsen af denne ret, medmindre det sker i overensstemmelse med loven og er nødvendigt i et demokratisk samfund af hensyn til den nationale sikkerhed, den offentlige tryghed eller landets økonomiske velfærd, for at forebygge uro eller forbrydelse, for at beskytte sundheden eller sædeligheden eller for at beskytte andres rettigheder og friheder."

Alvorlig miljøforurening kan påvirke individers velbefindende og forhindre dem i at udøve deres privat- og familieliv. En sådan tilstand vil udgøre et indgreb i borgernes rettigheder efter EMRK art. 8, jf. f.eks. Guerra m.fl. v. Italien, Storkammerdom af 19. februar 1998[86].

85 Det falder udenfor området for nærværende responsum at fremkomme med tilsvarende vurderinger ang. 2G, 3G og 4G, m.v.

86 Fordi Storkammeret fandt en krænkelse af art. 8, var det ikke nødvendigt at vurdere en klage over krænkelse af retten til livet, jf. EMRK art. 2, p.g.a. de samme kræftdødsfald.

Præmis 60:

"60. The Court reiterates that severe environmental pollution may affect individuals' well-being and prevent them from enjoying their homes in such a way as to affect their private and family life adversely (see, mutatis mutandis, the López Ostra judgment cited above, p. 54, § 51). In the instant case the applicants waited, right up until the production of fertilisers ceased in 1994, for essential information that would have enabled them to assess the risks they and their families might run if they continued to live at Manfredonia, a town particularly exposed to danger in the event of an accident at the factory.
The Court holds, therefore, that the respondent State did not fulfil its obligation to secure the applicants' right to respect for their private and family life, in breach of Article 8 of the Convention.

There has consequently been a violation of that provision."

De positive forpligtelser i så henseende overlapper i vidt omfang de ovenfor nævnte efter art. 2, jf. f.eks. dom af 20. marts 2008 i sagen Budayeva m.fl. mod Rusland, præmis 133 og dom af 28. februar 2012 i sagen Kolyadenko m.fl. mod Rusland, præmis 216.

Retten til beskyttelse af privat- og familielivet kan bringes i anvendelse, hvor en sygdomstilstand ikke har udviklet sig livsfarligt og heller ikke nødvendigvis gør det. I denne sammenhæng anvendes bestemmelsen af EMD som en slags "mindre i det mere" i forhold til art. 2, jf. ovenfor.

Dette blev f.eks. fremgangsmåden for alle klager undtagen én i dom af 24. juli 2014 i sagen Brincat m.fl. mod Malta, præmis 85:

"85. However, in the context of dangerous activities, the scope of the positive obligations under Article 2 of the Convention largely overlaps with that of those under Article 8 (see Öneryıldız, cited above, §§ 90 and 160). The latter provision has allowed complaints of this nature to be examined where the circumstances were not such as to engage Article 2, but clearly affected a person's family and private life under Article 8 (see López Ostra v. Spain, 9 December 1994, Series A no. 303-C and Guerra and Others, cited above). The Court therefore considers it appropriate to examine the complaints in respect of the remaining applicants under Article 8, which is applicable in the present case (see also Roche v. the United Kingdom [GC], no. 32555/96, §§ 155-156, ECHR 2005-X)."

Der skal foreligge en sygdomstilstand, som har en sådan karakter, at den vil udgøre et indgreb i vedkommendes privat- eller familieliv. Sygdomme som nødvendiggør f.eks. langvarige eller hyppige hospitalsindlæggelser, varige og indgribende funktionsnedsættelser (herunder lidelser såsom EHS, der indebærer overfølsomhed over for udstyr, der afgiver elektromagnetisk stråling, evt. også i meget små doser), markant nedsat fertilitet eller spontane aborter, m.v., kunne være egnede eksempler.

Hvor en begivenhed eller tilstand indtræffer, som gør indgreb i retten til privat- eller familielivet, vil EMD kunne forventes at påse, om f.eks. de tekniske forudsætninger var til stede for, at begivenheden eller tilstanden ikke indtraf, og om dette burde have været forudset af staten.

Finder EMD, at dette er tilfældet, vil det som udgangspunkt udgøre en krænkelse af statens positive forpligtelser efter art. 8. Der kan fra praksis henvises til dom af 28. februar 2012 i sagen Kolyadenko m.fl. mod Rusland, præmis 215 – 216 (sagen drejede sig om brud på et vandreservoir, som medførte livsfare og skader på menneskers hjem):

"215. The Court further notes that the Government seem to have argued, with reference to the findings of the domestic courts in the applicants' civil cases, that the alleged infringements of their rights under Article 8 and Article 1 of Protocol No. 1 were the result of a natural disaster, in the form of exceptionally heavy rain, which could not have been foreseen, and

could therefore not be imputed to the State. The Court cannot accept this argument. It reiterates in this connection that, being sensitive to the subsidiary nature of its role and cautious about taking on the role of a first-instance tribunal of fact, the Court nevertheless is not bound by the findings of domestic courts and may depart from them where this is rendered unavoidable by the circumstances of a particular case (see, for example, Matyar v. Turkey, no. 23423/94, § 108, 21 February 2002). In the present case, the Court has established in paragraphs 162-165 above that the flooding of 7 August 2001 occurred after the urgent large-scale evacuation of water from the Pionerskoye reservoir, the likelihood and potential consequences of which the authorities should have foreseen. The Court has furthermore established that the main reason for the flood, as confirmed by the expert reports, was the poor state of repair of the Pionerskaya river channel because of the authorities' manifest failure to take measures to keep it clear and in particular to make sure its throughput capacity was adequate in the event of the release of water from the Pionerskoye reservoir. The Court has concluded that this failure as well as the authorities' failure to apply town planning restrictions corresponding to the technical requirements of the exploitation of the reservoir put the lives of those living near it at risk (see paragraphs 168-180 and 185 above).

216. The Court has no doubt that the causal link established between the negligence attributable to the State and the endangering of the lives of those living in the vicinity of the Pionerskoye reservoir also applies to the damage caused to the applicants' homes and property by the flood. Similarly, the resulting infringement amounts not to "interference" but to the breach of a positive obligation, since the State officials and authorities failed to do everything in their power to protect the applicants' rights secured by Article 8 of the Convention and Article 1 of Protocol No. 1 (see Öneryıldız, cited above, § 135). Indeed, the positive obligation under Article 8 and Article 1 of Protocol No. 1 required the national authorities to take the same practical measures as those expected of them in the context of their positive obligation under Article 2 of the Convention (see, mutatis mutandis, Öneryıldız, cited above, § 136). Since it is clear that no such measures were taken, the Court concludes that the Russian authorities failed in their positive obligation to protect the applicants' homes and property.

217. There has, accordingly, been a violation of Article 8 of the Convention and Article 1 of Protocol No. 1 to the Convention in the present case."

EMD foretog ikke en udtrykkelig proportionalitetsafvejning i den pågældende sag, hvilket synes at være konsekvensen af, at staten intet havde foretaget sig, uanset den burde have forudset den skadegørende hændelse og kunne have handlet til afværgelse heraf.

2.2.1.2.1. Delkonklusion.

Der gælder i det væsentlige de samme positive forpligtelser efter art. 8 som art. 2 m.h.t. beskyttelse af mennesker over for forurening, jf. pkt. 2.2.1.1.1. Allerede derfor må iværksættelsen af 5G-netværket, ved brug af de nugældende grænseværdier, klart forventes at medføre sådanne forstyrrelser af borgeres privat- og familieliv p.g.a. sygdomme, at der tillige vil ske en krænkelse af disse menneskers rettigheder i henhold til art. 8.

2.2.2. FN's børnekonvention.

Konventionen af 20. december 1989 om barnets rettigheder blev ratificeret ved kgl. resolution af 5. juli 1991. Den er ikke inkorporeret i dansk ret, og gældende ret skal så vidt muligt fortolkes i overensstemmelse med de forpligtelser, Danmark har valgt at påtage sig ved ratifikationen (Dette gælder, så længe det ikke er nødvendigt direkte at tilsidesætte en lovbestemmelse i national ret.)

Art. 24, stk. 1 og 2, litra (c), i konventionen lyder:

*"**1.** Deltagerstaterne anerkender barnets ret til at nyde den højest opnåelige sundhedstilstand, adgang til at få sygdomsbehandling og genoprettelse af helbredet. Deltagende stater skal stræbe mod at sikre, at intet barn fratages sin ret til adgang til at opnå sådan behandling og pleje.*

***2.** Deltagerstaterne skal arbejde for fuld gennemførelse af denne ret og især tage passende forholdsregler for:*

- *...*
- *(c) at bekæmpe sygdom og underernæring, herunder inden for rammerne af den primære sundhedspleje, blandt andet ved anvendelse af let tilgængelig teknologi og gennem ydelse af tilstrækkelig og nærende mad og rent drikkevand under hensyntagen til de farer og risici, der er knyttet til forurening af miljøet;*
- *..."*

Statens egentlige forpligtelse går ud på, at den skal "stræbe mod at sikre" sådan behandling og pleje, og at "arbejde for fuld gennemførelse" af barnets ret til den højest opnåelige sundhedstilstand.

Den højest opnåelige sundhedstilstand kan ikke indebære, at staten tillader børn (som tilhører en særligt sårbar gruppe også i denne henseende) at blive udsat for stråling af helbredsskadelig karakter eller styrke.

Der foreligger videnskabelig dokumentation for, at en etablering af 5G-systemet, der vil indebære udsættelse for dels kraftigere og dels mere farlig[87] radiofrekvent elektromagnetisk stråling end de allerede etablerede 2G-, 3G- og 4G-systemer (som ifølge den foreliggende dokumentation i sig selv er skadegørende eller indebærer en risiko herfor), i sin nuværende form, jf. pkt. 1.1. ovenfor, klart forventeligt vil være direkte helbredsskadelig og indebære risiko for skader, og som sådan i strid med Danmarks forpligtelser efter art. 24 i FN's børnekonvention.

FN's børnekomité, som også træffer afgørelse i konkrete klagesager, har udstedt en "general comment" nr. 15 i 2013, som er retningslinjer for, hvorledes komitéen fortolker konventionens art. 24.

Det fremgår pkt. III.A, om artiklens normative indhold, at:

"The notion of "the highest attainable standard of health" takes into account both the child's biological, social, cultural and economic preconditions and the State's available resources, supplemented by resources made available by other sources, including nongovernmental organizations, the international community and the private sector.

Children's right to health contains a set of freedoms and entitlements. ... The entitlements include access to a range of facilities, goods, services and conditions that provide equality of opportunity for every child to enjoy the highest attainable standard of health." (understreget

87 Dele af den stråling, der ifølge det foreliggende vil blive udsendt fra 5G-systemet, vil have en mindre styrke, men vil pga. de øvrige karakteristika ikke desto mindre være farligere end den nuværende fra 2G-, 3G- og 4G-systemerne. Se Kuster et al (2018) i pkt. 1.2.2.1.3. ovenfor.

her)

Teleselskaberne har i forvejen stillet effektive kommunikationsmidler til rådighed, som ikke indebærer en implementering 5G-systemet.

Yderligere om stk. 2, litra (c), ang. forurening af miljøet har komitéen anført følgende, jf. ibid., s. 6 – 7:

"States should take measures to address the dangers and risks that local environmental pollution poses to children's health in all settings. ... States should regulate and monitor the environmental impact of business activities that <u>may</u> compromise children's right to health,..." (understreget her)

Formuleringen "may compromise" indikerer kraftigt, at komitéen anvender et forsigtighedsprincip, og at konstateringen af en risiko er tilstrækkelig til at staten skal regulere og monitorere sådanne aktiviteter.

Ud fra en formålsfortolkning må dette indebære, at hensynet til børns helbred (der i sig selv må antages at veje særdeles tungt, særligt over for økonomiske interesser) skal føre til, at staten forbyder former for forurening, som kan skade børns helbred. Dette vil i henhold til den foreliggende videnskabelige dokumentation indebære, at børnekonventionen er til hinder for iværksættelse af 5G-systemet, hvis systemet blot skal overholde de af ICNIRP anbefalede grænseværdier.

Der foreligger kun én afgørelse fra FN's børnekomité, der vedrører art. 24 (kommunikésagsnr. 35/2017). Sagen, der ikke er indholdsmæssigt beskrevet på komitéens hjemmeside, ses ikke ud fra de sparsomme beskrivelser (flygtningebarn) at have relevans for nærværende responsums emne.

Der er ikke taget stilling til spørgsmålet i national, dansk ret.

Der er således ikke en autoritativ retskilde, som kan bekræfte ovenstående fortolkning.

<u>2.2.2.1. Delkonklusion.</u>

Ud fra en fortolkning af FN's børnekonventions ordlyd og formål, sammenholdt med den foreliggende videnskabelige dokumentation for såvel skadevirkninger som skaderisici, er det min vurdering, at en aktivering af 5G-systemet, som det foreligger beskrevet, jf. pkt. 1.1. ovenfor, vil være i strid med den danske stats forpligtelser efter konventionens art. 24.

2.3. Miljøretlige regler.

2.3.1. Forsigtighedsprincippet i EU-retten.

Det EU-retlige forsigtighedsprincip er i dag at finde i Traktaten om den Europæiske Unions Funktionsmåde (TFEU) art. 191, stk. 2:

"Unionens politik på miljøområdet tager sigte på et højt beskyttelsesniveau under hensyntagen til de forskelligartede forhold, der gør sig gældende i de forskellige områder i Unionen. Den bygger på forsigtighedsprincippet og princippet om forebyggende indsats, ..."

I henhold til Europa-Kommissionens meddelelse af 20. februar 2000 om forsigtighedsprincippet, s. 9 – 10, kan det anvendes, *"...hvor de videnskabelige data er utilstrækkelige, foreløbige eller usikre, og den indledende objektive videnskabelige undersøgelse tyder på, at der er rimelig grund til bekymring for, at mulige farlige følger for miljø samt menneskers, dyrs og planters sundhed ikke stemmer overens med det valgte beskyttelsesniveau."*

For så vidt angår nærværende responsums emneområde, vil princippet klart være relevant at bringe i anvendelse, hvis det måtte lægges til grund, at der ikke foreligger tilstrækkelig videnskabelig sikkerhed for at konkludere, at radiofrekvent elektromagnetisk stråling inden for de p.t. anvendte grænseværdier, jf. pkt. 2.1. ovenfor, vil være helbredsskadeligt for (in casu) fugle, dyr og planter omfattet af de i det følgende behandlede miljøretlige direktiver.

2.3.2. Fuglebeskyttelsesdirektivet.

EU-direktivet "om beskyttelse af vilde fugle", kodificeret udgave af 30. november 2009, indeholder en række forpligtelser for EU-lande til at "træffe alle nødvendige foranstaltninger" til "beskyttelse" (herunder bevarelse) af fugle, deres æg, reder og levesteder, jf. art. 1.

De for nærværende responsums problemstilling relevante bestemmelser i direktivet er på det foreliggende grundlag følgende (understregninger indsat her), hvortil der er indsat løbende kommentarer:

Art. 1:

"1. Dette direktiv vedrører beskyttelse af alle de fuglearter, som i vild tilstand har deres naturlige ophold på medlemsstaternes område i Europa, hvor traktaten finder anvendelse. Det omhandler bevarelse, forvaltning og regulering af de pågældende arter og fastsætter regler for udnyttelse af de nævnte arter.
2. Dette direktiv gælder for fugle samt for deres æg, reder og levesteder."

Dette vil sige, at direktivbeskyttelsen omfatter enhver vild fugleart og deres levesteder.

Art. 2:

"Medlemsstaterne træffer alle nødvendige foranstaltninger til at opretholde eller tilpasse bestanden af samtlige de i artikel 1 omhandlede arter på et niveau, som især imødekommer økologiske, videnskabelige og kulturelle krav og samtidig tilgodeser økonomiske og rekreative hensyn."

Art. 3, stk. 1:

"Medlemsstaterne træffer ud fra de i artikel 2 omhandlede hensyn alle nødvendige foranstaltninger for at beskytte, opretholde eller genskabe tilstrækkeligt forskelligartede og vidtstrakte levesteder for alle de i artikel 1 omhandlede fuglearter."

De i pkt. 1.2.3.1. ovenfor i øvrigt citerede undersøgelser kan i princippet være relevante på samtlige fugle omfattet af direktivet.

Henvisningen til art. 2 giver medlemsstaterne en vis skønsmæssig beføjelse til, hvorledes hensynene i art. 3 skal varetages, uanset det er klart udtrykt i art. 2, at de økonomiske hensyn ikke må være de mest tungtvejende.

Det mest sandsynlige baseret på den i pkt. 1.2.3.1. ovenfor gennemgåede forskning er, at en indførelse af 5G-systemet i områder, hvor fuglene har deres levesteder, vil udgøre en overtrædelse af denne bestemmelse.

Art. 4, stk. 1 og 4:

"1. For arter, som er anført i bilag I, træffes der særlige beskyttelsesforanstaltninger med hensyn til deres levesteder for at sikre, at de kan overleve og formere sig i deres udbredelsesområde.
I denne forbindelse tages der hensyn til:

a) arter, der trues af udslettelse

b) arter, der er følsomme over for bestemte ændringer af deres levesteder

…

4. Medlemsstaterne træffer egnede foranstaltninger med henblik på i de i stk. 1 og 2 nævnte beskyttede områder at undgå forurening eller forringelse af levestederne samt forstyrrelse af fuglene, i det omfang en sådan forurening, forringelse eller forstyrrelse har væsentlig betydning for formålet med denne artikel. Medlemsstaterne bestræber sig på at undgå forurening eller forringelse af levesteder også uden for disse beskyttede områder."

Der er tale om en vidtfavnende beskyttelse, som bl.a. omfatter den hvide stork, der var genstand for den videnskabelige undersøgelse, der er refereret til ovenfor pkt. 1.2.3.1. (Balmori 2005). Undersøgelsen påviste bl.a., at der var forskelle i mængden af afkom, og at der var en sammenhæng med nærheden til telemaster, og at nogle reder således var helt uden afkom. Undersøgelsens resultater var endvidere underbygget af eksperimentelle studier på fugleæg.

De i pkt. 1.2.3.1. ovenfor i øvrigt citerede undersøgelser kan i princippet være relevante på samtlige fugle omfattet af bilag I.

Da undersøgelserne samtidig udgør en bastant, videnskabelig dokumentation for, at radiofrekvent elektromagnetisk stråling både kan reducere afkommet, mutere det og påføre skader på levende fugle (og muligvis herunder hindre deres navigationsevne), er det min vurdering, at der ved indførelsen af den påtænkte 5G-system sker en overtrædelse af Danmarks forpligtelser i henhold til fuglebeskyttelsesdirektivets art. 4, stk. 1, idet det ikke "sikres", at de beskyttede fugle kan overleve og formere sig.

Danmark vil ligeledes heller ikke have truffet egnede foranstaltninger til at undgå forurening eller forringelse af fuglenes levesteder eller forstyrrelse af fuglene, uanset dette vil have væsentlig betydning for formålet med art. 4.

Der vil heller ikke være sket nogen bestræbelse på at undgå forurening eller forringelse af levesteder for disse fugle også uden for de beskyttede områder, jf. stk. 4, in fine.

Væsentlig nedbringelse af bestanden af dyr, som insektædende fugle skal kunne leve af, jf. pkt. 1.2.3.2. ovenfor, må ligeledes forventes at have den betydning, at fuglenes levesteder forstyrres i en sådan grad, at det vil have væsentlig betydning for deres overlevelsesmuligheder.

Art. 5, stk. 1, litra a), b) og d):

"Med forbehold af artikel 7 og 9 træffer medlemsstaterne de nødvendige foranstaltninger til at indføre en generel ordning til beskyttelse af alle de i artikel 1 omhandlede fuglearter, herunder især forbud mod:

a) forsætligt at dræbe eller indfange dem, uanset hvilken metode der anvendes

b) forsætligt at ødelægge eller beskadige deres reder og æg samt fjerne deres reder

...

d) forsætligt at forstyrre fuglene navnlig i yngletiden, i det omfang, en sådan forstyrrelse har væsentlig betydning for formålet med dette direktiv

..."

Artikel 7, der drejer sig om jagt, og artikel 9, der indeholder en række undtagelsesbestemmelser uden betydning for etablering af 5G-netværk, er ikke relevante i nærværende sammenhæng.

Artiklen forpligter medlemsstaterne til at etablere generelle beskyttelsesordninger til beskyttelse af de i artikel 1 omhandlede fugle, og det er særligt fremhævet, at der skal være forbud imod bl.a. forsætligt drab på fugle, uanset hvilken metode, der anvendes, og forsætligt at ødelægge eller beskadige reder og æg.

Uanset det ikke er formålet med opstillingen af f.eks. 5G-telemaster at dræbe fugle eller at ødelægge deres reder og æg, er dette en klar og forudsigelig effekt, hvis de opstilles i tilpas nærhed af fuglenes levesteder.

Art. 8, stk. 1:

"For så vidt angår jagt på, fangst af eller drab på fugle i overensstemmelse med dette direktiv forbyder medlemsstaterne anvendelse af alle midler, indretninger eller metoder til massefangst eller -drab eller ikke-selektiv fangst eller drab, som kan medføre, at en art forsvinder lokalt; de forbyder herunder navnlig anvendelse af de i bilag IV, litra a), nævnte midler, indretninger og metoder."

Art. 8 omhandler alene drab, der i forvejen foretages i overensstemmelse med direktivet.

Det bemærkelsesværdige ved formuleringen er, at forbuddet omfatter ikke-selektiv drab, som kan medføre, at en art forsvinder lokalt. Dvs. at bestemmelsen er risikobaseret, således at den blotte fare for, at indretningen eller metoden kan medføre, at en art forsvinder lokalt, er tilstrækkelig til, at den pågældende indretning eller metode skal forbydes. Der fremgår ikke en sådan direkte udtrykt risikobaseret beskyttelse af de i øvrigt ovenfor citerede artikler. I stedet

anvendes udtryk såsom ”beskyttelse”, ”alle nødvendige foranstaltninger”, ”sikre, at de kan overleve”, o.l. Disse anderledes formuleringer lægger i større eller mindre grad op til, at der i disse andre bestemmelser ligeledes skal indfortolkes såvel en risikobaseret beskyttelse som anvendelse af forsigtighedsprincippet. Formuleringen af art. 8, der oven i købet vedrører arter omfattet af den lavere rangerende beskyttelse i direktivets ”bilag II”, underbygger en sådan fortolkning af de øvrige bestemmelser, hvilket endvidere vil være i god overensstemmelse med direktivets beskyttelsesformål.

2.3.2.1. Delkonklusion.

Det er på baggrund af den i pkt. 1.2 ovenfor refererede forskning min vurdering, at hvis 5G-systemet aktiveres, så vil det medføre eller kunne medføre væsentlig skade på de beskyttede vildfugle, der har deres levesteder tilstrækkeligt tæt på f.eks. en relevant telemast.

Denne virkning vil blive forstærket af, at disse installationer påviseligt også har betydelig skadevirkning på de dyr, som insektædende fugle skal leve af, jf. pkt. 1.2.3.2. ovenfor.

Det må følgelig også være min vurdering, at aktiveringen heraf vil udgøre en overtrædelse af Danmarks forpligtelser efter fuglebeskyttelsesdirektivets art. 4 og 5, samt formentlig art. 3.

Hvis det lagdes til grund, at der fortsat består en videnskabelig usikkerhed, bør anvendelsen af forsigtighedsprincippet føre til samme delkonklusioner.

2.3.3. Habitat-direktivet

EU-direktivet "om bevaring af naturtyper samt vilde dyr og planter" af 21. maj 1992 indeholder en række forpligtelser for EU-lande til at "sikre" opretholdelse af gunstig bevaringsstatus for de af direktivet omfattede naturtyper og levesteder for beskyttede arter, og at "sikre sig" ikke at skade de beskyttede lokaliteters integritet eller at "forstyrre" arterne på en måde, som har betydelige konsekvenser for direktivets formål.

Det er således ikke alle dyr og planter, der er omfattet af beskyttelsen. Imidlertid kan den i pkt. 1.3. ovenfor omtalte forskning ikke tages til indtægt for, at den alene finder anvendelse på de specifikke undersøgte arter. Dette gør sig særligt gældende, al den stund mange af dem vedrører forstyrrelse af almene mekanismer, ligesom det i flere tilfælde er udtrykkeligt anført, at de undersøgte arter (f.eks. bananfluer) vil udgøre "gode indikatorer".

De for nærværende responsums problemstilling relevante bestemmelser i direktivet er på det foreliggende grundlag følgende (understregninger indsat her), hvortil der er indsat løbende kommentarer:

Art. 2:

"1. Formålet med dette direktiv er at bidrage til at sikre den biologiske diversitet ved at bevare naturtyperne samt de vilde dyr og planter inden for det af medlemsstaternes område i Europa, hvor Traktaten finder anvendelse.

2. De foranstaltninger, der træffes efter dette direktiv, tager sigte på at opretholde eller genoprette en gunstig bevaringsstatus for naturtyper samt vilde dyre- og plantearter af fællesskabsbetydning.

3. De foranstaltninger, der træffes efter dette direktiv, tager hensyn til de økonomiske, sociale og kulturelle behov og til regionale og lokale særpræg."

Art. 3, stk. 1:

"Der oprettes et sammenhængende europæisk økologisk net af særlige bevaringsområder under betegnelsen Natura 2000. Dette net, der består af lokaliteter, der omfatter de naturtyper, der er nævnt i bilag I, og levesteder for de arter, der er nævnt i bilag II, skal sikre opretholdelse eller i givet fald genopretning af en gunstig bevaringsstatus for de pågældende naturtyper og levestederne for de pågældende arter i deres naturlige udbredelsesområde.

Natura 2000-nettet omfatter ligeledes de særligt beskyttede områder, som medlemsstaterne har udlagt i medfør af direktiv 79/409/EØF."

I henhold til denne bestemmelse skal staterne "sikre" opretholdelse/genopretning af en gunstig bevaringsstatus for levestederne for de af bilag II omfattede arter. Dette gælder bl.a. den hvide stork og de flagermus, som det fremgår af afsnit 1.2.3.1. og 1.2.3.2. ovenfor.

Når der henses til den videnskabelige dokumentation for skadevirkningerne, forekommer dette ikke at være muligt.

Dertil kommer, at en evt. (tilstrækkeligt videnskabeligt funderet) usikkerhed vil skulle afklares.

Art. 6, stk. 2 til 4:

"2. Medlemsstaterne træffer passende foranstaltninger for at undgå forringelse af naturtyperne og levestederne for arterne i de særlige bevaringsområder samt forstyrrelser af de arter, for hvilke områderne er udpeget, for så vidt disse forstyrrelser har betydelige konsekvenser for

dette direktivs målsætninger.

3. Alle planer eller projekter, der ikke er direkte forbundet med eller nødvendige for lokalitetens forvaltning, men som i sig selv eller i forbindelse med andre planer og projekter kan påvirke en sådan lokalitet væsentligt, vurderes med hensyn til deres virkninger på lokaliteten under hensyn til bevaringsmålsætningerne for denne. På baggrund af konklusionerne af vurderingen af virkningerne på lokaliteten, og med forbehold af stk. 4, giver de kompetente nationale myndigheder først deres tilslutning til en plan eller et projekt, når de har sikret sig, at den/det ikke skader lokalitetens integritet, og når de - hvis det anses for nødvendigt - har hørt offentligheden.

4. Hvis en plan eller et projekt, på trods af at virkningerne på lokaliteten vurderes negativt, alligevel skal gennemføres af bydende nødvendige hensyn til væsentlige samfundsinteresser, herunder af social eller økonomisk art, fordi der ikke findes nogen alternativ løsning, træffer medlemsstaten alle nødvendige kompensationsforanstaltninger for at sikre, at den globale sammenhæng i Natura 2000 beskyttes. Medlemsstaten underretter Kommissionen om, hvilke kompensationsforanstaltninger der træffes.
Hvis der er tale om en lokalitet med en prioriteret naturtype og/eller en prioriteret art, kan der alene henvises til hensynet til menneskers sundhed og den offentlige sikkerhed eller væsentlige gavnlige virkninger på miljøet, eller, efter udtalelse fra Kommissionen, andre bydende nødvendige hensyn til væsentlige samfundsinteresser."

Særligt ad stk. 3:

Forpligtelsen går ud på, at myndighederne skal sikre sig, at et projekt m.v. (f.eks. indførelse af 5G-systemet ved opførelse af nye telemaster eller opsættelse af 5G-sendere på eksisterende telemaster) ikke skader lokalitetens integritet.

Når der henses til den videnskabelige dokumentation for skadevirkningerne, forekommer dette ikke at være muligt.

Dertil kommer, at en evt. (tilstrækkeligt videnskabeligt funderet) usikkerhed vil skulle afklares.

Særligt ad stk. 4:

I og med at Sundhedsstyrelsen ikke anerkender henholdsvis skadevirkninger og -risici som gennemgået ovenfor, er der heller ikke grundlag for at antage, at staten har truffet "alle nødvendige kompensationsforanstaltninger", jf. stk. 4, hvis det må lægges til grund, at forskningen i pkt. 1.2 ovenfor er retvisende.

For så vidt angår lokaliteter med en prioriteret naturtype og/eller prioriteret art, finder ingen af de særlige undtagelser anvendelse. Etablering af et 5G-netværk har således ikke nogen væsentlig gavnlig virkning for menneskers sundhed, den offentlige sikkerhed eller miljøet, herunder når der sammenlignes med andre teknologiske muligheder. For så vidt angår hensynet til menneskers sundhed, er det tværtimod klart, at det vil have en skadelig virkning. Der foreligger heller ikke nogen udtalelse fra Kommissionen desangående.

Art. 7:

"Forpligtelserne i artikel 6, stk. 2, 3 og 4, i nærværende direktiv træder i stedet for forpligtelserne i artikel 4, stk. 4, første punktum, i direktiv 79/409/EØF, for så vidt angår de områder, der er udlagt som særligt beskyttede efter artikel 4, stk. 1, eller tilsvarende anerkendt efter artikel 4, stk. 2, deri, fra datoen for nærværende direktivs iværksættelse eller fra den dato, hvor en medlemsstat har udlagt eller anerkendt områderne efter direktiv 79/409/EØF, hvis denne dato er senere."

Direktiv 79/409/EØF er det ovenfor omtalte fuglebeskyttelsesdirektiv (nu: kodificeret ved direktiv 2009/147/EF). Det nye fuglebeskyttelsesdirektiv er også omfattet af henvisningsbestemmelsen i habitatdirektivets art. 7, jf. fuglebeskyttelsesdirektivets art. 18, stk. 2.

Art. 12, stk. 1, 3 og 4:

"1. Medlemsstaterne træffer de nødvendige foranstaltninger til at indføre en streng beskyttelsesordning i det naturlige udbredelsesområde for de dyrearter, der er nævnt i bilag IV, litra a), med forbud mod:
a) alle former for forsætlig indfangning eller drab af enheder af disse arter i naturen

b) forsætlig forstyrrelse af disse arter, i særdeleshed i perioder, hvor dyrene yngler, udviser yngelpleje, overvintrer eller vandrer

c) forsætlig ødelæggelse eller indsamling af æg i naturen

d) beskadigelse eller ødelæggelse af yngle- eller rasteområder.

...

3. Forbuddene i stk. 1, litra a) og b), samt stk. 2 gælder for alle livsstadier hos de dyr, der er omfattet af denne artikel.

4. Medlemsstaterne indfører en ordning med tilsyn med uforsætlig indfangning eller drab af de dyrearter, der er nævnt i bilag IV, litra a). På grundlag af de indhentede oplysninger gennemfører medlemsstaterne de yderligere undersøgelser eller træffer de bevaringsforanstaltninger, der er nødvendige for at sikre, at uforsætlig indfangning eller drab ikke får en væsentlig negativ virkning for de pågældende dyrearter."

Uanset det ikke er formålet med opstillingen af f.eks. 5G-telemaster at dræbe dyr eller at ødelægge deres reder og æg, er dette en klar og forudsigelig effekt af, hvis de opstilles i tilpas nærhed af de beskyttede dyrs levesteder.

Beskyttelsen i habitatdirektivet gælder udtrykkeligt for alle livsstadier hos de omfattede dyr, hvor det i fuglebeskyttelsesdirektivet er anført, at beskyttelsen gælder fugle, deres reder og æg. Der er næppe tilsigtet nogen forskellig anvendelse af bestemmelserne, henset til, at et "hul" i beskyttelsen af de pågældende arter ville kunne gøre reglerne ineffektive.

Art. 13, stk. 1, litra a) og stk. 2:

"1. Medlemsstaterne træffer de nødvendige foranstaltninger for at indføre en streng beskyttelsesordning for de plantearter, der er nævnt i bilag IV, litra b), med forbud mod:
a) forsætlig plukning, indsamling, afskæring, oprivning med rod eller ødelæggelse af disse vildtvoksende planter i naturen

¨...

2. Forbuddene i stk. 1, litra a) og b), gælder for alle livsstadier for de planter, der er omfattet af denne artikel."

Art. 15:

"Ved indfangning eller drab af de vilde dyrearter, som er nævnt i bilag V, litra a), og ved anvendelse efter artikel 16 af fravigelser i forbindelse med indsamling, indfangning eller drab af de arter, der er nævnt i bilag IV, litra a), forbyder medlemsstaterne anvendelse af alle ikke-selektive midler, der lokalt kan medføre, at bestande af en art forsvinder eller udsættes for

alvorlige forstyrrelser, navnlig
a) anvendelse af de indfangnings- og drabsmetoder, der er nævnt i bilag VI b)
...”

I bilag VI (rettelig er der tale om bilag VI a), ikke b)) er bl.a. nævnt *”...elektriske og elektroniske apparater, som kan dræbe eller lamme...”* Det er ikke afklaret, om der i denne definition kan inkluderes apparater såsom telemaster, antenner, m.v., som over en længere eller meget lang periode kan gøre dødelig skade på de af direktivet omfattede dyr. Det kan ikke udelukkes, uanset der med selve formuleringen formentlig er ment apparater, som mere umiddelbart kan dræbe eller lamme. Med anvendelsen af udtrykket ”navnlig” i selve art. 15 anføres imidlertid, at de i bilag VI a) nævnte midler ikke er udtømmende, og at forbuddet omfatter ethvert middel, som lokalt vil kunne medføre, at en artsbestand forsvinder eller forstyrres alvorligt.

Det forekommer således oplagt, at påtænkte 5G-installationer er i strid med selve art. 15, uanset de evt. også kan henføres til de specifikke apparater i bilag VI a).

Art. 16, stk. 1, litra c):

”1. Hvis der ikke findes nogen anden brugbar løsning, og fravigelsen ikke hindrer opretholdelse af den pågældende bestands bevaringsstatus i dens naturlige udbredelsesområde, kan medlemsstaterne fravige bestemmelserne i artikel 12, 13, 14 og 15, litra a) og b):
...
c) af hensyn til den offentlige sundhed og sikkerhed eller af andre bydende nødvendige hensyn til væsentlige samfundsinteresser, herunder af social og økonomisk art, og hensyn til væsentlige gavnlige virkninger på miljøet
...”

Der findes andre, brugbare løsninger.

Dertil kommer, at det på baggrund af det i pkt. 1.2 behandlede forskningsmateriale må være min vurdering, at en fravigelse af beskyttelsen med stor sandsynlighed over tid vil kunne hindre opretholdelse af bestandene.

2.3.3.1. Delkonklusion.

Det er på baggrund af den i pkt. 1.2 ovenfor refererede forskning min vurdering, at hvis 5G-systemet aktiveres, så vil det medføre eller kunne medføre væsentlig skade på de beskyttede dyre- og plantearter, der har deres levesteder tilstrækkeligt tæt på f.eks. en telemast.

Denne virkning vil blive forstærket af, at disse installationer påviseligt også har betydelig skadevirkning på insektædere, jf. pkt. 1.2.3.2. ovenfor.

Det må følgelig også være min vurdering, at aktiveringen heraf vil udgøre en overtrædelse af Danmarks forpligtelser efter habitatdirektivets art. 6, stk. 2 – 4.

Hvis det lagdes til grund, at der fortsat består en videnskabelig usikkerhed, bør anvendelsen af forsigtighedsprincippet føre til samme delkonklusioner.

2.4. Bern-konventionen

Konvention af 19. september 1979 "om beskyttelse af Europas vilde dyr og planter samt naturlige levesteder" (herefter: *"Bern-konventionen"*) blev ratificeret af Danmark i henhold til kongelig resolution af 5. juli 1982. Den er ikke inkorporeret i dansk ret, og gældende ret skal så vidt muligt fortolkes i overensstemmelse med de forpligtelser, Danmark har valgt at påtage sig ved ratifikationen (Dette gælder, så længe det ikke er nødvendigt direkte at tilsidesætte en lovbestemmelse i national ret.)

Konventionen indeholder bl.a. en række bestemmelser, hvormed de kontraherende stater har forpligtet sig til at *"...sikre..."* beskyttelsen af en række vilde dyr og planter, således at bestanden opretholdes, samtidig med at der "tages hensyn til de økonomiske behov", alt jf. art. 2.

De for nærværende responsums problemstilling relevante bestemmelser i konventionen er på det foreliggende grundlag følgende (understregninger indsat her), hvortil der er indsat løbende kommentarer:

Art. 2:
"De kontraherende parter skal træffe de nødvendige foranstaltninger for at opretholde bestanden af vilde dyr og planter på, eller at tilpasse den til, et niveau, som svarer til de særlige økologiske, videnskabelige og kulturelle behov, idet der samtidig tages hensyn til de økonomiske og rekreative behov og behov hos underarter, geografiske racer eller former, som trues lokalt."

Art. 3, stk. 2:
"Hver kontraherende part forpligter sig til i sin planlægnings- og egnsudviklingspolitik og i sine foranstaltninger mod forurening at tage hensyn til beskyttelsen af vilde dyr og planter."

Art. 4, stk. 1 til 3:
"1. Hver kontraherende part skal træffe passende og nødvendige lovgivningsmæssige og administrative foranstaltninger for at sikre beskyttelsen af levesteder for vilde dyre- og plantearter, navnlig de i liste I og II anførte, og beskyttelsen af truede naturlige levesteder.

2. De kontraherende parter skal i deres planlægnings- og egnsudviklingspolitik tage hensyn til beskyttelsesbehovene i de områder, som skal beskyttes i henhold til stk. 1, således at man undgår eller så vidt muligt begrænser en hvilken som helst forringelse af sådanne områder.

3. De kontraherende parter forpligter sig til at tage særligt hensyn til beskyttelsen af områder, som er af betydning for de migrerende arter, der er anført i liste II og III, og som har en passende beliggenhed i forhold til migrationsruter som overvintringsområder, rastepladser, fourageringspladser, yngleområder eller fældningsområder."

Art. 5, 1. pkt.:
"Hver kontraherende part skal træffe passende og nødvendige lovgivningsmæssige og administrative foranstaltninger for at sikre en særlig beskyttelse af de vilde plantearter, som er anført i liste I. ..."

Art. 6:
"Hver kontraherende part skal træffe passende og nødvendige lovgivningsmæssige og administrative foranstaltninger for at sikre en særlig beskyttelse af de vilde dyrearter, som er anført i liste II. Navnlig skal der i forbindelse med disse arter være forbud mod følgende:

-a.- alle former for forsætlig indfangning og fangenskabshold samt forsætlig ihjelslagning,

-b. forsætlig skade på eller ødelæggelse af yngle- og rastepladser,

-c.- forsætlig forstyrrelse af vilde dyr, i særdeleshed i perioder, når de yngler, udviser ynglepleje og overvintrer, for så vidt som forstyrrelsen måtte være væsentlig i forbindelse med denne konventions målsætninger,

…"

Art. 7, stk. 1 og 2:
"Hver kontraherende part skal træffe passende og nødvendige lovgivningsmæssige og administrative foranstaltninger for at sikre beskyttelse af de vilde dyrearter, som er anført i liste III.

Enhver udnyttelse af de vilde dyrearter, som er anført i liste III, skal under hensyntagen til bestemmelserne i artikel 2 reguleres med henblik på at forebygge, at bestandene bliver truet."

Til art. 4 til 7:

Den forudsatte "sikring" af beskyttelsen af de i liste I og II anførte arter er efter min vurdering på baggrund af den i pkt. 1.2. ovenfor gennemgåede forskning sammenholdt med de p.t. værende grænseværdier ikke mulig ved indførelsen af det påtænkte 5G-system.

Dette er særligt tydeligt for så vidt angår forpligtelsen i art. 4, stk. 2, til at undgå eller så vidt muligt begrænse en hvilken som helst forringelse af sådanne områder.

Art. 8:
"I forbindelse med indfangning eller ihjelslagning af de vilde dyrearter, som er anført i liste III, og i tilfælde af benyttelsen af undtagelser i medfør af artikel 9 på de arter, som er anført i liste II, skal de kontraherende parter forbyde anvendelsen af ikke-selektive fangst- og drabsmetoder og af alle midler, som vil kunne medføre, at bestande af en art forsvinder i et lokalt område eller forstyrres alvorligt, samt navnlig anvendelsen af de midler, som er opregnet i liste IV."

Bestemmelsen er formuleret som risikobaseret, således at forbuddet gælder den blotte mulighed for, at den ikke-selektive drabsmetode eller middel vil kunne medføre bestandenes forsvinden. (Det er således særligt oplagt at bringe forsigtighedsprincippet i anvendelse, hvis det lægges til grund, at der fortsat foreligger videnskabelig uklarhed.)

Endvidere indeholder art. 8 en reference til en *"Liste IV"* med angivelse af forbudte midler og metoder til ihjelslagning, m.v., af vilde dyr omfattet af konventionens *"Liste III*" (jf. art. 7 ovenfor). Listen omfatter bl.a. et forbud imod at anvende *"Elektriske apparater, som kan dræbe eller lamme"* i forhold til både pattedyr og fugle. Det er ikke afklaret, om der i denne definition kan inkluderes apparater såsom telemaster, antenner, m.v., som over en længere eller meget lang periode kan gøre dødelig skade på de i liste III omfattede dyr. Det kan ikke udelukkes, uanset der med selve formuleringen formentlig er ment apparater, som mere umiddelbart kan dræbe eller lamme. Med anvendelsen af udtrykket "navnlig" i selve art. 8 anføres imidlertid, at de i liste IV nævnte midler og metoder ikke er udtømmende, og at forbuddet omfatter ethvert middel, som vil kunne medføre at en artsbestand forsvinder eller forstyrres alvorligt i det lokale område.

Art. 9, stk. 1:
"Hver kontraherende part kan gøre undtagelser fra bestemmelserne i artiklerne 4, 5, 6 og 7, og fra forbudet mod anvendelse af de midler, der er nævnt i artikel 8, hvis der ikke findes andre tilfredsstillende løsninger, og hvis undtagelsen ikke er til skade for den berørte bestands overlevelse:

- for at beskytte dyr og planter,

- for at forhindre alvorlig skade på afgrøder, besætning, skove, fiskeri, vand og andre former for ejendom,

- af hensyn til den offentlige sundhed og sikkerhed, sikkerheden for luftfarten eller andre offentlige interesser, der måtte gå forud,

...”

Der findes andre tilfredsstillende løsninger.

Dertil kommer, at det på baggrund af det i pkt. 1.2 behandlede forskningsmateriale må være min vurdering, at en fravigelse af beskyttelsen med stor sandsynlighed vil være til skade for bestandenes overlevelse.

2.4.1. Delkonklusion.

Den forudsatte ”sikring” af beskyttelsen af de i liste I og II anførte arter er efter min vurdering på baggrund af den i pkt. 1.2. ovenfor gennemgåede forskning sammenholdt med de p.t. værende grænseværdier ikke mulig ved indførelsen af det påtænkte 5G-system.

Det forekommer sandsynligt, at beskyttelsen efter art. 8 af ”liste III-arter” ligeledes ikke vil blive respekteret ved etableringen af 5G-systemet sammenholdt med de p.t. værende grænseværdier.

2.5. Bonn-konventionen

Konvention af 23. juni 1979 "om beskyttelse af migrerende arter af vilde dyr" (herefter: *"Bonn-konventionen"*) blev ratificeret af Danmark i henhold til kongelig resolution af 5. juli 1982, samme dato som Bern-konventionen ovenfor. Den er ikke inkorporeret i dansk ret, og gældende ret skal så vidt muligt fortolkes i overensstemmelse med de forpligtelser, Danmark har valgt at påtage sig ved ratifikationen (Dette gælder, så længe det ikke er nødvendigt direkte at tilsidesætte en lovbestemmelse i national ret.)

Konventionen indeholder bl.a. en række bestemmelser, hvormed de kontraherende stater har forpligtet sig til "i passende omfang" at "tage skridt til" at bevare truede, migrerende dyrearter, samt deres bosteder, jf. art. 2, stk. 1.

De for nærværende responsums problemstilling relevante bestemmelser i konventionen er på det foreliggende grundlag følgende (understregninger indsat her), hvortil der er indsat løbende kommentarer:

Art. 2, stk. 1 og 2:

"1. The Parties acknowledge the importance of migratory species being conserved and of Range States agreeing to take action to this end whenever possible and appropriate, paying special attention to migratory species the conservation status of which is unfavourable, and taking individually or in co-operation appropriate and necessary steps to conserve such species and their habitat.

2. The Parties acknowledge the need to take action to avoid any migratory species becoming endangered." (understreget her)

Den forudsatte beskyttelse af migrerende arter er efter min vurdering på baggrund af den i pkt. 1.2. ovenfor gennemgåede forskning sammenholdt med de p.t. værende grænseværdier ikke mulig ved indførelsen af det påtænkte 5G-system.

Dertil kommer, at fastholdelsen af de nuværende grænseværdier efter min vurdering vil udelukke, at Danmark kan anses for at have taget "de nødvendige skridt" til opretholdelse af de migrerende arter.

Art. 3, stk. 4:

"Parties that are Range States of a migratory species listed in Appendix I shall endeavour:

a) to conserve and, where feasible and appropriate, restore those habitats of the species which are of importance in removing the species from danger of extinction;

b) to prevent, remove, compensate for or minimize, as appropriate, the adverse effects of activities or obstacles that seriously impede or prevent the migration of the species; and

c) to the extent feasible and appropriate, to prevent, reduce or control factors that are endangering or are likely to further endanger the species, including strictly controlling the introduction of, or controlling or eliminating, already introduced exotic species."

Formuleringen *"to the extent … appropriate"* (i passende omfang), som begrænser forpligtelsen i henhold til litra c, er ikke at finde i litra a og b.

Den forudsatte beskyttelse af migrerende arter er efter min vurdering på baggrund af den i pkt. 1.2. ovenfor gennemgåede forskning sammenholdt med de p.t. værende grænseværdier

ikke mulig ved indførelsen af det påtænkte 5G-system.

2.5.1. Delkonklusion.

Den forudsatte beskyttelse af migrerende arter er efter min vurdering på baggrund af den i pkt. 1.2. ovenfor gennemgåede forskning sammenholdt med de p.t. værende grænseværdier ikke mulig ved indførelsen af det påtænkte 5G-system.

3. Konklusion og afsluttende bemærkninger.

Det konkluderes i nærværende responsum, at etablering og aktivering af et 5G-netværk, således som det p.t. foreligger beskrevet, vil være i strid med gældende menneskeretlige og miljøretlige regler i EMRK, FN's børnekonvention, EU-regler og Bern- og Bonn-konventionerne.

Årsagen hertil er den meget betydelige, videnskabelige dokumentation, der foreligger for, at radiofrekvent elektromagnetisk stråling er helbredsskadelig og farlig for mennesker (og særligt for børn), dyr og planter.

Dette gælder også, når strålingen holder sig inden for de retningslinjer, som anbefales af ICNIRP, og som anvendes af Danmark og bredt i EU.

De nøjagtige helbredsmæssige skadevirkninger af 5G-systemet er ikke kendte, idet der ikke er tale om et eksakt defineret system, men det er på baggrund af den foreliggende forskning i radiofrekvent elektromagnetisk strålings påvirkninger af f.eks. menneskers og dyrs krop, herunder ved fremkaldelsen af DNA-skader og oxidativt stress, stærkt usandsynligt, at det ikke skulle medføre tilsvarende skadevirkninger som de hidtidige systemer, særligt al den stund det er baseret på samme grundlæggende stråling.

Den danske stat tjener betydelige beløb på at tillade oprettelse og drift af kommunikationssystemerne, bl.a. ved beskatning af overskud og auktioner over de frekvensbånd, som teleselskaber benytter til at opbygge den kommunikationsinfrastruktur, der kan indbringe selskaberne selv milliarder.

Alfonso Balmori er én blandt mange forskere, der har udtalt sig på følgende måde om den iboende interessekonflikt i dette strukturelle problem, jf. Balmori 2005 p. 116:

"Controversy is frequent when the scientists recognize serious effects on health and on the environment that cause high economic losses."

Holte, d. 4. maj 2019

Agarwal A. et al. 2009, Effects of radiofrequency electromagnetic waves (RF-EMW) from cellular phones on human ejaculated semen: an in vitro pilot study

https://www.sciencedirect.com/science/article/pii/S0015028208033566

"Result(s) Samples exposed to RF-EMW showed a significant decrease in sperm motility and viability, increase in ROS level, and decrease in ROS-TAC score. Levels of TAC [Total Antioxidant Capacity] and DNA damage showed no significant differences from the unexposed group."

Aitken R.J. et al. 2005, Impact of radio frequency electromagnetic radiation on DNA integrity in the male germline.

"In this study, mice were exposed to 900 MHz RFEMR at a specific absorption rate of approximately 90 mW/kg inside a waveguide for 7 days at 12 h per day. Following exposure, DNA damage to caudal epididymal spermatozoa was assessed by quantitative PCR (QPCR) as well as alkaline and pulsed-field gel electrophoresis... This study suggests that while RFEMR does not have a dramatic impact on male germ cell development, a significant genotoxic effect on epididymal spermatozoa is evident and deserves further investigation."

Campisi A. et al. 2010, Reactive oxygen species levels and DNA fragmentation on astrocytes in primary culture after acute exposure to low intensity microwave electromagnetic field

Our data demonstrate, for the first time, that even acute exposure to low intensity EMF induces ROS production and DNA fragmentation in astrocytes in primary cultures, which also represent the principal target of modulated EMF. Our findings also suggest the hypothesis that the effects could be due to hyperstimulation of the glutamate receptors, which play a crucial role in acute and chronic brain damage. Furthermore, the results show the importance of the amplitude modulation in the interaction between EMF and neocortical astrocytes.

d'Ambrosio G et al. 2002, Cytogenetic damage in human lymphocytes following GMSK phase modulated microwave exposure

Human peripheral blood cultures were exposed to 1.748 GHz, either continuous wave (CW) or phase only modulated wave (GMSK), for 15 min. The maximum specific absorption rate (approximately 5 W/kg) was higher than that occurring in the head of mobile phone users; however, no changes were found in cell proliferation kinetics after exposure to either CW or GMSK fields. As far as genotoxicity is concerned, the micronucleus frequency result was not affected by CW exposure; however, a statistically significant micronucleus effect was found following exposure to phase modulated field. These results would suggest a genotoxic power of the phase modulation per se.

https://www.ncbi.nlm.nih.gov/pubmed/11793401

De Luliis G.N. et al. 2009, Mobile Phone Radiation Induces Reactive Oxygen Species Production and DNA Damage in Human Spermatozoa In Vitro

"Principal Findings: Purified human spermatozoa were exposed to radio-frequency electromagnetic radiation (RF-EMR) tuned to 1.8 GHz and covering a range of specific absorption rates (SAR) from 0.4 W/kg to 27.5 W/kg. In step with increasing SAR, motility and vitality were significantly reduced after RF-EMR exposure, while the mitochondrial generation of reactive oxygen species and DNA fragmentation were significantly elevated ($P<0.001$). Furthermore, we also observed highly significant relationships between SAR, the oxidative DNA damage bio-marker, 8-OH-dG, and DNA fragmentation after RF-EMR exposure."

"Conclusions: RF-EMR in both the power density and frequency range of mobile phones enhances mitochondrial reactive oxygen species generation by human spermatozoa, decreasing the motility and vitality of these cells while stimulating DNAbase adduct formation and, ultimately DNA fragmentation. These findings have clear implications for the safety of extensive mobile phone use by males of reproductive age, potentially affecting both their fertility and the health and wellbeing of their offspring."

Diem E. et al. 2005, Non-thermal DNA breakage by mobile-phone radiation (1800 MHz) in human fibroblasts and in transformed GFSH-R17 rat granulosa cells in vitro.

"Abstract: Cultured human diploid fibroblasts and cultured rat granulosa cells were exposed to intermittent and continuous radiofrequency electromagnetic fields (RF-EMF) used in mobile phones, with different specific absorption rates (SAR) and different mobile-phone modulations. DNA strand breaks were determined by means of the alkaline and neutral comet assay. RF-EMF exposure (1800 MHz; SAR 1.2 or 2 W/kg; different modulations; during 4, 16 and 24h; intermittent 5 min on/10 min off or continuous wave) induced DNA single- and double-strand breaks. Effects occurred after 16 h exposure in both cell types and after different mobile-phone modulations. The intermittent exposure showed a stronger effect in the comet assay than continuous exposure. Therefore we conclude that the induced DNA damage cannot be based on thermal effects."

Garaj-Vrhovac V et al. 1992, The correlation between the frequency of micronuclei and specific chromosome aberrations in human lymphocytes exposed to microwave radiation in vitro.

Human whole-blood samples were exposed to continuous microwave radiation, frequency 7.7 GHz, power density 0.5, 10 and 30 mW/cm2 for 10, 30 and 60 min. A correlation between specific chromosomal aberrations and the incidence of micronuclei after in vitro exposure was observed. In all experimental conditions, the frequency of all types of chromosomal aberrations was significantly higher than in the control samples... The results of the study indicate that microwave radiation causes changes in the genome of somatic human cells and that the applied tests are equally sensitive for the detection of the genotoxicity of microwaves.

Karaca E. et al. 2011, The genotoxic effect of radiofrequency waves on mouse brain

Brain cell cultures of the mice were exposed to 10.715 GHz with specific absorbtion rate (SAR) 0.725 W/kG signals for 6 h in 3 days at 25°C to check for the changes in the micronucleus (MNi) assay and in the expression of 11 proapoptotic and antiapoptotic genes. It was found that MNi rate increased 11-fold and STAT3 expression decreased 7-fold in the cell cultures which were exposed to RF. Cell phones which spread RF may damage DNA and change gene expression in brain cells.

Liu C. et al. 2013, Mobile phone radiation induces mode-dependent DNA damage in a mouse spermatocyte-derived cell line: a protective role of melatonin.

RESULTS:The levels of DNA damage were significantly increased following exposure to Mobile Phone Radiation(MPR) in the listen, dialed and dialing modes. Moreover, there were significantly higher increases in the dialed and dialing modes than in the listen mode. Interestingly, these results were consistent with the radiation intensities of these modes. However, the DNA damage effects of MPR in the dialing mode were efficiently attenuated by melatonin pretreatment.

Lu Y. et al. 2012, Reactive Oxygen Species Formation and Apoptosis in Human Peripheral Blood Mononuclear Cell Induced by 900 MHz Mobile Phone Radiation

Abstract: We demonstrate that reactive oxygen species (ROS) plays an important role in the process of apoptosis in human peripheral blood mononuclear cell (PBMC) which is induced by the radiation of 900 MHz radiofrequency electromagnetic field (RFEMF) at a specific absorption rate (SAR) of ~0.4 W/kg when the exposure lasts longer than two hours. The apoptosis is induced through the mitochondrial pathway and mediated by activating ROS and caspase-3, and decreasing

the mitochondrial potential. The activation of ROS is triggered by the conformation disturbance of lipids, protein, and DNA induced by the exposure of GSM RFEMF. Although human PBMC was found to have a self-protection mechanism of releasing carotenoid in response to oxidative stress to lessen the further increase of ROS, the imbalance between the antioxidant defenses and ROS formation still results in an increase of cell death with the exposure time and can cause about 37% human PBMC death in eight hours.

Markova E. et al. 2010, Microwaves from Mobile Phones Inhibit 53BP1 Focus Formation in Human Stem Cells More Strongly Than in Differentiated Cells: Possible Mechanistic Link to Cancer Risk

"We studied whether microwaves from mobile telephones of the Global System for Mobile Communication (GSM) and the Universal Global Telecommunications System (UMTS) induce DSBs or affect DSB repair in stem cells... Microwaves from mobile phones inhibited formation of 53BP1 foci in human primary fibroblasts and mesenchymal stem cells. These data parallel our previous findings for human lymphocytes. Importantly, the same GSM carrier frequency (915 MHz) and UMTS frequency band (1947.4 MHz) were effective for all cell types. Exposure at 905 MHz did not inhibit 53BP1 foci in differentiated cells, either fibroblasts or lymphocytes, whereas some effects were seen in stem cells at 905 MHz. Contrary to fibroblasts, stem cells did not adapt to chronic exposure during 2 weeks."

Megha K. et al. 2015, Low intensity microwave radiation induced oxidative stress, inflammatory response and DNA damage in rat brain.

In conclusion, the present study suggests that low intensity microwave radiation induces oxidative stress, inflammatory response and DNA damage in brain by exerting a frequency dependent effect. The study also indicates that increased oxidative stress and inflammatory response might be the factors involved in DNA damage following low intensity microwave exposure.

Xu S. et al. 2010, Exposure to 1800 MHz radiofrequency radiation induces oxidative damage to mitochondrial DNA in primary cultured neurons.

In this study, we exposed primary cultured cortical neurons to pulsed RF electromagnetic fields at a frequency of 1800 MHz modulated by 217 Hz at an average special absorption rate (SAR) of 2 W/kg. At 24 h after exposure, we found that RF radiation induced a significant increase in the levels of 8-hydroxyguanine (8-OHdG), a common biomarker of DNA oxidative damage, in the mitochondria of neurons. Concomitant with this finding, the copy number of mtDNA and the levels of mitochondrial RNA (mtRNA) transcripts showed an obvious reduction after RF exposure. Each of these mtDNA disturbances could be reversed by pretreatment with melatonin, which is known to be an efficient antioxidant in the brain. Together, these results suggested that 1800 MHz RF radiation could cause oxidative damage to mtDNA in primary cultured neurons. Oxidative damage to mtDNA may account for the neurotoxicity of RF radiation in the brain.

EL DEFENSOR DEL PUEBLO
REGISTRO

SALIDA
21/08/2019 - 19080322

Estimado Sr.:

En relación con la queja arriba indicada, se le comunica que se ha recibido un informe elaborado por la Dirección General de Telecomunicaciones, dependiente de la Secretaría de Estado para el Avance Digital, que puede resumirse como sigue:

I. El Plan Nacional 5G, publicado por el anterior Ministerio de Energía, Turismo y Agenda Digital en diciembre de 2017, pretende contribuir a la consecución de los objetivos marcados a nivel europeo en el Plan de Acción de 5G para Europa aprobado por las instituciones comunitarias en abril de 2016 como estrategia para mejorar la competitividad europea en el desarrollo de esta tecnología emergente, en el que se incluye diversos objetivos para los Estados Miembros, entre ellos, la aprobación de planes de trabajo nacionales.

El Plan se enmarca en un contexto internacional en el que los principales países europeos (Alemania, Francia, Reino Unido, etc.) y de otras regiones del mundo (USA, Japón, Corea, etc.) están aprobando sus estrategias para el desarrollo del 5G, y España no podía quedarse atrás.

No obstante, el Plan Nacional 5G no es una norma que establezca preceptos jurídicos relacionados con los despliegues 5G, que deban ser objeto de una evaluación específica y previa a su aprobación y publicación, ni un documento vinculante que genere efectos frente a terceros. El Plan es únicamente un documento de carácter general y de referencia que define y trata de impulsar una estrategia de una política pública, en el que se identifican los tipos de medidas, de carácter estratégico, que se considera se deben a llevar a cabo para que España no quede retrasada en el desarrollo de esta nueva tecnología, y pueda perder las oportunidades que proporcionará en el futuro. Los aspectos ambientales deben ser analizados cuando se proceda al despliegue real de las infraestructuras que sirvan de soporte para la tecnología 5G.

II. Así, el Plan Nacional 5G no se ha sometido a evaluación ambiental estratégica. Se trata de un plan que contiene los principios programáticos y relaciona las líneas estratégicas que se considera deben ser ejecutadas para lograr el impulso de esta

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

"nueva tecnología disruptiva" a nivel social y económico. Es un documento estratégico que identifica las líneas directrices y distintas políticas públicas que deberían ser tenidas en cuenta para situar a nuestro país en una situación de liderazgo en la adopción y consolidación de la tecnología 5G. No es un norma ni un documento vinculante que genere efectos frente a terceros, como ser un plan general de ordenación urbana, que sea directamente aplicable y ejecutable, y que, en consecuencia, deba haber efectuado un evaluación medioambiental. Por tanto, el Plan Nacional 5G, atendiendo a su naturaleza y finalidad, "*no ha sido sometido a evaluación de impacto ambiental*" (sic).

Otra cuestión es el despliegue en concreto de las infraestructuras de red, en particular, de las estaciones base, en que se plasmará finalmente los recursos necesarios para poder utilizar la tecnología 5G a través la prestación de una serie de servicios a instituciones, empresas y ciudadanos.

En tal sentido, el artículo 34.6 de la Ley 9/2014, de 9 de mayo, General de Telecomunicaciones, establece:

> "*6. Para la instalación de las estaciones o infraestructuras radioeléctricas utilizadas para la prestación de servicios de comunicaciones electrónicas disponibles para el público a las que se refiere la disposición adicional tercera de la Ley 12/2012, de 26 de diciembre, de medidas urgentes de liberalización del comercio y de determinados servicios, no podrá exigirse la obtención de licencia previa de instalaciones, de funcionamiento o de actividad, ni otras de clase similar o análogas, en los términos indicados en la citada ley.*
>
> *Para la instalación de redes públicas de comunicaciones electrónicas o de estaciones radioeléctricas en dominio privado distintas de las señaladas en el párrafo anterior, no podrá exigirse por parte de las administraciones públicas competentes la obtención de licencia o autorización previa de instalaciones, de funcionamiento o de actividad, o de carácter medioambiental, ni otras licencias o aprobaciones de clase similar o análogas que sujeten a previa autorización dicha instalación, en el caso de que el operador haya presentado a la administración pública competente para el otorgamiento de la licencia o autorización un plan de despliegue o instalación de red de comunicaciones electrónicas, en el que se contemplen dichas infraestructuras o estaciones, y siempre que el citado plan haya sido aprobado por dicha administración.*
>
> *(…)*
>
> *Las licencias o autorizaciones previas que, de acuerdo con los párrafos anteriores, no puedan ser exigidas, serán sustituidas por declaraciones responsables, de conformidad con lo establecido en el artículo 71 bis de la Ley 30/1992, de 26 de noviembre, de Régimen Jurídico de las administraciones públicas y del Procedimiento Administrativo Común, relativas al cumplimiento de las previsiones legales establecidas en la normativa vigente. En todo caso, el declarante deberá estar en posesión del justificante de pago del tributo correspondiente cuando sea preceptivo.*
>
> *(…)*
>
> *La presentación de la declaración responsable, con el consiguiente efecto de habilitación a partir de ese momento para ejecutar la instalación, no prejuzgará en modo alguno la situación y efectivo acomodo de las condiciones de la infraestructura o estación radioeléctrica a la normativa aplicable, ni limitará el ejercicio de las potestades administrativas de comprobación, inspección,*

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

sanción, y, en general, de control que a la administración en cualquier orden, estatal, autonómico o local, le estén atribuidas por el ordenamiento sectorial aplicable en cada caso".

En todo caso, el inicio de la implantación de la tecnología 5G a corto y medio plazo se va a efectuar a través de la infraestructuras y estaciones bases actualmente desplegadas, que suelen estar utilizando la tecnología 4G en las mencionadas bandas de frecuencia que son objeto de uso a nivel masivo por diferentes servicios radioeléctricos comerciales (700 MHz, 800 MHz, 900 MHz, 1,8 GHz, 2,1 GHz, 2,6 GHz, 3,5 GHz), estaciones base que ya previamente han sido autorizadas tanto en lo relativo a su proyecto técnico como en su puesta en servicio.

Así, cabe traer a colación nuevamente la Ley General de Telecomunicaciones, cuyo artículo 34.7 prevé expresamente el supuesto de una renovación puramente tecnológica de una estación base previamente instalada, no sujetándola a un riguroso control administrativo en diferentes ámbitos de actuación, incluido el medioambiental:

"7. En el caso de que sobre una infraestructura de red pública de comunicaciones electrónicas, fija o móvil, incluidas las estaciones radioeléctricas de comunicaciones electrónicas, ya esté ubicada en dominio público o privado, se realicen actuaciones de innovación tecnológica o adaptación técnica que supongan la incorporación de nuevo equipamiento o la realización de emisiones radioeléctricas en nuevas bandas de frecuencias o con otras tecnologías, sin variar los elementos de obra civil y mástil, no se requerirá ningún tipo de concesión, autorización o licencia nueva o modificación de la existente o declaración responsable o comunicación previa a las administraciones públicas competentes por razones de ordenación del territorio, urbanismo o medioambientales".

Así se concluye que el Plan Nacional 5G, atendiendo a su naturaleza y finalidad, no ha sido sometido a evaluación de impacto ambiental ni se solicitó su evaluación.

III. El Plan Nacional 5G de España prevé la realización de proyectos piloto para probar las nuevas funcionalidades que ofrecerá la tecnología 5G. En particular, se han convocado 2 proyectos piloto por la entidad pública Red.es, que han sido adjudicados por dicha entidad mediante Resolución del 30 de abril de 2019.

Una parte de estas pruebas se desarrollan introduciendo nuevas funcionalidades en estaciones 4G ya existentes y en servicio. Cuando se requiere la instalación y operación durante un tiempo de una nueva estación, para la instalación y uso de la misma es aplicable la regulación del uso del dominio público radioeléctrico, que garantiza un control exhaustivo en la instalación y uso en el tiempo de todo centro emisor o estación base radioeléctrica.

IV. Los límites de las emisiones radioeléctricas no dependen de la tecnología utilizada en la comunicación (2G, 3G, 4G o 5G) sino de las características específicas de cada banda de frecuencias. Las bandas de frecuencias que se van a utilizar para la tecnología 5G, en un primer estadio o posterior, van a ser las que ya están siendo utilizadas masivamente por diferentes servicios radioeléctricos comerciales (700 MHz, 800 MHz, 900 MHz, 1,8 GHz, 2,1 GHz, 2,6 GHz, 3,5 GHz) con el único añadido de la

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

banda de 26 GHz. Esta última banda no ha sido aún adjudicada para el uso de 5G en España para servicios comerciales masivos.

Los organismos internacionales de normalización ya están trabajando en una norma técnica que cubra el cálculo y el procedimiento de medida de emisiones en las bandas milimétricas, como es esta de 26 GHz. En concreto, la Comisión Electrotécnica Internacional (IEC) está desarrollando la norma IEC 62232 (*Determination of RF field strength, power density and SAR in the vicinity of radiocommunication base stations for the purpose of evaluating human exposure*), en avanzado estado de elaboración, que permitirá la evaluación de los niveles de emisión en estas bandas milimétricas.

Asimismo, la Comisión Internacional sobre la Protección contra la Radiación No Ionizante (International Commission on Non-Ionizing Radiation Protection, ICNIRP), está estudiando y revisando las directrices científicas por ella. Estas directrices derivadas de los estudios de la exposición a campos electromagnéticos sirvieron de base para Recomendación 1999/519/CE del Consejo de Sanidad de la Unión Europea, de 12 de julio de 1999, relativa a la exposición del público en general a campos electromagnéticos desde 0 Hz a 300 GHz. Este es el marco europeo que garantiza el nivel de protección de la población en la exposición a los campos electromagnéticos procedentes de productos y aparatos eléctricos o electrónicos.

La ICNIRP publicará, en caso de que lo considere necesario, una actualización de las directrices científicas. Y en el caso de que se produzca esta revisión, se espera que consecuentemente sea revisada la Recomendación 1999/519/CE del Consejo de Sanidad de la Unión Europea, así como el Real Decreto 1066/2001 por el que se aprueba el Reglamento que establece condiciones de protección del dominio público radioeléctrico, restricciones a las emisiones radioeléctricas y medidas de protección sanitaria frente a emisiones radioeléctricas. Este decreto incorpora los criterios de protección sanitaria establecidos en la Recomendación, y su anexo II establece los límites de exposición, en el que se incluyen los límites máximos de emisión para las bandas de frecuencias usadas por las comunicaciones móviles, que son las que utilizará también la tecnología 5G. Así, este Real Decreto establece que el Ministerio de Sanidad y Consumo adaptará al progreso científico el mencionado anexo II, teniendo en cuenta el principio de precaución y las evaluaciones realizadas por las organizaciones nacionales e internacionales competentes.

Las directrices científicas de la ICNIRP son los estándares internacionales que tienen el respaldo de la Organización Mundial de la Salud (OMS). La OMS recomienda una estricta adhesión a los estándares internacionales citados con anterioridad, que han sido desarrollados para proteger tanto a los usuarios de telefonía móvil, como a las personas que trabajan cerca o viven alrededor de estaciones base de telefonía móvil, y a la gente que no hace uso de este tipo de comunicación. La OMS también recomienda que no se impongan límites arbitrarios, desautorizando o desconfiando de la regulación existente, pues esta se basa en el conocimiento científico.

Paseo de Eduardo Dato, 31 – 28010 Madrid

www.defensordelpueblo.es
registro@defensordelpueblo.es

V. El Reglamento sobre el uso del dominio público radioeléctrico, aprobado por el Real Decreto 123/2017, prevé mecanismos de seguimiento de los niveles de exposición, mediante la presentación de certificaciones e informes por parte de operadores de telecomunicaciones, la realización planes de inspección y la elaboración de un informe anual.

El Reglamento sobre el uso del dominio público radioeléctrico, establece que los operadores que establezcan determinadas redes, entre ellas las redes de telefonía móvil, tienen que elaborar un estudio detallado, realizado por técnico competente, que indique los niveles de exposición radioeléctrica en áreas cercanas a sus instalaciones radioeléctricas, en las que puedan permanecer habitualmente personas, y que este estudio tiene que ser presentado ante el Ministerio de Economía y Empresa incorporado en el proyecto que se tiene que presentar para solicitar la autorización de las instalaciones radioeléctricas.

Asimismo, con carácter previo al inicio de emisiones, los operadores tienen que obtener la autorización de puesta en servicio de las estaciones prevista en el Título IV del mencionado reglamento sobre el uso del dominio público radioeléctrico, y para otorgarla los servicios de inspección de la Secretaría de Estado para el Avance Digital comprueban el cumplimiento de los niveles de emisiones en el caso de estaciones que requieren de reconocimiento técnico, o los operadores tienen que presentar un certificado de niveles de exposición realizado por un técnico competente en materia de telecomunicaciones, en el caso de estaciones a las que sea aplicable el procedimiento de certificación sustitutiva del reconocimiento técnico.

Además de lo anterior, de acuerdo con lo establecido en el "Dispongo" cuatro de la Orden CTE/23/2002, de 11 de enero, por la que se establecen condiciones para la presentación de determinados estudios y certificaciones por operadores de servicios de radiocomunicaciones los operadores tienen que remitir al Ministerio de Economía y Empresa, en el primer trimestre de cada año natural, una certificación emitida por técnico competente de que se han respetado durante al año anterior los límites de exposición establecidos en el anexo II del Reglamento que establece las restricciones a las emisiones radioeléctricas y medidas de protección sanitaria frente a emisiones radioeléctricas, aprobado por el Real Decreto 1066/2001.

Adicionalmente, el Ministerio lleva a cabo unos planes de inspección anuales. En ellos se incluyen la realización de medidas en el entorno de una muestra de estaciones radioeléctricas y una auditoria de las certificaciones presentadas por los operadores.

Asimismo, y debido a la importancia que otorga la normativa española a los espacios sensibles (guarderías, centros de educación infantil, primaria, centros de enseñanza obligatoria, centros de salud, hospitales, parques públicos, residencias o centros geriátricos, etc) también se realizan trabajos específicos para comprobar los niveles de exposición radioeléctrica en dichos lugares sensibles.

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

Se concluye que la regulación actual sobre el uso del dominio público radioeléctrico y control de los niveles de emisión es adecuada, incluye las decisiones adoptadas por los organismos internacionales competentes e incorpora el principio de precaución en la delimitación y fijación de los límites de exposición a las emisiones radioeléctricas, garantizándose el oportuno y estricto control en su cumplimiento.

Hasta aquí la información recibida de la Secretaría de Estado para el Avance Digital, a la que esta institución ha dirigido, con esta misma fecha, las siguientes consideraciones:

"**1.** Lo primero que debe señalarse, es que la evaluación ambiental de planes tiene un objeto distinto y está sujeta a un procedimiento diferente a de la evaluación de impacto ambiental proyectos.

La Ley 21/2013 define con carácter general la evaluación ambiental como el proceso a través del cual se analizan los efectos significativos que tienen o pueden tener los planes y proyectos sobre el medio ambiente, antes de su adopción, aprobación o autorización. Ese análisis incluye los efectos de aquellos sobre la población, la salud humana, la flora, la fauna, la biodiversidad, la geodiversidad, la tierra, el suelo, el subsuelo, el aire, el agua, el clima, el cambio climático, el paisaje, los bienes materiales, incluido el patrimonio cultural, y la interacción entre todos los factores mencionados.

Partiendo de la definición general, la Ley distingue entre la evaluación ambiental estratégica, a la que deben someterse los planes, y la evaluación de impacto ambiental, que procede respecto de los proyectos.

Para aclarar la cuestión, la Ley define qué debe entenderse por plan y qué debe entenderse por proyecto.

El artículo 5.2 b) de la Ley define un plan como el conjunto de estrategias, directrices y propuestas destinadas a satisfacer necesidades sociales, no ejecutables directamente, sino a través de su desarrollo por medio de uno o varios proyectos. Por su parte, en el artículo 5.3 b) de la Ley, un proyecto se define como cualquier actuación que consista en: 1º la ejecución, explotación, desmantelamiento o demolición de una obra, una construcción, o instalación, o bien 2º cualquier intervención en el medio natural o en el paisaje, incluidas las destinadas a la explotación o al aprovechamiento de los recursos naturales o del suelo y del subsuelo, así como de las aguas continentales o marinas.

Definido el objeto de la evaluación, la Ley define la finalidad específica de una y otra evaluación según recaiga sobre un plan o un proyecto. La evaluación ambiental estratégica requiere incorporar los criterios de sostenibilidad en la toma de decisiones estratégicas. Ello significa que en la elaboración del plan deben valorarse y tenerse en cuenta los aspectos medioambientales, junto a los económicos y sociales, con el fin de

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

alcanzar un elevado grado de protección ambiental y promover el desarrollo sostenible (artículo 1 de la Ley 21/2013).

A través de la evaluación de proyectos, se garantiza una adecuada prevención de los impactos ambientales concretos que se puedan generar, al tiempo que se establecen las medidas necesarias de corrección o compensación de dichos impactos.

La distinción entre ambos tipos de evaluación tiene su reflejo en una diferente tramitación. Así, el procedimiento para evaluar los planes se regula en el artículo 6 y en el Capítulo I del Título II de la Ley 21/2013; y el de los proyectos, en el artículo 7 y en el Capítulo II del Título II.

Centrándonos ahora en la evaluación ambiental estratégica, esta requiere, en síntesis, la elaboración del estudio ambiental estratégico; la celebración de un trámite de información pública y de consultas a las Administraciones públicas afectadas y personas interesadas y una declaración ambiental estratégica en la que se incluyan las determinaciones, medidas o condiciones que deban incorporarse en el plan que finalmente se apruebe o adopte para garantizar su sostenibilidad.

2. Hecha la distinción entre ambas formas de evaluación, para averiguar si el Plan Nacional 5G debe someterse a evaluación ambiental debe comprobarse si cumple los requisitos establecidos en la legislación.

1º Como se ha dicho, el artículo 5.2 b) de la Ley define un plan como el conjunto de estrategias, directrices y propuestas destinadas a satisfacer necesidades sociales, no ejecutables directamente, sino a través de su desarrollo por medio de uno o varios proyectos. De la definición dada por esa Secretaría de Estado para el Avance Digital, a través del informe de la Dirección General de Telecomunicaciones, y del contenido del propio plan se deduce que el Plan Nacional 5G se ajusta a esta definición.

Así según la DG, *"El Plan Nacional 5G tiene como objetivo situar a España entre los países más avanzados en el desarrollo de esta nueva tecnología, de manera que cuando la 5G alcance su madurez tecnológica y comercial, España esté lo mejor preparada posible para aprovechar al máximo las oportunidades de este nuevo paradigma tecnológico.*

El Plan Nacional (…) es un documento que define y trata de impulsar una estrategia de una política pública que va a provocar efectos beneficiosos para la economía y sociedad españolas,...(…) Dicho Plan es únicamente un documento de carácter general en el que se identifican los tipos de medidas, de carácter estratégico, que se considera se deben a llevar a cabo para que España no quede retrasada en el desarrollo de esta nueva tecnología, y pueda perder las oportunidades que proporcionará en el futuro.

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

Por ello, este Plan se enmarca en un contexto internacional en el que los principales países europeos (Alemania, Francia, Reino Unido, etc.) y de otras regiones del mundo (USA, Japón, Corea, etc.) están aprobando sus estrategias para el desarrollo del 5G, y España no podía quedarse atrás en estos aspectos. Estas estrategias nacionales, al igual que el Plan de acción 5G para Europa, y el Plan nacional 5G publicado en España, constituyen documentos de referencia en cada uno de los países, en los que se identifican las grandes medidas estratégicas a llevar a cabo para el desarrollo del 5G, pero no se trata de medidas normativas específicas que deban ser objeto para su aprobación y publicación de una evaluación específica y sobre un caso concreto en lo que a su impacto en diferentes aspectos se refiere".

Conforme a lo anterior, el Plan define los objetivos estratégicos, las medidas estratégicas (entre ellas acciones para la gestión y planificación del espectro radioeléctrico, puesta en marcha de proyectos piloto y desarrollo de instrumentos legales que proporcionen seguridad jurídica para facilitar las inversiones en el despliegue) y la hoja de ruta para el despliegue de las acciones clave. De lo anterior se concluye que el Plan Nacional 5G se ajusta sin dificultad a la definición legal y es un plan a los efectos de la Ley 21/2013, pues constituye un conjunto de directrices y propuestas destinadas a satisfacer necesidades sociales, no ejecutables directamente.

2º El artículo 6.1 determina los planes que deben ser sometidos a evaluación ambiental estratégica ordinaria conforme a lo siguiente:

- *Que se adopten o aprueben por una Administración pública.* En este caso, esa Secretaría de Estado para el Avance Digital no ha informado de que el Plan haya sido aprobado formalmente por el Consejo de Ministros mediante un acuerdo o mediante una orden o resolución de un órgano del Ministerio de Economía y Empresa. No obstante, no está del todo claro que la Ley 21/2013 exija un acto de aprobación formal en sentido estricto, pues basta que el plan haya sido "adoptado" por una Administración pública, lo cual ocurre en este caso, pues como acaba de indicarse, y así lo reconoce la Dirección General de Telecomunicaciones, el Plan es un documento de referencia elaborado y difundido por el Ministerio, el cual define los pasos que han de darse y el calendario que ha de cumplirse para el despliegue de la tecnología 5G.

- *Que su elaboración y aprobación venga exigida por una disposición legal o reglamentaria o por acuerdo del Consejo de Ministros o del Consejo de Gobierno de una comunidad autónoma.* Este precepto traspone el artículo 2 a) segundo guión de la Directiva 2001/42/CE de evaluación ambiental de planes y programas. Esta Directiva se refiere a los planes que sean exigidos por disposiciones legales, reglamentarias o administrativas. Conforme a lo anterior, debe interpretarse que las disposiciones que prevén la adopción de un plan no se circunscriben al ámbito estatal o autonómico como dice la Ley 21/2013, sino que su necesidad puede derivarse también de disposiciones o actos emanados de las instituciones comunitarias. Según indica la Dirección General de

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

Telecomunicaciones, el Plan Nacional 5G, es consecuencia de la necesidad de cumplir con los objetivos marcados a nivel europeo en el Plan de Acción de 5G para Europa aprobado por las instituciones comunitarias en abril de 2016 "*como estrategia para mejorar la competitividad europea en el desarrollo de esta tecnología emergente, en el que se incluye diversos objetivos para los Estados Miembros, entre ellos, la aprobación de planes de trabajo nacionales*". Efectivamente, el Plan de Acción 5G para Europa fue adoptado por la Comisión Europea mediante la Comunicación 2016 (588). Las comunicaciones son actos atípicos propios del derecho derivado de la UE. Por tanto, el Plan Nacional 5G entra dentro de la categoría de disposiciones a las que hace referencia la Directiva y, por tanto, también cumple el requisito señalado.

- *Que los planes establezcan el marco para la futura autorización de proyectos legalmente sometidos a evaluación de impacto ambiental y se refieran entre otras materias a las telecomunicaciones, a la ordenación del territorio urbano y rural, o del uso del suelo*. La materia objeto del Plan se encuadra dentro de la categoría "telecomunicaciones" y obviamente establece el marco para la autorización de proyectos, pues tal y como se desprende de la información suministrada por la Dirección General de Telecomunicaciones, el Plan Nacional 5G de España prevé la realización de proyectos piloto para probar las nuevas funcionalidades que ofrecerá la tecnología 5G. En particular, al amparo de Plan Nacional 5G, se han convocado 2 proyectos piloto por la entidad pública Red.es, que han sido adjudicados por dicha entidad mediante Resolución del 30 de abril de 2019. Por tanto, el Plan sirve de marco para la autorización de proyectos.

La Ley establece otros requisitos alternativos para planes que también deben someterse a evaluación, por ejemplo, que afecten de forma apreciable a espacios Red Natura 2000.

A la vista de las dudas que pueden suscitarse sobre la concurrencia de los requisitos necesarios para efectuar dicha evaluación, resulta significativo que esa Secretaría de Estado no consultara en su momento al órgano ambiental acerca de la procedencia de tramitar dicha evaluación. Debe recordarse que la Administración sirve con objetividad los intereses generales y actúa de acuerdo con los principios de eficacia y coordinación, con sometimiento pleno a la ley y al Derecho, lo cual habilita el órgano sustantivo para consultar al órgano ambiental si existen dudas sobre la procedencia de aplicar la Ley 21/2013, cuyos preceptos vinculan a todas las administraciones públicas. El artículo 2 h) de la Ley establece un principio de colaboración activa entre los órganos que intervienen en el proceso de evaluación; y según el artículo 3.1, las Administraciones que puedan estar interesadas en el plan, debido a sus responsabilidades medioambientales, serán consultadas sobre la información proporcionada por el promotor y sobre la solicitud de adopción o aprobación de un plan. Finalmente, la Ley prevé la posibilidad de que el órgano ambiental decida someter a una evaluación simplificada un plan cuando se cumplan los requisitos del Anexo V de la Ley 21/2013 entre los que se incluyen los riesgos para la salud humana o el medio

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

ambiente y la magnitud y el alcance espacial de los efectos (área geográfica y tamaño de la población que puedan verse afectadas). Para ello debe tener conocimiento del Plan, el cual debe ser remitido por el órgano sustantivo y promotor del Plan.

También debe recordarse que la necesidad de someter el Plan Nacional 5G a este tipo de evaluación se alegó por varias asociaciones en el trámite de información pública del Plan. Esta institución no tiene constancia, pues esa Secretaría de Estado no ha procedido a informar de ello, de cómo se han valorado dichas alegaciones ni si se ha dado una respuesta motivada acerca de la manera en que se han tenido en cuenta en la adopción del Plan. Hay que destacar que una de las finalidades de la evaluación ambiental estratégica es garantizar la participación pública en la toma de decisiones y garantizar que la variable ambiental se tiene en cuenta adecuadamente en ese proceso (artículos 2 i) y k), 17.1 d) y siguientes de la Ley 21/2013).

Ello exige que esa Administración incluya el resultado de la información pública y la manera en que se han tenido en consideración las alegaciones tanto en el análisis técnico del expediente como en la declaración ambiental estratégica, en los términos establecidos en los artículos 24 y 25 de la Ley 21/2013 y 3.2 y conexos de la Ley 27/2006 de acceso a la información, participación pública y acceso a la justicia en materia de medio ambiente. Además, el órgano sustantivo debe publicar en el Boletín Oficial del Estado, junto con la adopción del Plan, un extracto que incluya los siguientes aspectos: 1º De qué manera se han integrado en el plan los aspectos ambientales; y 2º Cómo se ha tomado en consideración en el plan, entre otras cuestiones, los resultados de la información pública y de las consultas.

En el documento en el que resume el trámite de información pública, disponible en la página web del Ministerio de Economía y Empresa, no se da respuesta a las alegaciones planteadas sobre la necesidad de someter el Plan Nacional 5G a evaluación. Así, aunque se haya celebrado un trámite de información pública, la ausencia de valoración de alegaciones y de información al público de cómo se han tenido en cuenta esas alegaciones, la participación pública en el proceso de toma de decisiones ha resultado incompleta.

Tampoco esa Secretaría de Estado ha informado de que diera traslado al órgano ambiental de esas alegaciones. Con esta forma de proceder también ha ignorado lo establecido en el artículo 3.4 de la Ley 21/2013, según el cual, el órgano sustantivo debe informar al órgano ambiental de cualquier incidencia que se produzca durante la tramitación del procedimiento administrativo sustantivo de adopción de un plan que tenga relevancia a los efectos de la tramitación de la evaluación ambiental.

3. Las consideraciones anteriores conducen a la conclusión de que el Plan Nacional 5G no se sometió a evaluación ambiental estratégica y que dicha decisión se adoptó unilateralmente por el órgano sustantivo (y promotor del Plan) sin consultar con el órgano ambiental sobre la procedencia de efectuar dicha evaluación, aunque el Plan

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

podía cumplir los requisitos exigidos de la Ley 21/2013, en incluso podrían suscitarse dudas en relación con la falta de aprobación formal.

Respecto a esta última cuestión (la necesidad de aprobación formal de los planes) debe manifestarse que si bien no es irrazonable interpretar que los planes deben ser aprobados por la Administración que lo elabora (u otra) para ser evaluados ambientalmente, también es cierto que por la vía de no dictar una norma o un acto que apruebe formalmente un plan, podría eludirse fácilmente la evaluación, incluso de planes que cumplieran los demás requisitos señalados por la Ley 21/2013. En el caso del Plan Nacional 5G se da la contradicción de que siendo indispensable para "*situar a nuestro entre los países más avanzados en el desarrollo de esta nueva tecnología de manera que cuando la 5G alcance su madurez tecnológica y comercial, España esté preparada para aprovechar al máximo las oportunidades de este paradigma tecnológico*", no haya sido objeto de aprobación formal y que la Dirección General de Telecomunicaciones afirme que carece de efectos vinculantes, aunque su contenido se está cumpliendo.

En todo caso, existen planes estatales (por ejemplo, planes de infraestructuras), con una naturaleza, finalidad y estructura similar al Plan Nacional 5G (aunque más detallados y completos), que se han aprobado formalmente y que han sido sometidos a evaluación ambiental estratégica. Esa Secretaría de Estado sin embargo, no ha explicado las razones de la falta de aprobación formal del Plan Nacional 5G, pese a la importancia que atribuye al cumplimiento de su contenido para alcanzar los objetivos propuestos.

4. En todo caso, tener en cuenta las consideraciones ambientales en la toma de decisiones es una exigencia del desarrollo sostenible y, por tanto, los efectos ambientales de las decisiones públicas deben valorarse aunque para ello no se siga un procedimiento reglado. El artículo 3 del Tratado de la Unión Europea incluye entre sus objetivos el establecimiento de "un nivel elevado de protección y mejora de la calidad del medio ambiente". Y en el mismo sentido, el artículo 11 del Tratado de Funcionamiento de la UE señala que "las exigencias de la protección del medio ambiente deberán integrarse en la definición y en la realización de las políticas y acciones de la Unión, en particular con objeto de fomentar un desarrollo sostenible". A la luz de lo anterior, puede concluirse que la Secretaría de Estado no ha tenido en cuenta las consideraciones ambientales a la hora de decidir y aprobar el Plan Nacional 5G.

Esta institución no puede deducir del contenido del Plan Nacional 5G si este afecta o no apreciablemente al medio ambiente. Sin perjuicio de lo referido a las emisiones radioeléctricas (sobre lo que se volverá más adelante), la ausencia de información sobre los lugares de despliegue de nuevas infraestructuras, sobre posibles afecciones a espacios protegidos, o al paisaje, o al uso del suelo, ponen en evidencia que la variable ambiental no se ha tomado en consideración. Sin embargo, no puede obviarse que propio Plan Nacional 5G señala que "el desarrollo de los servicios 5G supondrá el despliegue masivo de nuevos elementos de red en el territorio español, ya

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

sea en *nuevos emplazamientos* o en los emplazamientos que se utilizan para otras tecnologías y servicios". Por ello, hubiera sido deseable un mayor grado de definición de la estrategia de despliegue del tecnología y, como se ha dicho, que se hubiera recabado el criterio del órgano ambiental respecto a la necesidad de practicar una evaluación reglada del Plan. Incluso en el caso de que la afección ambiental del Plan Nacional 5G no sea significativa, la valoración de la variable ambiental debería haberse incluido en el proceso de adopción del Plan y haberse tomado en consideración, al menos para justificar que no era necesaria una evaluación ambiental estratégica, conforme a los requisitos exigidos por la Ley 21/2013.

5. Señalado lo anterior, existe escaso margen de maniobra para subsanar la falta de evaluación y de valoración de los aspectos ambientales en la adopción del Plan nacional 5G. Por un lado, el artículo 9 de la Ley 21/2013, determina la falta de validez de los planes que han omitido la evaluación ambiental estratégica preceptiva. Sin embargo, puesto que el Plan Nacional 5G no ha sido objeto de aprobación formal y carece de efectos jurídicos vinculantes, la falta de validez pierde su sentido en este caso. Además, el Plan diseña las directrices de actuación hasta 2020, de manera que el ámbito temporal de la planificación está próximo a su fin. Dada esta situación, esta institución solo puede concluir sobre este punto que el Plan Nacional no ha tenido en consideración los aspectos ambientales del Plan y no los ha valorado ni siquiera a efectos de justificar que no era exigible una evaluación reglada conforme a la Ley 21/2013.

6. En relación con la evaluación de impacto ambiental de los proyectos piloto adjudicados, debe señalarse que esa Secretaría de Estado no se ha referido en ningún momento al artículo 7 de la Ley 21/2013 en el que se establecen los requisitos de evaluación de impacto ambiental proyectos. Conforme a este artículo, deben ser objeto de evaluación de impacto ambiental ordinaria los comprendidos en el anexo I; y deben ser objeto de evaluación de impacto ambiental simplificada, entre otros, cualquier proyecto que pueda afectar de forma apreciable a lugares de la Red Natura 2000 que no esté incluido en el anexo I.

De la información disponible sobre los dos proyectos piloto adjudicados en Andalucía y Galicia, no parece que se incluyan en alguno de los supuestos enumerados en el anexo I de la Ley. Por otro lado parece que las actuaciones se van a desarrollar en entornos urbanos, en parques tecnológicos, en instalaciones portuarias y otros entornos altamente antropizados, de manera que es posible que los proyectos piloto no afecten apreciablemente a lugares de la Red Natura 2000. No obstante, ello es una mera suposición, dada la falta total de valoración de los efectos ambientales de los proyectos por parte del órgano sustantivo o del órgano ambiental, incluso para justificar que dicha evaluación no es necesaria, de acuerdo con lo exigido por la Ley 21/2013.

Debe destacarse que para justificar la falta de evaluación de los proyectos piloto, esa Secretaría de Estado se refiere en todo momento a lo dispuesto en la Ley 9/2014 General de Telecomunicaciones y no a los requisitos exigidos en la Ley 21/2013.

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

Respecto a esta cuestión es necesario aclarar que la exención de *licencia ambiental* que efectúa la Ley General de Telecomunicaciones respecto a los proyectos en esta materia no alcanza al procedimiento de evaluación de impacto ambiental, que será obligatoria cuando los proyectos reúnan los requisitos establecidos en la Ley 21/2013.

La legislación estatal en materia de evaluación ambiental es transposición de una Directiva comunitaria de obligado cumplimiento que no ampara que las normas excluyan una determinada categoría de proyectos del deber de evaluar si estos pudieran tener efectos negativos y apreciables sobre el medio ambiente. Es decir, por aplicación de la Ley de Telecomunicaciones no puede argumentarse *a priori* que ningún proyecto en la materia tiene efectos apreciables sobre el medio ambiente y, que por tanto, en ningún caso será exigible la evaluación que regula la Ley 21/2013. Al contrario, los proyectos en materia de telecomunicaciones deberán someterse a evaluación de impacto ambiental reglada si cumplen los requisitos establecidos en la Ley 21/2013; y no deberán someterse si no los cumplen.

Otra cosa distinta es que, caso por caso, la Administración decida motivadamente que un proyecto concreto no debe ser sometido a evaluación de impacto ambiental antes de su autorización (aunque reúna los requisitos legales para ello), cuando se dé alguno de los supuestos regulados en el artículo 8 de la Ley 21/2013, es decir, proyectos en materia de defensa, emergencia civil, infraestructuras críticas etcétera. Pero incluso en estos casos es preciso que el órgano sustantivo valore si es necesario someter el proyecto a otra forma alternativa de evaluación y que dicha valoración se ponga a disposición del público y se comunique a la Unión Europea antes de su aprobación.

7. En relación con el estado del conocimiento científico sobre los efectos de la tecnología 5G en la salud, debe reiterarse que esta institución confía en la información suministrada por las autoridades científicas y sanitarias. No obstante, también debe señalarse lo siguiente:

1º Sin perjuicio de la Recomendación 1999/519CE del Consejo de Sanidad de la UE, España es también miembro del Consejo de Europa y debe seguir las recomendaciones que aprueba, entre ellas la Recomendación 1815 (2011) sobre los peligros potenciales de los campos electromagnéticos y sus efectos sobre el medio ambiente. En esa Recomendación se insta a los Estados miembros, entre otras cosas, a tener en consideración los principios de precaución y ALARA (mantener los niveles de exposición tan bajos como sea posible); a adoptar todas las medidas razonables para reducir la exposición a los CEM, en particular de niños y jóvenes; a prestar especial atención a las personas electrosensibles que sufren síndrome de intolerancia a los campos electromagnéticos; a llevar a cabo los procedimientos de evaluación de riesgos apropiados y mejorar los estándares de evaluación; y a mantener las instalaciones eléctricas a una distancia segura de las viviendas. La Recomendación requiere por tanto que determinados colectivos vulnerables tengan una consideración específica más allá de los niveles de exposición establecidos para el conjunto de la población. Dicha

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

atención específica no se encuentra ni en el Plan Nacional 5G ni en la adjudicación de los proyectos piloto.

Si bien esta institución comparte el criterio de que no deben imponerse límites arbitrarios, desautorizando o desconfiando de la regulación existente basada en el conocimiento científico, tampoco la Administración ha justificado concluyentemente que no deba atenderse la Recomendación del Consejo de Europa de prestar especial atención a determinados colectivos vulnerables.

2º Esa Secretaría de Estado dice que, en lo que se refiere a los límites de las emisiones radioeléctricas, estos límites no dependen de la tecnología utilizada (4G o 5G) sino de las características específicas de cada banda de frecuencias; y que las bandas que se van a utilizar para la tecnología 5G van a ser las que ya se utilizan a nivel masivo en España, con la única excepción de la banda de 26 GHz. Esta banda, según afirma esa Administración, aún no ha sido adjudicada para el uso de 5G para servicios comerciales masivos; y los organismos internacionales de normalización ya están trabajando en una norma técnica que cubra el cálculo y procedimiento de medida de emisiones en la banda de 26 GHz.

Esta información ratifica lo señalado por el Comité Científico sobre Radiofrecuencias y Salud (CCARS) en su informe en esta materia para 2013-2016 en el que se refiere expresamente a la ausencia de datos sobre límites de exposición de la tecnología 5G en bandas superiores a 6GHz "*pues están aún en proceso de discusión, definición y posterior estandarización, la cual no se espera cerrar antes del año 2020.*".

Dicho lo anterior, debe señalarse que si bien la utilización de la banda de 26 GHz puede no ser masiva, como dice esa Secretaría de Estado, esta institución ha podido comprobar que las bases reguladoras de la adjudicación de los proyectos piloto contempla la utilización de la banda de 26 GHz y esta se valora "*particularmente*" en los criterios de selección de proyectos (artículo 13 b) y anexo III) de la Orden ECE/1016/2018, de 28 de septiembre, por la que se establecen las bases reguladoras de la concesión de subvenciones a proyectos piloto de tecnología 5G).

Además, en los proyectos piloto hasta ahora adjudicados en Andalucía y Galicia, según la información suministrada por Red.es (una entidad pública empresarial del Ministerio de Economía y Empresa que depende de esa Secretaría de Estado) se prevé que el despliegue de la tecnología 5G se realice en las bandas 3.7 y 26 GHz. Ello significa que se va a utilizar una banda –la de 26 GHz- para la cual aún no se han fijado los niveles de exposición seguros.

Este supuesto es el ámbito propio de la aplicación del principio de precaución o cautela. Según este principio, cuando una actividad representa una amenaza o un daño para la salud humana o el medio ambiente, hay que tomar medidas de precaución incluso cuando la relación causa-efecto no haya podido demostrarse científicamente de forma concluyente.

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

El principio de precaución se menciona en el artículo 191 del Tratado de Funcionamiento de la Unión Europea con el fin de garantizar un elevado nivel de protección del medio ambiente aunque su ámbito de aplicación es más amplio y se extiende a la salud humana, animal y vegetal.

Por su parte, el Real Decreto 1066/2001, por el que se aprueba el Reglamento que establece condiciones de protección del dominio público radioeléctrico, restricciones a las emisiones radioeléctricas y medidas de protección sanitaria frente a emisiones radioeléctricas, alude a este principio en el artículo 7, cuando impone al Ministerio de Sanidad el deber de adaptar al progreso científico los límites de exposición a las emisiones radioeléctricas, teniendo en cuenta el principio de precaución y las evaluaciones realizadas por las organizaciones nacionales e internacionales competentes.

La Comunicación de la Comisión sobre el recurso al principio de precaución (COM (2000) 1 final de 2.2.2000), señala que las medidas basadas en el principio de precaución deberán ser proporcionales al nivel de protección elegido, no discriminatorias en su aplicación, coherentes con medidas similares ya adoptadas, basadas en el examen de los posibles beneficios y los costes de la acción o de la falta de acción, estar sujetas a revisión, a la luz de los nuevos datos científicos, y ser capaces de designar a quién incumbe aportar las pruebas científicas necesarias para una evaluación del riesgo más completa.

Obviamente, el análisis de estos aspectos y del potencial riesgo para la salud del empleo de la tecnología 5G a través de la banda de 26 GHz excede las funciones de esta institución y requiere la intervención de órganos y administraciones públicas distintas de esa Secretaría de Estado, entre ellas las sanitarias. La disposición adicional décima de la Ley de Telecomunicaciones prevé la creación de la Comisión Interministerial sobre Radiofrecuencias y Salud que debe ser el órgano, a nivel estatal, apto para abordar estas cuestiones de manera coordinada. La Comisión tiene por función asesorar e informar a la ciudadanía, al conjunto de las administraciones públicas y a los diversos agentes de la industria sobre las restricciones establecidas a las emisiones radioeléctricas, las medidas de protección sanitaria aprobadas frente a emisiones radioeléctricas y los múltiples y periódicos controles a que son sometidas las instalaciones generadoras de emisiones radioeléctricas, en particular, las relativas a las radiocomunicaciones.

Asimismo, dicha Comisión debe realizar y divulgar estudios e investigaciones sobre las emisiones radioeléctricas y sus efectos y cómo las restricciones a las emisiones, las medidas de protección sanitaria y los controles establecidos preservan la salud de las personas, así como, a la vista de dichos estudios e investigaciones, realizará propuestas y sugerirá líneas de mejora en las medidas y controles a realizar.

Paseo de Eduardo Dato, 31 – 28010 Madrid
Tel.: (+34) – 91 432 79 00 Fax: (+34) – 91 308 11 58
www.defensordelpueblo.es
registro@defensordelpueblo.es

De la Comisión interministerial formarán parte en todo caso, además del órgano competente en materia de telecomunicaciones, el Ministerio de Sanidad y el Instituto de Salud Carlos III. Contará además con un grupo asesor o colaborador en materia de radiofrecuencias y salud, con participación de comunidades autónomas, de la asociación de entidades locales de ámbito estatal con mayor implantación y un grupo de expertos independientes, sociedades científicas y representantes de los ciudadanos, para hacer evaluación y seguimiento periódico de la prevención y protección de la salud de la población en relación con las emisiones radioeléctricas, proponiendo estudios de investigación, medidas consensuadas de identificación, elaboración de registros y protocolos de atención al ciudadano.

Dicha Comisión aún no se ha constituido a pesar de haberlo sugerido esta institución al entonces Ministerio de Sanidad, Servicios Sociales e Igualdad en el año 2017 y sin que dicho departamento haya ofrecido razones que justifiquen desatender el mandato de la Ley. A la vista de las consideraciones expuestas, en particular el despliegue de la tecnología 5G a través de una banda para la que no se han establecido niveles de exposición a emisiones radioeléctricas seguras, su constitución resulta ineludible, con el fin de que se pronuncie sobre la aplicación del principio de precaución en este caso.

A juicio de esta institución no puede ignorarse que existe una preocupación ciudadana por los efectos del despliegue de esta nueva tecnología y que sus reclamaciones sobre los efectos de los campos electromagnéticos en la salud empiezan a ser atendidas por los tribunales de justicia, los cuales reconocen, en virtud de los informes médicos aportados, determinadas patologías por exposición a emisiones radioeléctricas.

La Administración puede estar convencida de la inocuidad de las emisiones cuando se respetan los valores de seguridad fijados por la Comisión Internacional para la Protección ante Radiaciones No Ionizantes (ICNIRP), por debajo de los cuales no se han reproducido efectos biológicos en las personas. Pero ello no le exime de poner en marcha los mecanismos previstos en la legislación en materia de investigación, asesoramiento, participación e información pública, ni de valorar y aplicar las medidas de precaución necesarias para asegurarse de que el despliegue de la nueva tecnología no suponga perjuicios para la salud, especialmente cuando aún no se han determinado los niveles de exposición segura para una determinada banda de frecuencia, cuyo uso, sin embargo, se ha autorizado.”.

En virtud de las consideraciones expuestas, y de conformidad con los artículos 28 y 30 de la Ley Orgánica 3/1981, de 6 de abril, el Defensor del Pueblo ha resuelto dirigir a la Secretaría de Estado para el Avance Digital las siguientes resoluciones:

RECORDATORIO DE DEBERES LEGALES

"Someter los planes y proyectos en materia de telecomunicaciones a evaluación ambiental estratégica y evaluación de impacto ambiental respectivamente, cuando reúnan los requisitos establecidos en la Ley 21/2013 de evaluación ambiental".

SUGERENCIAS

1. **"Elaborar, conjuntamente con el Ministerio de Sanidad, Consumo y Bienestar Social el proyecto de reglamento por el que debe regularse la Comisión Interministerial sobre Radiofrecuencias y Salud y, tras cumplimentar los trámites preceptivos, elevarlo al Consejo de Ministros para su aprobación.**

2. **Una vez constituida, someter a consulta de la Comisión la forma de proceder respecto a la aplicación del principio de precaución en el desarrollo de proyectos que impliquen el uso de la banda de 26 GHz, en tanto no se determinen los límites seguros de exposición a emisiones radioeléctricas exigibles para dicha frecuencia".**

Asimismo se ha solicitado a la Secretaría de Estado que informe de las medidas adoptadas para evaluar los posibles efectos sobre la salud que pudieran derivarse de los proyectos piloto en Andalucía y Galicia; si se ha consultado a dichas Comunidades Autónomas sobre estos proyectos; y si se han adjudicado o se van a adjudicar otros nuevos durante el ámbito de aplicación temporal del Plan Nacional 5G.

De la respuesta que a dichas resoluciones se reciba, se le informará, así como de las actuaciones que procedan.

Le saluda muy atentamente,

Francisco Fernández Marugán

ABSTRACT

This article identifies adverse effects of non-ionizing non-visible radiation (hereafter called wireless radiation) reported in the premier biomedical literature. It emphasizes that most of the laboratory experiments conducted to date are not designed to identify the more severe adverse effects reflective of the real-life operating environment in which wireless radiation systems operate. Many experiments do not include pulsing and modulation of the carrier signal. The vast majority do not account for synergistic adverse effects of other toxic stimuli (such as chemical and biological) acting in concert with the wireless radiation. This article also presents evidence that the nascent 5G mobile networking technology will affect not only the skin and eyes, as commonly believed, but will have adverse systemic effects as well.

1. Introduction

Wireless communications have been expanding globally at an exponential rate. The latest imbedded version of mobile networking technology is called 4G (fourth generation), and the next version (called 5G- fifth generation) is in the early implementation stage. Neither 4G

nor 5G have been tested for safety in credible real-life scenarios. Alarmingly, many of the studies conducted in more benign environments show harmful effects from this radiation. The present article overviews the medical and biological studies that have been performed to date relative to effects from wireless radiation, and shows why these studies are deficient relative to safety. However, even in the absence of the missing real-life components such as toxic chemicals and biotoxins (which tend to exacerbate the adverse effects of the wireless radiation), the literature shows there is much valid reason for concern about potential adverse health effects from both 4G and 5G technology. The studies on wireless radiation health effects reported in the literature should be viewed as extremely conservative, substantially underestimating the adverse impacts of this new technology.

2. Wireless radiation/electromagnetic spectrum

This section overviews the electromagnetic spectrum, and delineates the parts of the spectrum on which this article will focus. The electromagnetic spectrum encompasses the entire span of electromagnetic radiation, including:

- ionizing radiation (gamma rays, x-rays, and the extreme ultraviolet, with wavelengths below $\sim 10^{-7}$ m and frequencies above $\sim 3 \times 10^{15}$ Hz);
- non-ionizing visible radiation (wavelengths from $\sim 4 \times 10^{-7}$ m to $\sim 7 \times 10^{-7}$ m and frequencies between $\sim 4.2 \times 10^{14}$ Hz and $\sim 7.7 \times 10^{14}$ Hz);
- non-ionizing non-visible radiation

short wavelength radio waves and microwaves, with wavelengths between $\sim 10^{-3}$ m and $\sim 10^{5}$ m and frequencies between $\sim 3 \times 10^{11}$ to $\sim 3 \times 10^{3}$ Hz;

long wavelengths, ranging between $\sim 10^{5}$ m and $\sim 10^{8}$ m and frequencies ranging between 3×10^{3} and 3 Hz.

How are these frequencies used in practice?

- The low frequencies (3 Hz – 300 KHz) are used for electrical power line transmission (60 Hz in the U.S.) as well as maritime and submarine navigation and communications.
- Medium frequencies (300 KHz–900 MHz) are used for AM/FM/TV broadcasts in North America.
- Lower microwave frequencies (900 MHz – 5 GHz) are used for telecommunications such as microwave devices/communications, radio astronomy, mobile/cell phones, and wireless LANs.
- Higher microwave frequencies (5 GHz – 300 GHz) are used for radar and proposed for microwave WiFi, and will be used for high-performance 5 G.
- Terahertz frequencies (300 GHz – 3000 GHz) are used increasingly for imaging to supplement X-rays in some medical and security scanning applications (Kostoff and Lau, 2017).

In the present study of wireless radiation health effects, the frequency spectrum ranging from 3 Hz to 300 GHz is covered, with particular emphasis on the high frequency communications component ranging from ~1 GHz to ~300 GHz. Why was this part of the spectrum selected? Previous reviews of wireless radiation health effects found that pulsed electromagnetic fields (PEMF) applied for relatively short periods of time could sometimes be used for therapeutic purposes, whereas chronic exposure to electromagnetic fields (EMF) in the power frequency range (~60 Hz) and microwave frequency range (~1 GHz-tens GHz) tended to result in detrimental health effects (Kostoff and Lau, 2013, 2017). Given present concerns about the rapid expansion of 5G communications systems (which are projected to use mainly the higher microwave frequencies part of the spectrum in the highest performance (aka high-band) mode) in the absence of adequate and rigorous safety testing, more emphasis will be placed on the communications frequencies in this document.

3. Modern wireless radiation exposures

In ancient times, sunlight and its lunar reflections provided the bulk of the visible spectrum for human beings (with fire a distant second and lightning a more distant third). Now, many varieties of artificial light (incandescent, fluorescent, and light emitting diode) have replaced the sun as the main supplier of visible radiation during waking hours. Additionally, EMF radiations from other parts of the non-ionizing non-visible spectrum have become ubiquitous in daily life, such as from wireless computing and telecommunications. In the last two or three decades, the explosive growth in the cellular telephone industry has placed many residences in metropolitan areas within less than a mile of a cell tower. Future implementation of the next generation of mobile networking technology, 5 G, will increase the cell tower densities by an order of magnitude. Health concerns have been raised about wireless radiation from (1) mobile communication devices, (2) occupational exposure, (3) residential exposure, (4) wireless networks in homes, businesses, and schools, (5) automotive radar, and (6) other non-ionizing EMF radiation sources, such as ‘smart meters’ and ‘Internet of Things’.

4. Demonstrated biological and health effects from prior generations of wireless networking technology

There have been two major types of studies performed to ascertain biological and health effects of wireless radiation: laboratory and epidemiology. The laboratory tests performed provided the best scientific understanding of the effects of wireless radiation, but did not reflect the real-life environment in which wireless radiation systems operate (exposure to toxic chemicals, biotoxins, other forms of toxic radiation, etc). There are three main reasons the laboratory tests failed to reflect real-life exposure conditions for human beings.

First, the laboratory tests have been performed mainly on animals, especially rats and mice. Because of physiological differences between small animals and human beings, there have been continual concerns about extrapolating small animal results to human beings. Additionally, while inhaled or ingested substances can be scaled from laboratory experiments on small animals to human beings relatively straight-forwardly, radiation may be more problematic. For non-ionizing radiation, penetration depth is a function of frequency, tissue, and other parameters. Radiation could penetrate much deeper into a small animal’s interior than similar wavelength radiation in humans, because of the much smaller animal size. Different organs and tissues would be affected, with different levels of power density.

Second, the typical incoming EMF signal for many/most laboratory tests performed in the past consisted of single carrier wave frequency; the lower frequency superimposed signal containing the information was not always included. This omission may be important. As Panagopoulos states: “It is important to note that except for the RF/microwave carrier frequency, Extremely Low Frequencies - ELFs (0–3000 Hz) are always present in all telecommunication EMFs in the form of pulsing and modulation. There is significant evidence indicating that the effects of telecommunication EMFs on living organisms are mainly due to the included ELFs…. While ~50 % of the studies employing simulated exposures do not find any effects, studies employing real-life exposures from commercially available devices display an almost 100 % consistency in showing adverse effects” (Panagopoulos, 2019). These effects may be exacerbated further with 5 G: “with every new generation of telecommunication devices…..the amount of information transmitted each moment…..is increased, resulting in higher variability and complexity of the signals with the living cells/ organisms even more unable to adapt” (Panogopoulos, 2019).

Third, these laboratory experiments typically involved one stressor

(toxic stimulus) and were performed under pristine conditions. This contradicts real-life exposures, where humans are exposed to multiple toxic stimuli, in parallel or over time (Tsatsakis et al., 2016, 2017; Docea et al., 2019a). In perhaps five percent of the cases reported in the wireless radiation literature, a second stressor (mainly a biological or chemical toxic stimulus) was added to the wireless radiation stressor, to ascertain whether additive, synergistic, potentiative, or antagonistic effects were generated by the combination (Kostoff and Lau, 2013, 2017; Juutilainen, 2008; Juutilainen et al., 2006).

Combination experiments are extremely important because, when other toxic stimuli are considered in combination either with each other or with wireless radiation, the synergies tend to enhance the adverse effects of each stimulus in isolation. This was shown in several studies that evaluated the cumulative effects of chronic exposure to low doses of xenobiotics in combination (Kostoff et al., 2018; Docea et al., 2018; Tsatsakis et al., 2019a; Docea et al., 2019b; Tsatsakis et al., 2019b, c; Fountoucidou et al., 2019). For those combinations that include wireless radiation, combined exposure to toxic stimuli and wireless radiation translates into much lower levels of tolerance for each toxic stimulus in the combination relative to its exposure levels that produce adverse effects in isolation. Accordingly, the exposure limits for wireless radiation when examined in combination with other potentially toxic stimuli would be far lower for safety purposes than those derived from wireless radiation exposures in isolation.

Thus, almost all of the wireless radiation laboratory experiments that have been performed to date are flawed/limited with respect to showing the full adverse impact of the wireless radiation that would be expected under real-life conditions. Either 1) non-inclusion of signal information or 2) using single stressors only tends to underestimate the seriousness of the adverse effects from wireless radiation. Excluding ***both*** of these phenomena from experiments, as was done in the vast majority of the reported wireless radiation health effects studies, tends to amplify this underestimation substantially. Thus, the results reported in the biomedical literature should be viewed as 1) extremely conservative and 2) the very low 'floor' of the seriousness of the adverse effects from wireless radiation, not the 'ceiling'.

In contrast to the controlled pristine environments that characterize the wireless radiation animal laboratory experiments, the wireless radiation epidemiology studies carried out to date typically involved human beings who had been subjected to myriad known and unknown stressors prior to (and during) the study. The real-life human exposure levels from cell tower studies (reported by Kostoff and Lau (2017)) that showed increased cancer incidence were orders of magnitude lower than those exposure levels generated in the recent highly-funded National Toxicology Program animal laboratory studies (Melnick, 2019). We believe the inclusion of real-world effects in the cell tower studies accounted for the orders of magnitude exposure level decreases that were associated with the increased cancer incidence. The laboratory tests were conducted under controlled conditions not reflective of real-life, while the epidemiology studies were performed in the presence of many stressors, known and unknown, reflective of real-life. The myriad toxic stimuli exposure levels of the epidemiology studies were, for the most part, uncontrolled.

A vast literature published over the past sixty years shows adverse effects from wireless radiation applied in isolation or as part of a combination with other toxic stimuli. Extensive reviews of wireless radiation-induced biological and health effects have been published (Kostoff and Lau, 2013, 2017; Belpomme et al., 2018; Desai et al., 2009; Di Ciaula, 2018; Doyon and Johansson, 2017; Havas, 2017; Kaplan et al., 2016; Lerchl et al., 2015; Levitt and Lai, 2010; Miller et al., 2019; Pall, 2016, 2018; Panagopoulos, 2019; Panagopoulos et al., 2015; Russell, 2018; Sage and Burgio, 2018; van Rongen et al., 2009; Yakymenko et al., 2016; Bioinitiative, 2012). In aggregate, for the high frequency (radiofrequency-RF) part of the spectrum, these reviews show that RF radiation ***below the FCC guidelines*** can result in:

- carcinogenicity (brain tumors/glioma, breast cancer, acoustic neuromas, leukemia, parotid gland tumors),
- genotoxicity (DNA damage, DNA repair inhibition, chromatin structure),
- mutagenicity, teratogenicity,
- neurodegenerative diseases (Alzheimer's Disease, Amyotrophic Lateral Sclerosis),
- neurobehavioral problems, autism, reproductive problems, pregnancy outcomes, excessive reactive oxygen species/oxidative stress, inflammation, apoptosis, blood-brain barrier disruption, pineal gland/melatonin production, sleep disturbance, headache, irritability, fatigue, concentration difficulties, depression, dizziness, tinnitus, burning and flushed skin, digestive disturbance, tremor, cardiac irregularities,
- adverse impacts on the neural, circulatory, immune, endocrine, and skeletal systems.

From this perspective, RF is a highly pervasive cause of disease!

The response from industry has been that no mechanism could explain the biological action of non-thermal and non-ionizing EM fields. Yet, reports of clear perturbations of biological systems at levels near or even below 1000 μW/m^2 (Bioinitiaive, 2019) were explained by perturbations in electron and proton transfers supporting ATP production in mitochondria (Sanders et al., 1980; 1985) exposed to RF or ELF signals (Li and Heroux, 2014).

To obtain another perspective on the full spectrum of adverse effects from wireless radiation, a query was run on Medline to retrieve representative records associated with adverse EMF effects (mainly, but not solely, RF). Over 5400 records were retrieved, and the leading Medical Subject Headings (MeSH) extracted. The categories of adverse impacts from both approaches match quite well. The adverse health effects range from myriad feelings of discomfort to life-threatening diseases.

The full list of MeSH Headings associated with this retrieval is shown in Appendix 1 of (Kostoff, 2019). The interested reader can ascertain what other diseases/symptoms were included. The 5400+ references retrieved are shown in Appendix 2 of (Kostoff, 2019).

5. What types of biological and health effects can be expected from 5G wireless networking technology?

The potential 5G adverse effects derive from the intrinsic nature of the radiation, and its interaction with tissue and target structures. 4G networking technology was associated mainly with carrier frequencies in the range of ~1-2.5 GHz (cell phones, WiFi). The wavelength of 1 GHz radiation is 30 cm, and the penetration depth in human tissue is a few centimeters. In its highest performance (high-band) mode, 5G networking technology is mainly associated with carrier frequencies at least an order of magnitude greater than the 4G frequencies, although, as stated previously, "ELFs (0–3000 Hz) are always present in all telecommunication EMFs in the form of pulsing and modulation". Penetration depths for the carrier frequency component of high-band 5G wireless radiation will be on the order of a few millimeters (Alekseev et al., 2008a, b). At these wavelengths, one can expect resonance phenomena with small-scale human structures (Betzalel et al., 2018). Additionally, numerical simulations of millimeter-wave radiation resonances with insects showed a general increase in absorbed RF power at and above 6 GHz, in comparison to the absorbed RF power below 6 GHz. A shift of 10 % of the incident power density to frequencies above 6 GHz was predicted to lead to an ***increase in absorbed power between 3–***370 % (Thielens et al., 2018).

The common 'wisdom' presented in the literature and media is that, if there are adverse impacts resulting from high-band 5 G, the main impacts will be focused on near-surface phenomena, such as skin cancer, cataracts, and other skin conditions. However, there is evidence that biological responses to millimeter-wave irradiation can be initiated

within the skin, and the subsequent systemic signaling in the skin can result in physiological effects on the nervous system, heart, and immune system (Russell, 2018).

Additionally, consider the following reference (Zalyubovskaya, 1977). This is one of many translations of articles produced in the Former Soviet Union on wireless radiation (also, see reviews of Soviet research on this topic by McRee (1979, 1980), Kositsky et al. (2001), and Glaser and Dodge (1976)). On p. 57 of the pdf link, the article by Zalyubovskaya addresses biological effects of millimeter radiowaves. Zalyubovskaya ran experiments using power fluxes of 10,000,000 μW/square meter (the FCC (Federal Communications Commission) guideline limit for the general public today in the USA), and frequencies on the order of 60 GHz. Not only was skin impacted adversely, but also heart, liver, kidney, spleen tissue as well, and blood and bone marrow properties. These results reinforce the conclusion of Russel (quoted above) that ***systemic results may occur from millimeter-wave radiation.*** To re-emphasize, for Zalyubovskaya's experiments, the incoming signal was unmodulated carrier frequency only, and the experiment was single stressor only. Thus, the expected real-world results (when human beings are impacted, the signals are pulsed and modulated, and there is exposure to many toxic stimuli) would be far more serious and would be initiated at lower (perhaps much lower) wireless radiation power fluxes.

The Zalyubovskaya paper was published in 1977. The referenced version was classified in 1977 by USA authorities and declassified in 2012. What national security concerns caused it (and the other papers in the linked pdf reference) to be classified for 35 years, until declassification in 2012? Other papers on this topic with similar findings were published in the USSR (and the USA) at that time, or even earlier, but many never saw the light of day, both in the USSR and the USA. It appears that the potentially damaging effects of millimeter-wave radiation on the skin (and other major systems in the body) have been recognized for well over forty years, yet today's discourse only revolves around the possibility of modest potential effects on the skin and perhaps cataracts from millimeter-wave wireless radiation.

6. What is the consensus on adverse effects from wireless radiation?

Not all studies of wireless radiation have shown adverse effects. For example, consider potential genotoxic effects of mobile phone radiation. A study investigating "the effect of mobile phone use on genomic instability of the human oral cavity's mucosa cells" concluded "Mobile phone use did not lead to a significantly increased frequency of micronuclei" (Hintzsche and Stopper, 2010).

Conversely, a 2017 study investigated buccal cell preparations for genomic instability, and found "The frequency of micronuclei (13.66x), nuclear buds (2.57x), basal (1.34x), karyorrhectic (1.26x), karyolytic (2.44x), pyknotic (1.77x) and condensed chromatin (2.08x) cells were highly significantly ($p = 0.000$) increased in mobile phone users" (Gandhi et al., 2017). Also, a 2017 study to ascertain the "effect of cell phone emitted radiations on the orofacial structures" concluded that "Cell phone emitted radiation causes nuclear abnormalities of the oral mucosal cells" (Mishra et al., 2017). Further, a 2016 study to "explore the effects of mobile phone radiation on the MN frequency in oral mucosal cells" concluded "The number of micronucleated cells/1000 exfoliated buccal mucosal cells was found to be significantly increased in high mobile phone users group than the low mobile phone users group" (Banerjee et al., 2016). Finally, a study aimed at investigating the health effects of WiFi exposure concluded "long term exposure to WiFi may lead to adverse effects such as neurodegenerative diseases as observed by a ***significant alteration on AChE gene expression*** and some neurobehavioral parameters associated with brain damage" (Obajuluwa et al., 2017).

There are many possible reasons to explain this lack of consensus.

1) There may be 'windows' in parameter space where adverse effects occur, and operation outside these windows would show a) no effects or b) hormetic effects or c) therapeutic effects. For example, if information content of the signal is a strong contributor to adverse health effects (Panagopoulus, 2019), then experiments that involve only the carrier frequencies may be outside the window where adverse health effects occur. Alternatively, in this specific example, the carrier signal and the information signal could be viewed as a combination of potentially toxic stimuli, where the adverse effects of each component are enabled because of the synergistic effects of the combination.

As another example, an adverse health impact on one strain of rodent was shown for a combination of 50 Hz EMF and DMBA, while no adverse health impact was shown on another rodent strain for the same toxic stimuli combination (Fedrowitz et al., 2004). From a higher-order combination perspective, if genetic abnormalities/differences are viewed conceptually as potentially equivalent to a toxic stimulus for combination purposes, then a synergistic three-constituent combination of 50 Hz EMF, DMBA, and genetics was required to produce adverse health impacts in the above experiment. If these results can be extrapolated across species, then human beings could exhibit different responses to the same electromagnetic stimuli based on their unique genetic predispositions (Caccamo et al., 2013; De Luca et al., 2014).

1) Research quality could be poor, and adverse effects were overlooked.
2) Or, the research team could have had a preconceived agenda, where finding no adverse effects from wireless radiation was **THE** objective of the study. For example, studies have shown that industry-funded research of wireless radiation adverse health effects is far more likely to show no effects than funding from non-industry sources (Huss et al., 2007; Slesin, 2006; Carpenter, 2019). Studies in disciplines other than wireless radiation have shown that, for products of high military, commercial, and political sensitivity, 'researchers'/organizations are hired to publish articles that conflict with the credible science, and therefore create doubt as to whether the product of interest is harmful (Michaels, 2008; Oreskes and Conway, 2011). Unfortunately, given the strong dependence of the civilian and military economies on wireless radiation, incentives for identifying adverse health effects from wireless radiation are minimal and disincentives are many. These perverse incentives apply not only to the sponsors of research and development, but to the performers as well.

Even the Gold Standard for research credibility - **independent replication of research results** - is questionable in politically, commercially, and militarily sensitive areas like wireless radiation safety, where the accelerated implementation goals of most wireless radiation research sponsors (government and industry) are aligned. It is imperative that highly objective evaluators with minimal conflicts of interest play a central role ensuring that rigorous safety standards for wireless radiation systems are met before widescale implementation is allowed.

7. Conclusions

Wireless radiation offers the promise of improved remote sensing, improved communications and data transfer, and improved connectivity. Unfortunately, there is a large body of data from laboratory and epidemiological studies showing that previous and present generations of wireless networking technology have significant adverse health impacts. Much of this data was obtained under conditions not reflective of real-life. When real-life considerations are added, such as 1) including the information content of signals along with 2) the carrier frequencies, and 3) including other toxic stimuli in combination with

the wireless radiation, the adverse effects associated with wireless radiation are increased substantially. Superimposing 5G radiation on an already imbedded toxic wireless radiation environment will exacerbate the adverse health effects shown to exist. Far more research and testing of potential 5G health effects under real-life conditions is required before further rollout can be justified.

The International Commission on Non-Ionizing Radiation Protection: Conflicts of interest, corporate interests and the push for 5G

Brussels June 2020

This report was commissioned, coordinated and published by two Members of the European Parliament – Michèle Rivasi (Europe Écologie) and Klaus Buchner (Ökologisch-Demokratische Partei), and financed by the Greens/EfA group in the European Parliament.

The report was written by Hans van Scharen with editing and additional research support from Tomas Vanheste. Final Editing: Erik Lambert

Foreword by Klaus Buchner and Michèle Rivasi

This report deals with an issue of which the importance cannot be overrated: the possible health effects of Radiofrequency Radiation (RfR) or electro magnetic fields (EMF); It deals more specifically with how the scientific debate has been hijacked by corporate interests from the Telecom industry.

After having read the reports of a journalistic collective called Investigate Europe, the many articles from Microwave News as well as all the publications from independent scientists from around the world, who for years have all been ringing alarm bells on adverse health effects from the use of mobile phones and EMF, we decided that we needed to dig deeper into this strange, unknown to the public but powerful scientific NGO based in Germany called the 'International Commission on Non-Ionizing Radiation Protection' (ICNIRP).

The findings of this report ('The International Commission on Non-Ionizing Radiation Protection: Conflicts of interest and the push for 5G') give us an uncomfortable déjà-vu: many facts and processes that lead to the actual situation whereby European authorities – from the European Commission to most of the member states – simply close their eyes for real scientific facts and early warnings. We have seen exactly the same scenario in the debate on Tobacco, asbestos, climate change and pesticides.

Also in it's latest guidelines from March this year, ICNIRP assures the world that there is no scientific evidence of adverse health effects from the radiation that comes with the new communication technologies, within the limits it proposes. But at the same time a growing number of scientists and also citizens are worried that EMFs do cause health problems. ICNIRP pretends to be scientifically neutral, and free from vested interests of the Telecom industry. We show with this study that this is 'playing with the truth' or simply a lie.

Already in 2011 Dr. Jacqueline McGlade, Executive Director of the European Environment Agency said on mobile phones and the potential head cancer risk for EMF: "The European Parliament has responded (resolution of April 2009) to this public concern with a resolution on EMF in 2009 which, among other things, called for lowering exposure to electromagnetic fields and for lower exposure limits that would better protect the public from health hazards. We share these recommendations."

McGlade pleaded interim actions to protect public health, particularly for children on the basis of the precautionary principle, as central to public policymaking where there is scientific uncertainty and high health, environmental and economic costs in acting, or not acting, when faced with conflicting evidence of potentially serious harm. "This is precisely the situation that characterises EMF at this point in its history. Waiting for high levels of proof before taking action to prevent well known risks can lead to very high health and economic costs, as we have seen with asbestos, leaded petrol and smoking," said McGlade.

The EEA plea for a precautionary approach to policy making in this area, is based on an evaluation of the existing evidence and on the lessons from earlier hazards, analysed in the EEA "Late Lessons from Early Warnings" project. David Gee, EEA Senior Advisor on Science, Policy and Emerging Issue and on the drivers of this project said: "Mobile phones have numerous social, economic and even environmental benefits", said. "However, there is significant disagreement in the scientific community about whether mobile phone use increases the risk of head cancers. We recommend using the precautionary principle to guide policy decisions in cases like this. This means that although our understanding is incomplete, this should not prevent policy makers from taking preventative action".

In a recent discussion Gee stated that there are "several striking similarities" between 5G/radiofrequency radiation and many of the technologies or substances that featured in the "Late Lessons" case studies. Gee pointed to "a lot of hubristic hype surrounded the introduction of the new technology". Gee rightfully points to a "marketing hype which is widespread" on 5G and "a failure to systematically and independently scrutinise the claimed benefits and costs of the new technology". He sees a "gross imbalance between research on developing and promoting the technology and on anticipating and reducing potential harm to people and environments" as well as a "failure to ensure independent research into health and environmental effects that can help combat manufactured doubt".

Gee was tough for the scientific community because scientists fail to acknowledge what they do not know and "to properly understand and embrace knowledge from other relevant disciplines". Gee also sees "a failure of scientists to be transparent about the paradigms, assumptions, judgements and values used in academic science and in their evaluations of scientific evidence in regulatory science. A failure of scientists and policymakers to appreciate complex and variable realities; multi-causality; and the likelihood of inconsistent scientific results. A failure by policymakers to understand the difference between the high strength of evidence needed to establish robust scientific knowledge and the case specific appropriate strength of evidence needed to justify timely preventive action."

Late lessons from early warnings, is indeed also a clear pattern that rises from this report. And there have been more and more warnings (but unfortunately so far no lessons learned).

Also the Council of Europe adopted in May 2011 a strong resolution on "the potential dangers of electromagnetic fields and their effect on the environment" in which it called upon governments to take all reasonable measures to reduce exposure to electromagnetic fields and said about ICNIRP: "It is most curious, to say the least, that the applicable official threshold values for limiting the health impact of extremely low frequency electromagnetic fields and high frequency waves were drawn up and proposed to international political institutions (WHO, European Commission, governments) by the ICNIRP, an NGO whose origin and structure are none too clear and which is furthermore suspected of having rather close links with the industries whose expansion is shaped by recommendations for maximum threshold values for the different frequencies of electromagnetic fields".

In an article, 'Planetary electromagnetic pollution: it is time to assess its impact', published in *The Lancet (*December 2018) scientists from the Australian research group ORSAA state that out of 2266 studies on EMFs, no less than 68 percent found "significant biological effects or health effects". Significant biological effects do not necessarily mean that human health will be harmed, but is an important indicator for risk assessment and then for risk evaluation by regulators. To us the atgument that that there is insufficient scientiifc evidence for regulators to act is factual not corect and simply not true.

The International Agency for Research on Cancer (IARC), a global authority on cancer, concluded in 2011 that radiation from mobile phones is a 'possible' head cancer risk. And recently an Advisory Group has recommended that IARC should reassess the cancer risks associated with non-ionizing radiofrequency radiation with high priority. According to the panel's report, published in The Lancet, the group suggests that the new evaluation should take place between 2022 and 2024.

In 2012 a group of 29 independent scientists and health experts from around the world warned in an update of their Bio Initiative 2007 Report, about "possible risks from wireless technologies and electromagnetic fields". However, they acknowledge that "sometimes, science does not keep pace with new environmental exposures that are by-products of useful things we want to buy and use in

society. So, the deployment runs ahead of knowledge of health risks. It is an old story. This is the case for EMF (electric and magnetic fields) and RFR (Radiofrequency radiation)."

The Bio Initiative report underscores the "critical need to face difficult questions, make mid-course corrections, and try to repair the damage already done in this generation, and to think about protecting future generations".

And they state that the existing public safety limits as formulated by the US regulator FCC and by ICNIRP do not sufficiently protect public health against chronic exposure from very low-intensity exposures: "If no mid-course corrections are made to existing and outdated safety limits, such delay will magnify the public health impacts with even more applications of wireless-enabled technologies exposing even greater populations around the world in daily life."

In 2017, more than 200 doctors and scientists from various countries launched the, so-called 5G Appeal, that has since received more endorsements and whose mission statement starts with : "We the undersigned scientists and doctors(…), recommend a moratorium on the roll-out of the fifth generation, 5G, for telecommunication until potential hazards for human health and the environment have been fully investigated by scientists independent from industry."

Since then there have been five replies on this Appeal by the European Commission, the last one dating from December 2019. The first reply, the Commission states that 'the Commission is not aware of any conflicts of interests of members of international bodies such as ICNIRP or the members of SCENIHR'. One of the leading figures of the appeal professor Lennart Hardell stated that this «does not represent the scientific evidence of inherent conflicts of interest both in ICNIRP and SCENIHR. The European Commission seems to be ill-informed or even misinformed, as the EU seems to take information mainly from these two fraudulent organisations, but not from independent researchers. The EU does not seem to rely on sound science and thereby downplays the RF-related risks."

It is clear from this report that ICNIRP itself does not have a sharp definition of conflicts of interest (CoI's), nor does it have a well-developed policy to avoid these kinds of conflicts. It is a crying shame that under the pretext of 'scientific uncertainty' ICNIRP, but especially the European Commission and member states keep on failing to protect their citizens.

We very much agree with the title and content of the latest publication on Microwave News, which reads " The Lies Must Stop, Disband ICNIRP - Facts Matter, Now More Than Ever" . There are two major casualties in this polarised debate: the truth and public health. Both are too important not to protect with all that we have. That is what we consider as our responsibility as elected politicians .

By MEP's Michèle Rivasi (Europe Écologie) and Dr. Klaus Buchner (Ökologisch-Demokratische Partei)

Introduction & Scope

In the last few decades, since the introduction, and rapid expansion, of new communication technologies, there has been a proliferation of electromagnetic fields worldwide. A lot of countries are now about to roll out 5G networks. The International Commission on Non-Ionizing Radiation Protection (ICNIRP) assures the world that this can be done safely and that there is no scientific evidence of adverse health effects within the limits it proposes. But at the same time a growing number of scientists and also citizens are worried that EMFs do cause health problems.

It is therefore high time to look into the workings of ICNIRP. If the European Commission and national governments keep relying on this commission, as is currently the case, we must be completely sure that it functions wholly independently and that there is no evidence of its members being in situations of conflicts of interest.

ICNIRP is a non-governmental organisation (NGO) or association, registered in Munich, specialising in non-ionizing radiation protection. One of the organisation's tasks is to determine exposure limits for electromagnetic fields used by devices such as cellular phones. On its website, ICNIRP states that it is a non-profit organisation with a scientific mission, and that it is "formally recognised as an official collaborating non-state actor by the World Health Organisation (WHO) and the International Labour Organisation (ILO). ICNIRP is consulted by the European Commission and is linked to many organisations engaged in non-ionizing radiation (NIR) protection worldwide through diverse collaborative projects".

ICNIRP states that its "aim is to protect people and the environment against adverse effects of NIR." To this end, it "develops and disseminates science-based advice on limiting exposure to non-ionizing radiation." ICNIRP works with experts from all over the world, from a wide variety of disciplines, including biology, epidemiology, medicine, physics, and chemistry. ICNIRP's also states that its protection advice is based on current scientific knowledge about the biological effects, and the action mechanisms, of radiation for the whole NIR frequency range.

To a large extent, the European Commission, as well as the WHO, depend on the "exposure guidance" and safety advice given by ICNIRP. Furthermore, many EU member states look to the EC and WHO for (European) advice on this issue. Therefore, it goes without saying that ICNIRP has a significant role to play in ensuring the general public is protected against any possible health risks related to electromagnetic fields (EMF).

In March 2019, in a comprehensive report, *How much is Safe?, by Investigate Europe*, a collective of investigative journalists from all over Europe, ICNIRP is described as follows:

''ICNIRP is a particularly influential group, as it not only evaluates radiation and health risk research, but also provides guidelines for radiation safety limits that most countries use. It is a private, German-registered organisation located outside Munich, behind a yellow door on the premises of the German Federal office for radiation protection. Decisions on who to invite in, are taken by ICNIRP itself."

The report highlighted the close links that exist between ICNIRP and other important organisations in the field of health protection.

Most European governments and radiation protection authorities rely mainly on these four scientific bodies for advice on non-ionizing radiation protection:

- The international commission on non-ionizing radiation protection, ICNIRP.
- The EU Scientific Committee on Health, Environment and Emerging Risk, SCENIHR / SCHEER.
- The World Health Organisation WHO's International EMF Project.
- The WHO Cancer Unit IARC, International Agency for Research on Cancer.

Investigate Europe showed the close links between especially the first three bodies. "The groups, however, are to a remarkable degree, staffed by the same experts," it stated. "Of 13 ICNIRP scientists, six are members of at least one other committee. In the WHO group, this applies for six out of seven (members)." The SCENIHR Working Group on EMF also counts two ICNIRP-members.

In view of the rapid expansion of EMF's, in particular in the context of the planned deployment of 5G networks in which telecom and media operators have huge financial and economic vested interests, and given the evidence of closed circles of experts involved in determining health guidelines in this field, critical scrutiny on the functioning of ICNIRP is important and necessary.

New guidelines

In March 2020, ICNIRP published its latest 'Guidelines on Limiting Exposure to Electromagnetic Fields', designed for "the protection of humans exposed to radiofrequency electromagnetic fields (RF) in the range 100 kHz to 300 GHz. The guidelines cover many applications such as 5G technologies, Wi-Fi, Bluetooth, mobile phones, and base stations."

This publication replaces and supersedes earlier publications from 1998 and 2010. In a press release from March 11th 2020, the then ICNIRP Chairman, Dr Eric van Rongen (now co-chair) said: "The new electromagnetic field guidelines have taken seven years to develop and are more appropriate than the 1998 guidelines for the higher frequencies that will be used for 5G in the future. We know parts of the community are concerned about the safety of 5G and we hope the updated guidelines will help put people at ease. When we revised the guidelines, we looked at the adequacy of the ones we published in 1998. We found that the previous ones were conservative in most cases, and they would still provide adequate protection for current technologies."

Van Rongen's main message was that when the new ICNIRP guidelines are followed 5G is absolutely safe. He stated: "The new guidelines provide better and more detailed exposure guidance, in particular for the higher frequency range, above 6 GHz, which is of importance to 5G, and future technologies using these higher frequencies. The most important thing for people to remember is that 5G technologies will not be able to cause harm when these new guidelines are adhered to."

So, this is how ICNIRP presents itself: an independent organisation that gives sound scientific advice on safety guidelines with respect to non-ionizing radiation and that ensures citizens remain safe.

However, this description raises doubts on two levels: Firstly, is ICNIRP really independent and also, are its assurances that non-ionizing radiation is absolutely safe when their guidelines are applied correct? Our report will focus on the question of ICNIRP's independence, but first, we will briefly outline the current debate around the safety guidelines.

The health debate

The possible adverse health effects of non-ionizing radiation, mainly microwave radiation form mobile phones and other wireless devices/infrastructure, is a highly sensitive and polarising issue. In some countries citizens and scientists plead for the application of the 'pre-cautionary principle' in relation to the rolling out of 5G networks, whilst associations such as ICNIRP maintain that "the most important thing for people to remember is that 5G technologies will not be able to cause harm when these new guidelines are adhered to."

In 2012 a group of 29 independent scientists and health experts from around the world published an update of their Bio Initiative 2007 Report, about "possible risks from wireless technologies and electromagnetic fields". The scientists, of which ten holding a medical degree, still update their "rationale for Biologically-based Public Exposure Standards for Electromagnetic Fields (Extremely low frequency, ELF and radiofrequency, RF)" by assessing the latest scientific research and reporting on it. However, they acknowledge that "sometimes, science does not keep pace with new environmental exposures that are by-products of useful things we want to buy and use in society. So, the deployment runs ahead of knowledge of health risks. It is an old story. This is the case for EMF (electric and magnetic fields) and RFR (Radiofrequency radiation)."

The Bio Initiative report underscores the "critical need to face difficult questions, make mid-course corrections, and try to repair the damage already done in this generation, and to think about protecting future generations".

And they state that the existing public safety limits as formulated by the US regulator FCC and by ICNIRP do not sufficiently protect public health against chronic exposure from very low-intensity exposures: "If no mid-course corrections are made to existing and outdated safety limits, such delay will magnify the public health impacts with even more applications of wireless-enabled technologies exposing even greater populations around the world in daily life."

In an article, 'Planetary electromagnetic pollution: it is time to assess its impact', published in *The Lancet Planetary Health* in December 2018, scientists (from the Oceania Radiofrequency Scientific Advisory Association, ORSAA, and the Institute for Health and the Environment, of the University at Albany) state that out of 2266 studies on EMFs, no less than 68 percent found "significant biological effects or health effects". Significant biological effects do not necessarily mean that human health will be harmed, but is an important indicator for risk assessment and then for risk evaluation by regulators.

The authors stated that it is high time for a wide-ranging debate on the rapid global proliferation of artificial electromagnetic fields. “The most notable is the blanket of radiofrequency electromagnetic radiation, largely microwave radiation generated for wireless communication and surveillance technologies, as mounting scientific evidence suggests that prolonged exposure to radiofrequency electromagnetic radiation has serious biological and health effects.”

Unfortunately, this mounting evidence did not result in policy changes, the authors from ORSAA observe. “However, public exposure regulations in most countries continue to be based on the guidelines of the *International Commission on Non-Ionizing Radiation Protection* and Institute of Electrical and Electronics Engineers, which were established in the 1990s on the belief that only acute thermal effects are hazardous. Prevention of tissue heating by radiofrequency electromagnetic radiation is now proven to be ineffective in preventing biochemical and physiological interference”.

“For example, acute non-thermal exposure has been shown by NIH scientists, to alter human brain metabolism, electrical activity in the brain and systemic immune responses. Chronic exposure has been associated with increased oxidative stress and DNA damage, and cancer risk. Laboratory studies, including large rodent studies by the US National Toxicology Program and Ramazzini Institute of Italy, confirm these biological and health effects in vivo. As we address the threats to human health from the changing environmental conditions due to human activity, the increasing exposure to artificial electromagnetic radiation needs to be included in this discussion.”

The results of the National Toxicology Programme (NTP) the mentioned Lancet-authors referred to, were presented at the end of 2018. The U.S. Food and Drug Administration (FDA) nominated radio frequency radiation (RFR) used by cell phones for an NTP study because of the widespread public use of cell phones and the limited knowledge about potential health effects from long-term exposure. The study found that high exposure to RFR (900 MHz) used by cell phones was associated with:

- Clear evidence of tumours in the hearts of male rats. The tumours were malignant schwannomas.
- Some evidence of tumours in the brains of male rats. The tumours were malignant gliomas.
- Some evidence of tumours in the adrenal glands of male rats. The tumours were benign, malignant, or complex combined pheochromocytoma.

However, ICNIRP criticised the NTP-study, saying that it did not prove a link between Radio Frequency, Electro Magnetic Fields and carcinogenesis. But according to scientists like Lennart Hardell, an oncologist, professor and researcher at the University hospital in Örebro in Sweden, the ICNIRP rebuttal of the NTP-study was unfounded. The NTP-study leading scientist Ronald Melnick recently also published a comment on the ICNIRP-note in which he criticizes ICNIRP’s ”incorrect statements” and “false claims”.

James Lin, professor at the University of Illinois in Chicago and also editor of the online journal, *Bioelectromagnetics*, published a remarkable and nuanced review of the NTP-study in late 2019. The review is remarkable because, from 2004 to 2016, James Lin was himself a member of ICNIRP. As stated above, ICNIRP basically dismisses the NTP-study. However,

basing his conclusions partly on the NTP-study, Lin now questions if the existing safety guidelines are still adequate: “An outstanding question persists on the adequacy of these guidelines for safe long-term exposure to RF radiation at or below 1.6 or 2.0 W/kg. Perhaps, the time has come to judiciously reassess, revise, and update these guidelines.”

Lin’s review is nuanced in so much as he uses the peer-review process to analyse the conception and all possible methodological ‘problems’ of the NTP-study in depth: “This project is the largest NTP animal cancer study ever. It was nominated by the Food and Drug Administration (FDA) in 1999. The supposedly 5-year project was sole sourced in 2004 to an industrial research firm as the project’s principal investigator. The work began in 2005. However, the project had been protracted for more than a dozen years with huge budget overruns, and an estimated eventual price tag of $25 million.”

Somewhat surprisingly, at the end of his review, Lin advocates for wireless radiation to “get a more stringent cancer risk class": “Now that the NTP review panel has concluded that there is clear evidence of carcinogenicity from long-term RF exposure in rats, is it conceivable that IARC would upgrade its epidemiology-based classification of RF exposure to the next higher levels of carcinogenicity to humans?” Lin seems to suggest that IARC should put cell phone radiation in WHO-hazard class 1 (carcinogenic), instead of today’s 2B (possibly carcinogenic).

Worldwide, there is rapidly growing concern and a proliferation of publications about EMF, specifically concerning the out-roll of new generation 5G. On this subject, we will only cite a 2019 in-depth report called “5G Deployment: State of Play in Europe, USA, and Asia”[1]. It reads: “Increased exposure may result, not only from the use of much higher frequencies in 5G, but also from the potential for the aggregation of different signals, their dynamic nature, and the complex interference effects that may result, especially in dense urban areas. (…) The 5G radio emission fields are quite different to those of previous generations because of their complex beam-formed transmissions in both directions – from base station to handset and for the return.”

The authors state that with 5G we are entering unknown territory. “Although fields are highly focused by beams, they vary rapidly with time and movement and so are unpredictable, as the signal levels and patterns interact as a closed loop system. This has yet to be mapped reliably for real situations, outside the laboratory. (..) The problem is that currently it is not possible to accurately simulate or measure 5G emissions in the real world.”

The debate on the safety of non-ionizing radiation is fascinating, heated and important, and has been on-going for at least 30 years. This paper however does *not* go further into the scientific debate on the possible levels of harm to public health caused by non-ionizing radiation, mainly from mobile phones. We will focus on the independence of ICNIRP and the possible existence of conflicts of interest of its members.

[1] A study requested by the ITRE committee of the European Parliament, published in 2019 by the Policy Department for Economic, Scientific and Quality of Life Policies - Directorate-General for Internal Policies.

The importance of funding

ICNIRP claims it is “free of vested interests”. ICNIRP's funding relies on grants from public bodies. Additionally, ICNIRP members and ICNIRP SEG members may not be employed by industry.

But not being “employed by industry” is not, in itself, sufficient to avoid conflicts of interest. It is also important to ascertain to what extent ICNIRP research activities may be funded by industry.

It is a well-established fact that the source of funding for scientific research can have an influence on the outcomes of research. A clear and precise explanation of how this is may occur can be found on the website of UC Berkeley:

“In a perfect world, money wouldn't matter — all scientific studies (regardless of funding source) would be completely objective. But of course, in the real world, funding may introduce biases — for example, when the backer has a stake in the study's outcome. A pharmaceutical company paying for a study of a new depression medication, for example, might influence the study's design or interpretation in ways that subtly favour the drug that they'd like to market. There is evidence that some biases like this do occur. Drug research sponsored by the pharmaceutical industry is more likely to end up favouring the drug under consideration than studies sponsored by government grants or charitable organisations. Similarly, nutrition research sponsored by the food industry is more likely to end up favouring the food under consideration than independently funded research.”

“This does not lead to the conclusion that we should ignore any research funded by companies or special interest groups”, Berkeley says. But it is a reason for the need “to scrutinize studies funded by industry or special interest groups with extra care. *So, don't, for example, brush off a study of cell phone safety just because it was funded by a cell phone manufacturer — but do ask some careful questions about the research before jumping on the bandwagon*. Are the results consistent with other independently funded studies? Does the study seem fairly designed? What do other scientists have to say about this research? A little scrutiny can go a long way towards identifying bias associated with funding source.”

“A little scrutiny” is perhaps an understatement. In the 2013, the ‘Late lessons from early warnings’ report produced by the European Environment Agency (EEA), a chapter written by Lisa A. Bero, describes the various opinions on how to deal with private funding of scientific research without compromising an independent non-biased outcome and/or publication of that research.

For example, various researchers argue that it is logical for industry to fund research, in so much as it is about their products that concerns exist. Former ICNIRP scientist Norbert Leitgeb, professor at the Institute of Health Care Engineering at the Graz University of Technology in Austria, told *Investigate Europe* that what is crucial is the putting in place of effective firewalls to ensure that “private partners cannot interfere with researchers and influence scientific outcomes or conclusions”.

That the source of funding has an important influence, is also something various ICNIRP-researchers acknowledge. For example, in 2009 two scientists who are now members of the ICNIRP-commission – Anke Huss and Martin Röösli – where co-authors of a systematic

review that showed that "industry-sponsored studies were least likely to report results suggesting effects". They concluded that the correlation between the "source of funding and conflicts of interest are important in this field of research."

in his evaluation of the NTP-study, another former ICNIRP-member, professor James Lin, also pointed to the dominance of the telecom industry in the research: "The FDA should be applauded for nominating, and NIEHS/NTP should be lauded for having sponsored the research and conducted the Cell Phone Radio Frequency Radiation (RFR) Studies. It's important for the U.S. government to step in to conduct such a research program, and not leave the matter entirely to the cell phone industry. The wireless industry has had nearly free reign to develop and roll out cellular mobile phones and related RF devices as they see fit. (…)". Lin goes on to quote figures from the 'systematic review': "A systematic review of 59 published studies of controlled exposure to RF radiation with health-related outcomes [10] showed that public agencies or charities funded 11 (19%), the wireless communications industry funded 12 (20%), mixed sources (including industry) funded 14 (24%), and in 22 (37%) the source of funding was not reported."

This specific debate has been ongoing for many years, as *Investigate Europe* reports: "At least three studies over the years have documented that there is often a link between conclusions of studies and the source of the money that paid for the research. Science funded by industry is less likely to find health risks than studies paid for by institutions or authorities."

In 'How much is safe?' by *Investigate Europe*, Lennart Hardell, an oncologist, professor and researcher at the University hospital in Örebro in Sweden, a critical EMF researcher, warns that although funding for research often goes to universities with "firewalls" put in place between the individual scientist and the funder, the problem is, that researchers can come to depend on this private funding to safeguard the future of their research.

Hardell carries out research on the possible links between long-term mobile use and brain cancer and has published results that indicate that there are correlations between the two. Hardell was a member of the IARC committee that researched EMF-effects, but is not a member of (any) other committees concerned with the effects of non-ionizing radiation. *Investigate Europe*: "According to Hardell, his research is funded through his salary from the hospital, as well as by funds raised by local cancer foundations and national organisations. "Of course, I have also worked a lot on my free time", he says."

There are some ICNIRP-researchers who acknowledge that it is possible for the source of funding to influence conclusions, but they say that they are very aware of this and cautious to avoid it. For example, Gunnhild Oftedal, - associate professor at the Norwegian University of Science and Technology, who specialises in research on the effects of electromagnetic fields on humans, and is a member of ICNIRP and therefore part of "the small international network that determines what science to trust" said to *Investigate Europe* that "today we are concerned about it. I have the impression that scientists are much more cautious about receiving support from the industry – at least direct support."

What about the direct funding received by ICNIRP itself? ICNIRP states that its "funding stems from subsidies granted by national and international public institutions such as the German Federal Ministry for the Environment, Nature Conservation, and Nuclear Safety

(BMU), the European Union Programme for Employment and Social Innovation (EaSI) 2014-2020 (EC - Directorate General Social Affairs), and the International Radiation Protection Association (IRPA)."

"Occasionally, ICNIRP also receives support to organise meetings or workshops from national ministries or radiation protection agencies, such as the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA), and the Turkish Ministry of Health (MoH). Funding is reported yearly in the ICNIRP annual reports". ICNIRP also acknowledges that it receives funding from national or international public organisations and via private donations. But ICNIRP claims that in order to safeguard its independence, "only donations from private individuals or from businesses not related in any way to the field of non-ionizing radiations can be accepted. For reasons of transparency, donations cannot be anonymous and are listed in an ICNIRP donors' report."

According to the ICNIRP 2018 annual report, it received € 132,150 in subsidies. The Australian research group ORSAA points out that these kinds of funding sources are not always as neutral as they may seem: "ICNIRP funding partly comes from government regulatory bodies, such as, for example, the Australian Radiation Protection & Nuclear Safety Agency (ARPANSA). What is actually going on is best described as 'money laundering' by the Telecom industry through government (ARPANSA) and onto WHO's International EMF Project and ICNIRP."

In Australia, as is the case for many countries worldwide, the government issues spectrum licences to Telecom operators for large sums of money – often in the billions. In Australia, this licensing is the remit of the industry regulator ACMA, the Australian Media Communications Authority. ORSAA explains that ACMA also collects a separate levy, or tax, from the wireless industry, money that is earmarked for scientific research on RF-EMR health effects: "This has remained a set amount of $1M per annum since 1997, despite the massive increases in wireless industry revenues."

According to ORSAA, ACMA then diverts $300,000 to another government body, ARPANSA (Australian Radiation Protection & Nuclear Safety Agency) for its public information campaign, and $700,000 to the National Health & Medical Research Council (NHMRC). From the $300,000 received annually by ARPANSA, a portion goes to the WHO's IEMFP (some years ago this was around $50,000 a year), and finally, it appears that a portion goes to ICNIRP. So, after a long trajectory, money from the Telecom industry does end up with ICNIRP, which is contrary to the statement on the ICNIRP website: "Only donations from private individuals or from businesses not related in any way to the field of non-ionizing radiations can be accepted."

Still according to ORSAA, "the money that the Australian NHMRC receives in order to provide grants for medical research has mostly gone to industry-friendly researchers who have direct links with the wireless industry. For example, the largest recipient of these NHMRC research funds is Prof. Rodney Croft, a psychology researcher at the University of Wollongong, who held the role of Director of the Australian Centre for Electromagnetic Bio-effects Research (ACEBR) for many years[2]. Rodney Croft has essentially been the head of RF-EMR health research in Australia, despite his questionable qualifications for this health research role.

[2] See also portrqit of Rodney Croft on pqge 50 of this report.

Notably, he has led ICNIRP's RF-EMR exposure guidelines development team and now he has been elected as the next Chairman of ICNIRP as from May 2020. Prof. Croft has received ample direct industry funding in addition to his lucrative NHMRC grants, which should be termed indirect industry funding."

Finally, ICNIRP states on its website that all its experts "are required to comply with the ICNIRP policy of independence and declare their personal interests. (…) These are key elements to ICNIRP's commitment to independence and transparency, which ICNIRP believes is fundamental to carrying out its scientific mission."

Whether those declarations of interests are really checked is something that the Italian 'Vallisoletana Association of people affected by mobile phone antennas' (AVAATE) questioned in their public statement from July 2015, attacking ICNIRP: "It is hard to understand whether ICNIRP investigates the Declarations filed by appointed members of the ICNIRP Commission and Scientific Expert Committee, since in some cases these members report that they work or have worked for these organisations but do not specify what they have done or whether they are paid. It is also hard to understand how ICNIRP controls the content of the declarations by the appointed members of their Expert Committees, when in most cases the most contentious aspects of the biographical statement are not reported in these statements."

The citizens behind AVAATE also ask "how ICNIRP controls the content of the declarations by the appointed members of their Expert Committees when, at least in five cases, the persons concerned have not signed their statements".

Corporate capture

In the debate on EMF and possible health effects, terms like 'corporate capture' of scientific research and 'war game science' are often used, and references to the tactics of the tobacco industry are often made. According to several authors, these tactics also influence organisations like ICNIRP and WHO's International EMF Project.

In the 2013 'Late lessons from early warnings' report produced by the European Environment Agency (EEA), in collaboration with a broad range of external authors and peer reviewers, these tactics are described in detail in the chapter entitled 'Tobacco industry manipulation of research'. The focus is on "the strategies used by the tobacco industry to deny, downplay, distort and dismiss the growing evidence that, like active smoking, ETS causes lung cancer and other effects in non-smokers." Author Lisa A. Bero concentrated "on the 'argumentation' that was used to accept, or reject, the growing scientific evidence of harm. Who generated and financed the science used to refute data on adverse health effects? What were the motivations? What kind of science and information, tools and assumptions were used to refute data on the adverse health of tobacco?"

Bero says: "The release of millions of internal tobacco industry documents due to law suits in the US has given insights into the inner workings of the tobacco industry and revealed their previously hidden involvement in manipulating research. However, this insight is not available for most corporate sectors."

Bero also discusses the possibilities of 'full disclosure' of funding sources and special interests in research and risk assessment in order to secure independence and prevent bias

towards particular viewpoints. She states that “while smoking bans are now being introduced in more and more countries, other industries are drawing inspiration from tobacco company strategies, seeking to maintain doubt about harm in order to keep hazardous products in the marketplace.”

With respect to the EMF-debate, according to Bero, public institutions or authorities should adhere to the following: “when data on risk appear to be controversial, users of the data investigate the sources of the controversy. Does the controversy exist only because the findings of interest group-funded research are contrary to data collected by others? Is the controversy supported primarily by evidence published in interest group-supported publications? (…) Policymakers should apply these questions to all situations in which a company has an interest in creating controversy about the risks of its products.”

According to Bero, the tobacco industry's methods for influencing the design, conduct and publication of research are similar to those of other corporate interests.

One of the leading researchers in the US who defends the viewpoint that the same tactics are being used by Telecom companies is Theodora Scarato, Executive Director of the US based Environmental Health Trust (EHT). As a policy analyst, Scarato manages and updates the comprehensive EHT database on international policy that documents the 20+ nations that have protective policies in place to reduce public exposure to cell phone and wireless radiation.

Scarato and EHT claim that “Just as the Tobacco Industry created a ‘Playbook’ to defend cigarettes and manufacture doubt about the health effects of cigarettes, the Wireless Industry seems to have a fine-tuned the “Playbook” of advertising, public relations and industry-funded science to defend wireless products and falsely reassure the public that cell phones and wireless products are safe.”

“Key to this public relations effort are industry created resources, websites and materials that communicate the myth of no proof of harm from wireless products. These are all part of the Playbook to manufacture doubt that a problem exists. Examples of such propaganda range from glossy brochures, Questions and Answers on Hot Topics such as “children and cell phones”, websites on EMF and Health and research forums.”

And according to Scarato, “these materials are paid for, designed and prepared by ‘non-profit’ organisations that are created by telecom and wireless companies pooling money together. When citizens raise concerns about a particular product or when research comes out indicating a health risk, companies can simply pull from these materials to respond as if there are no concerns”.

These kind of tactics, used to influence science and risk assessment, also have their repercussions for standard-setting bodies like ICNIRP and WHO’s International EMF Project, according to scientific researcher Don Maisch (in his PhD thesis ‘An examination of the manipulation of telecommunications standards by political, military, and industrial vested interests at the expense of public health protection’): “In an ever increasingly globalised world the reliance on international organisations to set standards to protect public health seems inevitable. Proposed internationalised standards such as ICNIRP’s recommendations act as an aid to economic development by not hindering trade that might conflict with

stricter national standards (such as the Russian Federation, the Czech Republic's former standard and China for example). In the delicate trade-off between economic benefits and adequate health protection, international organisations should ideally be "eternally vigilant" to ensure that their tasks are not co-opted by vested interest groups that are the producers of risks to be regulated."

This appears to be a global issue. US researcher, Norm Alster, in his report 'Captured Agency' describes what this kind of corporate capture can lead to by referring to the workings of the FCC (Federal Communications Commission), which is the main official US institution that deals with Telecom issues, and is sometimes mentioned in critiques of ICNIRP: "That is a term that comes up time and time again with the FCC. Captured agencies are essentially controlled by the industries they are supposed to regulate. A detailed look at FCC actions—and non-actions—shows that over the years the FCC has granted the wireless industry pretty much what it has wanted".

"As a result, consumer safety, health, and privacy, along with consumer wallets, have all been overlooked, sacrificed, or raided due to unchecked industry influence. (…) Most insidious of all, the wireless industry has been allowed to grow unchecked and virtually unregulated, with fundamental questions on public health impact routinely ignored. (…) Industry control, in the case of wireless health issues, extends beyond Congress and regulators to basic scientific research. And in an obvious echo of the hardball tactics of the tobacco industry, the wireless industry has backed up its economic and political power by stonewalling on public relations and bullying potential threats into submission with its huge standing army of lawyers. (…) Industry behaviour also includes self-serving public relations and hyper aggressive legal action. It can also involve undermining the credibility of, and cutting off funding for, researchers who do not endorse cellular safety. It is these hardball tactics that recall 20th century Big Tobacco tactics."

Conflicts of Interest

In 2017, almost 200 doctors and scientists from various countries launched the, so-called 5G Appeal, that has since received more endorsements and whose mission statement starts with : *"We the undersigned scientists and doctors(…), recommend a moratorium on the roll-out of the fifth generation, 5G, for telecommunication until potential hazards for human health and the environment have been fully investigated by scientists independent from industry."*
Since then, as professor Hardell describes in his article "Appeals that matter or not on a moratorium on the deployment of the fifth generation, 5G, for microwave radiation" published in January 2020, there have been five replies on this Appeal by the European Commission, the last one dating from December 2019. The first reply, by the Commission (from October 13, 2017 by the Directorate-General Health and Food Safety) states that *'the Commission is not aware of any conflicts of interests of members of international bodies such as ICNIRP or the members of SCENIHR'*.

However, according to Hardell, "that does not represent the scientific evidence of inherent conflicts of interest both in ICNIRP and SCENIHR. The European Commission seems to be ill-informed or even misinformed, as the EU seems to take information mainly from these two

fraudulent organisations, but not from independent researchers. The EU does not seem to rely on sound science and thereby downplays the RF-related risks."

Given the important effects of funding on research outcomes described above, there can be no doubt that it is extremely important for ICNIRP to ensure it avoids any possibility of conflicts of interests in the way that it, or any of its members, function. In its statutes, it writes: 'No member of the Commission shall hold a position of employment that, in the opinion of the Commission, will compromise its scientific independence.'

The crucial words here are '*in the opinion of the Commission*'. The Commission evaluates itself about possible conflicts of interest. There are no clear rules by which the Commission judges if any of its members interests compromise its scientific independence. In its statement on the declarations of interests ICNIRP writes:

"The evaluation of personal integrity is very complex and might never be achievable in a perfect way. It is the duty of the ICNIRP Commission to carefully consider and decide if the declared interests potentially constitute a conflict of interest."

It is clear from this that ICNIRP itself does not have a sharp definition of conflicts of interest (CoI's), nor does it have a well-developed policy to avoid these kinds of conflicts.

It is useful to refer to a recent study requested by the European Parliament's Petitions (PETI) committee which, as a key message, said that "EU institutions and agencies lack a consistent definition of conflicts of interest and common rules on transparency'. This same study also stated that "a coherent policy should be developed for the required length of time between working in the industry and being called to a committee among agencies with a similar function, i.e. risk assessment".

In the online newsletter, *Politico*, the Greek MEP Alexis Georgoulis said: "There is a legal inconsistency between the definitions of the conflicts of interest that should clearly cover any conflicts between public and private functions, but also public functions with other public functions," The report recommends clear clarifications on whether conflicts of interest are potential or also perceived.

So, we will have to look at other, similar, organisations that have more stringent policies in this field. The European Food and Safety Authority (EFSA) seems to be a good candidate. In June 2017, EFSA, after a long history of accusations of CoI's, sharpened its definition and its policy to avoid CoI's.

EFSA defines a conflict of interest as "any situation where an individual has an interest that may compromise or be reasonably perceived to compromise his or her capacity to act independently and in the public interest in relation to the subject of the work performed at EFSA".

This definition is also somewhat broad and vague. EFSA's solution was to set clear rules to which its experts have to comply. For example: Research funding from the private sector benefiting EFSA's experts should not exceed 25% of the total research budget.

The EFSA-rules are minimum requirements. According to *Corporate Europe Observatory* they are not strict enough to completely avoid conflicts of interest. So, it is reasonable to say that

ICNIRP, that presents itself as an independent, scientific advisory board, should, at the very least, comply with the EFSA rules.

In this paper, we will therefore:

* Give an overview of the history and all existing knowledge on the independence of, and the conflicts of interest within, ICNIRP. These chapters provide the context in which we have a closer look at the ICNIRP-members.

* Try to identify all the potential sources of conflicts of interest of ICNIRP-members. Such as: research funding from the private sector; financial investments in, and employment by, telecom business operators; consultancy work for the telecom industry.

* Try to find out if the ICNIRP-members comply to the EFSA-rules on conflicts of interest and give an assessment on the independence of ICNIRP.

These are the ICNIRP experts whose professional backgrounds we will research (see the portraits of each member in Part V):

As from December 2019, the composition of the ICNIRP Commission for the term of office 2020-2024 is as below. The new term of office starts in May 2020.

MEMBERS OF THE ICNIRP COMMISSION:

GUNDE ZIEGELBERGER (SCIENTIFIC SECRETARY), GERMANY
RODNEY CROFT (CHAIR), AUSTRALIA
ERIC VAN RONGEN (VICE-CHAIR) , THE NETHERLANDS

TANIA CESTARI, BRAZIL
NIGEL CRIDLAND, UNITED KINGDOM
GUGLIELMO D'INZEO, ITALY
AKIMASA HIRATA, JAPAN
ANKE HUSS, NETHERLANDS
KEN KARIPIDIS, AUSTRALIA
CARMELA MARINO, ITALY
SHARON MILLER, USA
GUNNHILD OFTEDAL, NORWAY
TSUTOMU OKUNO, JAPAN
MARTIN RÖÖSLI, SWITZERLAND
SOICHI WATANABE, JAPAN

MEMBERS WHO HAVE LEFT THE ICNIRP COMMISSION IN MAY 2020
Maria Feychting
Adèle Green
Zenon Sienkiewicz

MEMBERS OF THE SCIENTIFIC EXPERT GROUP (SEG):

I- Historic overview of ICNIRP and accusations of COI

In this chapter, we give an overview of the history of ICNIRP as an organisation and examples of accusations of Conflicts of Interests (COI) and other controversies concerning the organisation's work. The authors do not want to suggest that this overview is, by any means, complete or comprehensive.

About ICNIRP's history, on its website, the organisation simply states that its beginnings go back to 1973 "when, during the 3rd International Congress of the International Radiation Protection Association (IRPA), for the first time, a session on non-ionizing radiation protection was organized. In 1977 the International Non-Ionizing Radiation Committee (INIRC) was created. This Committee was the immediate forerunner of ICNIRP that was chartered as an independent Commission in 1992 during the IRPA 7th International Congress."

In a speech in Rio de Janeiro, in 2008, Paolo Vecchia, the Italian former ICNIRP-chair (2004-2012), explained in more detail: "In June 1974, IRPA President, Italian Carlo Polvani (1973-1977), proposed "a possible role of IRPA in establishing criteria and standards in the field of health protection against non-ionizing radiations" and the IRPA Executive Council decided to set up a Working Group to review the health protection problems arising from different non-ionizing radiation (NIR)."

One could argue that IRPA itself, and then much later it's spin-off ICNIRP, came into existence as a "fall-out" of the first US atomic bomb testing. On its website, on the subject of its historical background, IRPA states: "Before the Second World War, radiation protection had been a largely secondary concern of radiologists and radiological physicists. With the concentration of effort under the Manhattan Project it was soon realised that this would involve working with quantities and types of radiation and radioactive materials that had not previously been envisaged. As a result, a distinct group of scientists within the project were assigned full time to what was termed "Health Physics"."

In an article from 2017 on the history of of ICNIRP, at the occasion of it's 25th anniversary founder Mike Repacholi wrote: "Concern about health risks from exposure to non-ionizing radiation (NIR) commenced in the 1950s after tracking radars were first introduced during the Second World War. Soon after, research on possible biological effects of microwave radiation in the former Soviet Union and the U.S. led to public and worker exposure limits being much lower in Eastern European than in Western countries, mainly because of different protection philosophies." As we will see further in this chapter this divide between Russia and the West on safety measures on non-ionizing radiation exists till today.

At the end of its conference in 1955, the US Atomic Energy Commission voted overwhelmingly to form a professional Health Physics Society and the first IRPA Congress was held in Rome between 5-10 September 1966. It is interesting to see that many of the 12 Executive Council Members of IRPA in 1966 remained in position for many years; a fact that echoes like a prelude to criticism that ICNIRP functions like an 'old-boys network'.

In 1974, IRPA President Polvani insisted that "a separate and independent International Commission on NIR Protection (later ICNIRP) should be established…The ICNIRP would look

to IRPA as the sponsoring international scientific organization in a similar way that ICRP looks to the International Congress of Radiology…. And "IRPA should consider broadening its institutional authority to include NIR".

So Carlo Polvani got what he wanted: the General Assembly amended the Constitution of IRPA so that it could "also apply its objectives and purposes in the field of non-ionizing radiation protection". Then the General Assembly created an International NIR Committee […] "with the objective of developing background documents and internationally accepted recommendations". This became INIRC, set up in 1977, that went on to become ICNIRP, in 1992. Already four years earlier, Mike Repacholi (more on him later), a member of IRPA, had begun writing the charter for ICNIRP which was signed in 1992.

But why elaborate so much on IRPA, before turning to ICNIRP itself? Critics often ask from where ICNIRP got its self-acclaimed international and institutional authority? Well, partly from IRPA, which still plays a role in the actual composition of ICNIRP. The IRPA Charter for the creation of ICNIRP, from 1992, says: "The election of the members of the Commission shall be made by the Commission from current members of the Commission and from nominations submitted by the Commission itself, the Executive Council of IRPA and the IRPA Associate Societies, with regard to an appropriate balance of expertise. Attention shall be paid to geographical representation."

At the end of the 15th International Congress of IRPA, planned for 11-15 May 2020, in Seoul, Korea, the new term of office of the new ICNIRP commission (2020-2024) would officially start. This occurred, despite the international congress in South-Korea being postponed until 2021 due to the corona-crisis. This international congress counts telecom companies of all kinds among its sponsors (platinum, silver, bronze as well as others). Since ICNIRP was born from IRPA, and that, like any parent, IRPA still exerts a strong influence over ICNIRP, and considering ICNIRP claims to function free of any vested interests, it seems important to us to look more closely at IRPA.

And maybe also because of the actual role that IRPA wants to play in the ongoing debate around safety and health in relation to EMF. Current IRPA-president, Roger Coates, writes that "a lot of effort over recent times has gone into preparing the IRPA Guidance for Engagement with the Public on Radiation and Risk". This seems to be the typical type of response given by bodies like IRPA, ICNIRP and others concerning public worries about possible health effects: *let's explain things better, because the public doesn't understand (…that everything is safe)*. It is the same kind of response given in the past by the nuclear sector when people started to become worried about nuclear safety issues (for example after Chernobyl).

Some governments – at various levels – try to put into practice a guiding principle of radiation safety, called "ALARA", which stands for "As Low As Reasonably Achievable". This principle means that even when being subjected to a small dose, if receiving that dose has no direct, practical or medical benefit, you should try to avoid it. IRPA-boss Roger Coates states that "the interpretation of what is 'Reasonable' in the implementation of optimisation of radiation protection is one of the key issues for our profession and is one of IRPA's current key themes. It is central to practical protection and is the dominant factor controlling exposures in any well-developed system of protection. But what does 'reasonable' mean?

There are growing concerns within our profession that we are giving more emphasis to 'as low as' and 'minimisation' rather than truly being 'reasonable'."

On the subject of safety: before Roger Coates became IRPA-president he had a life-long career in the British nuclear industry: he started working in 1975 at the Health Physics and Safety Department at the Sellafield site of *British Nuclear Fuels plc (*BNFL) and did so for over 30 years, "holding radiation protection roles covering operations, environmental protection and emergency planning. His responsibilities broadened to encompass nuclear safety, together with conventional safety and environmental issues. He completed his industry career as Director of Environment, Health and Safety for both BNFL and its British Nuclear Group subsidiary." Over the years, BNFL has had to face up to quite some issues in the field of safety and was the subject of a "damning report into the falsification of safety data at the Sellafield reprocessing plant" at the start of this century.

This year, on its website, IRPA published the first new safety guidelines of ICNIRP since 1998, of which ICNIRP-chair Van Rongen said, as we mentioned earlier: " The new guidelines provide better and more detailed exposure guidance in particular for the higher frequency range, above 6 GHz, which is of importance to 5G and future technologies using these higher frequencies. The most important thing for people to remember is that 5G technologies will not be able to cause harm when these new guidelines are adhered to."

Self-declared legitimacy

Since the signing of IRPA-charter in 1992, ICNIRP is based in Munich, Germany and registered as a self-governed NGO (non-governmental organisation) that was formally recognized as "an official collaborating non-state actor by the World Health Organization (WHO) and the International Labour Organization (ILO)." ICNIRP is consulted by the European Commission and is linked to many organizations engaged in NIR protection worldwide through diverse collaborative projects.

As mentioned in the introduction of this report, extensive reporting by *Investigate Europe*, in March 2019 (updated on June 10th 2020), showed that there are many close links between ICNIRP and other leading organisations in the field of health protection. Many ICNIRP-members are, or were, also members of one of these three scientific bodies (from which most radiation safety authorities in Europe and governments, seek their advice) and it is important to mention them again, because these are the bodies that guide government policies in most countries:

- The EU Scientific Committee on Health, Environment and Emerging Risk, SCENIHR / SCHEER.
- The World Health Organization (WHO) International EMF Project (IEMFP).
- The WHO Cancer Unit IARC, International Agency for Research on Cancer.

It is worth underlining, however, that IARC does not really fit into this "gang of four" because it has a much more critical and independent approach. IARC published a report in May 2011 which concluded that radiofrequency (RF) radiation is "possibly carcinogenic" to humans.

The IARC cancer classification includes all sources of RF radiation, of which the long-term exposure can come from mobile phone base stations, Wi-Fi access points, smart phones, laptops and tablets.

However, IARC may now have a solid reputation as independent scientific body, some years ago, IARC also got into trouble. Anders Ahlbom, senior professor of Epidemiology at the Karolinska Institute in Stockholm, and a long standing, influential member of ICNIRP (Commission Member and ICNIRP SCI working group (Epidemiology)), and ICNIRP Chairman from 1996 until 2008, was also part of the IARC panel of experts in 2011. Ahlbom was, until very recently, doing assessments of environmental health risks as chair of the Swedish Radiation Safety Authority's (SSM), the scientific council on electromagnetic fields, as a member of ICNIRP and of the EU advisory body SCENHIR.

But he was asked to step down from IARC after a journalist exposed him as being on the board of his brother's consulting firm in Brussels, which helps clients on telecoms issues. He had not made IARC aware of this. As the Swedish investigative reporter, Mona Nielsson, wrote: "Furthermore, Anders Ahlbom's brother, Gunnar Ahlbom, was for a long time a lobbyist for Swedish telecom giant Telia (previously TeliaSonera) in Brussels. At the same time Anders Ahlbom served as an "independent expert" on several important expert panels, in Sweden as well as at the WHO and EU. At a meeting organized by the European Commission in cooperation with GSM Association and Mobile Manufacturers Forum in Brussels in 2004, Anders Ahlbom was an invited expert to speak on health effects, while his brother Gunnar Ahlbom sat in the audience representing TeliaSonera."

There was, and is, more controversy and division on this topic within the WHO. In a 2017 article, "A hard nut to crack" , professor Lennart Hardell draws attention to a Fact Sheet issued by WHO in June 2011, only two months after the IARC's report adapting the cancer classification of RF radiation, which stated that "to date, no adverse health effects have been established as being caused by mobile phone use". According to Hardell, this statement was "not based on scientific evidence at that time on a carcinogenic effect from RF radiation. And it was certainly a remarkable conclusion by WHO since IARC is a part of WHO, although seemingly independent". And he goes on to conclude: "Considering the WHO statement of 'no adverse health effects' the aim might have been to undermine the IARC decision and give the telecom industry a 'clean bill' of health."

One of the main reasons for this schizophrenic approach within the WHO is to be found in the figure of ICNIRP-founder, Mike Repacholi, and the WHO's International EMF Project, IEMFP) (see more below). At least four ICNIRP-members were, or are, also members of the WHO-EMF Group.

In January 2019, in the German newspaper Der Tagesspiegel, investigative journalists described ICNIRP as "a Cartel", that systematically refutes all studies that show possible harm: "And no radiation protection agency, no EU commissioner and no minister, contradicts this. For European governments and their authorities, the 13 members of the self-appointed Commission act as a kind of force majeure. But why? Why are all the warners, even prominent figures like the panel of experts for the US Health and Safety Executive, not heard?"

The Investigative journalists describe an “astonishing phenomenon: the members of ICNIRP are simultaneously active in all the relevant institutions and thus have control over the official discourse.” They then go on to note that, legally speaking, ICNIRP is an association that auto-controls itself and thus avoids dissenting opinions, but in the first instance, the connection with the German state begins with the chosen address of ICNIRP which is the same as the German Federal Office for Radiation Protection (BfS).

Is it just a strange coincidence that ICNIRP’s secretariat is located in the building of the BfS in Munich. The scientific coordination for/of/within? ICNIRP has, for the last few years, been the responsibility of a BfS official: Gunde Ziegelberger. “Her predecessor even chaired the club until 2016. At the same time, the German government supports the NGO of scientists with about 100,000 euro a year. The spokesperson rejects the impression that the private organization is almost part of the German authority as "not applicable". The office only supports the international network of research, she said. Moreover, the ICNIRP is officially recognised by the WHO, which gives it legitimacy.”

We have asked Mrs Ziegelberger via email if she would agree to answer our questions on ICNIRP in writing, but we have, to this date, received no response (the ten questions can be found in Annex I)

This self-declared sense of legitimacy was carefully created by the Australian scientist, Michael Repacholi, who co-founded ICNIRP and also, a few years later, in 1996, the EMF Project of the WHO (officially the WHO’s International EMF Project, IEMFP) of which he became the head. The WHO’s International EMF Project (IEMFP) basically based itself on ICNIRP’s guidelines and by doing so gave itself a “quality label”.

ICNIRP under Michael Repacholi’s chairmanship

Since 1978, the Australian biophysicist, Repacholi, has been a member of the International Non-Ionizing Radiation Committee (INIRC), a part of the International Radiation Protection Association (IRPA), and between 1988—1992 he was chairman of INIRC, which then became into ICNIRP. Between 1996 and 2006, Repacholi called the shots at the WHO by creating, and then leading, the WHO EMF Project, to study the health effects of electric- and magnetic-field radiation (EMF).

So, almost simultaneously with his leadership of ICNIRP, Repacholi was able to set up the EMF Project of the WHO (officially the WHO’s International EMF Project, IEMFP) in 1996, and became its head (see more below) until 2006. From the very beginning, the WHO EMF Project and ICNIRP have been intertwined, as Louis Slesin wrote in *Microwave News*. Given the central role of Repacholi, it might explain why, from very early on, ICNIRP was officially recognized by the WHO. From 1996 until today, Repacholi has been “Member Emeritus” of ICNIRP and today, still has access to the organisation he founded.

As early as 1992, ICNIRP adopted Repacholi’s 1984 IRPA proposal that the only health issue to address in standard setting was the short-term effects due to the absorption of RF/MW energy of sufficient power to be converted to heat, based on the IEEE’s (Institute for Electrical and Electronic Engineers) Radiofrequency standard philosophy. Since then it seems to be carved in stone that ICNIRP only recognises the ‘thermal effects’ of radiation as a

serious concern. This is a crucial element to understand the position of ICNIRP, it was built on the logics and thinking of electrical and electronic engineers and completely lacking biomedical expertise.

In 1998, ICNIRP published its first "Guidelines on limits of exposure to time-varying electric, magnetic and electromagnetic fields (up to 300 GHz)", still largely produced under the chairmanship of Repacholi.

A fierce and long-standing critic of the first ICNIRP guidelines was Dr Neil Cherry, Associate Professor of Environmental Health. In November 1999, Dr Cherry was invited by the Ministry of Health/Ministry for the Environment of New Zealand to carry out a peer-review of the proposal to adopt the ICNIRP guidelines for cell sites in New Zealand.

Cherry: "The ICNIRP guidelines were covered by a published assessment in 1998. This review shows that the assessment had ignored all published studies showing chromosome damage. It was highly selective, biased and very dismissive of the genotoxic evidence and the epidemiological evidence of cancer effects and reproductive effects. The assessment gives the strong impression of being predetermined in the belief that the only effects were from high exposures that cause electric shocks and acute exposures that cause tissue heating. For, example, they cite two studies saying that they do not show any significant increased effects of Brain/CNS cancer from microwave exposures when the actual published papers, Grayson (1996) and Beall et al. (1996), both do show significant increases of Brain/CNS cancer."

In September 2000, he presented evidence of Health Effects of Electromagnetic Radiation to the Australian Senate Inquiry into Electromagnetic Radiation. The Inquiry Chairperson, Senator Lyn Allison, described Cherry's evidence as the only independent professional evidence with no relation to industry. The conclusions from this evidence are strongly contrasted with the position of Dr Michael Repacholi, the WHO, ICNIRP, the Australian Radiation Laboratory and many other organisations around the world.

Twenty years ago, Cherry said: "This issue has been so politicized. There are two major casualties, the truth and public health. On these matters, I have no respect for the position of ICNIRP, nor that of the WHO. The WHO position is taken solely by Dr Repacholi. ICNIRP is a small self-appointed, self-promoted group that claims standing by having WHO recognition. In other words, a body formed in part and led by Dr Repacholi, claims its standing by being recognized by Dr Repacholi."

Cherry used harsh words for INCIRP under Repacholi's chairmanship. "They consistently misquote and misrepresent the published research results. They reject all epidemiological evidence because every single epidemiological study occurs with mean exposure levels and orders of magnitude below their thermally-based standard. They are highly selective, using only a small proportion of the available studies in order to construct and defend their own case. They prefer author's conclusions that there are no effects, even when the data and analysis in the paper clash with this and contradict it. They dismiss large, reliable and well-defined studies as ill-defined and unreliable. They state that studies don't show significant increases in CNS cancers when they actually do, even when the papers include significant dose-response relationships. Both the WHO and ICNIRP, under Dr Repacholi's leadership, have maintained the thermal view to the present, despite the large and ever-growing body of scientific research that firmly and conclusively challenges this."

He also accused Repacholi of maintaining close links with industry. “He not only appeared in New Zealand in two court cases for industrial clients, in Vienna he was taken to an industry sponsored press conference where he stated that there was no evidence that GSM cell phones were hazardous to health. At the conference, he presented his paper on the Telstra (**Telstra** is Australia's largest mobile network operator and telecom company) funded project that showed that GSM cell phone radiation at quite low non-thermal levels, doubled the cancer in mice. When challenged by the conference chairman, Dr Michael Kundi, Dr Repacholi said that a study is not evidence until it is replicated. The conference rejected this. A study is evidence. Replication provides confirmation and establishment.”

The fact is that Repacholi has followed a remarkable career path, from member of IRPA and working in an Australian hospital, to holding a dominant position in the international debate on EMF risks. He also developed as a scientist, from publishing a study in 1997 on lymphoma incidence in mice exposed to RF radiation, to becoming a consultant for telecom and power companies ten years later.

In 2017, he published ‘A History of the International Commission on Non-Ionizing Radiation Protection (ICNIRP)’ in the scientific review *Health Physics*, in which he stated: “ICNIRP’s guidelines have been incorporated into legislation or adopted as standards in many countries. While ICNIRP has been subjected to criticism and close scrutiny by the public, media, and activists, it has continued to issue well-received, independent, science-based protection advice. This paper summarizes events leading to the formation of ICNIRP, its key activities up to 2017, ICNIRP’s 25th anniversary year, and its future challenges.”

It is quite revealing that Repacholi writes, “ICNIRP has been subjected to criticism and close scrutiny by the public, media, and activists”, and yet, forgets to mention, *and also by scientists*. Because, since the first publication of guidelines by ICNIRP in 1998, there has been a never-ending stream of critical academics publishing harsh analysis on the scientific work of ICNIRP. The issue is that Repacholi has not only been a dominant figure, but also a very divisive figure, in the international EMF-debate and he has been able to make sure that independent scientists who do not agree with the ICNIRP-dogma of ‘thermal effects only” have not become part of ICNIRP nor of the WHO EMF Project.

The fact that, in his article for the 25th anniversary of ICNIRP, Repacholi makes no mention of the criticism and close scrutiny by scientists is quite telling. Because basically, the story of ICNIRP and the ongoing controversy and ever deeper divisions within the scientific community in the EMF-debate, started around the persona of Michael Repacholi himself.

‘Good science’ and the EMF Project (IEMFP)

As we have stated above, Repacholi was not only ICNIRP chairman, but also the leader of the WHO EMF Project. In his own words: “The WHO established the International EMF Project to provide a mechanism for resolving the many and complex issues related to possible health effects of EMF exposure. The Project assesses health and environmental effects of exposure to static and time varying electric and magnetic fields in the frequency range 0 - 300 GHz, with a view to the development of international guidelines on exposure limits.”

In 1999, Repacholi published the Proceedings of an International Seminar on EMF Risk Perception and Communication that took place in Canada. The event was not only sponsored by the WHO, some government ministries and the Faculty of Medicine at the University of Ottawa, but also by the Cellular Telephone Industry Association, the Canadian Wireless Telecommunications Association and some electricity companies. The almost 300-page document published by Repacholi's "International EMF Project" (part of the WHO's Department of Protection of the Human Environment) kicks off with this statement: "Possible health effects of exposure to electromagnetic fields (EMF) have led to concerns among the general public and workers that appear to go well beyond those that are attributed to well-established risks. It is necessary to understand why this occurs and to deal with it through an effective communications programme. People have the right to access reliable, credible and accurate information about any health risks from EMF exposure."

In his review, "A hard nut to crack", professor Hardell writes: "Michael Repacholi immediately set up a close collaboration between WHO and ICNIRP (being head of both organizations) inviting the electric, telecom and military industries to meetings. He also arranged for large part of the WHO EMF project to be financed by the telecommunication industry's lobbying organisations; GSM Association and Mobile Manufacturers Forum, now called Mobile & Wireless Forum (MWF)." Hardell states that Repacholi acted like "a representative for the telecom industry while responsible for the EMF health effects department at the WHO"

An investigative article in US magazine, *The Nation*, stated: "Although Repacholi claimed on disclosure forms that he was "independent" of corporate influence, in fact Motorola had funded his research: While Repacholi was director of the WHO's EMF program, Motorola paid $50,000 a year to his former employer, the Royal Adelaide Hospital, which then transferred the money to the WHO program. When journalists exposed the payments, Repacholi denied that there was anything untoward about them because Motorola had not paid him personally."

According to *The Nation*, "eventually, Motorola's payments were bundled with other industry contributions and funnelled through the Mobile and Wireless Forum, a trade association that gave the WHO's program $150,000 annually. In 1999, Repacholi helped engineer a WHO statement that "EMF exposures below the limits recommended in international guidelines do not appear to have any known consequence on health."

In a *Microwave News* article, Repacholi claims that he always followed the WHO rules on funding and that, "NO funds were EVER sent to me." But the article's author, Louis Slesin goes on to say that "this is financial *legerdemain*. As *Microwave News* has previously reported, Repacholi arranged for the industry money to be sent to the Royal Adelaide Hospital in Australia, where he used to work. The funds were then transferred to the WHO. Seven years ago, Norm Sandler, a Motorola spokesman, told us that, "This is the process for all the supporters of the WHO program." At the time, Motorola was sending Repacholi $50,000 each year. That money is now bundled with other industry contributions and sent to Australia by the Mobile Manufacturers Forum (MMF), which gives the project $150,000 a year."

A scientist who is very critical about the activities of Repacholi is American Professor Andrew A. Marino (who used to work at the departments of Orthopedic Surgery, Neurology, and

Cellular Biology & Anatomy at the LSU Medical School in Louisiana) wrote: "In 1996 the World Health Organization began what it said was a program to assess the scientific evidence of possible health effects of EMFs. But the project was corrupted from the start because it was controlled by the power- and cell-phone companies in the industrialized countries. The companies designated Michael Repacholi as the project head. He had long been a consultant and spokesman for power companies, so it was unrealistic to expect him to conduct an open and honest inquiry, but his performance in office was even more miserable than could have been anticipated based on his known conflict-of-interest."

Marino: "While heading the EMF program at WHO, Repacholi dealt almost exclusively with experts on the payroll of cell-phone and power companies. Scientists who disagreed with the viewpoint of the EMF companies were excluded from the EMF evaluation process. The public was also excluded from participation even though it was a major stakeholder in the EMF debate. Only pro-industry spokesmen were heard in Repacholi's star-chamber processes, which ultimately resulted in reports and evaluations that exonerated the companies from any responsibility for human disease produced by their EMFs."

Marino saw Repacholi at the Annual Meeting of the Bioelectromagnetics Society (BEMS) in Cancun, Mexico, in June, 2006: "The Mobile Manufacturers Forum, a consortium of the world's major cell-phone companies, were "Gold Sponsors" of the BEMS meeting, and the leaders of BEMS, had invited Repacholi to give a talk entitled "Results from 10 Years of WHO's International EMF Project," which he delivered at a plenary session of the meeting. Unsurprisingly, his talk was a paean to his EMF activities at WHO. He was proud of having successfully stemmed the tide of concern regarding the link between environmental EMFs and other human diseases, and of having defended the principle that man-made environmental EMFs were harmless. He touted model legislation that he had drafted, and said that he hoped it would be enacted by various governments so that the fact that environmental fields were safe would be enshrined in law."

In 2006 Repacholi stepped down as director of WHO's EMF Project.

Not much later *Microwave News* announced: "It's Official: Mike Repacholi Is an Industry Consultant And He's Already in Hot Water": "Just months after leaving his post as the head of the EMF project at the World Health Organization (WHO), Mike Repacholi is now in business as an industry consultant. The Connecticut Light and Power Co. (CL&P), a subsidiary of Northeast Utilities, and the United Illuminating Co. (UI) have hired Repacholi to help steer the Connecticut Siting Council away from a strict EMF exposure standard."

To strengthen his testimony on behalf of the two electric utilities, Repacholi cited the findings of an unfinished WHO report —Environmental Health Criteria (EHC)— on EMF risks. Twenty invited experts drafted this report at a meeting in Geneva in October 2019. The final version was expected to be made public months ago but it's still being edited by the WHO staff.

According to Chris Portier, who chaired the expert EHC panel for the WHO, Repacholi has misrepresented the group's conclusions: "The paraphrasing sometimes has gone a bit far and may be misleading". Portier is the associate director for risk assessment at the National Institute of Environmental Health Sciences (NIEHS)." (see below).

Portier cites a couple of examples. For example, in a summary of the WHO report, Repacholi states that the EHC panel concluded that "The epidemiological evidence cannot be used as a basis for standards (exposure limits)". Portier retorts, "Such a statement is absurd, since they obviously can be used."

Repacholi has since also been involved in an industry propaganda video and interviews with GSM Association and Hydro Quebec where he clearly speaks in favour of the telecommunications and the power industries, respectively.

A year later, in 2007, *Microwave News* reported that "Mike Repacholi has now revealed that up to half of the funds raised for his EMF Project came from industry. This admission was made in an interview with *Resource Strategies Inc*. in an effort, he states, to "set the record straight." While Repacholi has acknowledged in the past that he raised funds from industry, the extent of the industry support is much greater than anyone has previously suspected. Repacholi has never disclosed how much money he received nor from whom. He insists that the EMF Project was not "influenced by industry."

According to an e-mail seen by *Microwave News*, Repacholi touts the interview as an example of "where the press finally got it right": "*Resource Strategies*, however, can hardly be considered "the press" in the usual meaning of the term. *Resource Strategies* is a corporate consulting firm that prepares briefing papers for clients, which are almost exclusively in the wireless and electric utility businesses. Among them are *EPRI, FGF, GSM Association* and *MMF*. All of these industry groups supported the EMF Project during Repacholi's tenure. And to bring it all full circle, the WHO is also on *Resource Strategies*' client list."

Some current ICNIRP members, such as the new chair, Rodney Croft, also declare doing work for EPRI.

Researcher Don Maisch wrote that Repacholi harmed the credibility of the WHO: "It is acknowledged that in an ever increasingly globalized world the reliance on international organisations to set standards to protect public health is an irrefutable fact of modern life. It is also a fact that international organizations charged with this task need to be "eternally vigilant" to ensure that their organisations are not co-opted by vested interest groups – as exampled by Big Tobacco and WHO. However, when it comes to non-ionizing radiation issues (in this case for power frequency health risk assessment) the evidence is clear that Michael Repacholi has used his standing in both WHO and ICNIRP to stack the WHO's Environmental Health Criteria Task Group for power frequency exposures with representatives of the power industry in contravention of WHO policy."

Maybe one of the most telling episodes in the professional life of Repacholi is his open fight with his former boss, Gro Harlem Brundtland, who was director-general of the WHO. In interviews and a speech, Brundtland admitted that she is 'electrically sensitive': "I never place a mobile phone next to my head because in one second I would develop a bad headache." Repacholi was not amused. In 2012, several Norwegian newspapers reported that the "Former head of WHO's EMF project and ICNIRP chairman says that Brundtland has created "fear of mobiles" in the population". He offered to examine her, as if she had a psychological problem.

Very seldom were critical voices heard within the WHO. From the minutes of the Sixth International Advisory Committee meeting in May 2001, we read that Russian professor Yuori Grigoriev (the one from the 'angry letter' mentioned below) tabled a document outlining EMF activities in Russia, and the difficulties with standards harmonization "particularly because of the inadequate consideration of non-thermal effects by ICNIRP and other national authorities".

Dr Paolo Vecchia, of the National Institute of Health in Italy, and later ICNIRP chair, reacted to this by saying that "it is important to be able to recognize what good science is. WHO should be a reference point or clearinghouse for good science and good scientific review. It is important to recognize that science and legal measures follow the technology – it is not possible to do a mobile phone epidemiological study before the introduction of the technology! Given the pace of new technological development it is not possible, even now, to envisage the complete set of new research that will be needed."

Vecchia also claimed to be personally very concerned about 'defensive science', speaking of over-cautiousness and an over-emphasis on uncertainties. "Scientists should be more confident 'about the state of art'". He is now doing consultancy work and speaks at Telecom-conferences.

IEEE/ ICES

In 2008, Vecchia wrote: "Guidelines for safe exposure to electromagnetic fields have also been developed by other international organizations, in particular the Institute of Electrical and Electronics Engineers (IEEE). Apart from some differences in terminology and numerical values of the limits, these guidelines are based on the same methodological approach, the same structure, and the same scientific database as ICNIRP."

In his thesis on "an examination of the manipulation of telecommunications standards by political, military, and industrial vested interests at the expense of public health protection" ORSAA-member and scientist, Don Maisch, compares the ICNIRP and IEMFP with the American based IEEE. It is interesting because while ICNIRP claims to be free from the influence of private interests, IEEE/ICES has always openly had members of the military and of the telecom industry among its ranks.

Maisch writes: "On the part of both IEMFP and ICNIRP, a disregard for their own stated principles on independence from industry and following questionable criteria for evaluating science, suggests an agenda to cut off the scientific controversy over EMF human health hazards by less than scientific means. It could be argued that IEEE's openly industry and military dominated standard-setting process is at least more honest than WHO / ICNIRP masquerading as independent scientific voices free of vested interest machinations."

Dariusz Leszczynski, Adjunct Professor at the University of Helsinki, writes about conflicts of interest concerning ICES: "ICES, equivalent of ICNIRP, prepares safety recommendations for the exposures of users by radiation emitted by cell phones. Unlike ICNIRP, anyone can apply for membership of ICES and all members of ICES participate in the decision-making process. Sounds nice… Not a "private club" as ICNIRP where participation is by invitation only and the invitees have to have the same opinion on radiation safety – this helps in reaching unanimous decisions… But ICES has another problem that caused me, member of ICES for a

couple of years, to resign my membership in 2009. The problem is that the ICES membership is clearly dominated by scientists working or consulting for telecoms."

And in another blogpost Leszczynski wrote: "The membership of the IEEE-ICES-TC95 consists predominantly of the industrial scientists and the committee is chaired by C.K. Chou since the time he was employed by Motorola. This means that all safety standards being developed by IEEE-ICES-TC95 are, in practice, developed by the industry scientists for the use by the industry they are employed by. The industry scientists have the majority on the committee and upper-hand in any process involving democratic voting. To me this is clear Conflict of Interests".

In the portraits of ICNIRP chair, Croft, and co-chair, Van Rongen, we describe (from page 50) how they worked on establishing closer relations between ICNIRP and ICES.

From the minutes of a meeting by the IEEE/ICES TC95 working groups at a Motorola headquarters, a few interesting things got clear: In 2017 Repacholi was still a member of the "ICES literature systematic review working group". And ICES-chair Faraone Antonio from 'Motorola Solutions' proudly announced that "ICNIRP has delayed finalizing their conclusions to give full consideration of ICES's recommendations".

Former Motorola employee Chou stated at the same meeting on the interaction with World Health Organization (WHO EMF Project) that "in response to C-K Chou, the WHO has agreed to encourage international harmonization of RF Safety Limits, especially between ICNIRP and ICES"

And concerning the WHO EMF Project, Hardell describes how Repacholi recruited Emilie Van Deventer to the WHO EMF Project in 2000, and to this day, she remains project manager at WHO for the EMF project: "She has been a long time member of the industry dominated organization Institute of Electrical and Electronics Engineers (IEEE). IEEE has prioritized international lobbying efforts for decades especially aimed at the WHO." Hardell states that Van Deventer is an electrical engineer and has no formal or earlier knowledge in medicine, epidemiology or biology, so it is surprising that she was selected for such an important position at the WHO. Hardell: "The very same year she was recruited to the WHO EMF Project, Toronto University Magazine wrote about Emilie van Deventer's work, stating that it was 'invaluable' to industry: 'The software modelling done by teams like van Deventer's is invaluable.' 'The industrial community is very interested in our research capabilities,' says Van Deventer. 'It always needs to be working on the next generation of products, so it turns to universities to get the research done'."

The importance of this work is reflected in the research funding van Deventer and her team received from the Natural Sciences & Engineering Research Council of Canada (NSERC), Communications & Information Technology Ontario (CITO), and their major industrial partner, Nortel. "We are fulfilling a very real need in the industry today, which will only increase as technology creates more opportunity. In the process, consumers will continue to enjoy faster computers, lighter cell phones, smaller electronic organizers and the vast array of other electronic gadgets the high-tech world has to offer."

In 2016, during a seminar at the SSI, concerning health effects of EMF, former Swedish investigative journalist, Mona Nilsson, asked both Emilie van Deventer, Head of the WHO

EMF Project, and Eric van Rongen, the then chair of the ICNIRP, "whom the citizens should believe: them or the opinion of 220 scientists who signed an Appeal submitted to the United Nations and the WHO?". Both Van Rongen and Van Deventer answered the question without defending their position. Apparently, neither Van Rongen or van Deventer are willing to fully defend the reliability of the evaluation of science by ICNIRP, because as Leszczynski points out, neither of them said that ICNIRP evaluation of science is reliable and that the Appeal's conclusions are unreliable. "This clearly demonstrates that there is no scientific consensus on the health effects of radiation emitted by wireless communication devices. This situation should be taken into consideration when the WHO selects expert group for preparation of the final version of the Environmental Health Criteria for RF-EMF. Scientists with diverse scientific opinions should and must be appointed in order to facilitate an unbiased scientific debate."

We have sent questions to Van Deventer, but have, to date, received no answer.

Angry Russian letter

Although ICNIRP was recognised as "an official collaborating non-state actor by the World Health Organization (WHO) and the International Labour Organization (ILO)", from the early days, ICNIRP has also been criticized for industry-bias and indisputable situations of conflict of interest.

Hardell notes that the Ethical Board at the Karolinska Institute in Stockholm, Sweden, concluded, already in 2008, that "being a member of ICNIRP may be a conflict of interest that should be stated officially whenever a member from ICNIRP makes opinions on health risks from EMF."

Nevertheless, for the WHO, this does not appear to pose a problem. After the IARC publication in 2011, the WHO announced a new 'formal risk assessment' in 2012, which was launched in 2014 and was then open for public consultation until the end of 2014.

The WHO stated "the drawing of conclusions from the literature and the drafting of these chapters is the remit of a formal Task Group that will be convened by WHO at a later stage in the process."

Hardell disclosed that "it turned out that of the six members in the WHO Core Group, four are active members of ICNIRP and one is a former member." Indeed, in a research paper from 2016, Sarah J Starkey concludes that "the anticipated WHO Environmental Health Criteria Monograph on Radiofrequency Fields, due in 2017, is being prepared by a core group and additional experts, with 50% of those named, being, or having been, members of AGNIR or ICNIRP (Table 2)."

In another research paper, from 2017, Hardell notes: "It is striking how ICNIRP has infiltrated the WHO Monograph core group, making it less likely that the conclusions in that Monograph will differ from ICNIRP's conclusions." And according to him, only one person seems to be independent of ICNIRP and "several persons also have affiliation(s) to other advisory groups, authorities and/or committees. Six of the 20 additional experts are affiliated with ICNIRP".

In March 2017, professor Oleg A. Grigoriev, Chairman and Head of the Scientific Department of Non-Ionizing Radiation, Federal Medical Biophysical Centre of Federal Medical Biological Agency (RNCNIRP) of Russia wrote an angry letter to Maria Neira, Director of Public Health and Environment at the WHO, in which he openly attacks ICNIRP: "It has just come to our attention that the WHO RF Working group consists mainly from present and past ICNIRP members. In general, the WG is not balanced and does not represent the point of view of the majority of the scientific community studying effects of RF. In particular, the private self-elected organization, ICNIRP, similar as majority of the current WHO RF WG members, does not recognize the non-thermal RF effects, which represent the main concern of widespread exposure to mobile communication and upholding guidelines from 1996, which are based on RF thermal effects only."

The Russian scientist concludes that "the guidelines of ICNIRP are irrelevant to the present situation when majority of population over the world is chronically exposed to non-thermal RF from mobile communication. Based on multiple Russian studies and emerging number of studies coming from other countries, the Russian equivalent of ICNIRP has consistently warned against possible health effects from mobile communication. This point of view of RNCNIRP (Russian radiation protection agency) is supported by hundreds of new publications including well known recent RF studies in human and animals."

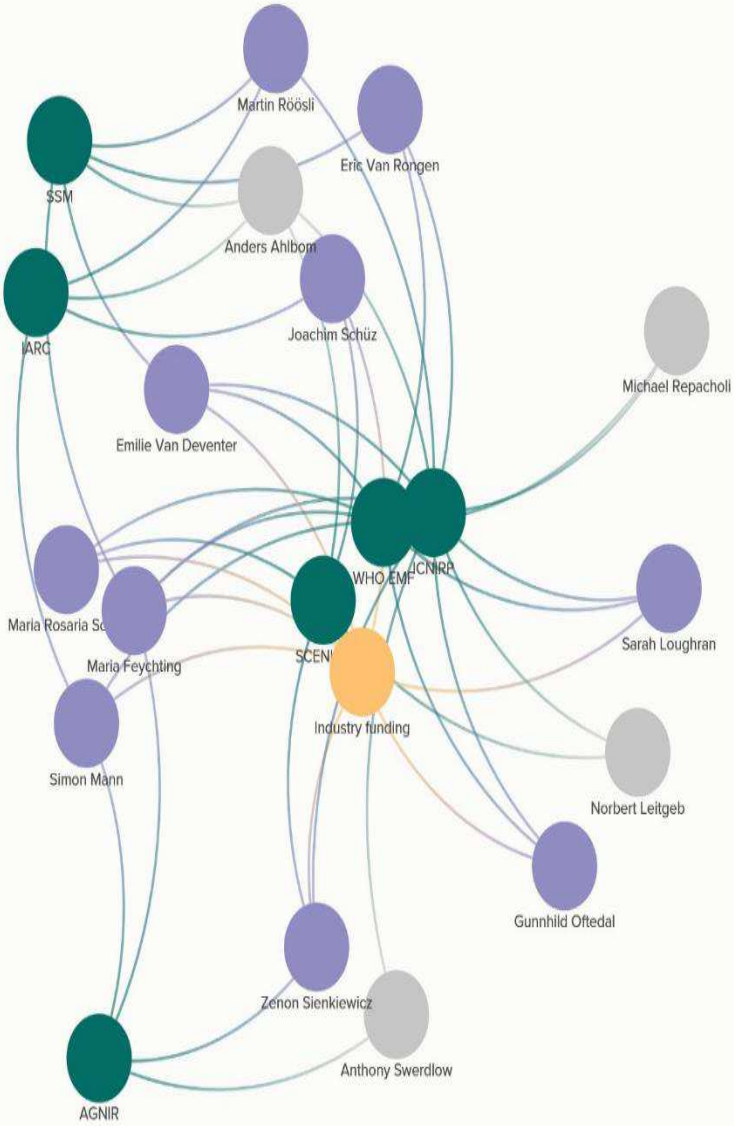
Apparently, this angry Russian letter, in addition to other outcries, did have some effect on the WHO, because it relaunched a Call for Expressions of Interest for systematic reviews (2020) for an 'Environmental Health Criteria Monograph': "The World Health Organization's (WHO) Radiation Programme has an ongoing project to assess potential health effects of exposure to radiofrequency electromagnetic fields in the general and working population. To prioritize potential adverse health outcomes, WHO conducted a broad international survey in 2018. Ten major topics were identified for which WHO will now commission systematic reviews to analyse and synthesize the available evidence."

We wonder if this time the WHO will try to avoid conflicts of interests and whether, for example, there will also be Russian experts and other non-ICNIRP affiliated scientists on the panels of experts.

Investigate Europe wrote that the conflicts in EMF research run deep: "Historically, science in this field has been associated with the telecom sector and the military. ICNIRP's safety limits primarily take into account the needs of the telecom industry, claims Dariusz Leszczynski, former long-time researcher at the Finnish radiation protection agency. In 2011, he sat on the committee of IARC, the cancer body of the World Health Organisation, when it decided that EMF is "possibly carcinogenic" to humans. ICNIRP's goal is to set safety limits that do not kill people, while technology works – so something in between", says Leszczynski."

Dariusz Leszczynski, has written about this many times on his blog and has often referred to an unbalanced expert composition: "ICNIRP can, and should, be considered as a "private club" where, members of the new Main Commission are selected by the members of the outgoing Main Commission. It is a self-perpetuating and self-promoting German NGO that is not accountable for its actions at all. Nobody controls it. Nobody supervises it. Nobody checks it for conflicts of interests. Nobody checks it for the scientific accuracy. In all what and how ICNIRP does, we, the general public, must rely on the self-assurances, from the

ICNIRP, that all is in order. One may ask whether such self-assurances are sufficient when ICNIRP is preparing advisories “enforced” world-wide by the WHO and applied by the numerous governments and by the multi-billion industry.”



The following Graphic – made by *Investigate Europe* shows the interlinkages between renowned ICNIRP-members and other scientific bodies. These groups, are to a large extent staffed by the same experts. “Of 13 ICNIRP scientists, six are members of at least one other committee. In the WHO group, this applies for six out of seven,” *Investigate Europe* writes.

III - Discussion & Controversies

An observation one could make based on what has been discussed above, is that ICNIRP is simultaneously one of the most powerful and one of the least-known non-governmental organisations (NGO's) in the world. Powerful, because for almost three decades, ICNIRP has enjoyed a monopoly in the regulation of exposure to EMFs through their guidelines thanks to the stamp of approval of the WHO. For the past 30 years, and currently, this advice and these guidelines, are to a large extent followed by governments all over the world. In every annual report, by any major telecom company, you will find references to ICNIRP in any discussion or statement on the safety of their mobile phones. ICNIRP garners huge influence worldwide, functioning on a modest yearly budget of around 140.000 euro, and yet ICNIRP is largely unknown by the general public.

ICNIRP presents itself, and is described by the European Commission and in the media, as an independent commission that gives advice based on scientific evidence. Our research shows that there are several reasons to question this (self)-image.

Biased composition

The composition of ICNIRP is very one sided. As one can read in the portraits of the members of the ICNIRP commission and of the Scientific Expert Group (SEG), they all share the same position on the safety issues: non-ionising radiation only poses a health threat at thermal levels.

Prominent ICNIRP-members therefore denounce the findings of the U.S. National Toxicology Program (NTP) that showed rats and mice contracted cancer when exposed to telephone radiation. In a scientific publication, Van Rongen and co-authors state, as we laid out in the portrait of the former chair of the ICNIRP-commission, that "substantial limitations (of the NTP-study) preclude conclusions being drawn concerning RF EMFs and carcinogenesis."

Professor Hans Kromhout of Utrecht University, who is leading a long-term study into the effects of mobile phone use on human health, and who is chairman of a special committee on Electromagnetic Fields of the leading Dutch Health Council, regrets the way INCIRP minimalizes the conclusions of the NTP study. "You can see that certain groups are trying to reason that away. But they are well-executed studies", he said in a Dutch newspaper.

According to Kromhout, a deep controversy divides the scientific community that researches EMF: "Two camps have arisen in science, with the two groups shouting at each other from their trenches. It has become impossible to conduct a normal conversation." This observation is also made by ORSAA-scientists.

And one of these two camps, is not represented at all inside ICNIRP. "It would seem that the Commission is composed only of 'non-believers," Kromhout wrote in an email to us. In the Dutch newspaper, he had earlier stated: "It's a bit of an opaque club. How candidates are elected is not clear. Call it self-indulgent. In that sense, it doesn't really have an independent status."

In more recent exchanges with us, he re-iterates that the use of the word "self-indulgent" is justified. He refers to the sentence in the ICNIRP Charter: "The election of the members of the Commission shall be made by the Commission from current members of the Commission and from nominations submitted by the Commission itself, the Executive Council of IRPA and the IRPA Associate Societies, with regard to an appropriate balance of expertise. Attention shall be paid to geographical representation." The first part – that it is the members of the Commission who elect its new members – puts the Commission at risk of remaining a closed circle made up only like-minded scientists.[3]

The unbalanced composition of ICNIRP is further demonstrated by the lack of expert-members with training and experience in medical and/or biological sciences. As one researcher pointed out, of the outgoing ICNIRP commission only one member was trained in medicine, and only three in biological sciences. Furthermore, the sole medical professional, Adele Green, was not an expert researcher in RF-EMR (with a single original research article back in 2005), but was specialised in UV-radiation and skin cancer. She also left ICNIRP in May 2020. It seems a good thing she has been replaced by Dutch scientist, Anke Huss, assistant professor at the Institute for Risk Assessment Sciences (IRAS) at Utrecht University (NL), who seems to be rather critical. Tania Cestari has replaced Adele Green ICNIRP in May 2020, although, like Green that she has collaborated with, her expertise seems to be on UV radiation in dermatology. Interestingly, a search on the PubMed database showed that she has no publications for radiofrequency or other EMFs so she is not an expert on wireless radiation.

The system of cooptation of ICNIRP and the resulting excessively homogeneous composition clearly favors such biases. In 2013, in his article "Not Entirely Reliable : Private Scientific Organizations and Risk Regulation - The case of Electromagnetic Fields", Gabriel Domenech Pascual, Professor Administrative Law at the University of Valencia, states in his conclusions : "That lack of plurality tends to reduce both the quantity and the quality of the available information that serves the basis of their judgments, to stifle critical dialogue, to exacerbate the common biases and positions of their members and to produce extreme outcomes, polarized in the direction of those biases and points of view."

We can safely say that ICNIRP has been, and is still lacking people with a relevant medical background and over represented by physical scientists, which may not be the wisest composition when your remit is to offer advice on human health and safety to governments around the world.

Dr. Chris Portier, former director of the National Center for Environmental Health and international expert in the design, analysis, and interpretation of environmental health data with a focus on carcinogenicity, writes to us that the ICNIRP Council and SEG "appear to have a very wide balance of experience". However, what they are lacking, according to Portier, "is representation by scientists who have a history of working in risk assessment for chemicals. This leads to their having different risk assessment approaches than the rest of the area."

[3] For a better understanding of IRPA and functioning of ICNIRP, we refer you to the historical section of this report

Portier argues that risk assessment for chemicals is “well-established and has been used for many, many years”. This standard of assessing risks of chemical substances, governs how to judge the quality of various types of scientific studies and how to incorporate them into the final risk assessment decisions.

Portier: “I have long felt that experts from EMF-research have been incorrectly arguing that this exposure is different and must be handled separately. But ionizing radiation is handled the same was as chemicals in risk assessment, why not EMF?” Portier states that ICNIRP could “expand their expertise in epidemiology and toxicology and experts who understand the challenges of biomedical study design and interpretation in a general sense.

And Portier states that “it would also be good to have a few scientists who are more outspoken about potential risks.” Portier writes that these improvements “would” challenge ICNIRP to “be exact about their dismissal of some of the positive findings” in research on health effect of EMF, that do exist.

The composition of ICNIRP is also one sided in another sense: there is a lack of representatives from the Middle East, Russia, China and India who have outstanding research contributions in the RF research and also (in many cases) have more stringent standards.

For Gabriel Domenech Pascual "this lack of plurality is not fortuitous at all, but caused by the system used to elect the members of the ICNIRP. As everybody knows, cooptation tends to produce homogeneous, conservative, immobile and not sufficiently innovative groups."

"This stands in sharp contrast with the principles underlying current European Union Law", Domenech Pascual adds. "As stated in the Communication from the Commission on the collection and use of expertise, pluralism is a determinant of the quality of the scientific advice. Therefore, “wherever possible, a diversity of viewpoints should be assembled. This diversity may result from differences in scientific approach, different types of expertise, different institutional affiliations, or contrasting opinions over the fundamental assumptions underlying the issue. Depending on the issue and the stage in the policy cycle, pluralism also entails taking account of multi-disciplinary and multi-sectorial expertise, minority and non-conformist views".

Various EMF-experts have pointed out on many occasions in the past years that ICNIRP is wrongfully dismissing certain scientific studies showing adverse health effects and sticking, in an almost dogmatic way, to the conviction that “non-ionising radiation poses no health threats and the only effects it has are “thermal”. Two leading experts, Kromhout and Portier confirm to us that ICNIRP is a closed, non-accountable and one-sided organisation. As concluded earlier, “a closed circle of like-minded scientists” has turned ICNIRP into a self-indulgent science club, with a lack of biomedical expertise as well as a lack of scientific expertise in risk assessment and risk management philosophies (similar to those used for ionizing radiation and for chemicals), which might lead to “tunnel-vision”.

Will world safety standards really be safe?

Several ICNIRP-members are, or were, also members of the International Committee on Electromagnetic Safety (ICES) of the IEEE. This is an organisation in which many people from the media and telecom industry and from the military are actively and openly involved. The former chair of the ICNIRP-commission was a member of an ICES-committee. As we mentioned in his portrait, ICES thanked Van Rongen for improving the relationship between ICES and ICNIRP and for his willingness to discuss the harmonisation of ICNIRP-guidelines and IEEE-exposure limits. In its latest published annual report (2016), ICES states: "ICES will maintain its collaborative relationship with ICNIRP with the goal of setting internationally harmonized safety limits for exposure to electromagnetic fields at frequencies below 300 GHz. This interaction with ICNIRP is considered a major step forward."

In 2016 Van Rongen invited members of ICES to give their comment on the new guidelines for HF Fields. And ICNIRP took these comments very seriously. In 2017 during the annual meeting of ICES it was stated that "ICNIRP has delayed finalizing their conclusions to give full consideration of ICES's recommendations".

The new chair of the ICNIRP-commission Croft was also member of ICES until December 2015. Seven other ICNIRP-scientists - Guglielmo d'Inzeo, Akimasa Hirata, Jose Gomez-Tames, Ilkka Laakso, Kensuke Sasaki, John Tattersall and Tongning Wu – were or are also members of an ICES-committee.

This clearly shows that ICNIRP has been working very closely with IEEE/ICES on the creation of the new RF safety guidelines that were published this year. And this implies that large telecom-companies as Motorola and others, as well as US military, had a direct influence on the ICNIRP guidelines, which are still the basis for EU-policies in this domain.

Kromhout comments that he was unaware of the fact that several ICNIRP-members also participate in ICES/IEEE. ICES/IEEE is not one of the organisations that is mentioned as a collaboration partner on the ICNIRP-website. On the subject of the IEEE, the Dutch professor writes that "this is not really an independent organisation when it comes to electromagnetic fields and health."

Portier sees the membership of ICES as a potential conflict of interest. He indicates as an example that the declarations of interests of some ICNIRP-members mention membership in ICES, but no mention of the travel costs associated with that membership being covered by ICES: "This has two consequences. Travel cost reimbursement is a perk and it could be removed if the member fails to give the right answer, hence a potential Conflict of Interests. Secondly, being a member in ICES gives industry access to the ICNIRP member which would not be available to the general public and can thus bias opinions."

A membership of and close cooperation of ICNIRP-members with ICES, which for several years held its annual meetings at a Motorola's branch, can be considered as a possible conflict of interest. As described, during the current leadership of ICNIRP, these ties got even closer "with the goal of setting internationally harmonized safety limits for exposure to electromagnetic fields".

Ties that bind

A lot of ICNIRP-scientists have also participated in research work that was funded, or partly funded, by the telecom industry.

The International Agency for Research on Cancer (IARC) has a strict policy when it comes to inviting scientists to assist it in the writing of the famous monographs – like the one from 2011, that classified radiofrequency electromagnetic fields as, "possibly carcinogenic to humans (Group2B), based on an increased risk for glioma, a malignant type of brain cancer associated with wireless phone use." In the final Monograph 2012 report, it is stated that each scientist must disclose pertinent research, employment, and financial interests during the past 3 years, unless that a grant from for example a company does not exceed more than 5% of total research budget: "All grants that support the expert's research or position and all consulting or speaking on behalf of an interested party on matters before a court or government agency are listed as significant pertinent interests."

In our introduction, we wrote that the European Food and Safety Authority (EFSA) has slightly less stringent member-selection criteria: "Research funding from the private sector benefiting EFSA's experts should not exceed 25% of their total research budget."

It seems that this percentage is not exceeded by most of the members of the ICNIRP-commission and Scientific Expert Group, insofar as we can trust their Declarations of Personal Interest. But these declarations are often not complete. Anssi Auvinen, for example, mentions that he received € 100,000 from the Mobile Manufacturers Forum for the Finnish section of the COSMOS-study. But he does not mention what percentage of his total research budget that amount constitutes. And Maria Feychting, former vice-chair of the ICNIRP-commission, did not mention any research support received from commercial entities in her Declaration of Personal interest, although a lot of her research actually was, as we showed in her portrait, funded by industry. Some of the member's DOI's are also somewhat out of date. For example, the last DOI available for Isabelle Lagroye, published on the ICNIRP-website, is dated October 2015.

The majority of ICNIRP-scientists did perform research partly funded by industry. But is this important information? As we argue in the introduction, we believe it is. Scientific publications, co-authored by two ICNIRP-scientists – Anke Huss and Martin Röösli, confirm the importance of funding. In 2006 and 2009 they did a systematic review of the effect of the source of funding in experimental studies of mobile phone use on health, and their conclusion was that, "industry-sponsored studies were least likely to report results suggesting (adverse health) effects".

And theirs is not the only study that showed this kind of bias. Portier agrees in writing to us that this is a problem: "There have been numerous studies of the differences in reporting from industry-funded research versus publicly-funded research that suggest a strong bias."

David O. Carpenter, professor of Environmental Health Sciences at the University at Albany, explains the mechanism behind this claim in the preface of the book Corporate Ties That Bind - An Examination of Corporate Manipulation and Vested Interest in Public Health: "One of the greatest problems in scientific discovery," he writes, "is the perversion that can result due to conflicts of interest. While there are other possible bases for conflicts of interest,

most are financial. Individual scientists may have financial conflicts of interest that influence the design of the studies they perform so that they obtain a result similar to that which they, or their funders, want. When funding for scientists comes from an organization or corporation with desires to present a clean bill of health to the public, there is strong motivation to give the funder what they want, if only to continue receipt of funding."

The Australian researcher, Don Maisch, claimed in his PhD-thesis, *The Procrustean Approach: Setting Exposure Standards for Telecommunications Frequency Electromagnetic Radiation* (2010), that the dismissal by ICNIRP of all studies that show health effects of non-ionizing radiation shows the influence industry exercises on ICNIRP: "Such dismissal may, on the surface, appear to be objective expert opinion, but an examination of ICNIRP's risk assessment processes finds, however, that power industry influence is endemic to the process. This influence appears to be aimed at ensuring economic protection for the industry against the need to spend enormous amounts of money on upgrading distribution networks as well as the risks of litigation if more restrictive limits were ever put in force.**"**

According to Maisch, the essence is that the thermal limitations of the IEEE standards and the ICNIRP RF Guidelines "can be said to be little more than an outdated artefact from a half-century ago, maintained by a scientific elite who have long staked their scientific credibility on maintaining that viewpoint. From their perspective, to retreat from that paradigm would be to admit that they had it wrong after all."

Ten years after Maisch' publication and many other similar criticisms, ICNIRP still adheres to the paradigm that the only proven effects are thermal. "ICNIRP appears to take into account only the warming of tissue and uncontrolled muscle contractions, although they claim in the most recent advice, that they also evaluated other mechanisms", writes Kromhout.

As many scientists and critical observers have pointed out, it seems as if ICNIRP members are either oblivious or ignoring scientific studies that find possible adverse health effects where there is an absence of heating. Even when some ICNIRP-members themselves acknowledge that industry-funding of scientific research tends to have less positive findings, and publicly funded studies – like the NTP-study – does find significant links between EMF and adverse health effects, this does not seem to influence one iota the views of ICNIRP-members.

A mixed bag of responsibilities

In an e-mail we received from Lloyd Morgan, Senior Research Fellow of the Environmental Health Trust and Director of the Central Brain Tumor Registry of the United States, is very critical of both ICNIRP and governments: "Who are ICNIRP? The International Committee on Non-Ionising Radiation Protection (ICNIRP) are a private, self-appointed body or NGO who together with the Advisory Group on Non-ionising Radiation (AGNIR) and Public Health England (PHE), have somehow ended up effectively setting microwave radiation exposure 'safety' standards for the populations of large parts of the world since the 1990s," he writes. "What amazes me, and simultaneously sickens me, is how did ICNIRP convince a large number of "independent" nations to adopt ICNIRP's so called "standards"?

Morgan suspects that high-level persons in the government's administration was "able to have the legislation passed because almost no-one in the government understood what was happening."

ICNIRP only publishes guidelines. It is then up to national governments to decide if they pass these guidelines into law. According to Lloyd Morgan, "that places the burden on each national government, should its citizens file a lawsuit".

Clearly, the Telecom sector as a whole, and the auctioning off of bandwidth and selling of Telecommunication licenses, are an important source of cash income for governments. The analogy with the Tobacco sector has often been made by scholars who study 'regulatory capture', but there is also an important similarity between the tobacco and telecom sectors in terms of their importance for State budgets.

The auctioning off of Radio frequency spectrums brings in billions of euros for European countries. Telecom companies also earn billions of euros thanks to these spectrum acquisitions, since 'owning the right' to use a specific radio frequency spectrum is an essential resource for telecommunication services such as mobile telephones, TV and radio broadcasting, satellite and broadband communications.

The *European 5G Observatory* notes that, "Germany's Federal Network Agency announced that the 5G auction, which started in March 2019, ended with 6.55 billion euros offered in total by the four bidders. *Deutsche Telekom* and *Vodafone* Germany criticized high prices of the country's auction". In the 5G Action Plan as adopted by the EU in 2016 it says:, "from September 2016, member states will be required to authorise the 700 MHz-band by 2020, unless there are justified reasons for delaying it until mid-2022 at the latest", reports the *European 5G Observatory*. The Observatory also stated, in April 2020, that "exceptional circumstances caused by the Covid-19 epidemic have forced some countries in Europe to postpone 5G auctions scheduled in the first months of 2020. Four EU countries, Austria, France, Spain and Portugal have postponed spectrum auctions for 5G due to the Covid-19 epidemic so far."

The European Commission selected the consultancy firm, Idate-digiworld to carry out the *European 5G Observatory,* to monitor the rolling out of the 5 G Action Plan. IDATE-DIGIWORLD is a smart-looking consultancy company and self-declared "European think-tank for members, policy-makers and players of the digital transformation", with some of the largest telecom operators and producers as its clients.

One of those clients, isn't a Telecom giant, but a governmental regulator, Ofcom in the UK. *European 5G Observatory* reports that 'Ofcom opened a consultation on human exposure to Electromagnetic Field Emissions (EMF) in the UK. The consultation started on February 21th 2020 and ended on May 15th 2020: "The regulator proposes to include a specific condition in telecom licences requiring licensees to comply with ICNIRP guidelines. {…) At the same time, Ofcom released the results collected close to 16 5G base stations in 10 cities across the UK and to 60 GHz fixed wireless equipment in Liverpool. In all cases, the measured EMF levels from 5G base stations were far below the ICNIRP Guidelines (the highest level was approximately 1.5% of the relevant level); the 5G share of the total emissions level observed was currently very low."

To the question, "Is ICNIRP responsible?", Paolo Vecchia, former Chairman for ICNIRP (2004-2012) answered very clearly at a conference in September 2008 that "the ICNIRP guidelines are neither mandatory prescriptions for safety, the "last word" on the issue, nor are they defensive walls for Industry or others." This statement makes it clear that the decision to adopt these guidelines into national legislation as "sufficient to protect public health" is

political. The possible misuse by governments of ICNIRP and its guidelines seems to be another key question, that still needs looking into and answering.

On the other hand, ICNIRP presents itself as the provider of scientific truth. For example, in a report for the Irish government, under the heading, "Recommendations International Guidelines" it states that "there should be strict compliance with ICNIRP guidelines: The ICNIRP guidelines on exposure limits have been recommended by the European Commission to its Member States, and they provide science-based exposure limits that are applicable to both public and occupational exposure from RF and ELF fields. They also provide sound guidance on limiting exposure from mobile phones and masts, as well as for power-line fields. The ICNIRP guidelines provide adequate protection for the public from any EMF sources. While the guidelines were published in 1998, they are constantly under review and still have appropriately protective limits. The guidelines are based on a weight of evidence review from all peer-reviewed scientific literature and not on the conclusions of any single scientific paper."

Even as ICNIRP has been positioning itself during the last 25 years as the sole scientific truth when it comes to possible relation between EMF and adverse health effects, it would not be correct to hold this scientific NGO accountable if one day it would be undisputed that EMF causes health problems. National governments have their own responsibility to protect their citizens, just as the European Commission has, which after all is the 'Guardian of the Treaty' and therefore should also take the legally binding 'precautionary principle' into account.

The telecommunication industry applauds ICNIRP

In most policy fields, industry keeps reiterating that the limits scientific advisory committees propose are too strict. But in the case of the exposure limits for non-ionizing radiation the telecom industry seems very content with the norms ICNIRP proposes. In many reports over the past twenty years, the Telecoms lobby in Europe has always referred to the safety assurances published by ICNIRP.

In its Environmental Report of 2005, the European Telecommunications Networks Operators' Association (ETNO) wrote: "Concerning the European Union's legislative and policy framework on EMF, ETNO has been in direct contact with EU institutions. The association has provided a steady stream of facts and advice to legislative bodies in order for the EU to base its Directive concerning 'minimum health and safety requirements regarding the exposure of workers to the risks arising from physical agents (electromagnetic fields)' on a sound scientific basis as provided by the International Commission on Non-Ionising Radiation Protection (ICNIRP)."

Thirteen years later, the Boston Consulting Group, in a report with the ominous title, 'A playbook for accelerating 5G in Europe', pleads for the harmonized limits ICNIRP (and also IRPA and the WHO EMF project) proposes, and criticizes governments that apply stricter limits. Exactly the same point was made by ETNO in a public consultation by the European Commission. ETNO was in favour of the "harmonised ICNIRP limits".

The same word, *harmonised*, comes back in a plea for "a harmonised EU approach to 5G security" that ETNO launched on 29 January 2020. "We therefore welcome today's publication of the "5G Security Toolbox", presented by EU Member States with ENISA and the European Commission. Europe's decision-making on 5G should continue being based on

facts, it should be proportionate to threats and build on a solid understanding of technology reality. In this context, we invite National Governments to avoid disproportionate actions that negatively impact the investment climate, and which could in turn harm both Europe's competitiveness and its strategic position in 5G development."

ETNO argues that rules and regulations should not hamper but support European investment and innovation, because "regulatory pressure still risks holding back European investment and innovation on many fronts"…"The speed of 5G rollout is significantly slowed by excessive spectrum prices and challenging license conditions."

ETNO continues to explain the policy-wish list: "The opportunity of fully unleashing fibre deployment awaits a pro-investment implementation of the European Electronic Communications Code. Regulatory asymmetries, especially in the field of data, still hold back European innovation. Market fragmentation still affects Europe's full potential in network investment. European institutions and national governments both have a major role to play in removing such barriers."

Yet again, ETNO does not lobby for lowering the ICNIRP standards, these are not seen as part of the "regulatory pressure" that hampers technological development. On the contrary: the norms ICNIRP proposes are the "harmonised limits" that ETNO welcomes.

All in all, the telecom-sector seems to be quite pleased with ICNIRP's positioning. This is deviating from the standard procedure in EU-policy making where a specific industry concerned will on essential aspects always try to influence laws and regulations in their favour through various ways of lobbying. Apparently in case of ICNIRP there is simply no need to do so.

The Telecom Lobby

In order to promote a continuation of favourable policy-making, European telecom companies have many lobby-meetings with the European Commission, and no doubt also at national political levels. According to the EU transparency Register, ETNO has a budget of over one million euros for lobbying and representing Europe's telecom companies. With at least seven registered lobbyists, ETNO had 70 registered lobby meetings with the European Commission (EC) in 2019. "ETNO's primary purpose is to develop top-level policy papers and support members in promoting a positive policy environment allowing the EU telecommunications sector to deliver best quality services to consumers and businesses. We also organize some of the main European events for discussing telecom and digital policy."

But of course, the individual telecom companies also have lobbying budgets and lobbyists representing them at the European institutions in Brussels. Ericsson had a lobby budget of 700.000 euros and five accredited lobbyist in 2019, Telefonica had a lobbying budget of 1,8 million euros and 6 lobbyists who covered no less than 83 meetings with the EC, Deutsche Telekom had a 1,5 million lobbying budget, with 5 lobbyists and a total of 110 lobby meetings with the EC.

In early December 2019, a large delegation of CEOs from ETNO met with Margrethe Vestager, Executive Vice-President of the European Commission responsible for "Europe fit for the Digital Age". The delegation included: Tim Hoettges from *Deutsche Telekom*,

Stephane Richard from *Orange*; Thomas Arnolder from *Telekom Austria*, Salvatore Rossi from *TIM*, Alexandre Fonseca from *Altice Portugal*, as well as the Chairman of ETNO, Steven Tas, the Director General of ETNO, Lise Fuhr, and senior representatives from *Telefonica* and *Telenor*.

At the end of January 2020, an important event was held, the European 5G conference. It welcomed more than 250 delegates, who discussed "the necessary next steps to ensure the success of 5G in Europe". Eric Van Rongen, at the time still ICNIRP-Chair, was among the speakers who provided "the audience with insightful views on their areas of expertise." The purpose, apparently, was not to discuss the sagacity and safety of rolling out 5G, but rather to ensure the success of 5G deployment.

It is important to note that the efforts of the telecom industry to influence regulatory agencies often take illegal forms. Telecommunications companies are high on the list of the companies that were penalised in the U.S. for corrupt practices. European companies like *Ericsson, Alstom* and *Telia* are in the top ten.

Also significant, is the fact that more and more world leading insurance companies are backtracking from insuring telecom companies concerning the risks around EMF. In March 2019, in its "SONAR Emerging risk insights" report, one of the world's largest insurance companies, *Swiss Reinsurance Company* (Swiss Re), classified "unforeseen consequences of electromagnetic fields" into the highest risk class, together with endocrine disrupting chemicals. "The ubiquity of electromagnetic fields (EMF) raises concerns about potential implications for human health, in particular with regard to the use of mobile phones, power lines or antennas for broadcasting. Over the last decade, the spread of wireless devices has accelerated enormously. The convergence of mobile phones with computer technology has led to the proliferation of new and emerging technologies. This development has increased exposure to electromagnetic fields, the health impacts of which remain unknown."

The lobby power of the telecom-industry in Brussels, the decision-making heart of the EU, is enormous. Yet the corporations involved do not have to lobby the guidelines and health advice related to their technology, because ICNIRP has been providing the "safety certification" for over 25 years. At the same time the insurance sector is not very assured and does not want to pay possible litigation costs once telecom companies would get sued, which is happening more and more frequently.

The call for more independent scientific assessment in this area

Almost ten years ago, in May 2011, the Council of Europe adopted a report from Mr Jean Huss on "The potential dangers of electromagnetic fields and their effect on the environment". It stated that the findings of scientific research on the possible risks of electromagnetic fields were inconclusive and contradictory. In the light of the correlation between origin of funding and the findings it called for "genuine independence on the part of the expert appraisal agencies and for independent, multidisciplinary and properly balanced expert input. There must no longer be situations where whistle blowers are discriminated against and renowned scientists with critical opinions are excluded when

experts are selected to sit on expert committees or no longer receive funding for their research."

In the meantime, not a lot seems to have changed. In a letter, published this year in *Bioelectromagnetics,* three researchers - Steven Weller , Victor Leach and Murray May - of the Australian "Oceania Radiofrequency Scientific Advisory Association" (ORSAA) write: "Half a century of scientific research into the safety of EMFs (from static to 300GHz) has not resulted in any substantial policy advice changes. The question that we believe needs to be asked is as follows: Is the continuing unchanged policy advice on EMFs occurring because those who are trying to advocate change have no voice in the process and because the process is dominated by groups with self-interests in maintaining the status quo?"

The three researchers point to the fact that radiofrequency electromagnetic radiation is "a booming multi-trillion-dollar industry globally, and changing current prescribed safety levels to more stringent standards would bring about unfavourable financial consequences and affect industrial and military functions. In some countries, such as Australia, the regulator, which has a health protection responsibility, also sells RF spectrum licenses, which represents a clear conflict of interest. The very same agencies with responsibility for providing safety advice to the public are also considered by some to have been captured by the industry."

The huge financial weight and power of the telecom companies is something the industry itself also stresses. In its report from January 2020, 'The State of Digital Communications 2020', ETNO boasts that "its Telecom members are thriving and business is booming: Telecom is Europe's major technology business, with a €136.9 billion per year value added and training on the rise. (…) Of the 17 Europe-based companies figured in the 2019 Forbes Digital 100 index, 11 are either telecoms operators or telecoms equipment vendors, and more than half of them are ETNO members."

Whether or not ICNIRP is 'captured by industry', a remarkable fact is that the organisation that appears to be the world's most important body responsible for advice on non-ionizing radiation is a private organisation, not a public authority.

"To me it seems wiser if the EU and national governments stop relying only on the advice of ICNIRP. A committee of its own is not an unnecessary luxury," Hans Kromhout writes. When we ask him if it would seem to him more logical that it be a public organisation giving advice on non-ionizing radiation, he answers: "I completely agree."

But this is not what is happening in the heart of the European Union. According to ICNIRP's website there is a contractual partnership between the European Commission, which is the Guardian of the Treaty, and thus also of the legally enshrined precautionary principle. It states: "The European Commission and ICNIRP collaboration over the years, relies on annual or specific contracts, such as the Concerted Action within FP5 - Life Quality, Key action Environment and Heath. ICNIRP also takes part, in consultation together with other stakeholders, on the development of directives and liaises, upon request, with different EC entities, such as the Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR). Support to ICNIRP is provided by the European Commission through its Directorate General Health and Safety at Work as part of an EC grant agreement, as laid down in the ICNIRP reports."

Given the experience with ICNIRP of the past 25 years, the growing body of evidence that there are serious concerns on adverse effects of EMF on public health and the huge economic interests involved, it seems not very wise for the European Commission and national governments to base their policies solely on the ICNIRP guidelines and advice.

Chris Portier agrees by saying that “governments have no say in the governance or membership of ICNIRP. In addition, without their own review committees, governments do not have their own experts to advise them about these topics. I believe it would be best if such an entity was run by a trusted organization that has some form of government oversight.”

Portiers adds in writing to us: “I have been in the position of managing, running, chairing and/or being a member of dozens of national and international committees. These were always government committees or WHO-related entities. When run properly, governments can get excellent advice on issues. There is usually a place for interested parties (industry, concerned citizens) to express their opinions to these committee members at public forums. And there are legal consequences to providing false information on Conflict of Interest forms, etc. All of these reasons lead one to believe a government managed Commission would be better.”

We think that the call for more independent scientific assessment in this area is, for all the arguments mentioned in the above, fully justified.

IV - Conclusion

ICNIRP presents itself, and is described by the European Commission and in the media, as an independent international commission that gives advice based on scientific evidence. We believe that there are various reasons to question this (self)-image.

The composition of ICNIRP is very one sided. With only one medically qualified person (but not an expert in wireless radiation) out of a total of 14 scientists in the ICNIRP Commission and also a small minority of members with medical qualifications in the Scientific Expert Group, we can safely say that ICNIRP has been, and is still, dominated by physical scientists. This may not be the wisest composition when your remit is to offer advice on human health and safety to governments around the world.

As one can read in the 45 portraits of the members of the ICNIRP commission and of the Scientific Expert Group (SEG), they all share the same position on the safety issues: non-ionising radiation poses no health threats and the only effects it has are thermal. ICNIRP says "non-ionising radiation poses no health threats if it does not heat the tissue by more than 1 °C", by which it admits that there are possible health effects, but only if exposure levels to strong radiation are too high".

Over the past years, and on many platforms, various EMF-experts have stated that ICNIRP is wrong to continue dismissing certain scientific studies showing adverse health effects – like the American NTP-study - and is mistaken in its almost dogmatic conviction that "non-ionising radiation poses no health threats and the only possible health effects it has are thermal in case of strong radiation".

Even after much criticism from members of the global scientific community, ICNIRP still adheres to the paradigm that the only proven effects (on health) are thermal. "ICNIRP appears to take into account only the warming of tissue and uncontrolled muscle contractions, although they claim in the most recent advice, that they also evaluated other mechanisms", writes Dutch Professor Hans Kromhout, who is currently leading a long-term study (in the Netherlands) into the effects of mobile phone use on human health, and who is chairman of a special committee on Electromagnetic Fields of the leading Dutch Health Council, which advises the Dutch government.

It seems that "a closed circle of like-minded scientists" has turned ICNIRP into a self-indulgent science club, with a lack of bio-medical expertise, as well as a lack of scientific expertise in specific risk assessments. Thereby, creating a situation which might easily lead to "tunnel-vision" in the organisation's scope. Two leading experts, Hans Kromhout and Chris Portier, confirmed to us that ICNIRP is a closed, non-accountable and one-sided organisation.

As many scientists and critical observers have pointed out, it seems that ICNIRP members are either oblivious to, or are ignoring, scientific studies that find possible adverse health effects in the absence of heating. Even though some ICNIRP-members have themselves acknowledged that industry-funded scientific research tends to produce less findings showing adverse health effects of EMF, whereas publicly funded studies – like the NTP-study – do find significant links between EMF and adverse health effects, this does not seem to influence one iota the views of ICNIRP-members.

The majority of ICNIRP-scientists have done, or are doing, research partly funded by industry. Is this important? As we argue in the introduction, we believe it is. Scientific publications, co-authored by two ICNIRP-scientists – Anke Huss and Martin Röösli, confirm the importance of funding. In 2006 and 2009 they did a systematic review of the effects of the source of funding in experimental studies of mobile phone use on health, and their conclusion was that, "industry-sponsored studies were least likely to report results suggesting (adverse health) effects". And theirs is not the only study that showed this, as there have been numerous studies of the differences in reporting from industry-funded research versus publicly-funded research that suggest a strong funding bias on the results.

In addition to the fact that certain members of ICNIRP, are simultaneously members of the International Committee on Electromagnetic Safety (ICES) of the US-registered Institute of Electrical and Electronics Engineers (IEEE), we have seen further evidence of a close cooperation between ICNIRP and ICES, an organisation in which many people from the media and telecom industries, as well as from the military, are actively and structurally involved. During the current leadership of ICNIRP, these ties have become even closer "with the goal of setting internationally harmonized safety limits for exposure to electromagnetic fields". This must surely be considered as a situation in which conflicts of interest are a real possibility.

It is clear from ICES minutes that ICNIRP worked very closely with IEEE/ICES on the creation of the new RF safety guidelines that were published in March 2020. And this implies that large telecom-companies such as Motorola and others, as well as US military, had a direct influence on the ICNIRP guidelines, which are still the basis for EU-policies in this domain.

Although there is a lot of lobby-power by the telecom sector in the European Union (both in Brussels and in the member states), the European Telecommunications Networks Operators' Association (ETNO) does not lobby for lowering the ICNIRP standards, as these are not seen as part of the "regulatory pressure" that hampers technological development. On the contrary: the norms ICNIRP proposes are the "harmonised limits" that ETNO welcomes. All in all, the telecom-sector seems to be quite pleased with ICNIRP's positioning. This deviates from the standard procedure in EU-policy making, where a specific industry concerned will, on essential aspects, always try to influence laws and regulations in its favour through various lobbying strategies. Apparently, in the case of ICNIRP, there is simply no need to do so. At the same time, the insurance sector does not, at present, seem very reassured and does not want to be put in a situation of having to pay potential litigation costs, if and when telecom companies get sued, something that is happening more and more often.

Despite ICNIRP positioning itself, during the last 25 years, as the sole purveyor of scientific truth when it comes to possible relation between EMF and adverse health effects, it would not be right to hold this scientific NGO solely accountable if, one day, it were to become undisputed that EMF do cause health problems. National governments, as well as the European Commission, which is, after all, the 'Guardian of the Treaty', have a duty of care and protection of their citizens, and therefore should also take the legally binding 'precautionary principle' into account.

We think that the call for more independent scientific assessment in this area is, for all the arguments mentioned above and in what follows, fully justified.

That is the most important conclusion of this report: for really independent scientific advice we cannot rely on ICNIRP. The European Commission and national governments, from countries like Germany, should stop funding ICNIRP. It is high time that the European Commission creates a new, public and fully independent advisory council on non-ionizing radiation. The funds currently allocated to ICNIRP could be used to set up this new organisation. And given the overall rise in R&D funding via Horizon Europe, with a foreseen budget (for 2021-2027) of between 75 and 100 billion euros, funding should in no way constitute an insurmountable hurdle to setting up this new, truly independent, body.

V - PORTRAITS OF THE ICNIRP-MEMBERS

ICNIRP COMMISSION:

Gunde Ziegelberger (Scientific Secretary)

Biography

On ICNIRP's website we read that Gunde Ziegelberger holds a PhD in Biology and after a career at the Max-Planck-Institute, she joined the Federal Office for Radiation Protection (BfS) in 2002, where she works on "Non-Ionizing Radiation". Since 2004 she also worked as Scientific Secretary for ICNIRP- she replaced Rüdiger Matthes, who became a commission member - and in that function, she is also a member of the ICNIRP Board together with the Chair (see Croft) and Vice Chair (see Van Rongen). ICNIRP's website clarifies: "The three Board members represents ICNIRP externally and mostly in its relations with the international and national partners and the press. The Scientific Secretariat is in charge with some specific scientific projects mostly related to workshops and with all administrative and operational tasks."

Position

In February 2019 Dr Ziegelberger gave a short interview in which she stated that when the limit values are respected so far scientific findings show that human beings don't run any risk from electromagnetic radiation.

Ziegelberger functions as Scientific Secretary of ICNIRP, she co-authors many scientific publications with ICNIRP-members. In September 2016 for example Ziegelberger was co-author of a publication 'A Closer Look at the Thresholds of Thermal Damage: Workshop Report by an ICNIRP Task Group'. The article concludes the workshop – co-organsied by the WHO and financed by the European Commission, the Turkish Ministry of Health, the International Radiation Protection Association (IRPA), the German Federal Ministry for the Environment (BMUB), and the Finnish Radiation and Nuclear Safety Authority (STUK). The conclusion shows that the workshop "will provide valuable input into the revision of the guidelines being formulated by ICNIRP for limiting human exposure to RF fields." It was also clear that only thermal (adverse) effects were discussed as was the case in the new ICNIRP guidelines from 2020.

She co-authored as BfS -researcher a study within the ARIMMORA risk assessment which concluded that "the relationship between exposure to the agent ELF-MF and risk of childhood leukaemia is considered consistent with "IARC Group 2B" classification of possibly carcinogenic to humans (Fig. 1). This category is the result of limited evidence of carcinogenicity in humans and inadequate evidence of carcinogenicity in experimental animals."

Possible conflicts of interest.

Although Ziegelberger plays an important role for ICNIRP, given her position in the board and the fact that she works in an important department for radiation protection (BfS) of the German government, we could not find any DOI.

Rodney Croft (chair as of May 2020)

Biography

Rodney Croft is a psychology researcher. He works as professor of Health Psychology at the School of Psychology, University of Wollongong, Australia.

He joined the ICNIRP Biology Standing Committee in 2008 and the Main Commission in 2012, to become chair in May 2020.

ICNIRP's website states that his research focuses on the delineation of human brain function, as well as psychiatry more generally. He participates in a variety of national and international scientific and government committees, was Executive Director of the Australian Centre for Radiofrequency Bioeffects Research ((ACRBR 2004-2011) and is currently Director of the Australian Centre for Electromagnetic Bioeffects Research.

In June 2011, Rodney Croft as Executive Director of ACRBR announced that the organisation would cease operations because "it had been unable to secure further funding to continue its research activities". But many of the ACRBR Directors would be able to continue their Rf research but under the banner of the Bioelectromagnetics Research Group, part of the Brain and Psychological Sciences Research Centre (BPsyC) at the Swinburne University of Technology, which has for many years very close ties to Telstra, Australia's biggest Telecom company.

In August 2012 Croft received new funding when Australian Minister for Health, Tanya Plibersek, announced the establishment of a new $2.5 million NHMRC Centre of Excellence: the Australian Centre for Electromagnetic Bioeffects Research (ACEBR) to be based at the University of Wollongong and led by Professor Croft. One of the central university partners of the ACEBR research Swinburne University.

Position

Croft is a typical ICNIRP member and has been defending for years and from different positions the point of view that there are no dangers associated with the use of mobile phones. On the ABC Lateline program (April 4, 2009) Dr. Rodney Croft, then Director of ACRBR, stated: "There really has been a lot of research done to date and the research has very clearly shown that there aren't any effects. With children, I really don't think there is any evidence suggesting that this might be a problem. There isn't anything to suggest that we may have to be a little bit more cautious."

Much earlier in 2003 the Australasian College of Nutritional and Environmental Medicine (ACNEM) published a paper by Don Maisch "that detailed reasons why extra precautions

needed to be taken for children and cell phone use. The paper included a number of statements of concern specific to this issue from scientific and medical organizations internationally and concluded with the question: “Is it worth the risk” to continue to allow unrestricted cell phone use by children.”

In 2008 the Russian National Committee on Non-Ionising Radiation Protection (RNCNIRP) issued official advice that the “health of the present generation of children and future generations is under danger” from cell phone use and therefore the committee has recommended that cell phone use be restricted for people under 18 years of age.

Croft said in 2011: “With children, I really don’t think there is any evidence suggesting that this might be a problem. There isn’t anything to suggest that we may have to be a little bit more cautious” And to visually back up ACRBR’s on children and cell phone use on the ACRBR web site published “an animated image that included images of children happily using cell phones”.

In 2009 a scientific review paper with Van Rongen and Croft as first and second authors respectively stated. “Subjective symptoms over a wide range, including headaches and migraine, fatigue, and skin itches, have been attributed to various RF sources both at home and at work. However, in provocation studies a causal relation between EMF exposure and symptoms has not been demonstrated, suggesting that psychological factors such as the conscious expectation of effect may play an important role in this condition.” The article mentions that “all authors are either current or former members of the Standing Committee on Biology of the ICNIRP” but does not mention anything on funding of the study.

During an International Workshop on RF Measurements, Research Studies & Standards Development in 2018 Croft downplays scientific research that shows effect from EMF by saying that “Counterbalancing is necessary to enable appropriate interpretation of data” and “Conclusions must be based on the scientific literature, not just a data set”.

In 2019, Croft and a researcher (expert in antipsychotics) were awarded 1.2 Million$ for a project entitled "Exposures of mobile phone radiofrequency electromagnetic energy in juveniles: effects on brain development and behaviours." Neither of the two researchers are experts in the area of brain development, developmental psychology or juvenile behaviour.

Within ICNIRP, Rodney Croft was the chair of the Project Group that was tasked with preparing the new ICNIRP Guidelines, published early 2020. According to critics, ICNIRP still dismisses completely: the existence and significance of non-thermal effects, existence of the risk of cancer in long term avid users of mobile phones, IARC’s classification of RF as a possible human carcinogen (the IARC monograph review of science was not included in list of science reviews used by ICNIRP in preparation of the new guidelines).

Possible conflicts of interest

Just like his predecessor Van Rongen, Rodney Croft provides unpaid services to the IEEE ICES SC/4 Standards committees, a US version of ICNIRP, with a broad number of representatives from both military and telecom industry; ICES boasted that they had “at least two members of ICES as members of the new 13 person ICNIRP Project Group (PG) on HF guidelines (up to 300 GHz), of which the PG Chairman (Croft), is now very willing to work with ICES to develop

science based safety standards. This will enhance the possibility of harmonizing international RF safety standards."

Croft also advises the EMF reference group, and a community group managed by the Australian Government organization, ARPANSA. He receives funding from the Electric Power Research Institute EPRI for a project investigating RF effects on EEG and thermoregulation.

To possibly answer this question a brief examination of ACEBR's Science & Wireless 2013 seminar "Health & Future RF Technologies" is an indication. In the seminar acknowledgements, the following was stated: "The ACEBR gratefully acknowledges the financial support of the National Health & Medical Research Council of Australia and Telstra Corporation, which has enabled SW2013 to run".

In Rodney Croft's introduction to the presentation by Mr. Mike Wood from the Australian Mobile Telecommunications Association (AMTA) on "4G telecommunications technologies", he said the following, in part: "Clearly what we see here is a whole lot of new technologies which are going to come about. How do we know what's going to be most relevant to us? Well, in the short term I think that our industry representatives are going to give the best indicator of this"

Croft was appointed in 2014 an Associate Editor of the BEMS journal of the Bioelectromagnetics Society (BEMS); The annual meetings of BEMS are a heavily industry sponsored event. The annual meeting celebrating the Bioelectromagnetics Society (BEMS) and the European Bioelectromagnetics Association (EBEA) was in 2015 in California (USA), had sponsors including companies such as, the Electric Power Research Institute (EPRI), Mobile Manufacturers Forum (MMF), Korean Institute of Electromagnetic Engineering Society (Mobile EMF Consortium) and, GSM-ATM5.

Croft also held talks and expert opinion on behalf of industry and for the Mobile Manufacturers Forum, a consortium of the world's major cell-phone companies. At a 5G Conference in Dubai In December 20, 2019, Croft held a lecture on behalf of ICNIRP alongside ICES Chairman Jafar Keshvari and TC95 Chairman C-K. Chou.

He joined the conference organized by the Telecommunication Regulatory Authority (TRA) of the United Arab Emirates held on December 8-9, 2019 in Dubai. Three presentations were on RF exposure safety limits: "5G RF safety concerns: New IEEE StdC95.1TM-2019" by C-K. Chou; "Scientific Basis of 5G Exposure Limits IEEE C95.1:2019 Standard" by Jafar Keshvari, and "Ensuring 5G Safety with the New ICNIRP Guidelines (100 kHz to 300 GHz)" by Rodney Croft of ICNIRP.

Croft has also actively collaborated in research with Ray McKenzie, who is a manager at the Mobile Carriers Forum (MCF) which is a special division of the Australian Mobile Telecommunications Association (AMTA) dealing with the policy, regulatory, public communications and health and safety aspects of the deployment of mobile networks in Australia.

On his website Croft's disclosure statement says: Rodney Croft has consulted to a range of organisations such as Shelharbour City Council, Department of Defence, Comcare and Optus. According to his ICNIRP declaration of interests he received personal remuneration for

providing data analysis services to Heptares Therapeutics Ltd, a pharmaceutical company. And Croft received personal remuneration for providing advice to Australian Bureau of Statistics (ABS) on effects of RF devices used by field staff on field staff, resulting from a contract between University of Wollongong and ABS. He also received personal remuneration for "providing advice to Victorian Government on conducting bioelectromagnetics research, resulting from a contract between University of Wollongong and Victorian Government".

As explained before in this report the Australian government receives billions from issuing spectrum licences to Telecom operators. In Australia, this licensing is carried out by industry regulator ACMA, the Australian Media Communications Authority. ACMA also collects a separate levy or tax from the wireless industry, money that is earmarked for scientific research on RF-EMR. ACMA then diverts $300,000 to the other government institution ARPANSA (Australian Radiation Protection & Nuclear Safety Agency) for its public information campaign) and $700,000 to the National Health & Medical Research Council (NHMRC).

According to the Australian research group ORSAA "the money that the Australian NHMRC receives in order to provide grants for medical research has mostly gone to industry-friendly researchers who have direct links with the wireless industry. For example, the largest recipient of this NHMRC research funds is Prof. Rodney Croft. He has essentially been the head of RF-EMR health research in Australia, despite his questionable qualifications for this health research role. Prof. Croft has received ample direct industry funding in addition to his lucrative NHMRC grants, which should be termed indirect industry funding." Croft was the only Australian who played a part in determining what NHMRC research on EMR and health should be funded.

He used his international contacts at the WHO to get more Australian funding. This is how it worked behind the scenes: Croft was invited from Australia to the WHO for an expert consultation to determine which areas of medical research was needed; The Australian NHMRC research on EMR then looked to the WHO guidelines (co-influenced by Croft and ICNIRP or hi-jacked as some critics say) in order to decide their funding priorities (the 2010 WHO RF Research Agenda is the basis of funding for NHMRC research grants). Croft's laboratory then received the funding and has continued to get most of the research money over many years.

Croft had good relations with an influential industry man, Dr K. Joyner. Which researchers or research groups have been granted the NHMRC funds has been influenced to a large extent by Joyner, who was Motorola's Director of "Global EME Strategy and Regulatory Affairs" and also represented the Australian Mobile Telecommunications Association, an industry group, on the telecommunications standards committee and the Mobile Manufacturers Forum ; Notwithstanding these ties Joyner was a longstanding member of the Standards Australia TE/7 Committee: Human Exposure to Electromagnetic Fields, and later on he was on the ARPANSA committee that set the current Australian Radiofrequency/Microwave human exposure standard. He was regarded by the cell phone companies as Australia's foremost authority on the industry's position on health issues with EMR and has represented Motorola and the Australian cell phone industry on several international standards-setting

bodies. Joyner also had connections with Burson Marsteller, the PR firm representing the cell phone industry in Australia.

In October 2003 Ken Joyner, the key Motorola representative gave a presentation at the Annual Conference of the Australian Radiation Protection Society called: “A Review of RF Bioeffects Studies Relevant to the Use of Mobile Phones by Children”. Don Maisch writes in an article Motorola’s Micky Mouse Review: “The Motorola review’s conclusions as to a lack of scientific evidence of possible harm to children using mobile phones ignores a large body of expert opinion calling for a precautionary approach when it comes to children and mobile phone use.”

As reported in Microwave News (1999) in Europe there was some discontent with scientists with Motorola’s involvement with the EC research and telling European scientists how to spend research funds. As Don Maisch writes in ‘Corporate ties that bind: An Examination of Corporate Manipulation and Vested Interest in Public Health’ (2017): “In January 2009, Dr. Joyner announced that he was leaving his Director position at Motorola after 12 years and was "looking for new opportunities to work in the telecommunications industry". In that same year, Dr. Joyner was listed on the NHMRC's Peer Review Honour Roll which acknowledged its many peer reviewers and external assessors who had exhibited "excellent track records and wide-ranging expertise in Australian and international health and medical research fields". However, under the section "Administering Institution/Employer" he was listed as simply "consultant" and nothing about possible conflicts of interests. He later was appointed as the sole non-radiation expert on the 14-member Victorian government's Health department's Radiation advisory committee.

ORSAA calls this “pure corruption at a huge cost to public health everywhere. This system of funding and promoting an in-club of industry friendly researchers has kept a small number of people in powerful positions within the WHO, ICNIRP, ARPANSA etc., influencing decision making for most of the world.”

Eric van Rongen (Vice Chair ICNIRP-commission, until May 2020 chair)

Biography

Eric Van Rongen is a biologist. He is a staff member of the Dutch Health Council since 1992, where he focuses on non-ionizing radiation.

Van Rongen is a member of ICNIRP since May 2001. In 2016, he became the chair of the ICNIRP-commission. Since the beginning May 2020 he is no longer chair but vice-chair.

He also a member of the International Advisory Committee WHO EMF Project since 1995.

Van Rongen did not publish original research studies on EMF himself, only opinions or review articles.

Position

Van Rongen systematically, in scientific publications and in press articles, defends for more than twenty years the point of view that there are no dangers associated with the use of mobile phones. According to him, even for children there are no reasons to apply the precautionary principle. In 2004 for example he published an article in which he stated: 'The Health Council therefore sees no reason to recommend limiting the use of mobile phones by children.'

He systematically criticizes all studies that seem to show that non-ionizing radiation poses a problem. Recently the National Toxicologic Program (NTP) study on Cell Phone Radio Frequency concluded that there was clear evidence of tumors in the hearts of male rats But in an ICNIRP-publication Van Rongen and others stated that 'substantial limitations (of the NTP-study) preclude conclusions being drawn concerning RF EMFs and carcinogenesis.'

Possible conflicts of interest

The WHO EMF project was severely criticized in 2007 for being for a large part financed by the telecom industry, for example by the Mobile Manufacturers Forum (now Mobile & Wireless Forum), a lobby organisation of the industry.

Since 2000 Van Rongen is a member of the International Committee on Electromagnetic Safety (ICES) of the IEEE. This committee is dominated by people from industry and military. The ICES chairman Jafar Keshvari works at Intel, the chairman of one of the main committees C.K Chou at Motorola. ICES clearly is an industry lobby and standard setting organisation. Maybe Van Rongen decided for that reason to become a 'non active member' according to his declaration of personal interests 2019.

In previous years there was some competition between ICNIRP and ICES/ IEEE – at the time when the chair of ICES was still Dr. Ralf Bodemann, topshot of Siemens and Dr. B Jon Klauenberg from US Air Force Research Laboratory was the chair of ICES working group TC95. (Klauenberg was the US counterpart of former ICNIRP-chair Repacholi to lead the very start of the WHO EMF in the 90'ies.) According to an annual report of ICES it was thanks to the arrival in 2016 of Van Rongen as chair of ICNIRP that the relations with ICES improved significantly, as they were not so cordial before: "In May 2016, there was a change of leadership and some members of ICNIRP. The new ICNIRP Chairman and one of the new members of the 14-member committee are also ICES members and ICNIRP is now willing to discuss harmonization of the exposure limits found in IEEE Stds C95.1 TM -2005 and C95.6 TM -2002 and the ICNIRP Guidelines."

The ICES annual report further mentions that thanks to the invitation to do so by Van Rongen, ICES has been able to comment on the proposed new guidelines by ICNIRP. ICES workgroup TC95 formed a 19-member task group to draft a document to comment on the ICNIRP proposed guidelines on time. "ICES will maintain its collaborative relationship with ICNIRP with the goal of setting internationally harmonized safety limits for exposure to electromagnetic fields at frequencies below 300 GHz. This interaction with ICNIRP is considered a major step forward."

A year later during the annual meeting of ICES in 2017 it was stated that “ICNIRP has delayed finalizing their conclusions to give full consideration of ICES’s recommendations”. And Van Rongen gave a presentation saying that there is “No evidence that HF-EMF causes such diseases as cancer, no evidence that HF-EMF impairs health beyond effects that are due to established mechanisms of interaction.”

Scientist Dariusz Leszczynski was a member of TC95, but resigned. He explained why on his blog: “My problem was that the membership of the IEEE-ICES-TC95 consists predominantly of the industrial scientists and the committee is chaired by C.K. Chou since the time he was employed by the Motorola. This means that all safety standards being developed by IEEE-ICES-TC95 are, in practice, developed by the industry scientists for the use by the industry they are employed by.” According to Leszczynski this is a clear conflict of interests.

The latest minutes of TC95 that ICES published on its website (August 2019) show that the committee is still dominated by industry scientists.

In October 2019 Van Rongen spoke at the GSMA Europe EMF Forum. The GSM Association is a lobby organisation that defends the interests of mobile operators worldwide. In 2018, he also was a guest at the Forum. Then he defended ideas that GSMA received with pleasure: "The ICNIRP limits provide a high level of protection for all people against known adverse health effects. Dr van Rongen explained that there is no scientifically substantiated evidence that radio signals cause diseases such as cancer and that ICNIRP had considered studies such as that of the American National Toxicology Program."

In November 2019 Van Rongen presented the “ICNIRP RF guidelines revision” at 23rd GLORE (Global Coordination of Research and Health Policy on RF Electromagnetic Fields) conference held on 4th – 6rth of November in Lima, Peru. GLORE is an initiative to coordinate research and policy initiated by Japan and Korea in 1997 and joined by Europe and then by USA, Australia and Canada. Main speakers were also his ICES-colleagues Jafar Keshvari and TC95 Chairman C-K. Chou.

Van Rongen recently assured the Dutch press that there are no conflicts of interest inside ICNIRP right now. He stated: 'In the past certain members maybe received co-funding from the private sector, but currently no member has ties with the telecom sector.'

Of course, it depends on what you consider as a 'tie with industry', but his own involvement in ICES is already shows that it is not true that 'currently no member had ties with the telecom sector'. He also published articles together with researchers who did receive industry funding, for example with Bernard Veyret, who is 'a member of the Scientific Council of the French mobile operator Bouygues Telecom. His laboratory has received research funds from the same operator.' This information can be found in the footnotes of this article.

Tania Cestari

Biography

Tania Cestari received her medical degree from the University of Rio Grande do Sul and completed her medical Residency in Dermatology in Porto Alegre, Brazil and since 1995 she works as Professor of Dermatology at the same university, where she studies predominantly on clinical aspects and skin response. Dr Cestari has authored 112 scientific peer-reviewed publications, 42 book chapters and joined the ICNIRP Commission in May 2020.

Position

Dr Cestari has been doing mainly research into skin allergies and dermatological problems; We could not find any publication linked to EMF.

Possible conflicts of interest

In her 'Declaration of Interests' it is mentioned that she received research grants via the Medical Foundation of her hospital from Pfizer, Abbvie Pharmaceutical and Vichy Laboratoires for drug research.

Nigel Cridland

Biography

Nigel Cridland is Senior Group Leader at Public Health England. He joined what was to become the Public Health England (PHE) already in 1990, where he specialised in non-ionising radiation. He was member of the project team that wrote the European Commission guide to implementation of the Artificial Optical Radiation Directive (2006) and leader of the project team that developed the guide to implementation of the EMF Directive (2013).

He was Scientific Co-ordinator Mobile Telecommunications and Health Research (MTHR) Programme 2001 - 2012. Cridland was a member of the Independent Expert Group on Mobile Phones (2000). On LinkedIn he states that he was also member of the management committee of the European COST 281 action Potential Health Implications from Mobile Communications Systems.

Position

The 2000-report of the Independent Expert Group on Mobile Phones stated that 'the balance of evidence to date suggests that exposures to RF radiation below NRPB and ICNIRP guidelines do not cause adverse health effects to the general population'. But at the same time, it said: "the gaps in knowledge are sufficient to justify a precautionary approach".

The MTHR-programme (2001-2012) of which he was the Scientific Co-ordinator concluded that no association between cancer and mobile phone use was found. We can now be, said

professor David Coggon, the chairman of the MTHR-programme, ‘be much more confident about the safety of modern telecommunications systems.’ Curiously enough the authors stated that: ‘We see no need for need for further research in any of the areas addressed by the research that is summarised in this report.’

Possible conflicts of interest

The MTHR-programme was funded by government and industry together, both for half of it. The final report states that to ensure that any of the funding organisation could not influence the outcome of the Programme an independent Programme Management Committee was set up. But there can be doubts about the independence of its members. From 2001 until 2007 Mike Repacholi (ICNIRP-founder, see the chapter on the history of ICNIRP) was for example member of the committee.

Guglielmo d'Inzeo

Biography

On ICNIRP’s website it reads that Guglielmo d'Inzeo is a Professor of "Bioelectromagnetic Interaction" at "La Sapienza" University of Rome since 1990. He researched active and passive microwave component design and bioelectromagnetism, mainly the interaction of electromagnetic fields with biological tissues, the effects of microwaves and ELF fields on biological samples and humans. He is author or co-author of more than seventy papers in international refereed journals and books.

He became a member of the European Bioelectromagnetics Association EBEA in 1989, and then President from 1993 to 1998. From 1992 to 2000 he was an Italian representative for the COST 244 and 244Bis projects on "Biomedical Effects of Electromagnetic Fields". From 1998 to 2004 he chaired the Italian ICEmB (Inter-University Centre Electromagnetic Fields and Biosystems). From 2001 to 2006 he was an Italian National representative in COST 281 project “Potential Health Effects from Emerging Wireless Communication Systems” and from 2007 in COST BM0704 related project.

Position

He has been active in the IEEE since the 80’ies, served as secretary–treasurer of ‘the IEEE Middle and South chapters’ and was from 2004 to 2009, also a member of the Technical Committee 95 (TC95) of IEEE International Committee on Electromagnetic Safety (ICES), of which Eric Van Rongen and Rodney Croft are also members. He published in the past 20 years a number of studies in IEEE Transactions on Biomedical Engineering and other IEEE publications, in which several times ICNIRP-founder Mike Repacholi was heartily thanked for his help.

In 2005 he was responsible for the Italian chapter of the report “European Information System on Electromagnetic Fields Exposure and Health Impacts” published on behalf of DG SANCO (European Commission), which was coordinated by the Joint research Centre (JRC of the EU); Alongside this project the “JRC developed during 2003-2004 the EIS-EMF project on behalf of DG SANCO with the overall objective of promoting cooperation among policy makers on public health and EMF risk communication issues in the EU”. What these projects basically reflect is the idea that concerns about possible health effect occur because people

do not understand the issue well enough and that the concerns can be taken away by better communication.

Possible conflicts of interest

As we stated before (see Van Rongen and Croft), ICES is dominated by people from industry and military.

His declaration of personal interest 2019 is signed but only partly completed. d'Inzeo did some paid consultancy for an Italian legal office called Trifirò & Partners and for a Environmental Measurement Report Managers & Partners - Actuarial Services S.p.A in Rome. His DOI from 2016 mentions that he has been doing work for the "Marconi Foundation". The Guglielmo Marconi Foundation states to "promote research in the field of telecommunications and carries out activities devoted to the knowledge and diffusion of Guglielmo Marconi's scientific activity". The Marconi Foundation further states that "professional training and teaching play a major role" in its activities and that "their research focuses on two major fields: 1) mobile and personal communication systems, with a special focus on radio access and propagation; and 2) the computer-assisted design of non-linear microwave devices".

What is not declared in his DOI is that d'Inzeo, is a director of the scientific committee of Elettra 2000, a consortium of Marconi and other foundations. The self-declared aim of Elettra 2000 is to "spread knowledge of Bioelectromagnetics and start a dialogue between science, politics, industry and citizens, involving young people and schools." And "Elettra 2000 promotes researches and studies related to specific areas of interest. In particular, the consortium co-finances a number of national and international projects devoted to the study of the effects of electromagnetic fields on human health, in order to provide an authoritative scientific answer, fair and independent to the problem."

Elettra 2000 provides "advice to enterprises" and "owns a modern fleet of instruments for measuring electromagnetic fields in both low and high frequency" which "are available to both institutional and private entities in order to promote the improvement of standards of protection and safety of people and environment."

This paper from 2008 (The Italian national electromagnetic field monitoring network) is an example of the kind of research projects that is financing. The conclusions reads: "The monitoring campaign, combined with the travelling communication campaign contributed to create a different and more constructive approach to the problem by the citizens. This is demonstrated by the analysis of the data press that shows criticality and greater negative involvement in those areas where the monitoring campaign has been less efficient or less intense".

Furthermore, in 2019 an Italian journalist of Investigative Europe wrote the following in *Il Fatto*: "He has done multiplied scientific opinions for companies such as Vodafone, participated in European projects - all funded by industry, such as Interphone, Cosmos, Cefalo, and since the late 90s participates in the Efhran portal, where among the financiers are Deutsche Telecom and the European Association of GSM producers."

Akimasa Hirata

Biography

Akimasa Hirata is professor of Electrical and Electronic Engineering at the Nagoya Institute of Technology and Director of Center of Biomedical Physics and Information Technology.

He also is an Administrative Committee Member and Subcommittee Chairperson (SC6 EMF Dosimetry Modelling) in IEEE International Committee on Electromagnetic Safety (ICES). The latest committee (also called TC95) is the one of which Eric Van Rongen and Rodney Croft were also members.

Position

In November 2019 TC95 once again came to conclusion that the IEEE standards are safe. The authors, among which Hirata, wrote:

"a) The weight-of-evidence provides no credible indication of adverse effects caused by chronic exposures below levels specified in IEEE Std C95.1TM-2019.

b) No biophysical mechanisms have been scientifically validated that would link chronic exposures below levels specified in IEEE Std C95.1TM-2019 to adverse health effects."

Possible conflicts of interest

As we stated before (see Van Rongen and Croft), ICES is dominated by people from industry and military.

Hirata conducted research published in *IEEE Transaction* in 2010 partly funded by KDDI Foundation. KDDI Corporation is a Japanese telecommunications operator.

But according to a recent publication Hirata himself judges that he has no conflicting interests.

Anke Huss

Biography

ICNIRP's website states that Anke Huss is an assistant professor at the Institute for Risk Assessment Sciences (IRAS) at Utrecht University, the Netherlands. "Her research focuses on environmental and occupational exposure assessment to environmental factors including electromagnetic fields and their health".

Huss is also involved in the GERoNiMO project, cancer and neurodegenerative diseases such as Parkinson's disease, Alzheimer's or ALS in the NOCCA (Nordic Occupational Cancer Study) and SNC (Swiss National Cohort) studies and on electromagnetic hypersensitivity. She is a

member of the Dutch Health council, and the Scientific Council for Electromagnetic fields of the Swedish Radiation Safety Authority (SSM).

Position

She is one of the rare members of ICNIRP who seems to be aware of an industry-bias; In the book "Overpowered: The Dangers of Electromagnetic Radiation (EMF) and What You Can do about it" by Martin Blank, Anke Huss is quoted on Industry bias in research to the possible health risks of EMF.

In a scientific paper Huss writes that 82% of the research funded by public agencies or governments and 71% of the research jointly funded by industry and public sources, report health effects from RF exposure. When the research is solely funded by industry only 33% finds such a link.

Later Huss published another study in which she and colleagues examined whether the source of funding of 59 studies of the effects of low-level RF radiation has an effect on the results of studies. "Of these 59 studies, 12 (20%) were funded exclusively by the telecommunications industry, 11 (19%) were funded by public agencies or charities, 14 (24%) had mixed funding (including industry), and in 22 (37%) the source of funding was not reported." Huss et all conclude that "there is widespread concern regarding the possible health effects associated with the use of cellular phones, mobile telephone base stations, or broadcasting transmitters. Most (68%) of the studies assessed here reported biologic effects. At present, it is unclear whether these biologic effects translate into relevant health hazards. Reports from national and international bodies have recently concluded that further research efforts are needed, and dedicated research programs have been set up in the United States, Germany, Denmark, Hungary, Switzerland, and Japan. Our study indicates that the interpretation of the results from existing and future studies of the health effects of radiofrequency radiation should take sponsorship into account."

In 2010, she published a follow up study which confirmed the previous findings: "Of 75 additional studies 12% were industry-funded, 44% had public and 19% mixed funding; funding was unclear in 25%. Previous findings were confirmed: industry-sponsored studies were least likely to report results suggesting effects.

She also published in 2018 a meta-analysis based on among others epidemiologic studies "to examine associations of occupational exposure to extremely-low frequency magnetic fields (ELF-MF)" with amyotrophic lateral sclerosis (ALS).

Possible conflicts of Interests

Her DOI says she gets funding from US based EPRI for a study called TransExpo on leukaemia in children. Ironically, she states that the contract does not mention complete independence from the funder, but she explains clearly why the data will be analysed independently and "that there is no way that the funders can have an influence on what we report to them."

Ken Karipidis

Biography

Ken Karipidis has been working as a scientist at the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) since 2000. He is, states ICNIRP, 'currently the assistant director of the Assessment and Advice Section at ARPANSA where he is heavily involved in the scientific and regulatory aspects of radiation protection from electromagnetic radiation sources.'

He is member of the Scientific Expert Group since August 2015. In May 2020, he became member of the ICNIRP Commission.

Position

In 2017 Karipidis published an article with the conclusion that the exposure to radiofrequency radiation due to Wi-Fi in schools was very low. In a letter to the editor three scientists criticized the study as 'of little practical use' and 'misleading'.

Karapidis and Rodney Croft were part of a subcommittee established by ARPANSA to look at EHS and the research in 2016/17. According to an ORSAA member present in these meetings both Karipidis and Croft ignored clinical/medical evidence "in favour of poorly conducted provocation studies performed by psychologists, some of whom were funded by industry".

At the end of 2018 Karipidis together with among others Rodney Croft published a study that claimed to proof that in Australia there has been no increase in any brain tumour that can be attributed to mobile phones. That study received a lot of criticism because it excluded the group of people above sixty, which is the largest segment of the population with brain tumours.

In August 2019 Karipidis advised 40,000 Australian doctors or general practitioners via an article on the website of Royal Australian College of General Practitioners (RACGP) in which he wanted "GPs and their patients to know there is no evidence to support the concern that 5G technology, which uses radio waves and emits low-level radiofrequency (RF) electromagnetic energy (EME), will cause harms to the public". He stated: "There's been a lot of research into whether radio waves cause adverse health effects, and the only established health effects of radio waves are very high-power levels, where they raise temperature. An everyday example of that is your microwave oven at home; inside the microwave is very powerful radio waves which make the water molecules in the food bounce very fast, heating them up."

Possible conflicts of interest

In the introductory chapter, we wrote about the financial relationship between ARPANSA and the telecom industry. ARPANSA every year has a meeting with the Australian Telecommunications Association (AMTA), a lobby-organisation of the telecom industry. Minutes of this meeting made public after a Freedom of Information Request show that the funding of research was also on the agenda. 'Industry remains supportive of continued funding,' it says.

Carmela Marino

Biography

Carmela Marino studied Biological sciences in Faculty of Sciences of "La Sapienza" University of Rome. According to ICNIRP she is currently Head of the Unit of Radiation Biology and Human Health, at Casaccia Research Center of Italian Agency for New Technologies, Energy and Sustainable Economic Development (ENEA).

On behalf of ENEA she coordinated the research activity Subprogram 3 *Interaction between sources and biosystems* (MURST/ENEA-CNR Italian National Program *"Human and Environmental Protection from Electromagnetic Emissions")* and was involved in *several projects of the 5° and 6°FP, as member of steering Committee and Coordinator of research unit.*

Position

On the one hand Marino seems to agree with the official ICNIRP position; On the other hand In May 2012, during ICNIRP's 7th International NIR Workshop in Edinburgh, Marino held a lecture on the advantages, challenges and limits of experimental studies, in which she said that there is a "large number of studies but with controversial results and also a limited number of studies in relation to particular endpoints." Marino asked her fellow ICNIRP members the rhetorical question, whether these studies "really able to give conclusive information?" ICNIRP's answer to that question was and is no.

Possible conflicts of interest

Her Declaration of Personal Interests does not mention anything. Notaby, not that since April 2020 her university holds a patent based on her research, not mentioned in her DOI 2019, although the worldwide application for this patent was filed years ago.

Sharon Miller

Biography

Sharon Miller works at the Food and Drug Administration (FDA) as optical engineer since 1981. According to ICNIRP she served on numerous committees of the International Commission on Illumination (CIE) and the International Organisation for Standardization (ISO).

Position

Miller publications are mainly in the field of ultraviolet radiation and optical issues. It is difficult to find scientific publications or public statements in which she says anything about the safety of non-ionizing radiation.

Possible conflicts of interest

In her Declaration of Personal Interest Miller does not state any possible conflict of interest and we did not find any.

Gunnhild Oftedal

Biography

Gunnhild Oftedal is associate professor at the Norwegian University of Science and Technology (NTNU). According to ICNIRP she is currently, working as Research Co-ordinator at the Faculty of Information Technology and Electrical Engineering, NTNU. "From the early 1990s, she has been involved in research on health effects of EMF in the ELF and the RF ranges, mainly with experimental human studies and observational studies.

She is member of international organisations in the field of non-ionising radiation and participates in the work of WHO (Environmental Health Criteria project) on the health risk assessment on RF fields."

She was one of the experts on a government-commissioned study, published in 2012, of possible health risks with radiation from mobile phones, base stations and wireless networks in Norway.

Position

In 2004 she answered on the questions if electromagnetic radiation from mobile phones may well affect us in other ways, too "that scientists are skating on thin ice when discussing these issues. They know little about the cause-and-effect mechanisms involved, and hence cannot eliminate the possibility that the effect of electromagnetic fields, however weak in mobile phones, may cause health problems".

But she sticks with the official ICNIRP position and in a study for the Norwegian government she suggests that this approach is the right one: "Only effects for which there was reliable scientific evidence were used (by ICNIRP) as the basis for the exposure restrictions."

In another recent study she concludes that "overall, the evidence points towards no effect of exposure. If physical effects exist, previous findings suggest that they must be very weak or affect only few individuals with IEI-EMF. Given the evidence that the nocebo effect or medical/mental disorders may explain the symptoms in many individuals with IEI-EMF, additional research is required to identify the various factors that may be important for developing IEI-EMF and for provoking the symptoms."

As writes Leszczynski the 'nocebo' hypothesis argues that people first become aware, e.g. from news and social media, of the possible health risks of EMF-emitting devices and then worries about the possible health risk lead to develop symptoms, which they attribute to EMF exposures.

Oftedal denies in an article by IE that the health debate is polarised: "In our field it is easy to put people in two camps, but the landscape is much more nuanced". Also, the closed culture

at ICNIRP is being denied: “People who demonstrate that they are skilled are asked to contribute.”

Possible conflicts of interest

In the study on “Mobile phone headache: a double blind, sham-controlled provocation study” co-financed by The Research Council of Norway, Norwegian Post and Telecommunication Authority, Statnett, Telenor, Norsk tele- og informasjonsbrukerforening (NORTIB), Netcom. The study found no effects.

She is member of Bioelectromagnetics society (BEMS) according to the DOI and also of the European Bioelectromagnetics Association (EBEA)

Tsutomu Okuno

Biography

Tsutomu Okuno worked for the National Institute of Occupational Safety and Health, Japan from 1980 to 2015.

He became a member of the Scientific Expert Group in 2013 and is a member of the ICNIRP Commission since 2016.

Position

Okuno was one of the authors of the ICNIRP note that criticized the NTP-study that showed carcinogenicity in rats. For the rest, his work seems mainly to be on ultraviolet radiation, not on radiofrequency radiation.

Possible conflicts of interest

In his Declaration of Personal Interest there do not seem to be sources of possible conflicts of interest and we did not find information that contradicts this.

Martin Röösli

Martin Röösli is Professor for environmental epidemiology at the Swiss Tropical- and Public Health Institute in Basel and leads the Environmental Exposures and Health Unit. His background is situated in atmospheric physics and environmental epidemiology.

In the field of non-ionizing radiation Röösli did several exposure assessments and epidemiological studies on the health effects of electromagnetic fields “including population based studies dealing with cancer, neurodegenerative diseases and non-specific symptoms of ill health”.

He is the chair of BERENIS, a Swiss expert group advising the government on electromagnetic fields and non-ionising radiation. He is a member of the advisory group of Cohort Study of Mobile Phone Use and Health (COSMOS) and between 2015 and 2018 of the the Scientific

Council of the IARC, specifically SC52. Since 2013 he is also a Member of the Editorial Board of Bioelectromagnetics.

He is still a member of the Expert Group for the Swedish Radiation Safety Authority (SSM), for which he gets 3000 Swiss francs yearly.

Relevant to this report Röösli was part of the Working Group of the IARC Monographs on the Evaluation of Carcinogenic Risks to Humans Volume 102: Non-Ionizing Radiation, Part II: Radiofrequency Electromagnetic Fields.

Position

Röösli has contributed to a study (see portrait of Anke Huss) which show that the funding of scientific research into EMF can influence the findings. Nevertheless, he confirms the general position of ICNIRP that no adverse health effects are proven.

In a study from 2010 ("Systematic review on the health effects of exposure to radiofrequency electromagnetic fields from mobile phone base stations") Röösli concludes: "Our review does not indicate an association between any health outcome and radiofrequency electromagnetic field exposure from MPBSs at levels typically encountered in people's everyday environment."

In a recent 5G report for the Swiss government Röösli et all conclude that "No health effect has been consistently proven," which he repeated in an interview.

In an annual report prepared for the Swedish Radiation Safety Authority (April 2020) by a nine-member panel of experts of which, ICNIRP vice-chair Eric Van Rongen and Röösli, which according to *MicroWave News* is published each year "as an annual update with the past year's most important scientific developments on the health effects of EMFs and RF radiation" states very bluntly that "no new established causal relationships between EMF exposure and health risks have been identified." The annual report simply does not mention the NTP report. "The two ICNIRP members and their seven colleagues made believe that the NTP report does not exist. It's not mentioned, there is no citation. Nothing at all. For the record, the NTP final report was released on November 1, 2018."

Louis Slesin of *MicroWave News* wrote: "There is a discussion of the NTP findings in last year's Swedish update. But that was based on an earlier NTP draft where the staff had opted for a weaker designation, "some evidence" of cancer. Later, after an in-depth public peer review, the NTP strengthened the conclusion to "clear evidence" of cancer. That was the headline news of 2018. "Clear evidence" was a game changer; leaving it out of the annual update is a sure sign of bias. The NTP conclusion was now qualitatively different from the earlier draft —it could well have been the title of the panel's 2018 update. But van Rongen, Röösli and the others ignored it."

On January 7, 2020 prof. Lennart Hardell and supported by 22 scientists researching EMF wrote a remarkably critical, open letter to Mrs. Simonetta Sommaruga, President of the Swiss Confederation, in which they conclude: "It is imperative that the chair and other experts evaluating scientific evidence and assessing health risks from RF radiation do not have such clear conflicts of interests or bias as Martin Röösli has. Indeed, being a member of ICNIRP and being funded by industry directly or through an industry funded foundation, constitutes clear conflicts of interest. Furthermore, it is recommended that the

interpretation of results from studies of health effects of radiofrequency radiation should take sponsorship from telecom industry into account."

The group of scientists also point out to a strange contradiction in the positioning of Röösli: "Surprisingly the IARC classification from 2011 of RF-EMF exposure as class 2B, 'possibly' carcinogenic to humans, was ignored in the background material to the new ICNIRP draft on guidelines. Remarkably one of the ICNIRP commission members, Martin Röösli, was also one of the IARC experts evaluating the scientific RF carcinogenicity in May 2011. Röösli did not abstain from the IARC Group 2B classification and should be well aware of that decision, but seems now to neglect that fact being an ICNIRP member. That may be due to the fact that the IARC classification contradicts the scientific basis for the ICNIRP guidelines."

Hardell et al. suggest to the Swiss government that Mr. Martin Röösli should be released from his duties as a scientist who is not objective and has substantial conflicts of interest. On the letter Röösli reacted by saying: "It's not a scientific letter. It sounds like activists who do not use scientific facts but who just attack people. It would be much more compelling if Lennart responded to my criticism of him in a scientific way instead of derailing the debate".

A recent publication of the COSMOS (October 2019) on the outcomes states reassuringly that "using mobile phones most extensively for making or receiving calls at baseline reported weekly headaches slightly more frequently at follow-up than other users, but this finding largely disappeared after adjustment for confounders and was not related to call-time in GSM with higher RF-EMF exposure. (See also the portrait of Anissi Auvinen)

Possible conflicts of interests

Röösli does "unpaid work" for the COSMOS study, which received considerable funding from telecom companies. In the 2019-publication on this study for example, Nokia and mobile network providers TeliaSonera and Elisa are mentioned in the category 'funding'.

According to his DOI he gets 70,000 Swiss francs a year for the Berenis work, from the Federal Office for the Environment.

He also received 16,000 francs for assisting in the Working Group Mobile Phone and Radiation the Federal Office for the Environment of the Swiss government.

The Swiss Tropical and Public Health Institute in which he plays a leading role, has a lot of corporate clients of which Swisscom, the biggest telecom company in Switzerland, of which the Swiss government holds 51% of the shares. In the annual Report 2019 the institute states that of the total budget of roughly 90 million Swiss francs, 78. 6 % was "competitively acquired" and 21.4 % came from "Core contributions".

Studies selected or self-directed by Röösli, were directly funded by the (Research Foundation for Electricity and Mobile Communication)

of which Martin Röösli is a member since 2011, according to his CV on the website of the Swiss Tropical and Public Health Institute. FSM is "a non-profit-making foundation with the purpose of promoting scientific research into the chances and risks of radio and electric power technologies that produce and use electromagnetic fields". The five founders of the FSM are:

ETH Zurich, Swisscom, Salt, Sunrise, 3G Mobile (liquidated in 2011) and the current main sponsors are Swisscom and Swissgrid. The sponsors are also represented in the FSM Foundation Board with one delegate out of seven.

Soichi Watanabe

Biography

Watanabe is currently Director of the Electromagnetic Compatibility Laboratory of the "National Institute of Information and Communications Technology (NICT).

He was a member of ICNIRP Standing Committee III since 2004 and is a member of the Commission since 2012.

He is a guest lecturer of several universities and at the Central Research Institute of Electric Power Industry.

Position

All publications to which Watanabe contributed as author point in the same direction: no effect. For example, this article about tumorgenenis in rats.

In 2019, he was co-author of an article which stated: 'To date, no adverse health effects of the EMF, linked to these applications, have been established.'

Possible conflicts of interest

As a guest lecturer at the Central Research Institute of Electric Power Industry he receives a small amount (about € 450 for each lecture, 1 or 2 a year).

He was co-author of the article with commission-member Hirata on the research funded partly by KDDI Foundation.

MEMBERS WHO HAVE LEFT THE ICNIRP COMMISSION IN MAY 2020

Maria Feychting

Biography

Maria Feychting is a Professor of Epidemiology at the Institute of Environmental Medicine, Karolinska Institutet, Stockholm, Sweden.

She joined the Commission in 2008 and was elected vice chair in 2012. She left the Commission in May 2020.

Position

Feychting was in charge of the Swedish part of the Interphone study which concluded that there was no link between brain tumours and mobile phone use.

Feychting also conducted the Swedish part of the COSMOS-study, which in 2011 came to the conclusion that there was no increase in glioma in the Nordic countries that could be attributed to the use of mobile phones.

She recently repeated this point of view in the media in an article on the risks of 5G, which were none according to her.

According to this source she criticized the NTP-study on false grounds.

Possible conflicts of interest.

In a 2019 study in the context of COSMOS, she declared a declaration of interest as "vice chairman of the ICNIRP".

The telecom industry contributed € 5.5 billion to the funding (total € 19.2 billion) of the Interphone Study.

A 2016 publication on the Interphone Study once again mentioned industry funding by among other the Mobile Manufacturers Forum.

The Swedish part of the COSMOS-study was partly funded by the telecom industry: TeliaSonera, Telenor and Ericsson. In her Declaration of Interests for 2015 she declares that her Institute received a grant from industry sources which constituted "no more than 4% of her unit of epidemiology total income."

A 2011 study was partly funded by the Swiss Research Foundation on Mobile Communication, an organisation which is founded and funded by the telecom industry.

A 2012 study was funded by the Electric Power Research Institute (EPRI), an organisation funded by industry.

She did not mention these sources of funding in her Declarations of Personal Interest.

Adèle Green

Biography

Green is an Australian epidemiological scientist at the Queensland Institute of Medical Research, Australia and is the institute's Head of Cancer and Population Studies Group. She specialised in UV and skin cancer causation, harmful effects of UVR exposure in childhood and the prevention of melanoma. Apart from various Australian research bodies, she was also member of many committees at the International Agency for Research on Cancer (IARC) and contributed to the IARC monograph that led to classification in

Position

Although she focussed mostly on UV radiation, Green seemed to agree with her ICNIRP colleagues on the ICNIRP position, for example in this study from 2005 where Green was first author the research did not find any consistent or biologically relevant effect of specific radiation on cells. And another study from 2009 Epidemiologic Evidence on Mobile Phones and Tumor Risk, concludes by saying that "In the last few years, the epidemiologic evidence on mobile phone use and risk of brain and other tumors of the head has grown considerably. In our opinion, overall the studies published to date do not demonstrate a raised risk within approximately 10 years of use for any tumor of the brain or any other head tumor." And despite certain methodologic shortcomings and limited data on long-term use, "the available data do not suggest a causal association between mobile phone use and fast-growing tumors such as malignant glioma in adults, at least those tumors with short induction periods."

Conflicts of Interests

The declarations of interests of Dr Green have disappeared from the ICNIRP's website. The IARC Monograph mentions that Dr Green received "research funds (not exceeding 5% of total research support) from L'Oréal which makes products intended to reduce the dose from solar radiation."

Zenon Sienkiewicz

Biography

Sienkiewicz worked until his retirement in 2018 for Public Health England. There he led a research group that investigates the effects of ionizing and non-ionizing radiation. Since 2011 he has been a member of ICNIRP. He was also external expert for the Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR) report on 'Potential health effects of exposure to electromagnetic fields (EMF)', adopted in January 2015.

Position

Sienkiewicz systematically defends the position that there is no proof for any harm caused by non-ionizing radiation. In 2002, he said in the media: "The bottom line is there are no known mechanisms by which mobile phone radiation can increase the risk of cancer." Fifteen years later he still holds exactly the same position. In a 2017-article he stated that all the extensive research done has 'not identified any public health risks with any degree of certainty.' Moreover, it concluded that 'animal studies investigating the carcinogenic potential of exposure to multiple RF frequencies should not be given a high priority for research at this time.'

Possible conflicts of interest

A remarkable fact in his latest Declaration of Personal Interests is that he has shares in telecommunications multinational BT Group, one of the largest telecommunications companies in the world from 2003 to the present day. The gain is very little: about 100

pounds a year. But still: if you want to avoid the impression of conflicts of interest buying shares in a telecom company doesn't seem to be a wise decision.

He himself acknowledges this is a potential conflict of interest. Under an article published in 2017 the 'Statement on the Conflict of Interest' is: The authors declare that this work was conducted in the absence of any commercial or financial relationships that could be constructed as a potential conflict of interest, *except Sienkiewicz declares that he has owned 440 ordinary shares in BT Group, a communication services company.'*

In his 2015 Declarations of Interests he declares to have done since 2012 "Provision of research and scientific advice to UK government and other stakeholders". It is not specified who those other stakeholders were, but it can be assumed those were not civil society groups.

Also since 2009, he has been a consultant to the Rapid Response Group at the Japan EMF Information Center, which is funded by "Japan Electrical Safety & Environment Technology Laboratories, where he conducts reviews and analyses of recently published scientific studies

He was between 2001 and 2012 member of the Mobile Telecommunications Health Research (MTHR)-programme. The programme did not find any association between exposure to mobile telephone communication and an increased risk of developing cancer. In the final report of the programme we read that that the core funding was provided in approximately equal share by government and industry. He systematically defends the point of view that there are no health risks associated with non-ionizing radiation. He was co-author of the 2019 article which criticized the NTP-study.

SCIENTIFIC EXPERT GROUP

Jacques Abramowicz

Biography

Jacques Abramowicz is Professor of Obstetrics and Gynecology and the Director of the Ultrasound Services at the University of Chicago.

He is a member of the Scientific Expert Group since May 2016.

Position

Abramowicz is, says his personal page at Chicago University, "an expert in the use of ultrasound for prenatal diagnosis of foetal anomalies and screening for early detection of ovarian cancer."

As far as we could find out, he did not perform research into the health effects of mobile phone radiation.

Possible Conflicts of Interest

In his declaration of personal interests Abramowicz doesn't mention possible conflicts of interest and we did not find information that contradicts this.

Anssi Auvinen

Biography

Auvinen is currently a professor of Epidemiology at the School of Health Sciences, University of Tampere in Finland. He is a member of ICNIRP's Scientific Expert Group since 2013. He was also external expert for the Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR) report on 'Potential health effects of exposure to electromagnetic fields (EMF)', adopted in January 2015.

Position

In harmony with all ICNIRP-members Auvinen criticizes research that seems to show an association between health problems and mobile phone use. Although there have been individual reports of associations between MP-use and tumours, this research is not consistent and on balance does not provide evidence of an association,' he and his co-authors wrote in 2008. His own research systematically shows no association between health problems and non-ionizing radiation.

Auvinen participated in the Finish Cohort Study of Mobile Phone Use and Health (COSMOS). A recent publication (October 2019) on the outcomes states reassuringly that "using mobile phones most extensively for making or receiving calls at baseline reported weekly headaches slightly more frequently at follow-up than other users, but this finding largely disappeared after adjustment for confounders and was not related to call-time in GSM with higher RF-EMF exposure. Tinnitus and hearing loss were not associated with amount of call-time." In another publication on the COSMOS-outcomes (April 2020) an association between sleep quality and mobile phone use is also not found.

Possible conflicts of interest

In his Declaration of Interests he submitted to ICNIRP he states that he in 2014 and 2015 received research € 100,000 funding from the Mobile Manufacturers Forum, an international organization founded in 1998 by leading manufacturers of mobile phones and radio equipment, such as Alcatel, Ericsson, Mitsubishi Electric, Motorola, Nokia, Panasonic, Philips, Sagem, Samsung, Siemens and Sony Ericsson.

The funding was for the COSMOS-study. In the 2019-publication on this study Nokia and mobile network providers TeliaSonera and Elisa are mentioned in the category 'funding'.

Another recent article states that Auvinen received 'consulting fees from Epid Research Inc.' According to his Declaration of Interest he received a fee of € 1000 in 2015 and 2017. Not in

his declaration of interest is that he received lecture fees from pharmaceutical companies Glaxo Smith Kline and MSD. Maybe one can argue that these companies do not operate in the field of non-ionizing radiation. But to avoid conflicts of interests it seems wise to be transparent about all fees and funding received from industry.

Christian Cajochen

Biography

ICNIRP's website states that Cajochen studied natural sciences followed by a 3-y postdoctoral stay at the Harvard Medical School in Boston, USA. He leads the Centre for Chronobiology at the University of Basel and focusses on the influence of light on human cognition, circadian rhythms and sleep, circadian related disturbances in psychiatric disorders, and age-related changes in the circadian regulation of sleep and neurobehavioral performance.

He serves as associate editor for established sleep-related scientific journals and is editor in chief for "Clocks&Sleep".

He started as a member of the Scientific Expert Group (SEG) in May 2018.

Position

As stated Cajochen focusses on the influence of lights and far as we could find out, he did not perform research into the health effects of mobile phone radiation.

Possible conflicts of interest

In his DOI it is stated that he studies the "effects of day LED on human performance, melatonin and sleep. Research studies in healthy human volunteers partially sponsored by Toshiba Materials." In the period from 2014-2018 that accounts for 120.000 (we assume euro), whereby Toshiba has the right "to request (i) revisions to the publication, so that no Confidential Information is inadvertently disclosed or a delay of not more than 60 days to allow for protection of any potentially patentable subject matter by filing of a patent application."

Toshiba does not focus on telecommunications, but rather on mainly infrastructure energy and Electronic Devices.

Jose Gomez-Tames

Biography

Gomez-Tames is Research Associate Professor in Nagoya Institute of Technology.

He is also Working Group Chair of the Subcommittee on EMF Dosimetry Modelling of the IEEE International Committee on Electromagnetic Safety from 2017.

Gomez-Tames is member of the Scientific Expert Group since 2018.

Position

Gomez-Tames work is more on the modelling of non-ionizing radiation than on the health effects.

Possible conflicts of interest

See Van Rongen and others on the role of IEEE/ICES.

In his Declaration of Personal Interest Gomez-Tames doesn't mention other sources of possible conflicts of interest and we did not find information that contradicts this.

Penny Gowland

Penny Gowland worked at the University of Nottingham School of Physics and Astronomy until 2016 and is now retired. She did a PhD in Magnetic Resonance Imaging from the Institute of Cancer Research in 1990.

According to ICNIRP's website "her work at high field and on foetal development as led her to take a strong interest in the interactions of EMF with the human body, and safety aspects of MRI."

Penny Gowland is a member of the ICNIRP Scientific Expert Group (SEG) since March 2013.

Position

She declared in her DOI that her "research interests are in MRI: but I am also academically and professionally interested in any biological effects of EMFs."

As stated Gowland focussed mainly on MRI and far as we could find out, she did not perform research into the health effects of mobile phone radiation.

Possible conflicts of interest

According to the organisation AVAATE her previous Declaration of Interests, she reported that she has held many research contracts with Phillips Electronics but without any money involved. Gowland has been part of the MR safety working group of British Institute of Radiology. According to the British Institute of Radiology website, Phillips and Siemens are platinum sponsors.

In 2015 AVAATE also stated that the European Society for Magnetic Resonance in Medicine and Biology (ESMRMB), organization mentions that Gowland was a member of several committees, including the Committee on Security, and has received financial support from companies like Hitachi, Philips, Siemens, Toshiba and General Electric.

John Hanifin

Biography

John Hanifin is laboratory director of the Light Research Program at Thomas Jefferson University.

He is a member of the Scientific Expert Group since May 2018.

Position

Hanifin is specialized in the effects of light. A recent publication he contributed to is for example is about the effect on nurse and patient experience of the overnight use of blue depleted illumination. He did not conduct research on the health effects of mobile communications technologies.

Possible conflicts of interest

The Light Research Program received industry support from among others OSRAM, Philips Lighting and Panasonic.

His PhD-thesis (2015) was also party funded by industry, by Philips Lighting, Apollo Lighting and OSRAM.

Hanifin's Declaration of Personal Interest shows that his laboratory earns about 5% of its yearly income by conducting clinical research for Bios Lighting. It mentions that his laboratory is obliged to submit a manuscript to the sponsor before publication for review and comment, 'however Sponsor shall not exercise editorial control over the publication'. The fact that the sponsor can review and comment the manuscript does not seem to be a strong guarantee of independence.

Jukka Juutilainen

Biography

He is a retired professor emeritus of Radiation Biology and Radiation Epidemiology, and Department Head of the Department of Environmental Science at the University of Eastern Finland. Juutilainen teaches generic courses on environmental health and risk assessment, as well as specific courses on non-ionizing and ionizing radiation

He is an Associate Editor of *Bioelectromagnetics*, effective immediately for which he was nominated by the European Bioelectromagnetics Association (EBEA) a non-profit scientific association with many current and former ICNIRP-members.

He was a member of the ICNIRP Standing Committee on Biology from 2004 until 2012 and became a member of the Scientific Expert Group (SEG) in March 2013.

Position

In 2007, *Microwave News* reported positively about a study published by Juutilainen: "Every now and then a new paper comes along that gives hope that one day we'll make sense of the conflicting results that have become the hallmark of EMF research." The study was financed partly by the cell phone industry —the MMF and the GSMA and although Juutilainen suggested that needed a follow-up it never got one.

Another study from 2007 concluded that "the data did not show any effects of radiofrequency electromagnetic fields on micronucleus frequency in erythrocytes. The findings were consistent in two mouse strains (and in a transgenic variant of the second strain), after 52 or 78 weeks of irradiation, at three SAR levels relevant to human exposure from mobile phones, and for three different mobile phone signals." The study was co-funded by Nokia, Elisa Communications Corporation, Finland Benefon, Finland Sonera.

Juutilainen published this study in 2009, together with Croft and Van Rongen, on the 'Effects of Radiofrequency Electromagnetic Fields on the Human Nervous System'. The conclusion was that "However, in provocation studies a causal relation between EMF exposure and symptoms has never been demonstrated. There are clear indications, however, that psychological factors such as the conscious expectation of effect may play an important role in this condition."

Possible conflicts of interest

In his past ICNIRP Declaration of Interests, he stated that he has received research funding from government organizations and foundations.

In his last non-signed DOI he indicates "The Department of Environmental and Biological Sciences of the University of Eastern Finland (UEF) has received funding from the Electric Power Research Institute (EPRI). Although EPRI is an independent, non-profit research organization (and therefore not reported above in research support received from commercial entities), this funding might be perceived as affecting my independence (Period: 2015-2019)."

According to AVAATE he had "numerous research programs funded by Nokia, Benefon, Sonera, Elisa, FINNET, the GSM Association and the Mobile Manufacturer Forum." For example, the national research programme on possible health effects of mobile phones in Finland (from 1998 to 2003) which was coordinated by Juutilainen was mainly funded by TEKES, National Technology Agency a governmental organisation, and also supported by Nokia, Benefon, Sonera, Elisa, Radiolinja, Finnish 2G, Mobile Manufacturers Forum and the GSM Association.

He has participated in conferences and publications funded in part by organizations with interests in the telecommunications sector.

Masami Kojima

Biography

Masami Kojima is a professor of Kanazawa Medical University. He is specialized in ocular damage due to microwaves.

In the period 2001-2004 he was a consulting member for ICNIRP, since november 2014 he is a member of the Scientific Expert Group.

Position

Kojima's research is mainly on the effects of microwaves on the eye, often of rabbits. In his publications, we found no direct statements about possible effects on the eye within the ICNIRP-norms.

Possible conflicts of interest

He was co-author of the 2010 article partly funded by KDDI Foundation (see Hirata and Watanabe).

His Declaration of Personal Interest does not mention other sources of possible conflicts of interest and we did not find any.

Ilkka Laakso

Biography

He is Professor of Electromagnetics in Health Technologies at Aalto University, Finland and focuses on theoretical and computational bioelectromagnetics at both extremely low and radio frequencies. Laakso has been "combining computational electromagnetics with medical image processing and biological neuron modelling." The purpose of this research is to offer the medical and electrical engineering community new computational methods for individual physical modelling of the human body.

According to ICNIRP's website he is the "secretary of Subcommittee of EMF Dosimetry Modeling (SC6) of the IEEE International Committee on Electromagnetic Safety and a working group chairman since 2015."

Laakso became a member of the Scientific Expert Group (SEG) in 2016.

Position

A study from 2009 (Assessment of the Computational Uncertainty of Temperature Rise and SAR in the Eyes and Brain Under Far-Field Exposure From 1 to 10 GHz') about the specific absorption rate (SAR) seems to suggest that the 'reference levels by ICNIRP and maximum permissible exposure limits by IEEE seemed to be conservative in the sense that at the reference levels the temperature rise in the eyes and brain was always less than 1◦C."

Possible conflicts of interest

For IEEE/ICES see Van Rongen and others.

According to his DOI for ICNIRP he owns stocks of and is a board member of 'Fieldsim Oy', a consulting company in Finland that does computer simulations of electromagnetic fields, including electromagnetic field exposure.

Isabelle Lagroye

Biography

Isabelle Lagroye is a director of studies at the Ecole Pratique des Hautes Etudes (EPHE) and works at Bordeaux University. Her research, states a recent publication, 'deals mainly with the biological and toxicological effects of non-invasive electromagnetic fields.' She is currently member of the Bruxelles-Capitale expert committee on non-ionising radiations.

She was member of an ICNIRP committee in the period 2009-2012 and was elected member of the Scientific Expert Group in March 2013.

Position

In 2018 Lagroye together with two other scientists published an article in *European Scientist* in which she concluded that the NTP-study "consolidates current knowledge and reinforces the fact that when effects of mobile radiofrequency fields can be observed, it is at exposure levels that far exceeds the maximum permissible exposure values. In practice, these limits cannot be reached with commonly used wireless communication technologies (relay antennas, mobile phones, Wi-Fi …)."

This statement seems to be in contradiction with findings from her own research. A recent publication of which Lagroye was co-author concludes: 'However, we found that exposure to GSM-modulated 1800 MHz signals at 2 W/kg decreased the PMA maximal efficacy to activate both RAS and ERK kinases' activity.' So, it influences the signaling between proteins.

This is an effect at 2 W/kg, while according to the new ICNIRP-norms health effects in head and torso are only above 20W/kg and the norm is, with a safety factor of ten, 2W/kg.

Lagroye was also co-author of the final report of the Geronimo-project. In this report, we do find indications for health effects. It says:

"Results suggest that increased RF dose to the brain and longer mobile phone call time may be associated with risk of hyperactivity and conduct problems."

And: "a meta-analysis among four birth cohorts (n=55,507) indicated that maternal cell phone use during pregnancy may be associated with shorter pregnancy duration and increased risk for preterm birth (Tsarna et al., 2019, accepted Am J Epidemiol)."

Interesting is also that research conducted by Lagroye seems to suggest non-thermal effects, while ICNIRP states that thermal effects are the only ones for which there is scientific evidence. In this article the authors write: "Altogether, our experimental findings provide

evidence for dose-dependent effects of RF signals on the bursting rate of neuronal cultures and suggest that part of the mechanism is non-thermal."

In 2009, she co-authored a scientific paper with Van Rongen and Croft which stated on the 'effects of radiofrequency electromagnetic fields on the human nervous system' that "there are clear indications, however, that psychological factors such as the conscious expectation of effect may play an important role in this condition."

Possible conflicts of interest

The latest Declaration of Personal Interest of Lagroye that can be found on the ICNIRP-site dates from 19 October 2015, almost five years ago. At that moment, she stated that she got 2,35% of the income of her research unit from a commercial partner, the Réseau de Transport d'Électricité (RTE).

A study published in 2010 which suggested that exposure to WiFi did not damage the brains of young rats was funded by France Telecom and La Fondation Santé et Radiofréquences, an organisation that is for the half funded by industry.

This organisation also partly funded several other studies to which she contributed, like this one published in 2011 and this one published in 2012.

Another 2012 publication was partly funded by Bouygues Telecom.

Sarah Loughran

Biography

ICNIRP's website states that Loughran is currently a researcher at the University of Wollongong in the Australian Centre for Electromagnetic Bioeffects Research (ACEBR) human neurophysiology research group, an NHMRC Centre of Research. She studied physiology and psychology and got a PhD in cognitive neuroscience/psychophysiology at Swinburne University of Technology, investigating the effects of electromagnetic fields on human sleep, the electroencephalogram (EEG), and melatonin.

To this centre (ACEBR) also ICNIRP-chair Rodney Croft and ICNIRP-member Andrew Wood are connected. Swinburne university and in particular the Radiofrequency Dosimetry Laboratory is part of the ACEBR which has a very close relationship with and is co-funded by Telstra, the biggest Telecom company in Australia. (See also portraits on Woods and Croft)

Loughran is also a member of the current World Health Organisation (WHO) RF Environmental Health Criterion evaluation committee, and is on the board of directors for the Bioelectromagnetics Society (BEMS). She is a member of the ICNIRP Scientific Expert Group (SEG) since March 2013.

Position

A 2005 study by Loughran and Woods on the effects of EMF on human sleep demonstrated that "a short exposure to mobile phone-type radiation has an effect on subsequent sleep EEG, although no conclusions can be made regarding adverse health consequences as the mechanisms of the effects are still unknown."

In 2007 Microwave News reports that "the ability of mobile phone radiation to affect sleep is emerging as a robust low-level effect. A team led by Bengt Arnetz has reported that a three-hour exposure to GSM radiation at 1.4W/Kg an hour before bed can disrupt sleep." This study supported earlier findings of Peter Achermann of the University of Zurich and Loughran at the time working at the Brain Sciences Institute at Swinburne University.

Because later findings of other studies got quite some media attention, Loughran, Peter Achermann & Niels Kuster published a statement to temper the seriousness of the findings.

Loughran worked for some years in Switzerland, where several scientists like Kuster do research on EMF and sleep. *The Nation* reported that Niels Kuster, a Swiss engineer co-authored in *The Lancet Oncology* a summary of the WHO's findings of the Interphone study which was launched by the WHO's International Agency for Cancer Research in 2000 (and to which two wireless trade associations contributed $4.7 million or 20 percent of the $24 million budget). Kuster had filed a conflict-of-interest statement affirming that his research group had taken money from "various governments, scientific institutions and corporations." But after his publication The Lancet "issued a correction expanding on Kuster's conflict-of-interest statement, noting payments from the Mobile Manufacturers Forum, Motorola, Ericsson, Nokia, Samsung, Sony, GSMA, and Deutsche Telekom. Nevertheless, Kuster participated in the entire 10 days of WHO-deliberations."

In general, Loughran (ACEBR) is in agreement with Croft. In an interview with Computerworld: "*There are people that are suffering and yes, it's **not due** to electromagnetic energy exposure, it's more of a **psychosomatic** condition…*"

According to a 2017 study "IEI-EMF provocation case studies: A novel approach to testing sensitive individuals" of which Loughran is the second author "*the present experiment failed to show a relationship between RF-EMF exposure and an IEI-EMF individual's symptoms*". The information on Electro hypersensitivity from the WHO's EMF Project (see also History chapter in this report) to which Loughran is connected has not been updated since 2005.

Possible conflicts of interest

In her DOI she declares for 2015 having received almost 16.000$ from EPRI funding a*nd NPF research Institute, which accounted "approximately for 5% of her lab's income".*

In a 2016 EPRI workshop "Loughran provided an overview of the current state of knowledge in the field of human laboratory studies, an assessment of the critical gaps in knowledge, and recommendations for research priorities. Loughran and the session rapporteur, Rodney Croft, University of Wollongong, led the workshop participants in a discussion of human laboratory studies".

See also portraits on Croft and Wood.

Jack Lund

Biography

Jack Lund was research physicist with the US Army Medical Research Command. There he studied the effect of laser radiation on ocular tissue and the visual system. He retired in 2018.

He was an ICNIRP Consulting Expert from 2002 to 2012. He joined the Scientific Expert Group in 2018.

Position

Jack Lund is an expert in laser safety issues. He did not publish article about the health effects of mobile communication technologies and did not make, as far as we could find out, make public statements about it.

Possible conflicts of interest

Lunds 'Declaration of personal interest' is completely empty. We did not find other information about possible conflicts of interest.

Simon Mann

Biography

According ICNIRP's website Simon Mann is a chartered electrical engineer and heads the Physical Dosimetry Department at Public Health England's Centre for Radiation, Chemical and Environmental Hazards. Man is responsible for programmes of scientific work to develop health-related advice on exposures to electromagnetic fields (EMFs) and optical radiation across the UK.

He was secretary to the independent Advisory Group on Non-ionising Radiation (AGNIR), and member of the IARC Working Group that evaluated the carcinogenic potential of radiofrequency EMFs in 2011. He currently works with WHO EMF Project (see also history part) to develop its Environmental Health Criteria monograph on radiofrequency fields.

He is also active in technical standardisation and is a UK delegate to the CENELEC TC106X Committee.

During a meeting of the WHO EMF Project in 2013 Lindsay Martin from ARPANSA – (Australia) and Simon Mann (PHE - UK) were elected chair and vice chair respectively. In the meeting J. Keshvari from International Committee on Electromagnetic Safety (ICES)and the International Electrotechnical Commission (IEC) TC 106 said that "Maintenance work is in hand on several EMF exposure Standards. Harmonisation and avoiding duplication of effort,

between CENELEC, IEEE and ITU is encouraged where possible." Keshvari also mentioned that IEEE/ICES "has been developing an RF safety Standard for NATO".

He is a member of the ICNIRP Scientific Expert Group since 2015.

Position

Mann is part of the close network of ICNIRP and WHO EMF scientists that claim there are no real immediate health effects from EMF. For more on the WHO Project and EMF IEEE/ICES, see the history part of this report and the portrait of Croft and Van Rongen.

Possible conflicts of interest

We could not find a recent DOI on ICNIRP's website: the link to Mann's DOI on ICNIRP's website is not functioning.

However, he did not mention in his former Declaration of Interests statement submitted to ICNIRP, that he has received research funding from the GSM association, the Mobile Manufacturer Forum and the UK's Mobile Telecommunication and Health Research Program (MTHR), on which he still plays a leading role. According to AVAATE MTHR in the past received funding from the Vodafone, a wireless company.

Since 2009 he has been a member of BEMS and the EBEA22.

Rüdiger Matthes

Biography

Rüdiger Matthes was from 1989 until his retirement in 2016 Head of the group "Non-Ionizing Radiation (Dosimetry)" at the German Federal Office for Radiation Protection. He became the Scientific Secretary of ICNIRP in 1993. He was Chairman of the Standing Committee on Physics and Engineering (SCIII) from 2004 to 2008. He became Vice-Chair in 2008, and Chair again in 2012. Since 2016 he is a member of the Scientific Expert Group.

Position

Matthes defends the position that there are no studies that prove the existence of non-thermal health effects of non-ionizing radiation and that no plausible mechanism has been described whereby these effects could take place. There is no evidence for a link between cancer and the use of mobile phones, he said in 2010.

Matthes was one of the authors of a recent ICNIRP-publication in which ICNIRP explains the principles for health protection on which its guidelines are based.

Possible conflicts of interest

In his Declaration of Personal Interests Matthes does not mention any possible conflict of interest and we did not find any information that contradicts this.

During a meeting of the WHO EMF Project in 2013 Matthes spoke on behalf of both BfS and ICNIRP by stating that: “Exposure recommendations have been developed by several organisations such as ICNIRP and IEEE/ICES, and there is good harmonisation between these on fundamental limits.”

John *O'Hagan*

Biography

On ICNIRP’s website it says that John O’Hagan heads the Laser and Optical Radiation Dosimetry Group at Public Health England. This research group covers all aspects of optical radiation dosimetry, including both the beneficial and detrimental effects of optical radiation on people.

He is Vice-President Standard of the International Commission on Illumination (CIE), Convenor of the International Electrotechnical Commission Technical Committee 76 “Optical Radiation Safety and Laser Equipment” Working Group 9 “Non-coherent sources”, Chairman of the British Standards Committee EPL/76 “Optical Radiation Safety and Laser Equipment” and is a member of a number of other national and international committees.

According to his DOI he was also a member of EU SCENHIR/SCHEER Working Group on Potential risks to human health of Light Emitting Diodes (2016-2018) and is a Member of WHO Core Group on NIR Basic Safety Recommendations.

He joined the ICNIRP Scientific Expert Group (SEG) in March 2013.

Position

In 2017 O’Hagan co-wrote a chapter in Clay's Handbook of Environmental Health in which the general line of ICNIRP, SCENHIR and WHO EMF Project is repeated: no adverse health effects.

Possible conflicts of interest

In his DOI he states under activities “Provision of scientific support and advice to government and other stakeholders”, but fails to mention which stakeholders.

In his statement, he says that he is the President of the Committee EPL/76 Optical radiation safety and laser equipment, of BSI Standards Development (BSI is a company that sets rules to help organizations worldwide achieve excellence). Organizations that work with this committee include the Association of Industrial Laser Users, the Association of Manufacturers of Domestic Appliances, GAMBICA Association Limited (a UK national organisation representing the interests of companies in the instrumentation, control, automation and laboratory technology industry) the Institute of Physics, the Institution of Engineering and Technology, the Institution of Mechanical Engineers, and the Lighting Industry Association.

He also reports that he is the Vice President of the CIE-UK National Illumination Committee of Great Britain. This committee was established by the Illuminating Engineering Society of

Great Britain, the Institute of Electronic and Electrical Engineers, the Institute of Gas Engineers, and the NPL, in collaboration with industry and professional associations, government departments and lighting technicians.

Chiyoji Ohkubo

Biography

Chiyoji Ohkubo is Director of the Japan EMF Information Center (JEIC). This organisation was established in July 2008 'to facilitate communication on EMF issues among government agencies, industry, the media and the general public.'

In the period 2005-2007 he worked for the EMF WHO-project.

He is a member of Scientific Expert Group since March 2013.

Position

All his publications seem to fit into the same category: no effect. See for example this study in which the exposure of rats to RF EMF radiation did not alter their cerebral microcirculation.

Possible conflicts of interest

For criticism of the WHO EMF Project see among others Van Rongen.

The Japan EMF Information Center, writes Okhubo himself, 'has been financed from donations by stakeholders and governmental funds.' An information leaflet of the organisation says: 'The JEIC is founded to present in a neutral way the positions of industry, science and society, and to discuss the risk analysis.' It seems to be no coincidence that industry is mentioned first.

Ohkubo did research funded by the Association of Radio Industries and Businesses (ARIB), Japan.

Margarethus Paulides

Biography

Margarethus ('Maarten') Paulides obtained his MSc in Electrical Engineering at Eindhoven University in 2002 and his PhD in Medical Electromagnetics

He works as Associate Professor, Department of Electrical Engineering, Electromagnetics, at the university of Eindhoven as well as Associate Professor, Erasmus Medical Centre in Rotterdam.

The outcome of his research were novel devices, patient-specific simulation technology and pioneering data and knowledge for improving EMF exposure guidelines.

Since 2015 he is board member of the Dutch National Antenna Research Framework (NARF). From 2017, he serves in the Electromagnetics Committee of the Dutch Health Council that advises the relevant ministers in the Netherlands on EMF related subjects. He also is a Management Committee member and Workgroup leader in COST action CA17115.

He is a Member of the ICNIRP Scientific Expert Group (SEG) since 2017.

Position

Most of his research is focussed on applications in health monitoring, disease diagnosis and therapy. We did not find much research on the health effects of radiofrequency radiation.

He did some research on thermal effects on tissue which resulted in this 2018 study in which the authors basically state that the protection levels of ICNIRP and IEEE are conservative and safe: "To protect against any potential adverse effects to human health from localised exposure to radio frequency (100 kHz-3 GHz) electromagnetic fields (RF EMF), international health organisations have defined basic restrictions on specific absorption rate (SAR) in tissues. These exposure restrictions incorporate safety factors which are generally conservative so that exposures that exceed the basic restrictions are not necessarily harmful."

Possible conflicts of interest

According to the ICNIRP website he "also acts as advisor of start-up companies aimed at providing solutions for computer simulation and image guided interventions".

His DOI further states that he does paid consultancy for a company Sensius.biz, which in fact he co-founded, for an amount of 5000€. He also owns 4,9% in stocks of this company.

The same amount he got from a German company Sennewald Medizin Technic.

He received a 45.000€ research Grant form General Electric Research Centre in Germany.

For the contracting company Phillips he received a STW research grant of 10.000€ in cash and 66.300€ in kind.

Kensuke Sasaki

Biography

Kensuke Sasaki is a Researcher of the National Institute of Information and Communications Technology, Japan.

He is a member of Subcommittee of EMF Dosimetry Modelling of IEEE International Committee on Electromagnetic Safety. He is also an expert for a committee of the International Electrotechnical Commission.

He joined the Scientific Expert Group in November 2018.

Position

Most publications of Sasaki are about how to measure the effects of non-ionizing radiation and about the thermal effects of it on for example the eye. We did not find direct statements about the health effects.

Possible conflicts of interest

For information about IEEE/ICES see Van Rongen.

Together with Hirata and Watanabe (see above) he conducted research published in *IEEE Transaction* in 2010 partly funded by KDDI Foundation.

David Savitz

Biography

Savitz is currently Professor of Epidemiology and Obstetrics and Gynecology, at the American Brown University.

His teachings and research is focussed mainly on epidemiologic methods and, reproductive, environmental, and cancer epidemiology and he authored a book entitled "Interpreting Epidemiologic Evidence".

He was a member of the ICNIRP Standing Committee on Epidemiology from 1997 until 2012 and then became a member of the ICNIRP Scientific Expert Group (SEG) in 2013.

Position

Given the fact that he has been connected to ICNIRP for 23 years we can safely assume that he agrees with the position of this NGO on health effects of EMF.

Possible conflicts of interest

His Declaration of Interests statement to ICNIRP, says that he does paid consultancy but "non-relevant to ICNIRP".

According to AVAATE this is not really true: "He gave expert witness testimony on behalf of the defendants in a January 2012 lawsuit in Federal District court in Portland, Oregon."

A company AHM Wireless sued the Portland Public School System, because it called for the removal of a Wi-Fi system in the schools. The testimony of Savitz was requested to assess the expertise of plaintiffs' claims that the implementation of wireless devices and wireless systems in the schools could possibly cause cancer or other adverse health effects.

In court, he states that the purpose of his contract with Battelle was to investigate relationships between environmental agents and human health and that he had a variety of sponsors, including some federal government agencies and other groups that he does not recall at this time.

Remarkably when he is asked about his ICNIRP membership he said that doesn´t consider himself to be really an active member and that he contributed all those years to just four reports, together with Anders Ahlbom, who coordinated their advice work for ICNIRP and whom had also recruited Savitz to join ICNIRP (in 2011 was asked to step down from IARC panel after he was exposed to be on the board of his brother's consulting firm, which telecom clients). Savitz: "My understanding of the organization is really actually quite limited. My role in it has been much narrower to participate in the evaluation of evidence and the reporting of the results of that evaluation. I have not been involved in what's done with that evaluation."

When the lawyer of the public school asks "So the organization, though, it's involved with the protection of human beings from non-ionizing radiation; is that correct?" Savitz answers: "Again, my understanding is not much deeper than as you described it based on the name of the organization. My understanding is that they evaluate evidence and make recommendations that are intended to be protective of health."

When asked if he is paid to be part of scientific committees, he says that he remembers only travel expenses being reimbursed by ICNIRP. He says he doesn´t even remember how many scientific committees he belongs to. He wasn´t involved with what ICNIRP does in making decisions after it receives the results of the evaluation carried out by the Standing Committee on Epidemiology. He says that he has never read the ICNIRP Statutes, its mission, etc. He maintains that he is hired to help evaluate a particular line of research. Also, when asked if there was any relationship between ICNIRP and the WHO for the work in which he contributed to, he said he did not know.

It almost seems as if Savitz does not want to be remembered too much about ICNIRP and tries to distance himself from the NGO and its position. When the lawyer of the public schools asks "you would agree then that we need protection from non-ionizing radiation; is that correct?", Savitz answers: "Well, that's not something that I get involved in the technical judgment of the sort of guidelines or regulations or decision-making. If you're asking, obviously there are levels of exposure that I'm aware that can be harmful, so that I can understand in a general way that it makes sense that there be consideration of regulation."

AVAATE notes that "when asked whether he has been paid out of funds acquired from companies and/or telecom consultants and law firms that represent these companies, he replied that there are a few cases where he has done research funded by the electric utility industry. However, he emphasized that the funders tried to isolate his work from the source of funding. He says he once had done a study before realizing where the money came from."

Savitz also stated that he has done work sponsored by EPRI, as many ICNIRP members, which is funded by the electrical power industry.

There is no record of these kind of data in the Declaration of interests that he submitted to ICNIRP.

Karl Schulmeister

Biography

Karl Schulmeister is since 1994 head of the Laser, LED and Lamp Safety group at Seibersdorf Laboratories in Austria. On his LinkedIn profile he describes himself as 'Consultant on Laser and Optical Radiation Safety'.

He was a member of the ICNIRP Standing Committee on Optical Radiation in the period 2008-2012 and joined the Scientific Expert Group in March 2013.

Position

Karl Schulmeister is specialized in optical radiation. He did not perform research on the health effects of radiofrequency radiation.

Possible conflicts of interest

Seibersdorf Laboratories is a firm, not an academic institution. Schulmeister's group derives, according to his Declaration of Interest, about 10% of its income from paid consultancy.

Research for an article published in 2015 and a white paper published in 2016 received both the support of the Laser Illuminated Projector Association, which presents itself as "a single industry voice in rationalizing laser regulations".

David H. Sliney

Biography

Sliney serves as chair of the IES Photobiology Committee and holds a Ph.D. in biophysics and medical physics from the University of London, Institute of Ophthalmology. He worked for the US Army Public Health Center for 42 years, serving as Program Manager, Laser/Optical Radiation Program, until retiring in 2007.

Het still acts as Safety Director, American Society for Lasers in Medicine and Surgery; And he remains an associate faculty member of the Johns Hopkins School of Public Health, Department of Environmental Science and Engineering, Baltimore, MD.

He served as member, advisor and chairman of numerous committees that are active in the establishment of safety standards for protection against non-ionizing radiation (ANSI, ISO, ACGIH, IEC, WHO, NCRP).

He has been an ICNIRP Commission Member from the very start in1992 until 2004 and as Chairman of ICNIRP SCIV (optical radiation) from 1998 until 2004. He is a member of the ICNIRP Scientific Expert Group (SEG) since November 2017.

Position

Sliney has been mainly focussing on safety and health issues of laser lights, UV light or other sources, important for safety for medical staff who work with laser application in surgery

and medicine. Also, scientists and military staff are risk groups for laser damage to the eye. We could not find research on the health effects of radiofrequency radiation.

Which does not mean that he is not involved in the scientific debate. In 2013 for example he participated in a webinar by the American Conference of Governmental Industrial Hygienists (ACGIH) on electromagnetic radiation.

In an article from 2017 on the history of of ICNIRP founder Mike Repacholi explicitly gives a special thanks to long-term INIRC and ICNIRP member David Sliney for his help with reviewing the article.

In a book from 2000 in 'the NATO Science Series' by B.Jon Klauenberg (US Air Force Research Laboratory) and also NATO-liaison, Sliney is described as "Dr Dave Sliney and army employee who serves on the ICNIRP". Klauenberg who in the first years led the WHO EMF Project together with Repacholi, is a prominent figure from the US Department of Defense (DOD) and describes it as follows: "Because the US military services operates globally and with many different national partners, uniformity of the RFR exposure standards is a desirable goal." He then describe the various ways that the DOD contributes to "worldwide standards harmonisation". So, the DOD participates in the WHO EMF project for example "through active engagement of US Air Force Research Laboratory as well as US army personnel providing service on the IEEE". And Sliney thus seems to be the US army representative in ICNIRP.

Possible conflicts of interest

His DOI is signed in 2019 but does not mention much.

Rianne Stam

Biography

Rianne Stam is senior scientist at the National Institute for Public Health and the Environment (Bilthoven, the Netherlands) since 2007. There she performs risk assessments and policy research on the biological effects and possible health risks of electromagnetic fields (EMF).

She is a member of the Scientific Expert Group since March 2013.

Position

Stamm made in 2015 and 2019 overview reports of the long term effects of electromagnetic fields on the health of workers. The conclusion: 'Scientific research has not yet proven any links between the exposure of workers and the occurrence of cancer, disorders of the nervous system or other illnesses in the long term.'

Possible conflicts of interest

According to her 'Declaration of Personal Interest' Stam has no possible conflicts of interest and we did not find any information that contradicts this.

Bruce Stuck

Biography

Bruce E. Stuck He is now retired. He was from 1992-2010, the Director of the U.S. Army Medical Research Detachment of the Walter Reed Army Institute of Research, where he had responsibilities for the Army Medical Department's laser and radio frequency radiation biological effects research program. Until 2013 he was the Director of the Ocular Trauma Research Division at the U.S. Army Institute of Surgical Research in San Antonio, Texas.

Since 2012 Stuck is a part-time independent consultant on non-ionizing radiation bioeffects.

He has been a member of ICNIRP SC IV since 1999 and of the Commission from 2004 until 2016. Stuck is now supporting the work of the Project Group as a SEG member.

Position

His research focussed on laser and radio frequency radiation biological effects and "establishes protection strategies (e.g. exposure limits or physical protection products) and develops triage and treatment approaches for ocular injury from non-ionizing radiation and shock wave exposures from blast". During his 32 years-experience in laser hazards research experience he was author/co-author of numerous papers on ocular and cutaneous effects of laser and radio frequency radiation. His primary interests are in the biological effects of visible and infrared laser radiation on the retina and cornea and the assessment of laser-induced eye injuries and their treatment.

Possible conflicts of interest

His DOI states that he is "a consultant to Perfect Lens, LLC on a proprietary project under a signed confidentiality agreement to provide advice and written assessment on biological exposure limits as applied to their repetitively pulsed fem to second laser application for use in medical application in the eye". He delivered oral and written reports on the device hazard assessments. Income was less than 1% of personal income from his retirement annuity in 2018 tax year.

John Tattersall

Biography

John Tattersall **i**s scientist in the Defence Science and Technology Laboratory, a government Agency which provides research and advice for the UK Ministry of Defence and other

government departments. He also is Honorary Senior Lecturer in Clinical Neurosciences at the University of Southampton.

He was a member of the IEEE International Committee on Electromagnetic Standards from 2012 until 2017.

He joined the Scientific Expert Group in March 2013.

Position

Twenty years ago, Tattersall did research that showed effects of RF Radiation on the brain of rats. *New Scientist* wrote: "Last year, fears about mobiles affecting brain function received fresh impetus thanks to work by John Tattersall and his colleagues at the Defence Evaluation and Research Agency's labs at Porton Down in Wiltshire. Tattersall exposed slices of rat brain to microwave radiation. He found that it blunted their electrical activity and weakened their responses to stimulation. Because the brain slices were taken from the hippocampus, a structure with a role in learning, the results were seized upon as further evidence that mobile phones could scramble human memories."

But according to later research these effects were artificial, "may be explained by localised heating produced by interaction of the RF fields with the recording and stimulating electrodes".

Tattersall was involved in the new guidelines that were published in 2020.

Possible conflicts of interest

For IEEE/ICES see Van Rongen and others.

Tim Toivo

Biography

Tim Toivo works as senior inspector for the Radiation and Nuclear Safety Authority STUK in Helsinki, Finland. He is mainly involved in regulatory, research and expert work in the area of safety issues of electromagnetic fields (EMF) and ultrasound.

He studied biomedical engineering at Tampere University of Technology 1996. And started his work at STUK–Radiation and Nuclear Safety Authority in 1998 as a scientist in the unit of non-ionizing radiation.

Part of his work is to inform users of EM fields and communicate with the general public about safety issues. He participated in the preparation of the EU directive (EU 2013/35/EU) as an expert for the Finnish delegation.

He is a member of the ICNIRP Scientific Expert Group (SEG) in February 2017.

Position

Toivo was quoted in the book 'Behind the Screen: Nokia's success story in an industry of navel-gazing executives and crazy frogs': "It is fairly easy to prove that something is hazardous, but it is extremely difficult to prove that something is totally safe under all circumstances. It may take 20-30 years before any meaningful results are available from people who have been exposed to low power radiation."

In 2009 STUK published a position that 'children's mobile phone use should be limited.

A publication in 2006 – 'Epidemiological risk assessment of mobile phones and cancer: Where can we improve?' - together with Anssi Auvinen, concluded that "the major opportunity to improve the quality of evidence is, however, through prospective studies. The major limitation of epidemiological studies addressing the health effects of mobile phone use is related to exposure assessment. These limitations are inherent in case–control studies."

A 2008, in Vitro study of Pulsed 900MHz GSM Radiation on human Spermatozoa showed no effect.

In a 2009 publication – 'Specific absorption rate and electric field measurements In the near field of six mobile phone base station antennas' - Toivo and colleagues seem to suggest that the ICNIRP safety standards are very conservative: "It was also shown that the ICNIRP basic restriction for local exposure could be exceeded before the basic restriction for whole-body exposure if the distance to the antenna is less than 240mm."

With several ICNIRP colleagues he published the 'Progress report: ICNIRP Statement on non-ionizing radiation for cosmetic purposes' for the IEEE. They concluded that "'for cosmetic devices using radiofrequency EMF and optical radiation, there is the potential that occupational exposure limits can be exceeded if adequate protection measures are not applied."

Possible conflicts of interest

Hid DOI states that he gets funds from ministries which go directly to the Radiation and Nuclear Safety Authority STUK.

Andrew Wood

Biography

Wood is Professor in Bioelectromagnetic Research Group at Swinburne University of Technology in Melbourne. He also is a Chief Investigator with the new Australian Centre for Electromagnetic Bioeffects Research (a centre to which Rodney Croft and Sarah Loughran are also connected).

Wood used to work at Telstra Research Labs and is now a leading researcher at Swinburne Radiofrequency Dosimetry Laboratory, which is a part of the Bioelectomagnetic Research

Group. Telstra is Australia's largest telecommunications company. Swinburne university and in particular the Radiofrequency Dosimetry Laboratory has close relationship with and is co-funded by Telstra, the biggest Telecom company in Australia.

The close working relationship between the Swinburne University and Telstra is not new, as Don Maisch pointed out: "In fact the Chancellor of Swinburne University, Mr. Bill Scales (2005-2014) was previously Telstra's Group Managing Director, Regulatory, Corporate and Human Relations, and Chief of Staff at Telstra. He was also Telstra's Director of IBM Global Services Australia Ltd. and a Director of the Telstra Foundation."

Wood was a member of the Radiation Health Committee of the Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) for over ten years.

He is a member of the Scientific Expert Group since March 2013.

Position

Wood does not see dangers of 5G and warns for being too cautious: "Wireless technologies bring enormous benefits, and being over-cautious would potentially deny these benefits to needy communities."

In a recent article he stated that studies which show health effects have a poor quality: "There are some comprehensive reviews of these, demonstrating that the quality of the studies is very variable, and that, for example, results claiming to show increased genetic damage or other biological effects are much more common in studies of low quality, whereas higher-quality studies predominantly show no significant effects."

Possible conflicts of interest

In a 2016 publication that gave an overview of the work Wood's group performed he and his co-authors wrote: "Over its 25-year history the Bioelectromagnetics Group has received support from national competitive grants and from industry research support schemes. It has been a node for both the Australian Centre for Radiofrequency Bioeffects Research (ACRBR) and the Australian Centre for Electromagnetic Bioeffects Research (ACEBR—see article in this edition). It has benefitted from industry collaboration and with national regulatory authorities."

The close collaboration with industry we see time and again. Just like the actual chair of the ICNIRP-commission Croft, Wood had actively collaborated with McKenzie, who is a manager at the Mobile Carriers Forum (MCF). See for more information the portrait of Croft.

In 2016, he published an article together with an employee of telecommunications company Telstra.

He has done contract work on the issue of smart meters for the private company EMC Technologies Pty Ltd.

According to his Declaration of Personal Interest he receives research support "from two engineers employed by Telstra Corp and one by the Australian Mobile Telecommunications Association."

Tongning Wu

Biography

According to ICNIRP's website Tongning Wu is a senior engineer in the Chinese Academy of Information and Communications Technology. His research focusses on electromagnetic dosimetry, anatomical modelling and biomedical applications of electromagnetic fields.

He is the member of International Advisory Committee (IAC) on Electromagnetic Fields of WHO. He also participated in the IEC/IEEE workgroups on EMF safety. He is currently the co-rapporteur of ITU-D Q7/2 (Strategies and policies concerning human exposure to electromagnetic fields).

He became a member of the ICNIRP Scientific Expert Group (SEG) in 2019.

Position

Wu agrees with the general ICNIRP assessment that "to date, no adverse health effects of the EMF, linked to these applications, have been established." This was also one of the conclusions of a study 'Electromagnetic fields (EMF) exposure' published in 2019.

In 2012 WU published a study on 'A large-scale measurement of electromagnetic fields near GSM base stations in Guangxi, China for risk communication'. The results were that "in general, the measurement mission promotes the science on EMF exposure among the general public. Risk-related public behaviours have been positively influenced. The mission also facilitates the cooperative conflict resolution. It helps strengthen the effectiveness of risk communication."

Possible conflicts of interest

His DOI gives no information.

See Van Rongen and others on the role of IEEE/ICES.

Annex I

Questions put to ICNIRP's secretariat

1 - When will the ICNIRP Annual report 2019 be published?

2 - Are the 14 members of the Commission being paid for their work for ICNIRP (for "representing ICNIRP externally and mostly in its relations with the international and national partners and the press" as well as for their collaboration on specific Projects?)

3 - Same questions as n° 2 go for the Scientific Expert group and the Project Groups?

4 - If they are not paid, do you consider this as a normal practice that international renowned experts work for free, especially given the importance and influence of the work of ICNIRP?

5 - ICNIRP itself claims it is "free of vested interests". ICNIRP's budget relies on support granted by public bodies; Why is the income not specified in your annual reports? Is it possible to get specifications from which public bodies you get which amounts?

6 Who selects the 14 members of the Commission and how?

7 - ICNIRP's statutes state: 'No member of the Commission shall hold a position of employment that in the opinion of the Commission will compromise its scientific independence'

Do we understand it correctly that basically the Commission evaluates itself about possible conflicts of interest? What are the rules by which the Commission judges if interests of the members compromise the scientific independence?

8- In its statement on the declarations of interests ICNIRP states: "The evaluation of personal integrity is very complex and might never be achievable in a perfect way. It is the duty of the ICNIRP Commission to carefully consider and decide if the declared interests potentially constitute a conflict of interest."

By which criteria or protocol are these considerations and decisions being made?

9- Do you consider the membership of IEEE ICES by some ICNIRP-members as a possible conflict of interests?

10- How do you explain the fact that a private organisation like ICNIRP, which is not accountable in democratic terms to anyone, has the position to de facto "determine" via guidelines the EMF policies of most EU member states?

Several attempts to get a reaction to

these questions remained unanswered'

Annex II

Questions put to emfproject@who.int

On your website, you write: "Because disparities in EMF standards around the world has caused increasing public anxiety about EMF exposures from the introduction of new technologies, WHO commenced a process of harmonization of electromagnetic fields (EMF) standards worldwide. With 54 participating countries and 8 international organizations involved in the International EMF Project, it provides a unique opportunity to bring countries together to develop a framework for harmonization of EMF standards and to encourage the development of exposure limits and other control measures that provide the same level of health protection to all people. "

1 - Is there a time schedule for this process of harmonization of electromagnetic fields (EMF) standards worldwide?

2 - We see on your website that the last EMF -WHO meeting took place in 2018. Are there any new meeting planned and if yes when?

3 - Do you know what IARC is currently working on and if so when will IARC publish an update of the monograph?

https://publications.iarc.fr/Book-And-Report-Series/Iarc-Monographs-On-The-Identification-Of-Carcinogenic-Hazards-To-Humans/Non-ionizing-Radiation-Part-2-Radiofrequency-Electromagnetic-Fields-2013

4 - How do you consider the debate on "conflicts of interests" in this specific research area? Would you agree that there has been and still is a lot of attention for this debate? Has his debate been useful in narrowing the divide in the scientific community? What is in your view the role of the WHO on this?

(see for example this recent letter published in "Bioelectromagnetics": https://onlinelibrary.wiley.com/doi/full/10.1002/bem.22225)

REVIEW

Electromagnetic interference in cardiac electronic implants caused by novel electrical appliances emitting electromagnetic fields in the intermediate frequency range: a systematic review

Sarah Driessen[1]*, Andreas Napp[2], Kristina Schmiedchen[1], Thomas Kraus[1], and Dominik Stunder[1]

[1]Research Center for Bioelectromagnetic Interaction (femu), Institute of Occupational, Social and Environmental Medicine, University Hospital, RWTH Aachen University, Pauwelsstr. 30, 52074 Aachen, Germany; and [2]Department of Internal Medicine I (Cardiology, Angiology, Pneumology and Internal Intensive Care Medicine), University Hospital, RWTH Aachen University, 52074 Aachen, Germany

Received 2 March 2018; editorial decision 5 June 2018; accepted 7 June 2018; online publish-ahead-of-print 9 July 2018

Electromagnetic fields (EMF) in the intermediate frequency (IF) range are generated by many novel electrical appliances, including electric vehicles, radiofrequency identification systems, induction hobs, or energy supply systems, such as wireless charging systems. The aim of this systematic review is to evaluate whether cardiovascular implantable electronic devices (CIEDs) are susceptible to electromagnetic interference (EMI) in the IF range (1 kHz–1 MHz). Additionally, we discuss the advantages and disadvantages of the different types of studies used to investigate EMI. Using the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) statement, we collected and evaluated studies examining EMI in *in vivo* studies, *in vitro* studies (phantom studies, benchmark tests), and simulation studies. Our analysis revealed that cardiac implants are susceptible to malfunction induced by EMF in the IF range. Electromagnetic interference may in particular be provoked by security systems and induction hobs. The results of the studies evaluated in this systematic review further indicate that the likelihood for EMI is dependent on exposure-related parameters (field strength, frequency, and modulation) and on implant- as well as on lead-related parameters (model, type of implant, implant sensitivity setting, lead configuration, and implantation site). The review shows that the factors influencing EMI are not sufficiently characterized and EMF limit values for CIED patients cannot be derived yet. Future studies should therefore, consider exposure-related parameters as well as implant- and lead-related parameters systematically. Additionally, worst-case scenarios should be considered in all study types where possible.

Keywords Electromagnetic interference • Implantable cardioverter-defibrillator • Cardiac pacemaker • Electric fields • Magnetic fields • Intermediate frequency • Systematic review

Introduction

In recent years, the number of patients that have been fitted with cardiovascular implantable electronic devices (CIEDs) such as cardiac pacemakers (PMs) or implantable cardioverter-defibrillators (ICDs) has strongly increased. In the USA, while 9000 CIEDs were implanted in 1990,[1] its number increased to 368 829 in 2009.[2] Over 4.2 million primary CIED implantations were performed between 1993 and 2008.[3] In Europe, 547 586 PMs and 105 730 ICDs were implanted in 2016.[4] Additionally, novel CIEDs like leadless PMs, subcutaneous ICDs, and heart failure devices are gaining more and more importance.

* Corresponding author. Tel: +49 241 808 0749; fax: +49 241 808 2587. *E-mail address*: driessen@femu.rwth-aachen.de

At the same time, with the success of the CIED technology during the past decades, exposure to external electric, magnetic, and electromagnetic fields (EMF) has increased, at least in the intermediate frequency (IF) and radiofrequency (RF) range.[5–8] Electromagnetic fields are used e.g. to transmit communication signals or arise along power transmission lines. Other sources of EMF are electrical appliances. Electromagnetic fields are classified according to their wavelength and frequency. For example, power lines or electrical household devices emit EMF with a lower frequency (LF) while mobile phones, Wi-Fi, or microwave ovens produce EMF of a higher frequency. Electromagnetic fields in the IF range are generated by many novel electrical appliances, including electric vehicles, RFID (RF identification) systems, induction hobs, or energy supply systems, such as wireless charging systems.

Cardiovascular implantable electronic devices are known to be susceptible to malfunction in the presence of strong EMF.[9–12] Many researchers have studied electromagnetic interference (EMI), i.e. potential, undesirable effects of EMF on the operation of CIEDs. The EMF-Portal (www.emf-portal.org), the most comprehensive scientific literature database on biological and health-related effects of EMF provided by our institute currently comprises 639 records on EMI (June 2017). The Manufacturer and User Facility Device Experience (MAUDE) database of the American Food and Drug Administration[13] identified 2843 cases of malfunctions of medical devices induced by EMI between January 2010 and March 2017. However, this may be an underestimation of events as reporting of such incidents is not mandatory and some physicians may misjudge EMI episodes e.g. as atrial fibrillation. A survey of physicians in France showed that 16% of them were concerned about patients who reported EMI at least once a year, e.g. oversensing of noise signals due to EMF exposure is a phenomenon regularly seen in daily practice.[14] Napp *et al.*[9] demonstrated the general mechanisms of effects in CIED caused by EMF, e.g. heating of the implant or lead by RF fields or induction of electric currents within the human body by LF fields leading to e.g. disturbance of the sensing capabilities of the implant. Additionally, Beinart and Nazarian[10] showed potential everyday sources of EMI and documented typical effects, e.g. damage to CIED circuitry, PM inhibition, asynchronous pacing, or inappropriate ICD shocks.

Standard organizations have not proposed limit values to EMF exposure for patients with CIEDs. The American National Standards Institute (ANSI),[15,16] the International Commission on Non-Ionizing Radiation Protection (ICNIRP),[17] and the European Union[18,19] did not consider patients with CIEDs in their safety guidelines for the protection of humans exposed to EMF. Consequently, it is often difficult for physicians and patients to identify sources of EMF which pose a risk and to determine appropriate safety distances which should be respected. In some cases, the applied safety measures in occupational environments might result in a ban from workplaces for CIED carriers.

To date, no systematic analysis has been done for EMI in the IF range (1 kHz–1 MHz). The aim of this systematic review is therefore to evaluate whether CIEDs are susceptible to EMI in the IF range. In particular, we consider the results from different types of studies (*in vivo* and phantom studies, benchmark test) and outline their advantages and disadvantages. Additionally, we identify the type of study which is most appropriate to further investigate the various parameters (implant setting, lead configuration, and individual parameters) that influence the likelihood for EMI.

Methods

Literature search strategy and general information

As prescribed by the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-analyses) statement,[20] we conducted a systematic literature search to identify relevant studies published from inception to October 2016 using our thematically specialized open-access literature database EMF-Portal (www.emf-portal.org). The EMF-Portal is the most comprehensive scientific literature database on biological and health-related effects of EMF and has been approved by the WHO as a reference database.[21] It has been publicly available for more than 15 years and comprises currently 25 900 publications[22] (January 2018). Our search in the EMF-Portal for the current systematic review was based in a first step on the more general search term 'electromagnetic interference' (for a link to the search string, see Supplementary material online: search strategy). Additionally, we performed a more specific search in the frequency range <10 MHz and in the category 'electromagnetic interference'. The lists of results were corrected for double publications.

Eligibility criteria and study selection

Articles were included when they reported experimental studies on EMI with CIED in the frequency range of 1 kHz–1 MHz. We accepted benchmark tests, studies with phantoms, *in vivo* studies, and numerical simulations. Only articles written in English or German and published in a peer-reviewed journal were considered. There was no restriction regarding the year of publication.

Excluded were studies that focused on CIED-programmer interference, CIED-interference with further (cardiac) implant, EMI with other implants (e.g. neurostimulator), or EMI induced by current application (e.g. by medical devices). Furthermore, studies without specification of the tested frequency range were excluded. Review articles, case studies, editorials, commentaries, and unpublished or clearly not peer-reviewed articles were also excluded.

Two authors independently (S.D. and D.S.) screened the studies for eligibility based on inclusion/exclusion criteria. Articles were screened in two stages. First, titles and abstracts were reviewed to identify potentially relevant articles. For those abstracts which met the inclusion criteria, the full text was retrieved and independently reviewed in the second stage of assessment. The two review authors made a joint decision about inclusion of the articles.

Data extraction

The data from the studies included were extracted independently by two authors (S.D. and D.S.). The extraction protocol was defined and agreed upon before the start of the project. Extracted data included bibliographical data, study type (e.g. phantom, *in vivo* study), exposure parameters (field source, i.e. electrical appliance, frequency, and field strength if provided), number of patients/CIED, CIED characteristics, and outcome (disturbance). Additionally, for *in vivo* studies, implant settings and lead polarities were extracted. Disagreements and uncertainties were discussed and resolved between the two review authors.

Results

The systematic literature search identified 389 articles that matched the search criteria. After screening the title and abstract, 203 articles were excluded for various reasons (e.g. secondary literature, not dealing with EMI). The full text was obtained for the remaining 186

articles to check for eligibility to be included in our analysis. Of these, 146 articles were excluded for the following reasons: frequency range not provided or appropriate ($n = 48$), current application ($n = 35$), case report ($n = 21$), CIED-implant interference ($n = 15$), no CIED ($n = 10$), CIED-programmer interference ($n = 4$), or other reasons ($n = 13$). Forty articles fulfilled the eligibility criteria and were included in this review (see *Figure 1*). Of these, most studies ($n = 15$) used combinations of several methods to investigate EMI (e.g. phantom and benchmark), 13 studies used phantoms only, 10 articles investigated EMI in patients (*in vivo*), and one study used a benchmark test only. Additionally, the search identified one simulation study (see *Figure 2*).

Most of the studies investigated EMI on PMs only ($n = 20$), while four studies considered ICDs only. Ten studies considered different types of CIEDs [PMs, ICDs, and implantable loop recorder (ILR)]. Five studies did not use a CIED but a modified CIED case to measure the induced voltage at its terminals. One study investigated EMI on ILRs only.[23]

In some studies, additional frequency ranges or electrical appliances outside the IF range were investigated, but these data on EMI are not considered in this review—if not stated otherwise.

Table 1 provides detailed information on the most important technical terms which are used in this review.

In vivo studies

In *in vivo* studies, patients with CIEDs are directly exposed to EMF to assess the electromagnetic compatibility of CIEDs. As such, individual interference thresholds of the CIED can be determined for specific exposure conditions.

In the current review, 10 *in vivo* studies were evaluated which exposed patients with CIEDs to EMF (Supplementary material online, *Table S1*). Additional five studies used a combined methods approach, i.e. they conducted also benchmark or phantom tests (Supplementary material online, *Table S3*).

Altogether, potential EMI was investigated in 1084 patients that had been fitted with CIEDs (769 PMs, 313 ICDs, and 2 ILRs). The nine studies providing details on PM and ICD types included 369 single chamber (217 PM, 152 ICD), 433 dual chamber (361 PM, 72 ICD), and 42 resynchronization therapy devices (13 PM, 29 ICD). Eight of the 15 studies included CIED carriers with both unipolar and bipolar leads, whereas three studies[24–26] tested only patients with one lead configuration (unipolar OR bipolar). Four studies did not provide any details on lead configuration.[27–30] Eleven of the 15 studies left the CIED sensitivity unchanged or investigated different sensitivities settings (e.g. maximum, nominal), whereas two studies[29,31] tested under maximum sensitivity only. Two studies did not provide any details on sensitivity.[28,32]

All included studies used real-life electrical appliance exposure such as security systems [electronic article surveillance (EAS) systems or metal detector gates, $n = 8$], medical devices ($n = 4$), induction hobs ($n = 3$), or avalanche transceivers ($n = 1$). One study tested both an EAS system and an induction hob (counted separately in each category).[31] None of the included *in vivo* studies were performed under a standardized exposure set-up, i.e. with e.g. a Helmholtz coil. Furthermore, not all of the studies provided details on the field strengths which actually occurred at the height of the implant (chest area). At least, one study measured the magnetic field strength at a distance from the patient to the security device (1.6–2.7 A/m, 50 cm to the security gates)[33] and another study performed comprehensive field measurements (14–310 A/m), but the field strength required to induce EMI remained unclear.[34]

The data of three studies showed that the acoustomagnetic EAS system (58 kHz) could disturb PMs.[31,32,34] There was no evidence that ICDs could be disturbed. However, only 38 ICD patients were included in these studies compared with 265 PM patients (whereof the PMs of 72 patients were disturbed). Electromagnetic interference with PMs was also found with other security systems operating at higher (120 kHz) or lower (10 kHz) frequencies.[33,35] Importantly, the study by Wilke *et al.*[33] provided evidence that PMs can be negatively affected by security systems below the ICNIRP limits for the general public (i.e. 21 A/m).

Two further studies did not observe EMI following exposure to metal detectors[36] or EAS systems[23]; with the latter being one of the two studies investigating ILRs. In a further study it remained unclear whether EMI was induced by a 100 Hz or 1 kHz metal detector.[24]

Three studies on potential EMI of induction hobs[25,26,31] showed that the patients' safety with CIEDs was guaranteed when minimum distances were respected, i.e. no EMI was observed at distances of 20–35 cm. It was, however, not documented in these studies whether disturbances occurred in closer proximity to the induction hobs.

Other devices such as an electromagnetic articulography device,[29] an ultrasonic dental scaler,[30] a magnetic endoscope imager,[27] or avalanche transceivers[37] did not cause EMI under the used conditions. Some dental devices appeared to have the potential to disturb PMs,[28] however, the frequency was provided only for one device and it is unclear whether the other dental devices emitted EMF in the IF range. The relevance of this data is, however, debatable for today's applications, because the study[28] was published in 1975.

Altogether, EMI in the IF range was revealed in 6 out of the 15 studies resulting in e.g. sensing anomalies (e.g. undersensing or oversensing),[31–34] asynchronous pacing,[33,34] increased pacing rate,[24,34] pacing inhibition,[24,32–35] and mode switch.[32] In McIvor *et al.*[34] EMI was accompanied by symptoms in patients, e.g. palpitations and presyncope.

For a general risk assessment, *in vivo* studies with exposures to a single device, such as avalanche transceivers[37] have only a limited significance due to the lack of a proper dosimetry. Additionally, the applicability of the data to other exposure situations is limited. Studies performed under standardized exposure set-ups, i.e. using e.g. a Helmholtz coil or antenna settings are better suited, because EMF can be homogenously generated and EMF at different frequencies and field strengths can be applied systematically. That way, more general data for various applications can be obtained.

Phantom studies

Phantoms simulate the human body or parts of the human body including different tissue characteristics.[38] Experimental *in vitro* studies using phantoms examine either directly the disturbance (EMI) of CIEDs or they are used to determine the intracorporal voltage induced by external EMF at the terminals of CIEDs. In phantoms, both the response of CIEDs to different EMF and the impact of the lead can be tested.

Potential EMI with CIEDs was investigated in 15 studies and five studies measured the induced voltage. An additional five studies

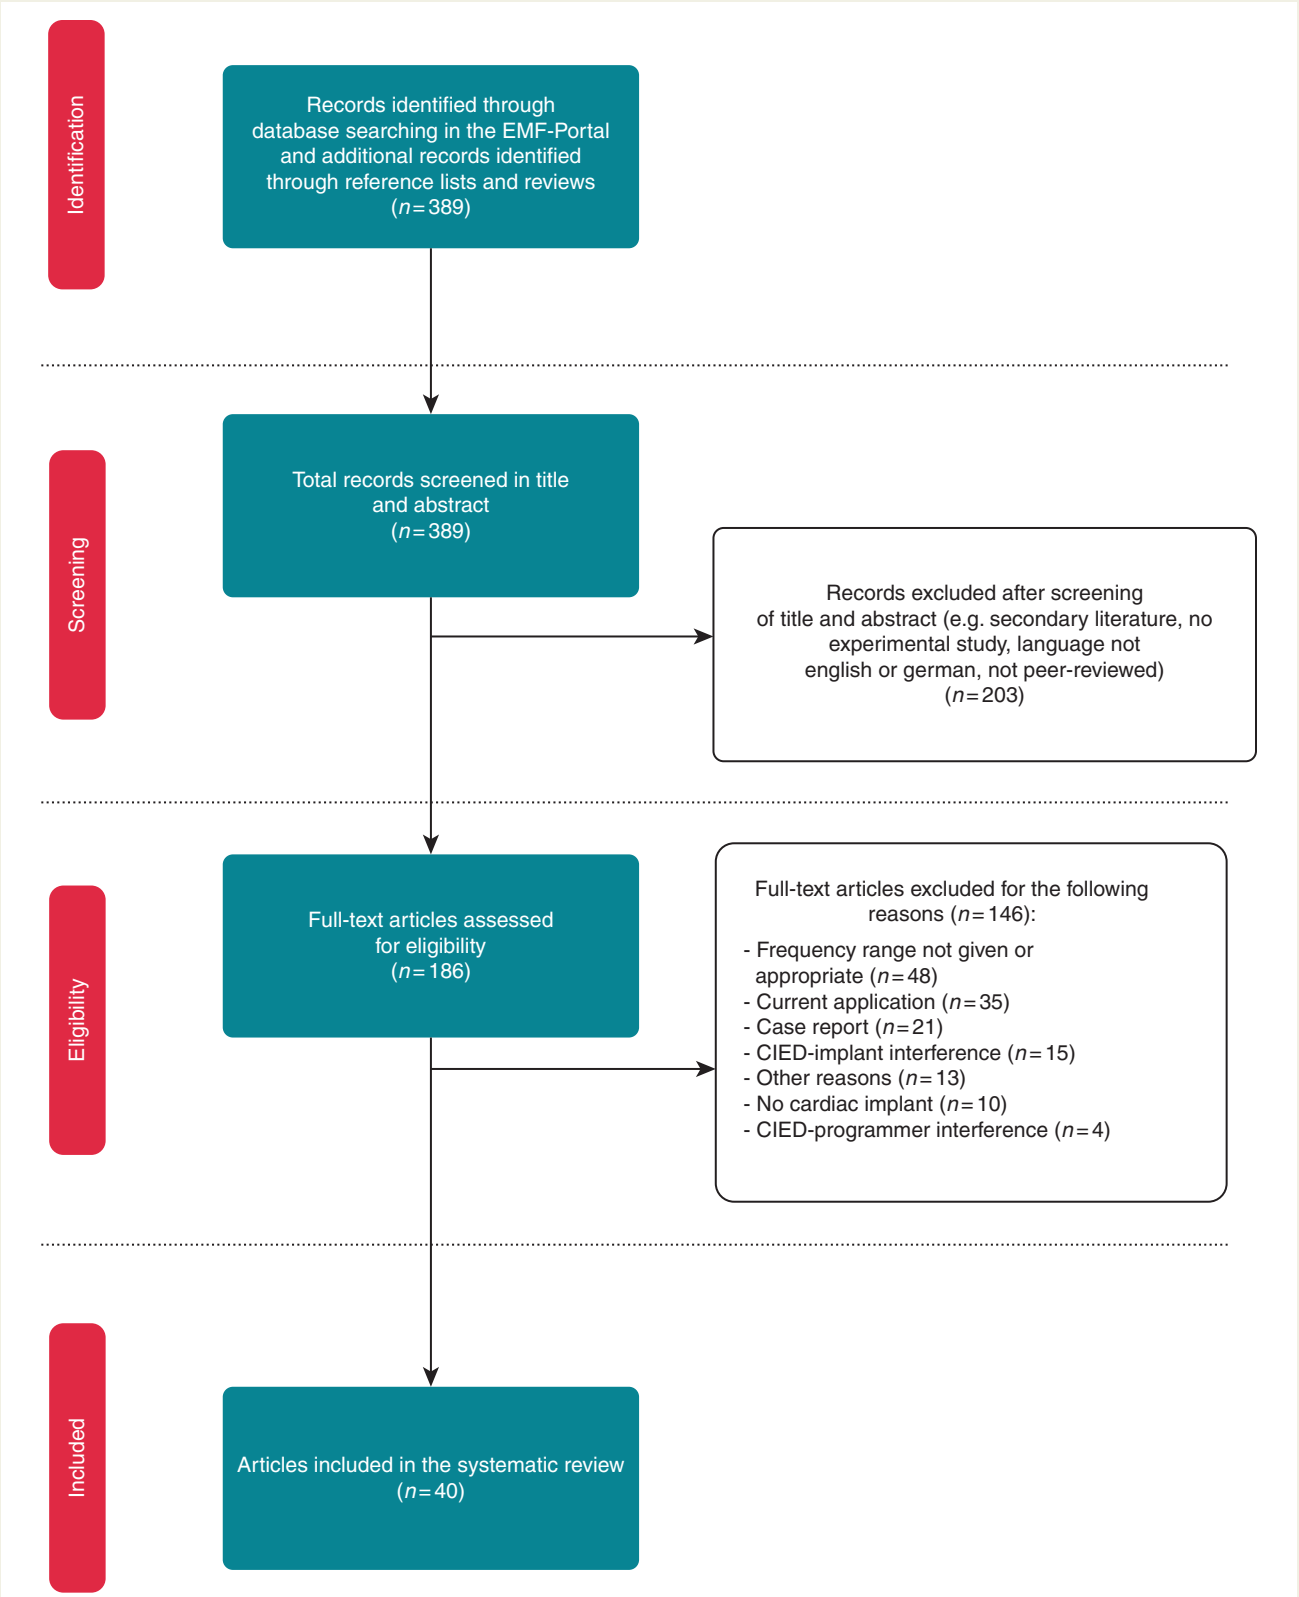

Figure 1 Flow diagram of literature search, eligibility, and inclusion process. Adapted from Moher *et al.*[20] CIED, cardiovascular implantable electronic device; EMF, electromagnetic field.

considered the development of a coupling model (Supplementary material online, *Tables S2* and *S3*). In Babouri *et al.*,[39] the phantom served to validate detection levels recorded in benchmark tests. Therefore, this study is discussed in the 'Benchmark tests and test *in air*' section.

Studies investigating electromagnetic interference

In the 15 studies on potential EMI, altogether, 185 CIEDs were investigated [100 PMs, 60 ICDs, and 25 PM/ICDs (not further specified[40])]. Only 4 out of the 15 studies used a standardized exposure set-up, e.g. a Helmholtz coil setting,[41–44] whereas the remaining 11 studies investigated potential EMI in phantoms upon exposure to real-life electrical appliances [RFID/security systems ($n = 5$), induction hobs ($n = 2$), medical devices ($n = 2$), wireless power transfer (WPT) systems ($n = 1$), or a magnetically levitated linear motor car ($n = 1$)]. Only one study provided precise data on the correlation of EMI and exposure characteristics.[45]

The data of two studies[46,47] on RFID systems showed that the majority of the investigated PMs (67–83%) and ICDs (47–71%) could be disturbed by different 134 kHz RFID systems at a distance of up to 61.3 cm. There was no clear correlation between EMI and lead configuration and no difference between maximum and nominal sensitivity,[46] most likely due to the high intensity field strength of the RFID system. Mattei *et al.*[45] investigated typical exposure patterns of RFID systems and identified EMI from 40 A/m at 125 kHz for a pulsed signal and from 60 A/m for a continuous wave (CW) signal.

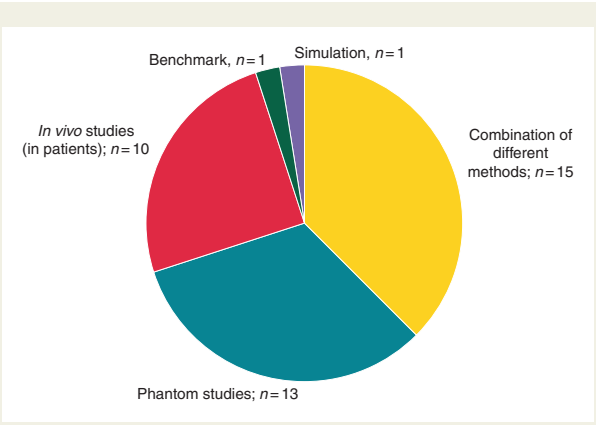

Figure 2 Study types used for EMI investigation in the IF range. EMI, electromagnetic interference; IF, intermediate frequency.

Two further studies on security systems showed that EMI was induced by an anti-theft device of 120 kHz[33] and by different EAS signals (100 Hz–8 kHz, CW or pulsed[48]). Kainz *et al.*[48] found that the interference level of a pulsed signal was lower than that of a CW.

Two studies on induction hobs[25,49] revealed that EMI occurred both as a function of the distance to the induction hob and dependent on the presence/absence of the pot or the position of the pot. However, the exact field strengths at specific distances were not clear from both studies.

The data on security systems or induction hobs showed that some devices in our everyday life may induce EMI in CIEDs and thus confirm the findings of *in vivo* studies.

Hikage *et al.*[40] investigated 14 different WPT systems. Electromagnetic interference occurred in 5 of the 12 WPT systems for mobile application with modulated fields at a maximum distance of ≤2 cm for PMs and at a distance of ≤1 cm for ICDs. The two WPT systems for electric vehicle charging provoked no EMI. However, no field strengths were provided and no details were shown which WPT system caused which kind of EMI.

No EMI was induced under the specific study conditions for a microtron device used for cancer therapy,[50] nor for an electromagnetic navigational bronchoscopy device[51] or for a magnetically levitated linear motor car[52].

The four phantom studies on potential EMI using a standardized exposure set-up[41–44] found that EMI depended on field frequency, CIED type, and programmed sensitivity.

For a general risk assessment, the data of the evaluated phantom studies on potential EMIs are limited as are the data of the discussed *in vivo* studies. Although there are many studies using a comprehensive study design, the applicability of the data to other electrical appliances or comparable exposure scenarios is limited due to the lack of sufficient dosimetric data or a missing correlation of those data to

Table 1 Technical terms used in this review

Terms	Explanation
EMI	Disturbance of CIEDs' operation by induction of intracorporal voltage caused by electric, magnetic, or EMF
External EMF	EMF emitted by an electrical appliance, e.g. magnetic field (measured in T or A/m) or electric field (measured in V/m)
Induced voltage	Intracorporal voltage occurring at the terminals of a CIED induced by external EMF
Interference thresholds	Minimum field strength of an external EMF required to cause EMI
Disturbance/interfering signal	Noise signal that may disturb the regular operation of a CIED
CW, AM, PW, and pulses	Waveforms (CW, AM, PW, and pulses) of an external EMF or a disturbing/interfering signal; the waveform can significantly influence the response of a CIED
Detection level	Voltage of a disturbing/interfering signal which causes disturbance of CIEDs' operation
Performance limits	Minimum detection levels of CIEDs defined in product standards, given in mV

A/m, Ampere/meter; AM, amplitude modulation; CIED, cardiovascular implantable electronic device; CW, continuous wave; EMF, electromagnetic fields; EMI, electromagnetic interference; mV, millivolts; PW, pulsed modulation; T, Tesla; V/m, Volt/meter.

EMI.[25,33,49] Likewise, phantom investigations with exposures to only a single device, such as a magnetically levitated linear motor car[52] only contribute in a limited way to a general risk assessment. The same applies to studies using standardized conditions if EMI is not systematically tested for various frequencies and field strengths.

Determination of induced voltage

Besides the direct measurement of EMI, phantom studies can also serve to determine the voltage induced by external EMF at the terminals of CIEDs. The induced voltage is the critical measurement parameter for electromagnetic compatibility testing of CIEDs and can be compared with international product standards, e.g. Ref.[53] These CIED standards set performance limits up to 3 GHz with the objective of preventing malfunctions induced by EMF. The performance limits increase linearly in the IF range (3 kHz–167 kHz) and vary between unipolar (9–500 mV) and bipolar (0.9–50 mV) testing.[53–55]

The induced voltage was investigated in five studies.

Bassen[56] investigated different iPods but the induced voltage was below the noise level of their measurement instruments. They concluded that no EMI would be expected.

Irnich and Bernstein[57] investigated 11 induction hobs and the induced voltage was between 6 and 800 mV dependent on the distance and the position of the pot. The combination of their phantom study with a benchmark test showed that 14.8% of PMs would be disturbed under worst-case conditions and never at a minimum distance of 35 cm to the thorax. These results confirm the findings of phantom studies on EMI[25,49] and the findings of *in vivo* studies[25,26,31] in that induction hobs appear to be safe at a specific distance.

Seckler *et al.*[58] investigated a WPT system and compared the data with a standardized exposure set-up using Helmholtz coils (111 kHz, both systems). Under the standardized exposure condition the performance limit (i.e. 333 mV for CIEDs with unipolar leads and 33.3 mV for bipolar leads) was already exceeded at 11 μT and thus below the ICNIRP limit[17] of 27 μT; whereas with the WPT system, the limits—even with the WPT system touching the phantom—were not exceeded. This comprehensive study approach demonstrates the significant difference between the voltage induced by a homogenous field of Helmholtz coils and by inhomogenous fields of an electronic device. Moreover, this study highlights the importance to characterize the emitted field patterns (e.g. CW and AM) and dosimetric data of electronic devices.

Mattei *et al.*[59] used an antenna design at 125 kHz to emulate RFID systems and measured a maximum induced voltage for a unipolar lead of 62.2 mV and 19.8 mV for a bipolar lead, thus indicating that the performance limits (i.e. 375 mV for CIEDs with unipolar and 37.5 mV for bipolar leads) were not exceeded under the specific exposure conditions. In a later study by the same authors,[45] however, EMI was detected and thus, the performance limits seemed to be exceeded by exposure of RFID systems (see section 'phantom studies—Studies investigating electromagnetic interference'). Exceeding of the performance levels under consideration of EAS-similar exposure scenarios was also demonstrated by numerical simulations of Leitgeb *et al.*[60] who calculated induced voltages between 3.2- and 13.5-fold above the performance limits in the IF range (60 kHz–5 kHz, respectively) under worst-case conditions (Supplementary material online, *Table S5*).

Gustrau *et al.*[61] identified induced voltages at the PM terminals of 0.126 mV–131 mV (1 kHz–1 MHz, at 1 A/m, i.e. 1.26 μT). Gustrau *et al.*,[61] Seckler *et al.*,[58] and Mattei *et al.*[59] found a dependence of the induced voltage on lead configuration.

Coupling model

A further motivation to perform phantom studies, is the development of a coupling model (transfer function). Transfer functions demonstrate the relationship between the strength of an external EMF and the induced intracorporal voltage at the terminals of a CIED. The transfer functions of the five studies included were determined by numerical or analytical approaches based on data gained in phantom studies or benchmark tests.

Hedjiedj *et al.*[62] developed a transfer function based on a simple phantom and found detection levels from >55/104 mV at 10/25 kHz for a sensitivity level of 0.7 mV. The authors also included benchmark tests and reported detection levels in two out of five PMs of >150/130 mV at 10/25 kHz for a sensitivity level of 1 mV.

In two comprehensive studies, Andretzko *et al.* presented a numerical model for the determination of transfer functions between electric fields[63] or magnetic fields[64] and the induced voltage. The results obtained by numerical simulation were in agreement with experimental data from benchmark tests and phantom studies. The detection levels increased with increasing PM sensitivity values; additionally, the interference thresholds depended on the loop area formed by the CIED with its lead, i.e. for a large (300 cm^2) loop area interference threshold occurred from 20 μT and for a standard loop area (225 cm^2) from 26 μT (unipolar lead).

In a further study by the same research group,[43] the realistic lowest interference thresholds were calculated and given with 33.36 μT (25 kHz) or 79.18 μT (10 kHz), respectively, for unipolar lead settings (200 cm^2). However, the coupling model was not validated and tests *in air* and tests with a phantom yielded different results. The result of this study together with the results of the other three studies suggest that the detection levels of the considered CIEDs were significantly above the performance limits recommended by international product standards,[53] thus indicating compliance with the proposed standards, although the applied magnetic fields (30–85.4 μT) exceeded the limit value recommended by ICNIRP (i.e. 27 μT).[43,64] Whether the transfer function presented by this research group could serve as a solid basis for the calculation of induced voltages from external EMF should be validated by comprehensive realistic data obtained from benchmark tests, phantom, and *in vivo* studies.

Finally, in a study by van Wijk van Brievingh *et al.*,[65] the authors calculated—according to their coupling model—interference thresholds between 0.1 and 100 A/m (i.e. 0.126–126 μT) for 100 Hz and 250 kHz. However, no specific values for induced voltages were provided.

In general, the data of these five studies indicate that interference thresholds depend on the loop area formed by the CIED with its lead, on the frequency of the applied external EMF, the sensitivity setting of the CIED and the device itself and thus confirm the findings of several other phantom studies. Universal transfer function therefore, may provide a helpful tool to estimate induced voltages under specific conditions (e.g. lead type) and in dependence of specific exposure scenarios (frequency and field strength).

Benchmark tests and tests *in air*

Manufactures of CIEDs are obligated to test their implants for compliance with product standards in order to obtain approval for the European market (CE marking) or from the Food and Drug Administration (FDA) for the US market. Regarding electromagnetic compatibility performance limits as well as test methodologies (benchmark tests) are defined in ISO 14117:2012[53] for the US market and in EN 45502-2-1:2004[55] (PMs) and EN 45502-2-2:2008[54] (ICD) for the European market. In benchmark tests disturbance signals are fed directly into the pace/sense channel of the CIED by galvanic coupling in order to analyse the CIED's response and detection levels. The simple methodology is a major advantage of benchmark tests. Cardiovascular implantable electronic devices of different manufacturers and with different settings can be tested and evaluated by any number of various disturbance signals. However, a disadvantage of benchmark tests is that individual parameters of the patient or the lead are not considered and the data cannot be transferred to external EMF of e.g. a certain electrical appliance.

Although benchmark tests are a well-accepted method, many researchers preferred to perform tests *in air*. In such tests, implants are equipped with leads and located within the exposure area of a standardized set-up or close to a specific electrical appliance, comparable to phantom studies but without a phantom. Thus, potential EMI can be correlated with field strengths of an external EMF. In the current review, benchmark tests were used in six studies, whereas tests *in air* were performed in seven studies (Supplementary material online, *Tables S3* and *S4*). Andretzko *et al.*[64] conducted both benchmark tests and tests *in air* (counted in each category separately). Altogether, in the 12 studies included interference was evaluated in >286 PMs (exact number not given in van Wijk van Brievingh *et al.*[65]), in one ICD and in three ILRs. The results of benchmark studies generally indicated compliance with the performance limits set by product standards. Additionally, the results of some benchmark tests and tests *in air* showed the dependence of potential EMI on frequency, the CIED and its sensitivity level.[39,64,66]

In 4 of the 12 studies included, benchmark tests or tests *in air* were combined with other methods in order to establish a transfer function.[62–65] These studies are discussed in detail in the 'Phantom Studies—Coupling Model' section. Nevertheless, due to the data of these studies it can be summarized that the lowest detection levels were found from 55 mV (10 kHz)[62] and 95 mV (25 kHz)[64] depending on the sensitivity level of the PM.[64] Comparable detection levels were also found in an earlier study by the same research group[39] combining benchmark tests and phantom investigations.

A further publication with tests *in air*[43] reported interference thresholds from 1.09 μT at 10 kHz (single-chamber PM) and from 0.54 μT at 25 kHz (dual-chamber PM); however, this was found under artificial loop conditions (90 turns-lead).

Irnich and Bernstein[57] performed benchmark tests in order to investigate the impact of a typical signal of induction hobs (24 kHz) and reported detection levels below the performance limits. It has to be noted, however, that the data was recorded for an older PM model which was released before 1998.

Three out of four studies performing tests *in air* on security systems found that EMI was caused by different EAS systems and EAS signals.[35,48,66] Only the study by de Cock *et al.*[23] did not report EMI. Potential EMI provoked by EAS systems was also found in *in vivo* studies e.g. Refs[31,32,34,35] and in phantom studies e.g. Refs[46,47]. The strengths of external EMF were only provided for EAS systems used in Dodinot *et al.*[35] and for signals used in Kainz *et al.*[48] where interference thresholds were reached from 1.13 mT and approximately 15 $A/m_{peak\text{-}to\text{-}peak}$, respectively. Additionally, the study by Lucas *et al.*[66] indicated that unipolar PMs were affected more often than bipolar PMs.

Finally, Corbett *et al.*[27] investigated a medical magnetic endoscope imager and did not find EMI with different CIEDs. The same result was obtained in their experiment with patients (see *In Vivo* Studies section).

Discussion

The aim of this systematic review was to evaluate whether CIEDs are susceptible to EMI in the IF range generated by many novel electrical appliances, including electric vehicles, induction hobs, or wireless charging systems.

Forty articles fulfilled the eligibility criteria and were included in this review. Most of the studies investigated EMI on PMs only ($n = 20$), while four studies considered ICDs only. Ten studies considered PMs, ICDs, and ILRs. Five studies did not use a CIED but a modified CIED case to measure the induced voltage at its terminals. One study investigated EMI on ILRs only.[23]

There is only limited data on EMI with CIEDs in the IF range and only a few of the evaluated studies correlated the documented EMI with exposure data (e.g. Refs[33,45,58]). Likewise, the studies that did not report EMI, rarely provided detailed data on exposure conditions.[26,29,31,41,42,51]

More than one-third of the studies investigated CIEDs which were exposed to security systems, including EAS, metal detectors, and RFID ($n = 15$), and five studies investigated potential EMI in the proximity of induction hobs. Single studies also investigated other electronic appliances, such as iPods,[56] a magnetically levitated linear motor car,[52] WPT systems,[40,58] or avalanche transceivers.[37]

There is evidence that EMF sources of everyday life such as security systems may induce EMI.[31–34,45,46] Also, induction hobs appear to provoke EMI in close proximity.[25,26,31,49] For other electronic appliances, EMI or exceeding of performance levels was found only for WPT systems.[40,58] However, it cannot be concluded that the other investigated electrical appliances that did not reveal any EMI adhere to safety standards in general, because some studies investigated only a few CIEDs or a few patients (7 ICD[51] or 3 PM, 1 ICD[52]) or the exposure parameters were insufficiently described.[37,56]

We evaluated benchmark tests, simulation, phantom, and *in vivo* studies. As shown in *Table 2*, the studies evaluated in this review used different methods (e.g. phantom and benchmark) to investigate EMI for various electrical appliances. For RFID/EAS systems, EMI was consistently reported in *in vivo* studies, phantom studies, and benchmark tests, whereas for induction hobs and wireless charging systems, EMI was found only in phantom studies.

Clinical relevance

Previous studies have shown that oversensing of noise signals due to EMF exposure occurs in everyday life and physicians caring for CIED patients are regularly confronted with EMI.[14,67,68] In the studies

Table 2 Types of studies used for EMI investigation in different electrical appliances

Electrical appliance	*In vivo* studies	Phantom studies	Benchmark tests and tests *in air*	Simulation
Standardized exposure set-up		X[39,41–44,58,61–65]	O[39,43,62–65]	O[43,61,63,64]

EAS, electronic article surveillance; EMI, electromagnetic interference; O, no EMI was found in this category; RFID, radiofrequency identification; X, EMI was reported for this study type in at least one study.

included in this review sensing anomalies (e.g. undersensing, oversensing),[31–34] asynchronous pacing,[33,34] increased pacing rate,[24,34] pacing inhibition,[24,32–35] and mode switch[32] were reported.

Oversensing in the atrial channel can be misinterpreted by CIEDs as atrial fibrillation and cause a change in the pacing mode to either VVI(+R) or DDI(+R) mode, which results in atrioventricular dysynchrony. The event may remain unnoticed and has no clinical consequence if the interference is brief. However, in the case of extended atrioventricular dysynchrony, patients with a high ventricular pacing percentage may develop the pacemaker syndrome, including symptoms of palpitations, dizziness, and reduced physical capacity.[69] Additionally, inappropriate mode switch episodes could lead physicians to initiate therapeutic oral anticoagulation if the episodes are not correctly identified as EMI. If atrial oversensing occurs and if mode switch is disabled, inappropriate ventricular pacing may be triggered up to the upper tracking rate.[9]

Oversensing in the ventricular channel may result in pacing inhibition with subsequent severe bradyarrhythmias, (near-)syncope, or asystole in PM-dependent patients.[70] Additionally, sustained ventricular oversensing in ICD patients may lead to inappropriate shock delivery. Inappropriate shocks are not only painful and can result in psychological distress but they can be potentially proarrhythmic and are associated with adverse overall survival.[71] In the case of strong EMF exposure, PMs/ICDs may switch to noise mode with asynchronous pacing (VOO/DOO).[72] In noise mode, the subsequent loss of sensing of the intrinsic signal prevents the detection of the underlying intrinsic rhythm faster than the pacing frequency resulting in a risk of T-wave stimuli as well as the perception of ventricular arrhythmias. Thus, anti-tachycardia therapy of ICDs would be withheld with potential lethal consequences.

Precautionary methods

Cardiologists can reduce the risk of EMI for CIED patients by evaluating and programming the sensitivity settings. The lowest possible sensitivity should be selected, which still ensures an appropriate sensing of intrinsic signals. Features like automatic capture measurement or adaptive sensitivity control may lead to inappropriate automatic reprogramming of the sensitivity and should therefore, be switched off in patients with foreseeable strong EMF exposure or documented EMI. In the case of ICDs, defibrillator testing with ventricular fibrillation induction may be necessary to evaluate appropriate sensing of fibrillation waves with sensitivity settings lower than the manufacturer's recommendations. Prolonged detection intervals and elevation of the VT/VF zones as mentioned in several studies[73–75] may prevent inappropriate shocks without impairing the outcome of the patients.

Programming to VVI mode is an additional option to prevent atrial oversensing which usually occurs before the ventricular channel is affected due to the small intrinsic atrial signals and the corresponding high sensitivity setting (poor signal-to-noise ratio). Therefore, to be able to programme a lower sensitivity it is important to achieve a stable anchoring of the lead with good sensing amplitudes during the implantation procedure.

In a systematic investigation on the CIED's lead location, we found that a medial position and horizontal orientation of a bipolar lead's distal end as well as a short lead's tip-to-ring spacing makes CIEDs less susceptible to EMI.[76] We, therefore, recommend the implantation of true bipolar leads and programming the sensing configurations appropriately in all patients, if possible. When changing the sensing configuration or in case of pre-existing unipolar leads, physicians, and patients should be aware of a higher likelihood of EMI.

Patients with recent EMI events, should first be advised to maintain a greater distance (usually >30 cm) to the source of EMF, followed by a careful evaluation of the technical integrity of the CIED. In addition, an in-depth analysis of the situation of EMI including field measurements, e.g. at the workplace, should be performed and a history of earlier device disturbances should be obtained. Furthermore, remote monitoring of devices may be of great help for early EMI detection.

Research needs

For future studies, we recommend using standardized exposure setups and to conduct different types of studies in order to achieve a comprehensive risk assessment for patients with CIEDs.

Exposure set-up and characterization

Only 11 of the 40 studies included in this review used a standardized exposure set-up, e.g. a Helmholtz coil or an antenna setting, while most of the studies conducted experiments with a single electronic appliance. For a general risk assessment, however, studies with single device exposure have only a limited value, often due to a lack of a proper dosimetry. In contrast, under standardized conditions, EMF of a defined frequency and field strength can be generated and applied. In such a setting, it is possible to determine exactly the exposure parameters for which EMI is likely or unlikely to be induced. When conducting studies with single devices a complete dosimetry should be performed such that the results are applicable to different exposure scenarios, including new technologies. It is important to characterize the field strength and distribution as well as the frequency and modulation (i.e. waveform such as CW vs. pulses) of EMF sources in the vicinity of the patient or implant. This view is supported by McIvor *et al.*[34] and Seidman *et al.*[47] who noted that the field strength, frequency and modulation are the crucial parameters for EMI. From their findings, McIvor *et al.*[34] further concluded that susceptibility to interference was enhanced by the 60 Hz pulsed signal. Additionally, Hikage *et al.*[40] found that EMI were more likely when CIEDs were exposed to pulsed signals with a repetition time close to the physiological heart rhythm.

Different types of studies

Beyond the use of standardized exposure set-ups and the characterization of the exposure parameters, we recommend performing benchmark tests, phantom, and *in vivo* studies. The combination of different types of studies will help to systematically evaluate the influence of CIED-, lead-, and patient-related factors. However, it has to be noted that each type of study has several advantages and disadvantages.

Benchmark tests are highly suited for investigating the influence of different CIED types and sensitivity settings. The disturbance signals are fed directly into the pace/sense channel of the CIED by galvanic coupling in order to analyse the CIED's response and detection levels. Several studies included in this review have shown that the likelihood for disturbance depends on the CIED type (i.e. PM or ICD, model[41,46,47]) and CIED sensitivity settings.[32,66] The simple methodology is a major advantage of benchmark tests. However, a disadvantage is that individual parameters of the patient or the lead cannot be considered.

The influence of the lead can best be examined in phantom studies. Additionally, with phantom studies, the intracorporal voltage induced by external EMF in the CIED-lead system can also be determined. The induced voltage is an important measurement parameter for electromagnetic compatibility testing of CIEDs because it can directly be compared with the performance limits set in international product standards, e.g. Ref.[53] Several studies included in this review have shown that the likelihood for EMI depends on the lead parameters (bipolar and unipolar[42]), lead configuration (i.e. loop area formed by implant housing with its lead wire), and implantation site.[58,59] In clinical practice, the susceptibility of CIEDs to EMI has been reduced by using bipolar instead of unipolar leads. However, bipolar leads are still susceptible to interference in the presence of strong EMF.[76]

Individual parameters, including height or physique, which are also affecting the interference threshold,[77] can however, neither be considered in phantom studies nor in benchmark tests. Therefore, *in vivo* studies should be performed in which patients with CIEDs are directly exposed to EMF and in which individual interference thresholds of the CIED can be determined for specific exposure conditions. Data obtained from *in vivo* studies need no additional validation and can be transferred directly to real-life exposure situations. Therefore, results from benchmark tests and phantom studies should always be validated by *in vivo* studies. A disadvantage of *in vivo* studies is, however, that they are time-consuming and that a large number of patients has to be tested to identify patient-related, CIED-related, and lead-specific predictors.

The combination of benchmark tests, phantom, and *in vivo* studies allows the development of a coupling model (transfer function). Transfer functions demonstrate the relationship between the strength of an external EMF and the induced intracorporal voltage at the terminals of a CIED. A solid transfer function which serves as the basis for the calculation of the induced voltages from various external EMF can be derived by using comprehensive data obtained from the different types of studies. Establishing a transfer function is necessary to define limit values.

It is of great importance to define limit values for patients with CIEDs because the current EMF limit values (e.g. ICNIRP,[17] 27 μT and 21 A/m for 3 kHz–10 MHz) proposed for the general public may be exceeded by everyday electrical appliances emitting EMF in the IF range. According to Leitgeb *et al.*,[60] EAS systems may exceed the limits by a factor of 13 compared with ICNIRP's recommendation published in 2010[17] and even by a factor of 60 with regard to ICNIRP's recommendation published in 1998.[78] Induction hobs may also exceed ICNIRP limit values in close proximity and depending on the position of the pot.[25] This does not suggest that the general public (including people with CIEDs) is automatically at risk but caution is warranted for worst-case exposure scenarios.[60] Vice versa, compliance with ICNIRP does not suggest that the safety of patients with CIEDs is guaranteed, because ICNIRP does not consider people fitted with electronic implants in their recommendation. Furthermore, the results of single studies in the present review provide evidence that EMI may even be induced below the proposed ICNIRP limit values.[33,58] Thus, the establishment of limit values for patients with CIEDs will contribute to estimate which electronic appliances can be considered safe for CIEDs carriers and which distances to various electronic appliances should be respected in order to prevent EMI.

Conclusion

There are several studies investigating EMI of CIEDs by novel electrical appliances emitting EMF in the IF range. However, the current data do not allow a general risk assessment for CIED carriers regarding common or future potential interferers, especially due to the lack of a proper dosimetry in most of the studies or the missing correlation of dosimetric data with EMI. The findings were only consistent for security systems and induction hobs for which EMI in CIEDs could be demonstrated in close proximity to the appliances. The results of the studies evaluated in this systematic review and the results of studies on EMI in other frequency ranges indicate that the likelihood for

EMI is dependent on exposure-related parameters (field strength, frequency, modulation) and on implant- as well as on lead-related parameters (model, type of implant, implant sensitivity setting, lead configuration, and implantation site). To better characterize the factors influencing EMI, future studies should consider all these factors systematically by conducting different types of studies. Benchmark test and phantom studies should be performed according to international standards.[53–55] Concerning *in vivo* studies, where no comparable recommendations exist, good experiences[70,72] were had in cooperation between cardiologists with profound knowledge in electrophysiology and electrical engineers with profound knowledge in exposure set-ups.

Additionally, worst-case scenarios should be considered in all study types where possible (i.e. unipolar sensing, maximum sensitivity, atrium sensing, sustained pacing of the CIED, left-sided implantation, lateral lead's tip position, vertical lead's tip orientation, homogeneous field exposure, and thorax perpendicular to the magnetic field exposure). That way, it might be possible to derivate EMF limit values for CIED patients in the future.

DOI: 10.3892/ol.2020.11876

Abstract. The fifth generation, 5G, of radiofrequency (RF) radiation is about to be implemented globally without investigating the risks to human health and the environment. This has created debate among concerned individuals in numerous countries. In an appeal to the European Union (EU) in September 2017, currently endorsed by >390 scientists and medical doctors, a moratorium on 5G deployment was requested until proper scientific evaluation of potential negative consequences has been conducted. This request has not been acknowledged by the EU. The evaluation of RF radiation health risks from 5G technology is ignored in a report by a government expert group in Switzerland and a recent publication from The International Commission on Non-Ionizing Radiation Protection. Conflicts of interest and ties to the industry seem to have contributed to the biased reports. The lack of proper unbiased risk evaluation of the 5G technology places populations at risk. Furthermore, there seems to be a cartel of individuals monopolizing evaluation committees, thus reinforcing the no-risk paradigm. We believe that this activity should qualify as scientific misconduct.

Introduction

Most politicians and other decision-makers using guidelines for exposure to radiofrequency (RF) radiation seem to ignore the risks to human health and the environment. The fact that the International Agency for Research on Cancer (IARC) at the World Health Organization (WHO) in May 2011 classified RF radiation in the frequency range of 30 kHz to 300 GHz to be a 'possible' human carcinogen, Group 2B (1,2), is being ignored. This has been recently exemplified in a hearing at the Tallinn Parliament in Estonia (3).

An important factor may be the influence on politicians by individuals and organizations with inborn conflicts of interests (COIs) and their own agenda in supporting the no-risk paradigm (4,5). The International Commission on Non-Ionizing Radiation Protection (ICNIRP) has repeatedly ignored scientific evidence on adverse effects of RF radiation to humans and the environment. Their guidelines for exposure are based solely on the thermal (heating) paradigm and were first published in ICNIRP 1998 (6), updated in ICNIRP 2009 (7) and have now been newly published in ICNIRP 2020 (8), with no change of concept, only relying on thermal effects from RF radiation on humans. The large amount of peer-reviewed science on non-thermal effects has been ignored in all ICNIRP evaluations (9,10). Additionally, ICNIRP has successfully maintained their obsolete guidelines worldwide.

COIs can be detrimental, and it is necessary to be as unbiased as possible when assessing health risks. There are three points that should be emphasized. Firstly, the evidence regarding health risks from environmental factors may not be unambiguous, and therefore informed judgements must be made. Furthermore, there are gaps in knowledge that call for experienced evaluations, and no conclusion can be reached without value judgements. Secondly, paradigms are defended against the evidence and against external assessments by social networks in the scientific community. Thirdly, the stronger the impact of decisions about health risks on economic, military and political interests, the stronger will stakeholders try to influence these decision processes.

Since the IARC evaluation in 2011 (1,2), the evidence on human cancer risks from RF radiation has been strengthened based on human cancer epidemiology reports (9-11), animal carcinogenicity studies (12-14) and experimental findings on oxidative mechanisms (15) and genotoxicity (16). Therefore, the IARC Category should be upgraded from Group 2B to Group 1, a human carcinogen (17).

The deployment of the fifth generation, 5G, of RF radiation is a major concern in numerous countries, with groups of citizens trying to implement a moratorium until thorough research

Key words: Switzerland, European Union, World Health Organization, International Commission on Non-Ionizing Radiation Protection, Scientific Committee on Emerging and Newly Identified Health Risks, Swedish Radiation Safety Authority, 5G, electromagnetic field, appeals, moratorium, microwave radiation, radiofrequency electromagnetic field, health risks, non-ionizing radiation guidelines, conflicts of interest

on adverse effects on human health and the environment has been performed. An appeal for a moratorium, currently signed by >390 international scientists and medical doctors, was sent to the European Union (EU) in September 2017 (18), currently with no EU response (19). Several regions have implemented a moratorium on the deployment of 5G motivated by the lack of studies on health effects, for instance Geneva (20).

In the present article, the current situation in Switzerland is discussed as an example (21). Additionally, the ICNIRP 2020 evaluation is discussed (8).

Evaluation of health risks in Switzerland

Several Swiss citizens have brought to our attention that Associate Professor Martin Röösli is the chair of two important government expert groups in Switzerland (directeur), despite possible COIs and a history of misrepresentation of science (22,23). These groups are Beratende Expertengruppe NIS (BERENIS; the Swiss advisory expert group on electromagnetic fields and non-ionizing radiation) (24), and the subgroup 3, the Mobile Communications and Radiation Working Group of the Department of the Environment, Transport, Energy and Communications/Eidgenössisches Departement für Umwelt, Verkehr, Energie und Kommunikation, evaluating RF-radiation health risks from 5G technology (25,26).

The conclusions made in the recent Swiss government 5G report are biased and can be found here (27,28). This 5G report concluded that there is an absence of short-term health impacts and an absence or insufficient evidence of long-term effects [see Table 17 (Tableau 17) on page 69 in the French version (27) and Table 17 (Tabelle 17) on page 67 in the German version (28)].

Furthermore, it was reported that there is limited evidence for glioma, neurilemmoma (schwannoma) and co-carcinogenic effects, and insufficient evidence for effects on children from prenatal exposure or from their own mobile phone use. Regarding cognitive effects, fetal development and fertility (sperm quality), the judgement was that the evidence on harmful effects is insufficient. These evaluations were strikingly similar to those of the ICNIRP (see Appendix B in ICNIRP 2020; 8). Other important endpoints, such as effects on blood-brain barrier, cell proliferation, apoptosis (programmed cell death), oxidative stress (reactive oxygen species) and gene and protein expression, were not evaluated.

According to Le Courrier November 19, 2019, Martin Röösli presented the conclusion in an interview in the following way: '*Sur l'aspect sanitaire pur, «le groupe de travail constate que, jusqu'à présent, aucun effet sanitaire n'a été prouvé de manière cohérente en dessous des valeurs limites d'immissions fixées», résume Martin Röösli, professeur d'épidémiologie environnementale à l'Institut tropical et de santé publique suisse*' (29). [*Regarding the health issue, the working group concludes that, until now, no health effect has been consistently proven below the given exposure limits, summarizes Martin Röösli, professor in environmental epidemiology at the Swiss Tropical and Public Health Institute*].

This Swiss evaluation is scientifically inaccurate and is in opposition to the opinion of numerous scientists in this field (18). In addition, 252 electromagnetic field (EMF) scientists from 43 countries, all with published peer-reviewed research on the biologic and health effects of nonionizing electromagnetic fields (RF-EMF) have stated that:

'*Numerous recent scientific publications have shown that RF-EMF affects living organisms at levels well below most international and national guidelines. Effects include increased cancer risk, cellular stress, increase in harmful free radicals, genetic damages, structural and functional changes of the reproductive system, learning and memory deficits, neurological disorders, and negative impacts on general well-being in humans. Damage goes well beyond the human race, as there is growing evidence of harmful effects to both plant and animal life*' (30).

We are concerned that the Swiss 5G report may be influenced by ties to mobile phone companies (COIs) by one or several members of the evaluating group.

COIs

Funding from telecom companies is an obvious COI. Martin Röösli has been a member of the board of the telecom funded Swiss Research Foundation for Electricity and Mobile Communication (FSM) organization and he has received funding from the same organization (31-33).

It should be noted that the FSM is a foundation that serves formally as an intermediate between industry and researchers. According to their website, among the five founders of FSM who '*provided the initial capital of the Foundation*' four are telecommunications companies: Swisscom, Salt, Sunrise, 3G Mobile (liquidated in 2011). The fifth founder is ETH Zurich (technology and engineering university). There are only two sponsors, Swisscom (telecommunications) and Swissgrid (energy), who '*support the FSM with annual donations that allow for both the management of the Foundation and research funding*' (34).

The same situation applies to being a member of ICNIRP (Table I) (35). In 2008, the Ethical Council at Karolinska Institute in Stockholm stated that being a member of ICNIRP is a potential COI. Such membership should always be declared. This verdict was based on activities by Anders Ahlbom in Sweden, at that time a member of ICNIRP, but is a general statement (2008-09-09; Dnr, 3753-2008-609). In summary: '*It is required that all parties clearly declare ties and other circumstances that may influence statements, so that decision makers and the public may be able to make solid conclusions and interpretations. AA [Anders Ahlbom] should thus declare his tie to ICNIRP whenever he makes statements on behalf of authorities and in other circumstances*' (translated into English).

COIs with links to industry are of great importance; these links may be direct or indirect funding for research, payment of travel expenses, participation in conferences and meetings, presentation of research, etc. Such circumstances are not always declared as exemplified above. A detailed description was recently presented for ICNIRP members (22).

ICNIRP

ICNIRP is a non-governmental organization (NGO) based in Germany. Members are selected via an internal process, and the organization lacks transparency and does not represent the

[a]WHO Observer in the main commission (95); [b]2002-2011; [c]2020-2024. The table is based on members of WHO, SCENIHR and SSM during the defined time period(s). No other individuals among those within WHO or SCENIHR were found in the list of SSM participants. A total of 15 additional experts in WHO were not members of SCENIHR, SSM or ICNIRP. SCENIHR, Scientific Committee on Emerging and Newly Identified Health Risks; SSM, Swedish Radiation Safety Authority; WHO, World Health Organization; EU, European Union; ICNIRP, International Commission on Non-Ionizing Radiation Protection.

opinion of the majority of the scientific community involved in research on health effects from RF radiation. Independent international EMF scientists in this research area have declared that: '*In 2009, the ICNIRP released a statement saying that it was reaffirming its 1998 guidelines, as in their opinion, the scientific literature published since that time has provided no evidence of any adverse effects below the basic restrictions and does not necessitate an immediate revision of its guidance on limiting exposure to high frequency electromagnetic fields. ICNIRP continues to the present day to make these assertions, in spite of growing scientific evidence to the contrary. It is our opinion that, because the ICNIRP guidelines do not cover long-term exposure and low-intensity effects, they are insufficient to protect public health*' (30).

ICNIRP only acknowledges thermal effects from RF radiation. Therefore, the large body of research on detrimental non-thermal effects is ignored. This was further discussed in a peer-reviewed scientific comment article (3).

In 2018, ICNIRP published '*ICNIRP Note: Critical Evaluation of Two Radiofrequency Electromagnetic Field Animal Carcinogenicity Studies Published in 2018*' (36). It is surprising that this note claims that the histopathological evaluation in the US National Toxicology Program (NTP) study on animals exposed to RF radiation was not blinded (12,13). In fact, unfounded critique of the NTP study had already been rebutted (37); however, this seems to have had little or no impact on this ICNIRP note casting doubt on the findings of the animal study: '*This commentary addresses several unfounded criticisms about the design and results of the NTP study that have been promoted to minimize the utility of the experimental data on RFR [radiofrequency radiation] for assessing human health risks. In contrast to those criticisms, an expert peer-review panel recently concluded that the NTP studies were well designed, and that the results demonstrated that both GSM- and CDMA-modulated RFR were carcinogenic to the heart (schwannomas) and brain (gliomas) of male rats*' (37).

In contrast to the opinion of the 13 ICNIRP commission members, the IARC advisory group of 29 scientists from 18 countries has recently stated that the cancer bioassay in experimental animals and mechanistic evidence warrants high priority re-evaluation of the RF radiation-induced carcinogenesis (38).

ICNIRP draft. On July 11, 2018, ICNIRP released a draft on guidelines (39) for limiting exposure to time-varying electric, magnetic and electromagnetic fields (100 kHz to 300 GHz). It was open for public consultations until October 9, 2018. Appendix B was based on assessment of health risks based on a literature survey (39).

Surprisingly, the IARC classification of RF-EMF exposure as Group 2B ('possibly' carcinogenic to humans) from 2011 was concealed in the background material to the new ICNIRP draft on guidelines. Notably, one of the ICNIRP commission members, Martin Röösli (40), was also one of the IARC experts evaluating the scientific RF carcinogenicity in May 2011 (41). He should be well aware of the IARC classification. The IARC classification contradicts the scientific basis for the ICNIRP guidelines, making novel guidelines necessary and providing a basis to halt the rollout of 5G technology.

Therefore, the ICNIRP provides scientifically inaccurate reviews for various governments. One issue is that only thermal (heating) effects from RF radiation are considered, and all non-thermal effects are dismissed. An analysis from the UK demonstrates these inaccuracies (4), also discussed in another article (5). All members of the ICNIRP commission are responsible for these biased statements that are not based on solid scientific evidence.

ICNIRP release of novel guidelines for RF radiation. On March 11, 2020, ICNIRP published their novel guidelines for exposure to EMFs in the range of 100 kHz to 300 GHz, thus including 5G (8). The experimental studies demonstrating a variety of non-thermal biological/health effects (9,10) are not considered, as in their previous guidelines (6,7). Additionally, the ICNIRP increased the reference levels for the general public averaged over 6 min for RF frequencies >2-6 GHz (those that will be used for 5G in this frequency range), from 10 W/m^2 (Tables 5 and 7 in ref. no. 6) to 40 W/m^2 (Table 6 in ref. no. 8), which paves the way for even higher exposure levels to 5G than the already extremely high ones.

Background dosimetry is discussed in Appendix A of the ICNIRP 2020 guidelines (8). The discussion on 'Relevant Biophysical Mechanisms' should be criticized. The only mechanism considered by ICNIRP is temperature rise, which may also occur with 5G exposure, apart from the established non-thermal biological/health effects (42,43). It is well known among experts in the EMF-bioeffects field that the recorded cellular effects, such as DNA damage, protein damage, chromosome damage and reproductive declines, and the vast majority of biological/health effects are not accompanied by any significant temperature rise in tissues (44-47). The ion forced-oscillation mechanism (48) should be referred to as a plausible non-thermal mechanism of irregular gating of electrosensitive ion channels on cell membranes, resulting in disruption of the cell electrochemical balance and initiating free radical release and oxidative stress in the cells, which in turn causes genetic damage (15,49). The irregular gating of ion channels on cell membranes is associated with changes in permeability of the cell membranes, which ICNIRP admits in its summary (8).

Health risks are discussed in Appendix B of the ICNIRP 2020 guidelines (8). Again, only thermal effects are considered, whereas literature on non-thermal health consequences is disregarded (9,10,50). In spite of public consultations on the draft, the final published version on health effects is virtually identical to the draft version, and comments seem to have been neglected (19). In the following section, Appendix B on health effects (8) is discussed.

Appendix B starts with: '*The World Health Organization (WHO) has undertaken an in-depth review of the literature on radiofrequency electromagnetic fields (EMFs) and health, which was released as a Public Consultation Environmental Health Criteria Document in 2014... Further, the Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR), a European Commission initiative, also produced a report on potential health effects of exposure to electromagnetic fields (SCENIHR 2015), and the Swedish Radiation Safety Authority (SSM) have produced several international reports regarding this issue (SSM 2015, 2016, 2018). Accordingly, the present guidelines have used these literature reviews as the basis for the health risk assessment associated with exposure to radiofrequency EMFs rather than providing another review of the individual studies'*.

In the last 11 years since its previous ICNIRP 2009 statement (7), ICNIRP has not managed to conduct a novel evaluation of health effects from RF radiation. However, as shown in Table I, several of the present ICNIRP members are also members of other committees, such as the EU Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR), the Swedish Radiation Safety Authority (SSM) and the WHO, thus creating a cartel of individuals known to propagate the ICNIRP paradigm on RF radiation (4,5,22,51). In fact, six of the seven expert members of the WHO, including Emelie van Deventer, were also included in ICNIRP (5,7). Therefore, Emilie van Deventer, the team leader of the Radiation Programme at WHO (the International EMF Project), is an observer on the main ICNIRP commission, and SSM seems to be influenced by ICNIRP. Among the current seven external experts (Danker-Hopfe, Dasenbrock, Huss, Harbo Polusen, van Rongen, Röösli and Scarfi), five are also members of ICNIRP, and van Deventer used to be part of SSM.

As discussed elsewhere (5), it is unlikely that a person's evaluation of health risks associated with exposure to RF radiation would differ depending on what group the person belongs to. Therefore, by selecting group members, the final outcome of the evaluation may already be predicted (no-risk paradigm). Additionally, we believe that this may compromise sound scientific code of conduct.

The SCENIHR report from 2015 (52) has been used to legitimate the further expansion of the wireless technology and has been the basis for its deployment in a number of countries. One method, applied in the SCENIHR report, to dismiss cancer risks involves the selective inclusion of studies, excluding studies reporting cancer risks and including some investigations with inferior epidemiological quality. The report has been heavily criticized by researchers with no COI (53): '*In January of 2015, the Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR) published its final opinion on (P)otential health effects of exposure to electromagnetic fields... SCENIHR has not answered the question it was appointed to investigate. The Committee has answered a*

different question, limiting its conclusions to whether certainty or causal effect is established, instead of possibility of health risks... Overall, SCENIHR has not conducted a scientific review process for judging possible health risks. This results in erroneous and deceptive conclusions by failing to conclude such possible health risks do exist. Evidence that SCENIHR has presented clearly and conclusively demonstrates that EMF health risks are possible, and in some cases are established. The Committee is obligated to draw to the attention of the European Commission that EMF is a new and emerging problem that may pose an actual or potential threat'.

Regarding the SSM, only yearly updates are available and no overall evaluations are made. Therefore, no thorough review is presented. Over the years, the ICNIRP has dominated this committee (Table I). Therefore, it is unlikely that the opinion of the SSM will differ from that of the ICNIRP.

In 2014, the WHO launched a draft of a Monograph on RF fields and health for public comments (54). It should be noted that the WHO issued the following statement: '*This is a draft document for public consultation. Please do not quote or cite*'. ICNIRP completely ignored that request and used the aforementioned document. The public consultations on the draft document were dismissed and never published.

In addition to van Deventer, five of the six members (Mann, Feychting, Oftedal, van Rongen, and Scarfi) of the Core Group in charge of the WHO draft were also affiliated with ICNIRP, which constitutes a COI (Table I). Scarfi is a former member of ICNIRP (5). Several individuals and groups sent critical comments to the WHO on the numerous shortcomings in the draft of the Monograph on RF radiation. In general, the WHO never responded to these comments and it is unclear to what extent, if any, they were even considered. Nevertheless, the final version of the WHO 'in-depth review' has never been published. Instead, WHO made a call on October 8, 2019 (Emelie van Deventer), for systematic reviews to analyze and synthesize the available evidence: '*Through this Call, WHO invites eligible teams to indicate their interest in undertaking a systematic review on one (or more) of the following topics: SR1 - Effect of exposure to RF on cancer (human observational studies); SR2 - Effect of exposure to RF on cancer (animal studies); SR3 - Effect of exposure to RF on adverse reproductive outcomes (human observational studies); SR4 - Effect of exposure to RF on adverse reproductive outcomes (animal and in vitro studies); SR5 - Effect of exposure to RF on cognitive impairment (human observational studies; SR6 - Effect of exposure to RF on cognitive impairment (human experimental studies); SR7 - Effect of exposure to RF on symptoms (human observational studies); SR8 - Effect of exposure to RF on symptoms (human experimental studies; SR9 - Effect of exposure to RF on biomarkers of oxidative stress; SR10 - Effect of exposure to heat from any source and pain, burns, cataract and heat-related illness*'.

The authors of the present article were part of a team that applied to review SR1- human cancer. On December 20, 2019, the following reply was received from the WHO Radiation Programme: '*After careful review, we have decided to choose another team for this systematic review*'.

Transparency is of importance for the whole process. Therefore, a query was sent to the WHO requesting information regarding the following points: '*Who did the evaluation of the groups that answered the call? What criteria were applied? How many groups had submitted and who were these? Which groups were finally chosen for the different packages?*'. In spite of sending the request four times, January 2, January 3, April 7 and April 30, 2020, there has been no reply from WHO. This appears to be a secret process behind closed doors. These circumstances have also been reported in Microwave News (55).

It is important to comment on the current ICNIRP evaluation. Notably, on February 27, 2020, two weeks before the ICNIRP publication, the WHO Team on Public Health, Environmental and Social Determinants of Health issued a statement on 5G mobile networks and health: '*To date, and after much research performed, no adverse health effect has been causally linked with exposure to wireless technologies*' (56). This statement is not correct based on current knowledge (4,5,9-11,17,19) and was without a personal signature. The lack of research on 5G safety has been previously discussed (19). Furthermore, there is no evidence that can 'causally link' an adverse effect to an exposure. Causality is no empirical fact, it is an interpretation.

In the following section, only one (cancer) of the eight different end points in the ICNIRP publication (8) is discussed, since it deals with our main research area.

viii) Cancer.

'I*n summary, no effects of radiofrequency EMFs on the induction or development of cancer have been substantiated.*

Summary

The only substantiated adverse health effects caused by exposure to radiofrequency EMFs are nerve stimulation, changes in the permeability of cell membranes, and effects due to temperature elevation. There is no evidence of adverse health effects at exposure levels below the restriction levels in the ICNIRP (1998) guidelines and no evidence of an interaction mechanism that would predict that adverse health effects could occur due to radiofrequency EMF exposure below those restriction levels'.

Comments

The ICNIRP draft (39) has been previously described to some extent (19). The published final version on health effects is virtually similar to the draft. It cannot be taken at face value as scientific evidence of no risk from RF radiation. One example is the following statement (p. 41): '*...a set of case-control studies from the Hardell group in Sweden report significantly increased risks of both acoustic neuroma and malignant brain tumors already after less than five years since the start of mobile phone use, and at quite low levels of cumulative call time'.*

This allegation is not correct according to our publication for glioma (11). In the shortest latency group >1-5 years, the risk of glioma was not increased (odds ratio (OR), 1.1; 95% CI, 0.9-1.4) for use of wireless phones (mobile phone and/or cordless phone). There was a statistically significant increased risk of glioma per 100 h of cumulative use (OR, 1.011; 95% CI, 1.008-1.014) and per year of latency (OR, 1.032; 95% CI,

1.019-1.046) (11). These published results are in contrast to the ICNIRP claims.

Regarding acoustic neuroma, the corresponding detailed results are reported in our previous study (57). The shortest latency period >1-5 years yielded an OR of 1.2 (95% CI, 0.8-1.6) for use of wireless phones; the risk increased per 100 h of cumulative use (OR, 1.008; 95% CI, 1.002-1.014) and per year of latency (OR, 1.056; 95% CI, 1.029-1.085) (57). Therefore, the allegation by ICNIRP is false.

It is remarkable that ICNIRP is uninformed and that their writing is based on a misunderstanding of the peer-reviewed published articles as exemplified above. Additionally, our studies (11,57) and another study by Coureau *et al* (58), as well as the IARC evaluation from 2011 (1,2), are not included among the references. Several statements by ICNIRP are made without any scientific references. On the other hand, the Danish cohort study on mobile phone use (59) is included, in spite of the fact that it was judged by IARC (1,2), as well as in our review (60), to be uninformative. A biased article written by authors including ICNIRP members, used to 'prove' the no-risk paradigm for RF radiation carcinogenesis (23), is cited by ICNIRP. Notably, the article has not undergone relevant peer-review and we believe that it should not have been published in its current version. The shortcomings in the aforementioned article are discussed in the following sections. As discussed below, another claim (23) is incorrect regarding increased risk of brain tumors associated with use of wireless phones: '*However, they are not consistent with trends in brain cancer incidence rates from a large number of countries or regions, which have not found any increase in the incidence since mobile phones were introduced'*.

The criticism of the ICNIRP draft guidelines from 2018 by the EMF call (61) can also be applied to the current ICNIRP publication. The call has been signed by 164 scientists and medical doctors, as well as 95 NGOs: '*The International Commission on Non-Ionizing Radiation Protection (ICNIRP) issued draft Guidelines on 11th July 2018 for limiting exposure to electric, magnetic and electromagnetic fields (100 kHz to 300 GHz).1 These guidelines are unscientific, obsolete and do not represent an objective evaluation of the available science on effects from this form of radiation. They ignore the vast amount of scientific findings that clearly and convincingly show harmful effects at intensities well below ICNIRP guidelines.2 The guidelines are inadequate to protect humans and the environment. ICNIRP guidelines only protect against acute thermal effects from very short and intense exposure. The guidelines do not protect against harmful effects from low-intensity and long-term exposure, such as cancer, reproductive harm, or effects on the nervous system, although these effects are convincingly shown to appear from chronic exposure at intensities below ICNIRP limits.2,3*

ICNIRP's mandate to issue exposure guidelines needs to be seriously questioned. ICNIRP is not independent of industry ties as it claims.12,13 Its opinions are not objective, not representative of the body of scientific evidence, but are biased in favor of industry. It is obvious from their reluctance to consider scientific findings of harm that ICNIRP protects industry, not the public health, nor the environment.

We ask the United Nations, the World Health Organization, and all governments to support the development and consideration of medical guidelines16, that are independent of conflict of interests in terms of direct or indirect ties to industry, that represent the state of medical science, and that are truly protective'.

In the recent report on ICNIRP published by two Members of the European Parliament it is concluded: '*That is the most important conclusion of this report: For really independent scientific advice we cannot rely on ICNIRP. The European Commission and national governments, from countries like Germany, should stop funding ICNIRP. It is high time that the European Commission creates a new, public and fully independent advisory council on non-ionizing radiation'* (22).

Other examples of scientific misrepresentation

Published article. This section discusses an article with conclusions not substantiated by scientific evidence, representing a biased evaluation of cancer risks from mobile phone use and is an example of lack of objectivity and impartiality (23). The aforementioned report was used by ICNIRP 2020 (8) to validate that no risks have been found for brain and head tumors. Therefore, the article should be discussed in further detail.

The aforementioned article has numerous severe scientific deficiencies. One is that the results on use of cordless phones as a risk factor for brain tumors are not discussed. In fact, detailed results on cordless phones in studies by Hardell *et al* (11,57) are omitted.

When discussing glioma risk, all results on cumulative use of mobile phones, as well as ipsilateral or contralateral use associated with tumor localization in the brain, are omitted from the figures in the main text. Some results in the article by Röösli *et al* (23), such as cumulative use, can be found in the Supplementary Material, although the increased risk among heavy users is disregarded (11,57,58,62). In Supplementary Figure 4, all odds ratios regarding long-term (≥10 years) use of mobile phones are above unity (>1.0) for glioma and neuroma (23). No results are provided for ipsilateral mobile phone use (same side of tumor localization and mobile phone use), which is of large biological importance. Results on cumulative use, latency and ipsilateral use are especially important for risk assessment and have shown a consistent pattern of increased risk for brain and head tumors (11,57).

In the aforementioned article, recall bias is discussed as the reason for increased risk (23). The studies by Hardell *et al* (11,57) included all types of brain tumors. In one analysis, meningioma cases in the same study were used as the 'control' entity (11), and still a statistically significant increased risk of glioma was identified for mobile phone use (ipsilateral OR, 1.4; 95% CI, 1.1-1.8; contralateral OR, 1.0; 95% CI, 0.7-1.4) and for cordless phone use (ipsilateral OR, 1.4; 95% CI, 1.1-1.9; contralateral OR, 1.1; 95% CI, 0.8-1.6). If the results were 'explained' by recall bias, similar results would have been obtained for both glioma and meningioma. Thus, this type of analyses would not have yielded an increased glioma risk. Also, for acoustic neuroma a statistically significant increased risk was found using meningioma cases as 'controls' (57). Therefore, the results in the studies by Hardell *et al* (11,57) cannot be explained by a systematic difference in assessment

of exposure between cases and controls. These important methodological findings were disregarded by Röösli *et al* (23).

In the analyses of long-term use of mobile phones, a Danish cohort study on mobile phone use is included (59), which was concluded to be uninformative in the 2011 IARC evaluation (1,2). A methodological shortcoming of the aforementioned study was that only private mobile phone subscribers in Denmark between 1982 and 1995 were included in the exposure group (59). The most exposed group, comprising 200,507 corporate users of mobile phones, were excluded and instead included in the unexposed control group consisting of the rest of the Danish population. Users with mobile phone subscription after 1995 were not included in the exposed group and were thus treated as unexposed at the time of cut-off of the follow up. No analysis of laterality of mobile phone use in relation to tumor localization was performed. Notably, this cohort study is now included in the risk calculations, although Martin Röösli was a member of the IARC evaluation group and should have been aware of the IARC decision. The numerous shortcomings in the Danish cohort study, discussed in detail in a peer-reviewed article (60), are omitted in the article by Röösli *et al* (23).

Regarding animal studies, a study by Falcioni *et al* (14) at the Ramazzini Institute on RF radiation carcinogenesis is only mentioned as a reference, but the results are not discussed. In fact, these findings (14) provide supportive evidence on the risk found in human epidemiology studies (3), as well as the results in the NTP study (12,13).

Furthermore, for incidence studies on brain tumors, the results are not presented in an adequate way. There is a lot of emphasis on the Swedish Cancer Register data (63,64), but the numerous shortcomings in the reporting of brain tumor cases to the register are not discussed. These shortcomings have been presented in detail in a previous study (63), but are disregarded by Röösli *et al* (23).

There is clear evidence from several countries regarding increasing numbers of patients with brain tumors, such as in Sweden (63,64), England (65), Denmark (66) and France (67).

The article by Röösli *et al* (23), does not represent an objective scientific evaluation of brain and head tumor risk associated with the use of wireless phones, and should thus be disregarded. By omitting results of biological relevance and including studies that have been judged to be uninformative, the authors come to the conclusion that there are no risks: '*In summary, current evidence from all available studies including in vitro, in vivo, and epidemiological studies does not indicate an association between MP [mobile phone] use and tumors developing from the most exposed organs and tissues'*.

Röösli *et al* (23), disregard the concordance of increased cancer risk in human epidemiology studies (11,57,58,62) animal studies (12-14,68,69) and laboratory studies (15,16,37). It is unfortunate that the review process of the aforementioned article has not been of adequate quality. Finally, there is no statement in the article of specific funding of this particular work, which is not acceptable. Only a limited number of comments on general funding are provided. It is not plausible that there was no funding for the study. We believe that, due to its numerous limitations, the aforementioned article should not have been published.

CEFALO. In 2011, a case-control study on mobile phone use and brain tumor risk among children and adolescents termed CEFALO was published (70). The study appears to have been designed to misrepresent the true risk, since the following question regarding cordless phone use was asked: '*How often did [child] speak on the cordless phone in the first 3 years he/she used it regularly?'*.

There are no scientific valid reasons to limit the investigation to the first 3 years. The result is a misrepresentation and a wrong exposure classification, since Aydin *et al* (70) willingly omitted any increase in the child's use of and exposure from cordless phone radiation after the first 3 years of use. This unscientific treatment of cordless phone exposure was not mentioned in the article other than in a footnote of a table and in the methods section (70); however, no explanation was provided: '*Specifically, we analyzed whether subjects ever used baby monitors near the head, ever used cordless phones, and the cumulative duration and number of calls with cordless phones in the first 3 years of use'*.

Since previous studies have demonstrated that these phone types, in addition to mobile phones, increase brain tumor risk (11,57), we believe that the exclusion of a complete exposure history on the use of cordless phones represents scientific misconduct.

In a critical comment the authors of the present study wrote: '*Further support of a true association was found in the results based on operator-recorded use for 62 cases and 101 controls, which for time since first subscription >2.8 years yielded OR 2.15 (95% CI 1.07-4.29) with a statistically significant trend (P = 0.001). The results based on such records would be judged to be more objective than face-to-face interviews, as in the study that clearly disclosed to the interviewer who was a case or a control. The authors disregarded these results on the grounds that there was no significant trend for operator data for the other variables - cumulative duration of subscriptions, cumulative duration of calls and cumulative number of calls. However, the statistical power in all the latter groups was lower since data was missing for about half of the cases and controls with operator-recorded use, which could very well explain the difference in the results*' (71).

Our conclusion was that: '*We consider that the data contain several indications of increased risk, despite low exposure, short latency period, and limitations in the study design, analyses and interpretation. The information certainly cannot be used as reassuring evidence against an association, for reasons that we discuss in this commentary*' (71).

This is in contrast to the authors that claimed that the study was reassuring of no risk in a press release from Martin Röösli, July 28, 2011: '*Kein erhöhtes Hirntumorrisiko bei Kindern und Jugendlichen wegen Handys... Die Resultate sind beruhigend*' ['*No increased brain tumour risk in children and adolescents for mobile phone users... The results are reassuring*'] (72).

A similar press release was issued by Maria Feychting at the Karolinska Institute in Stockholm stating: '*Reassuring results from first study on young mobile users and cancer risk… The so called CEFALO study does not show an increased brain tumor risk for young mobile users'* (73). Considering the results and the numerous scientific shortcomings in the study (70), the statements in these press releases are not correct.

Discussion

There is no doubt that several individuals included in Table I are influential, being members, as well as having consulting assignments, in several organizations, such as ICNIRP, BERENIS, the SSM, the Program Electromagnetic Fields and Health from ZonMw in the Netherlands, and the Rapid Response Group for the Japan EMF Information Center (74).

In fact, there appears to be a cartel of individuals working on this issue (75). Associate Professor Martin Röösli has had the chance to provide his view on the content of the present article relating to him. The only message from him was in an e-mail dated January 16, 2020: '*Just to be clear, all my research is funded by public money or not-for -profit fundations [foundations]. I think you will not help an important debate if you spread fake news'*. Obviously, as described in the present article, his comment is not correct considering his funding from the telecom industry (76,77).

As shown in Table I, few individuals, and mostly the same ones, are involved in different evaluations of health risks from RF radiation and will thus propagate the same views on the risks in agencies of different countries associated with the ICNIRP views (4,5). Therefore, it is unlikely that they will change their opinions when participating in different organizations. Furthermore, their competence in natural sciences, such as medicine, is often low or non-existent due to a lack of education in these disciplines (2). Therefore, any chance for solid evaluations of medical issues is hampered. Additionally, it must be concluded that if the 'thermal only' dogma is dismissed, this will have wide consequences for the whole wireless community, including permissions for base stations, regulations of the wireless technology and marketing, plans to roll out 5G, and it would therefore have a large impact on the industry. This may explain the resistance to acknowledge the risk by ICNIRP, EU, WHO, SSM and other agencies. However, the most important aspects to consider are human wellbeing and a healthy environment. Telecoms can make profit in a variety of ways, and wireless is just one of them. They have the capacity to maintain profits by using different techniques, such as optical fiber, that will provide more data with less RF radiation exposure. Particularly when considering the liability, they are incurring in their misguided insistence of wireless expansion that may ultimately catch up to them in the form of lawsuits, such as those previously experienced by asbestos and tobacco companies (78,79).

A recent book describes how deception is used to capture agencies and hijack science (80). There are certain tools that can be used for this. One is to re-analyze existing data using methods that are biased towards predetermined results (23). For example, this can be performed by hiring 'independent experts' to question scientific results and create doubt (81,82). As clearly discussed in a number of chapters of the books (80-82), front groups may be created to gain access to politicians and to influence the public with biased opinions. Other methods may involve intimidating and harassing independent scientists that report health risks based on sound science, or removing all funding from scientists who do not adhere to the no-risk pro-industry paradigm. Another tool would be economic support and courting decision makers with special information sessions that mislead them on science and mask bribery (3,5,19,80-82). An industry with precise marketing goals has a big advantage over a loose scientific community with little funding. Furthermore, access to regulatory agencies and overwhelming them with comments on proposed regulations is crucial (3). To counteract all these actions is time consuming and not always successful (19). Nevertheless, it is important that these circumstances are explored and published in the peer-reviewed literature as historical notes for future use.

Based on the Swiss and ICNIRP experiences, some recommendations can be made. One is to include only unbiased and experienced experts without COIs for evaluation of health risks from RF radiation. All countries should declare a moratorium on 5G until independent research, performed by scientists without any ties to the industry, confirms its safety or not. 2G, 3G, 4G and WiFi are also considered not to be safe, but 5G will be worse regarding harmful biological effects (42,83,84). The authors of the present article recommend an educational campaign to educate the public about the health risks of RF radiation exposure, and safe use of the technology, such as the deployment of wired internet in schools (85), as previously recommended by the European Council resolution 1815 in 2011 (86) and The EMF Scientist Appeal (87). Additionally, it is recommended that the government takes steps to markedly decrease the current exposure of the public to RF radiation, (88,89). Notably, DNA damage has been identified in peripheral blood lymphocytes using the comet assay technique, and in buccal cells using the micronucleus assay, in individuals exposed to RF radiation from base stations (90).

Finally, an alternative approach to the flawed ICNIRP safety standards may be the comprehensive work of the European Academy for Environmental Medicine (EUROPAEM) EMF working group that has resulted in safety recommendations, which are free from the ICNIRP shortcomings (50). Recently, the International Guidelines on Non-Ionising Radiation (IGNIR) have accepted EUROPAEM safety recommendations (91). The Bioinitiative group has recommended similar safety standards based on non-thermal EMF effects (92). WHO and all nations should adopt the EUROPAEM/Bioinitiative/IGNIR safety recommendations, supported by the majority of the scientific community, instead of the obsolete ICNIRP standards.

In conclusion, it is important that all experts evaluating scientific evidence and assessing health risks from RF radiation do not have COIs or bias. Being a member of ICNIRP and being funded by the industry directly, or through an industry-funded foundation, constitute clear COIs. Furthermore, it is recommended that the interpretation of results from studies on health effects of RF radiation should take sponsorship from the telecom or other industry into account. It is concluded that the ICNIRP has failed to conduct a comprehensive evaluation of health risks associated with RF radiation. The latest ICNIRP publication cannot be used for guidelines on this exposure.

Acknowledgements

The authors would like to thank Mr. Reza Ganjavi for valuable comments.

Funding

No funding was received.

Availability of data and materials

Data sharing is not applicable to this article, as no datasets were generated or analyzed during the present study.

Authors' contributions

LH and MC contributed to the conception, design and writing of the manuscript. Both authors read and approved the final manuscript.

Ethics approval and consent to participate

PREAMBLE

This Policy is a contract of insurance between **you** and **us**. **Your** Policy contains all the details of the cover that **we** provide, subject always to **our** receipt of the Premium. This Policy consists of and must be read together with the Declarations and any Endorsements. This Policy is not complete unless it is signed and a Declarations page is attached.

The Sections of this policy are identified by **BLUE LINES** across the page with **WHITE UPPER CASE PRINT**. Clause headings in blue **UPPER CASE PRINT** are for information only and do not form part of the cover given by this Policy. Other terms in **bold lower case print** are defined terms and have a special meaning as set forth in the **DEFINITIONS** section and elsewhere. Words stated in the singular shall include the plural and vice versa. However, this protocol does not apply to the **STATUTORY CONDITIONS** and subsequent Sections.

IMPORTANT: INSURING CLAUSES 1 and **2** provide cover on a claims made basis. Under these **INSURING CLAUSES** a **claim** must be first made against the company named as the Insured in the Declarations or any **subsidiary** during the **period of the policy** and notified to **us** during the **period of the policy** to be covered.

In consideration of the Premium and in reliance upon the information that **you** have provided to **us** prior to commencement of this insurance and which is deemed to form the basis of this insurance:

INSURING CLAUSES

INSURING CLAUSE 1: ERRORS & OMISSIONS

SECTION A: PROFESSIONAL LIABILITY

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** first made against the company named as the Insured in the Declarations or any **subsidiary** and notified to **us** during the **period of the policy** arising out of any:

a) negligent act, error or omission, negligent misstatement or negligent misrepresentation;
b) breach of any contractual term implied by law concerning necessary quality, safety or fitness, or **your** duty to use reasonable care and skill;
c) breach of warranty of authority, breach of duty, breach of trust, breach of confidence, misuse of information or breach of privacy;
d) libel, slander or defamation;
e) dishonesty of **your** directors, partners, officers or **employees** provided that **we** maintain all rights of subrogation to recover such legal **costs and expenses** from any director, partner, officer or **employee** if they are found guilty of such a dishonest act; or
f) other act, error or omission giving rise to civil liability to **your** clients but not any breach of contract save as specified above;

committed by **you** or on **your** behalf in the course of **your business activities**. **We** will also pay **costs and expenses** on **your** behalf.

SECTION B: BREACH OF CONTRACT

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** by a **client** first made against the company named as the Insured in the Declarations or any **subsidiary** and notified to **us** during the **period of the policy** arising out of any **breach of client contract**. **We** will also pay **costs and expenses** on **your** behalf.

SECTION C: INTELLECTUAL PROPERTY RIGHTS INFRINGEMENT

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** first made against the company named as the Insured in the Declarations or any **subsidiary** and notified to **us** during the **period of the policy** arising out of **your** infringement of any **intellectual property right** in the course of **your business activities**. **We** will also pay **costs and expenses** on **your** behalf.

SECTION D: POLLUTION LIABILITY

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** first made against the company named as the Insured in the Declarations or any **subsidiary** and notified to **us** during the **period of the policy** arising out of:

a) pollution or contamination of the atmosphere, or of any water, land, buildings or other property;
b) any enforcement action in connection with the containment, clean-up, removal or treatment of such pollution or contamination.

We will also pay **costs and expenses** on **your** behalf.

SECTION E: LOSS OF DOCUMENTS

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** first made against the company named as the Insured in the Declarations or any **subsidiary** and notified to **us** during the **period of the policy** arising out of destruction of, damage to, loss or mislaying of **your documents** or **documents** in **your** care, custody or control. **We** will also pay **costs and expenses** on **your** behalf.

SECTION F: COMPUTER VIRUS AND HACKING ATTACK

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** first made against the company named as the Insured in the Declarations or any **subsidiary** and notified to **us** during the **period of the policy** as a direct result of:

a) any **third parties**' financial losses arising directly from a **hacking attack** or **virus** that has emanated from or passed through **your** computer systems, or
b) any **third parties**' financial losses arising directly from their inability to access **your** computer systems in the way in which **you** have authorised them to as a direct result of **your** computer systems' failure or impairment due to a **hacking attack** or **virus**, or
c) any **third parties**' financial losses arising directly from the loss or theft of **your** data or data for which **you** are responsible or held to be responsible arising directly from a **hacking attack** or **virus**.

We will also pay **costs and expenses** on **your** behalf.

SECTION G: LOSS MITIGATION

We agree to pay any reasonable costs necessarily incurred by **you** with **our** prior written consent in respect of measures taken by **you** for the sole purpose of avoiding or mitigating a **claim** or potential **claim** for which **you** would be entitled to indemnity under **INSURING CLAUSE 1** of this Policy had such measures not been taken.

SECTION H: PAYMENT OF WITHHELD FEES

We agree to pay **your withheld fees** with **our** prior written consent in the event that **your client** brings or threatens to bring a **claim** against **you** that would be covered under **INSURING CLAUSE 1**, SECTIONS A or B for an amount greater than **your withheld fees** if **you** attempt to recover the **withheld fees** from them. Prior to payment of **your withheld fees you** must obtain written confirmation from **your client** that they will not bring a **claim** against **you** if **you** agree not to pursue them for **your withheld fees** and provide it to **us**.

ALL SECTIONS

We will not make any payment on **your** behalf under any **SECTION** of

this **INSURING CLAUSE** in respect of any **claim** arising directly or indirectly out of **injury** or **damage**:

a) from **products** or **workmanship**; or
b) that did not occur directly as a result of **your business activities**.

INSURING CLAUSE 2: EMPLOYEE BENEFITS LIABILITY

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** first made against the company named as the Insured in the Declarations or any **subsidiary** and notified to **us** during the **period of the policy** arising out of any negligent act, error or omission committed by **you** or on **your** behalf in the **administration** of **your employee benefit program**. **We** will also pay **costs and expenses** on **your** behalf.

Furthermore, **we** agree to pay on **your** behalf any **costs and expenses** necessarily incurred with **our** prior written consent in respect of measures taken by **you** with the object of avoiding or mitigating a **claim** for which **you** would be entitled to indemnity hereunder had such measures not been taken.

INSURING CLAUSE 3: THIRD PARTY LIABILITY

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** arising out of accidental **injury** or **damage** occurring during the **period of the policy** in the course of **your business activities**. **We** will also pay **costs and expenses** on **your** behalf.

However, **we** will not make any payment on **your** behalf under this **INSURING CLAUSE** in respect of any **claim**:

a) which is covered under **INSURING CLAUSE 1**, or would be covered under **INSURING CLAUSE 1** but for the exhaustion of the **limit of liability** or **aggregate limit of liability** of **INSURING CLAUSE 1**;
b) arising directly or indirectly out of any product.

INSURING CLAUSE 4: PRODUCTS LIABILITY

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** arising out of accidental **injury** or **damage** occurring during the **period of the policy** in the course of **your business activities** in connection with any product. **We** will also pay **costs and expenses** on **your** behalf.

However, **we** will not make any payment on **your** behalf under this **INSURING CLAUSE** in respect of any **claim** which is covered under **INSURING CLAUSE 1**, or would be covered under **INSURING CLAUSE 1** but for the exhaustion of the **limit of liability** or **aggregate limit of liability** of **INSURING CLAUSE 1**.

INSURING CLAUSE 5: TENANTS' LEGAL LIABILITY

We agree to pay on **your** behalf all sums which **you** become legally obliged to pay (including liability for claimants' **costs and expenses**) as a result of any **claim** arising out of accidental **damage** to premises leased to, hired by, on loan to or held in trust by **you** or otherwise in **your** care, custody or control occurring during the **period of the policy** in the course of **your business activities**. **We** will also pay **costs and expenses** on **your** behalf.

However, **we** will not make any payment on **your** behalf under this **INSURING CLAUSE** in respect of any **claim**:

a) which is covered under **INSURING CLAUSE 1**, or would be covered under **INSURING CLAUSE 1** but for the exhaustion of the **limit of liability** or **aggregate limit of liability** of **INSURING CLAUSE 1**;
b) arising directly or indirectly out of any product.

INSURING CLAUSE 6: MEDICAL EXPENSES

We agree to pay **medical expenses** for **injury** caused by an accident occurring during the **period of the policy**:

on premises **you** own or rent;

a) on ways next to premises **you** own or rent; or
b) because of **your business activities**;

provided that:

c) the injured person, at the time of the accident, is not entitled to benefits under any workers compensation or disability benefits law or similar law; and
d) the **medical expenses** are incurred and notified to **us** within one year of the date of the accident; and
e) the injured person submits to examination, at **our** expense, by physicians of **our** choice as often as **we** reasonably require.

We will make these payments regardless of fault.

INSURING CLAUSE 7: COMMERCIAL PROPERTY

We agree to reimburse **you** up to the **amount insured** shown in the Declarations for:

a) the cost of repairing **damage** occurring during the **period of the policy** to **your office** buildings, including landlord's fixtures and fittings, walls, gates and fences, yards, car parks and pavements, piping, ducting, cables, wires and associated control gear and accessories on the premises and extending to the public mains but only to the extent of **your** responsibility;
b) **damage** occurring during the **period of the policy** to **contents of every description** contained in **your office**;
c) **damage** occurring during the **period of the policy** to **contents of every description** kept at the home of **your** directors, officers, partners or **employees** in the course of **your business activities**;
d) **damage** occurring during the **period of the policy** to **contents of every description** temporarily elsewhere, including while in transit;
e) the necessary and reasonable costs **you** incur following **damage** occurring during the **period of the policy** to glass which belongs to **you** or for which **you** are legally responsible for:
   i) temporary boarding up;
   ii) repair of window frames or removal or replacement of fixtures and fittings in the course of replacing the glass;
   iii) replacement lettering or other ornamental work and alarm foil on glass;
f) **damage** occurring during the **period of the policy** to **money** held in the course of **your business activities**:
g) in the **office** during business hours, in transit or in a Bank Night Safe;
h) in the **office** outside business hours in a locked safe;
i) at the home of **your** directors, officers, partners or **employees**;
j) **damage** occurring during the **period of the policy** to the personal belongings of **your employees** or visitors to the **office** provided they are not covered under any other insurance;
k) the reasonable cost of compiling the **documents**, books of account, drawings, card index systems or other records including film, tape, disc, drum, cell or other magnetic recording or storage media for electronic data processing that **you** need to continue **your business activities** if these items have been lost or distorted as a direct result of **damage** covered under this **INSURING CLAUSE**;
l) the costs **you** incur to replace locks and keys necessary to maintain the security of **your office** or safes following theft of keys involving force and violence occurring during the **period of the policy**;
m) the amount of any rent for the **office** which **you** are legally obliged to pay for any period during which the **office** or any part of it is unusable as a result of **damage** covered under this **INSURING CLAUSE**.

We also agree to pay:

a) **costs and expenses** on **your** behalf;
b) compensation as shown in the Declarations if any of **your** directors, officers, partners or **employees** who are aged between 16 and 70 on the Inception Date shown in the Declarations suffers an **injury** in the course of **your business activities** in a robbery or attempted robbery and suffers:
   i) death, **permanent total disablement**, **loss of a limb** or **loss of sight** as a direct result of the **injury** within one year of the date of its occurrence;
   ii) **temporary total disablement**. The compensation for **temporary total disablement** will be the amount shown in the Declarations per week, for a maximum of 104 weeks.

However, **we** will not pay compensation under more than one heading in the Declarations for the same **injury**.

INSURING CLAUSE 8: BUSINESS INTERRUPTION

We agree to reimburse **you** up to the **amount insured** shown in the Declarations for **your loss** of **income**, extra expense, **loss** of **research and development expenditure** , **project delay costs** and **accounts receivable** resulting solely and directly from an interruption to **your business activities** caused by:

a) **insured damage** to **your office** or **contents of every description** or to any other property used by **you** at **your office**;
b) **insured damage** to property in the vicinity of **your office** which prevents or hinders **your** access to **your office**;
c) **insured damage** at the premises of one of **your** suppliers, other than a supplier of water, gas, electricity or telephone services;

d) failure in the supply of water, gas, electricity, or telephone services to **your office** for more than 24 consecutive hours caused by **insured damage** to any property;
e) **your** inability to use **your office** due to restrictions imposed by a public authority following:
   i) a murder or suicide;
   ii) an occurrence of a notifiable human disease;
   iii) **injury** traceable to food or drink consumed at **your office**;
   iv) vermin or pests at **your office**.

HOW MUCH WE WILL PAY

The maximum amount payable by **us** for all **claims**, **losses**, **damage**, **costs and expenses** and **medical expenses** shall not exceed the amounts shown in the Declarations in respect of each **INSURING CLAUSE** unless limited below.

However, solely with respect to any claims under this Policy that shall and must be governed by Quebec law on the scope of our liability, we agree to pay costs and expenses in addition to the Limits of Liability stated in the Declarations.

Where more than one **claim** or **loss** arises from the same original cause or single source or event all such **claims** or **losses** shall be deemed to be one **claim** or **loss** and only one **limit of liability** shall be payable in respect of the **aggregate** of all such **claims** or **losses**.

Where cover is provided under multiple **SECTIONS** of **INSURING CLAUSE 1** only one Limit of Liability shall be payable in respect of that **claim**.

In respect of **INSURING CLAUSES 1** to **5 we** may at any time pay to **you** in connection with any **claim** the amount of the **aggregate limit of liability** or **limit of liability** (after deduction of any amounts already paid). Upon such payment being made **we** shall relinquish the conduct and control of and be under no further liability in connection with such **claim** except for the payment of **costs and expenses** incurred prior to the date of such payment (unless the **aggregate limit of liability** or **limit of liability** is stated to be inclusive of **costs and expenses**).

In respect of **INSURING CLAUSE 7** only:
a) At **our** option, **we** will pay for any **damaged** property on the following basis:
   i) for the **office**, the cost of rebuilding or replacing the **damaged** property;
   ii) for **contents of every description**, the cost of repair or replacement as new.
b) If, at the time the **damage** occurs, the **amount insured** is less than 85% of the total value of the **office** or **contents of every description** insured, the amount **we** will pay will be reduced in the same proportion as the **amount insured** bears to the total value of the **office** or **contents of every description** insured.
c) The **amount insured** for the **office** and **contents of every description** will be adjusted monthly in line with any increase in nationally published indices. **We** will not reduce the **amount insured** without **your** consent.

In respect of **INSURING CLAUSE 8** the amount **we** will pay will be:
a) the difference between **your** actual **income** during the **indemnity period** and the **income** it is estimated **you** would have earned during that period or, if this is **your** first trading year, the difference between **your income** during the **indemnity period** and during the period immediately prior to the **loss**, less any savings resulting from the reduced **costs and expenses you** pay out of **your income** during the **indemnity period**; and
b) any additional **costs and expenses**;
c) any **project delay costs** during the **indemnity period**, including the total value of any milestone payments that were due in the **indemnity period** but will no longer be received by **you** either during the **indemnity period** or at any point in the future due to permanent termination of the project;
d) any **research and development expenditure** irrevocably lost during the **indemnity period**; and
e) any **accounts receivable**, provided **you** keep a record of all amounts owed to **you** and keep a copy of the record away from **your office**.

YOUR DEDUCTIBLE

We shall only be liable for that part of each and every **claim**, **loss** or **medical expenses** (which for the purpose of this clause shall be deemed to include all **costs and expenses** incurred) which exceeds the amount of the Deductible stated in the Declarations. Where more than one **claim**, **loss** or **medical expenses** arises from the same original cause or single source or event all such **claims**, **losses** or **medical expenses** shall be deemed to be one **claim**, **loss** or **medical expenses** and only one Deductible will apply.

If any expenditure is incurred by **us** which by virtue of this clause is **your** responsibility then **you** shall reimburse such amount to **us** on **our** request or where possible **we** will deduct such amount from any payment **we** make to **you**.

DEFINITIONS

1. **"Accounts receivable"**
   means:
   a) all sums due to **you** from customers, provided **you** are unable to effect collection thereof as the direct result of **insured damage** to records of accounts receivable;
   b) interest charges on any loan to offset impaired collections pending repayment of such sums made uncollectible by such **insured damage**;
   c) collection expense in excess of normal collection cost and made necessary because of **insured damage**.

2. **"Administration"**
   means:
   a) counseling **employees**, including their dependants and beneficiaries, with respect to **your employee benefit program**;
   b) handling records in connection with **your employee benefit program**;
   c) effecting enrolment or termination of any **employee's** participation in a plan included in **your employee benefit program**;
   d) interpreting **your employee benefit program**.

3. **"Aggregate limit of liability"**
   means the maximum amount payable as stated in the Declarations by **us** in respect of all **claims**, or in respect of all accidents giving rise to **medical expenses**.

4. **"Amount insured"**
   means the maximum amount payable by **us** as shown in the Declarations in respect of each of **INSURING CLAUSES 7** and **8**. The amount applies to each incident of **loss** or **damage** occurring during the **period of the policy** provided always that after the first incident of **loss** or **damage you** comply with **our** recommendations to prevent any further incidents of **loss** or **damage**.

5. **"Breach of client contract"**
   means **your** unintentional breach of a written contract relating to the performance of **your business activities** for a **client**.

6. **"Business activities"**
   means:

a) in respect of **INSURING CLAUSE 1**, the **business activities** as stated in the Declarations.
b) in respect of all other **INSURING CLAUSES**, the **business activities** as stated in the Declarations and shall include, for the purpose of those **business activities**:
   i) the ownership, repair and maintenance of **your** property;
   ii) provision and management of canteen, social, sports and welfare organisations for the benefit of **your** directors, officers, partners or **employees** and medical, fire fighting, and security services;
   iii) attendance at conferences and tradeshows as either an exhibitor or visitor.

7. **"Claim"**
means a demand received by **you** for **money** or services, including the service of suit or institution of arbitration proceedings. "Claim" shall also mean a threat or initiation of a suit seeking injunctive relief (meaning a temporary restraining order or a preliminary or permanent injunction).

8. **"Client"**
means any third party with whom **you** have a written or implied contract in place for the supply of **your business activities** in return for a fee.

9. **"Contents of every description"**
means the contents of **your office** used in connection with **your business activities** which are owned by **you** or for which **you** are legally responsible, including:
   a) computer and ancillary equipment (including monitors, keyboards, printers and software), television and video equipment, photographic, photocopying, surveying and telecommunications equipment;
   b) **documents**, briefs, manuscripts, plans, business books, computers systems records and programs;
   c) goods held in trust, stock and samples;
   d) wines, spirits and tobacco kept for entertainment purposes;
   e) works of art or precious metals;
   f) fixed glass in windows, doors and fanlights, glass showcases, glass shelves, mirrors and sanitary fixtures and fittings;
   g) heating oil for the **office** contained in fixed tanks in the open at the address shown in the Declarations;
   h) tenant's improvements, decorations, fixtures and fittings including, if attached to the building, external signs, aerials and satellite dishes;
   i) pipes, ducting, cables, wires and associated control equipment at the address shown in the Declarations and extending to the public mains.

   "**Contents of every description**" does not include **money** or the personal belongings of **your employees** or visitors to the **office**.

10. **"Costs and expenses"**
means:
   a) in respect of **INSURING CLAUSES 1** (**SECTIONS A** to **F** only) and 2,
      i) **your** legal **costs and expenses** in the defence or settlement of any **claim** made against **you**, and
      ii) **your** legal **costs and expenses** in the defence of any criminal claim made against **you**, provided that **we** maintain all rights of subrogation to recover such legal **costs and expenses** from any director, officer, partner or **employee** if they are found guilty of such a criminal act, and
      iii) the cost of bonds to release attachments but without any obligation to furnish these bonds, and
      iv) interest on that part of any judgment **we** pay that accrues after entry of the judgment and before **we** have paid, offered to pay, or deposited in court the part of the judgment that is within the **limit of liability**.
   b) in respect of **INSURING CLAUSES 3** to **5**,
      i) **your** legal **costs and expenses** in the defence or settlement of any **claim** made against **you**, and
      ii) the cost of bonds to release attachments but without any obligation to furnish these bonds, and
      iii) interest on that part of any judgment **we** pay that accrues after entry of the judgment and before **we** have paid, offered to pay, or deposited in court the part of the judgment that is within the **limit of liability**.
   c) in respect of **INSURING CLAUSES 7** and **8**, the **costs and expenses** incurred by **you** or on **your** behalf in establishing that **you** have sustained a **loss** or **damage** and the quantum of such **loss** or **damage** or the **costs and expenses** incurred by **you** or on **your** behalf in mitigating any such **loss** or **damage**.
   d) in respect of **INSURING CLAUSE 7** only, the necessary and reasonable **costs and expenses you** incur to remove debris from the premises or the area immediately adjacent, following **damage** covered under this **INSURING CLAUSE**.

   Subject to all **costs and expenses** being incurred with the Claims Managers' written consent (such consent not to be unreasonably withheld).

   If **costs and expenses** are shown in the Declarations to be in addition to the **aggregate limit of liability** or **limit of liability** in respect of any of **INSURING CLAUSES 1** to **5**, and if a payment in excess of the amount of indemnity available hereunder has to be made to dispose of any **claim** or number of **claims**, **our** liability for such **costs and expenses** shall be such proportion thereof as the amount of indemnity available hereunder bears to the amount required to dispose of such **claim** or **claims**.

   Costs and expenses are always included in the **amount insured** in respect of **INSURING CLAUSES 7** and **8**.

11. **"Damage/damaged"**
means direct physical damage to, or destruction of, or loss of possession of, or loss of use of, tangible property. In respect of **INSURING CLAUSES 1**, **3** and **4 damage** does not include damage to or destruction of, or loss of possession of, or loss of use of, or corruption of, data.

12. **"Documents"**
means deeds, wills, agreements, maps, plans, records, books, letters, certificates, forms, computer programmes or information stored, written or punched into card or tape or magnetic discs or tapes or any other data media and documents of any nature whatsoever, whether written, printed or reproduced by any other method (other than bearer bonds, coupons, banks notes, currency notes and negotiable instruments).

13. **"Employee"**
means any person employed by the company named as the Insured in the Declarations, or any **subsidiary**. Employee does not include any director, officer or partner of the company named as the Insured in the Declarations, or any **subsidiary**.

14. **"Employee benefit program"**
means group automobile insurance, group homeowners insurance, group life insurance, group dental insurance, group health insurance, profit sharing plans, pension plans, early retirement offerings, employee investment subscription plans, Workers' Compensation, Unemployment Insurance, Social Security, Disability Benefit Insurance, travel, savings or vacation plans or any similar benefit programs.

15. **"Extra expense"**
means the necessary and reasonable extra **costs and expenses you** incur in order to continue **your business activities** during the **indemnity period**.

16. **"Hacking attack"**
means any malicious or unauthorised electronic attack including but not limited to any fraudulent electronic signature, brute force attack, phishing, denial of service attack, that has been initiated by any **third parties** or by any **employees** and that is designed to damage, destroy, corrupt, overload, circumvent or impair the functionality of computer systems, software and ancillary equipment.

17. **"Income"**
means **your** total income from **your business activities**.

18. **"Indemnity period"**
means the period beginning at the date of the **damage**, or the date the restriction is imposed, and lasting for the period during which **your income** or expenditure is affected as a result of such **damage** or restriction, but for no longer than the number of months shown in the Declarations.

19. **"Injury"**
means:
a) in respect of **INSURING CLAUSE 1** death, bodily **injury**, mental **injury**, illness or disease;
b) in respect of all other **INSURING CLAUSES**:
i) death, bodily **injury**, mental **injury**, illness, disease, shock, mental anguish or humiliation; and
ii) false arrest, detention or imprisonment; and
iii) malicious prosecution; and
iv) wrongful entry into, or eviction of a person from, a room, dwelling or premises that the person occupies.

20. **"Insured damage"**
means **damage** to property provided that:
a) the **damage** is covered under **INSURING CLAUSE 7**; or
b) an insurer has paid the claim, or has agreed to pay the claim, under any other insurance covering such **damage**.

21. **"Intellectual property right"**
means any **intellectual property right** including but not limited to trademarks, trade secrets, broadcasting rights, domain names, metatags and copyrights but does not include patents.

22. **"Limit of liability"**
means the maximum amount payable by **us** as stated in the Declarations in respect of each **claim** or **loss**, or in respect of each accident giving rise to **medical expenses**.

23. **"Loss of a limb"**
means loss by physical separation of a hand at or above the wrist, of a foot at or above the ankle, and includes total and irrecoverable loss of use of a hand, arm or leg.

24. **"Loss of sight"**
means total and irrecoverable loss of sight.

25. **"Loss"**
means direct financial loss sustained by **you**.

26. **"Money"**
means cash, bank and currency notes, cheques, travellers' cheques, postal orders, **money** orders, crossed bankers' drafts, current postage stamps, savings stamps and certificates, trading stamps, gift tokens, customer redemption vouchers, company sales vouchers, credit card counterfoils, travellers tickets and contents of franking machines, all belonging to **you**.

27. **"Medical expenses"**
means reasonable expenses for:
a) first aid administered at the time of an accident;
b) necessary medical, surgical, x ray and dental services, including prosthetic devices;
c) necessary ambulance, hospital, professional nursing and funeral services.

28. **"Office"**
means the **office** space (including any outbuildings) **you** occupy at the address shown in the Declarations as more fully described in the application form.

29. **"Period of the policy"**
means the period between the Inception Date shown in the Declarations and the Expiry Date shown in the Declarations or until the Policy is cancelled in accordance with **GENERAL CONDITION 10** of this Policy.

30. **"Permanent total disablement"**
means disablement which entirely prevents the injured person from attending to any business or occupation for which he is reasonably suited by training, education or experience for 24 calendar months and at the expiry of that period being beyond hope of improvement.

31. **"Project delay costs"**
means any additional **costs and expenses** incurred by **you** as a direct result of a delay to a project, including the interest charges incurred from any reasonable loan required as a result of a delayed milestone payment.

32. **"Product"**
means any tangible property (including containers, packaging, labelling or instructions, but explicitly excluding any software, data, or source code) after it has left **your** custody or control which has been designed, specified, formulated, manufactured, constructed, installed, sold, supplied, distributed, treated, serviced, altered, processed, cleaned, renovated or repaired by **you** or on **your** behalf in the course of **your business activities**.

33. **"Research and development expenditure"**
means **your** expenditure on research and development less the cost of reusable materials consumed for the purposes of the research and development.

34. **"Subsidiary"**
means any company which the company named as the Insured in the Declarations controls through:
a) holding 50% or more of the voting rights, or
b) having the right to appoint or remove 50% or more of its board of directors; or
c) controlling alone, pursuant to a written agreement with other shareholders or members, 50% or more of the voting rights therein.

35. **"Temporary total disablement"**
means disablement which entirely prevents the injured person from attending to his business or occupation.

36. **"Third party"**
means any person or company who is not a director, officer, partner or **employee** of the company named as the Insured in the Declarations, or any **subsidiary**.

37. **"Virus"**
means any malicious software code including but not limited to any logic bomb, Trojan horse or worm that has been introduced by any **third parties** or by any **employees** and that is designed to **damage**, destroy, corrupt, overload, circumvent or impair the functionality of computer systems, software and ancillary equipment.

38. **"We/our/us"**
means the Underwriters named in the Declarations.

39. **"Withheld fees"**
means any contractually due fee that **your client** refuses to pay **you**, but excludes any part of the fee that represents **your** profit or mark-up or liability for taxes.

40. **"Workmanship"**
means any physical **workmanship** in manufacture, fabrication, construction, erection, installation, assembly, alteration, servicing, remediation, repair, demolition or disassembly (including any materials, parts or equipment furnished in connection therewith) by **you**.

41. **"Wrongful act"**
means any act or event the subject of **INSURING CLAUSE 1** of this Policy for which **you** have purchased coverage.

42. **"You/your"**
means:
a) the company named as the Insured in the Declarations, or any **subsidiary**, and
b) any past, present or future **employee**, trainee, director, officer or partner of the company named as the Insured in the Declarations or any **subsidiary**.

EXCLUSIONS

We will not

a) make any payment on **your** behalf for any **claim**, or
b) incur any **costs and expenses**, or
c) reimburse **you** for any **loss**, **damage**, legal expenses, fees or costs sustained by **you**, or
d) pay any **medical expenses**:

EXCLUSIONS RELATING TO OTHER INSURANCES:

1. **Marine and aviation**
arising directly or indirectly from the ownership, possession or use by **you** or on **your** behalf of any aircraft, hovercraft, offshore installation, rig, platform or watercraft.

2. **Auto**
arising directly or indirectly from the ownership, possession or use by **you** or on **your** behalf of any motor vehicle or trailer other than **injury** or **damage**:
a) caused by the use of any tool or plant forming part of or attached to or used in connection with any motor vehicle or trailer;
b) occurring beyond the limits of any carriageway or thoroughfare and caused by the loading or unloading of any motor vehicle or trailer;
c) arising out of the use of any motor vehicle or trailer temporarily in **your** custody or control for the purpose of parking;
provided always that **we** will not make any payment on **your** behalf or incur any **costs and expenses** in respect of any legal liability for which compulsory insurance or security is required by legislation or for which a government or other authority has accepted responsibility.

3. **Project-specific insurance**
arising out of any projects for which **you** have purchased project specific insurance.

4. **Product guarantee**
for costs incurred in the repair, alteration, reinstatement, inspection, reconditioning or replacement of any product or part thereof and any financial **loss** consequent upon the necessity for such repair, alteration, reinstatement, inspection, reconditioning or replacement, other than in respect of **INSURING CLAUSE** 1 when **you** are legally obliged to pay these sums to a **client**.

5. **Product recall**
arising directly or indirectly from the recall of any product or part thereof except for **claims** made under **INSURING CLAUSE** 1 where **you** are legally liable for these costs to a third party as the direct result of a **wrongful act** committed or alleged to have been committed by **you**.

6. **Employment practices**
arising out of or resulting from any employer-**employee** relations, policies, practices, acts, omissions, any actual or alleged refusal to employ any person, or misconduct with respect to **employees**.

7. **Employers' liability**
arising directly or indirectly out of **injury** to **your** directors, officers, partners or **employees**.

However, this **EXCLUSION** shall not apply to **employees** on whose behalf contributions are required to be made by **you** under the provisions of any Workers' Compensation Law in respect of whom liability has been denied by any Workers' Compensation authority.

8. **Directors' and Officers'**
arising out of any personal liability incurred by **your** directors or officers when they are acting in that capacity or managing **you**, or arising from any statement, representation or information regarding **your** business contained within any accounts, reports or financial statements.

9. **Double insurance**
for which **you** are entitled to indemnity under any other insurance except for:
a) any additional sum which is payable over and above such other insurance, or
b) any contribution that **we** are obliged to make by law and that contribution shall be in proportion to the respective limits of liability or **amounts insured** of the Policies.

EXCLUSIONS RELATING TO THE CONDUCT OF YOUR BUSINESS:

10. **Benefit laws**
arising directly or indirectly out of **your** failure to comply with the mandatory provisions of any law concerning workers compensation, unemployment insurance, social security, disability benefits or pension benefits.

11. **Circumstances known at inception**
arising out of any circumstances or occurrences which could give rise to a **claim**, **loss** or **damage** under this Policy or any accidents giving rise to **medical expenses** of which **you** are aware, or ought reasonably to be aware, prior to the Inception Date of this Policy, whether notified under any other insurance or not.

12. **Computer failure**
in respect of **INSURING CLAUSES 7** and **8** only, arising directly or indirectly from **loss** or distortion of **your** data or **damage** to **your** electrical or mechanical plant resulting from a failure of **your** computer or ancillary equipment (including monitors, keyboards, printers or software), television or video equipment, photographic, photocopying, surveying or telecommunications equipment. However, **we** will reimburse **you** up to the **amount insured** for **damage** occurring during the **period of the policy** to **your office** computer and ancillary equipment, but only if **your office** computer and ancillary equipment is subject to a manufacturer's guarantee or a maintenance contract providing free parts and labour in the event of a breakdown.

13. **Contractual fines and penalties**
for fines and penalties arising from **your** breach of contract, including any liquidated damages, service credits or associated penalties arising from **your** failure to perform under a service level agreement

14. **Employee benefit program advice**
arising directly or indirectly from:
a) advice given to any person to participate or not to participate in any plan included in your employee benefit program;
b) the failure of any investment to perform as represented by you.

15. **ERISA**
arising out of or resulting from **your** acts related to any pension, healthcare, welfare, profit sharing, mutual or investment plans, funds or trusts; or any violation of any provision of the Employee Retirement Income Security Act of 1974, or any amendment to the Act or any violation of any regulation, ruling or order issued pursuant to the Act.

16. **Failure to ensure feasibility of contracts**
arising from any contract where before entering into or amending the contract **you** failed to take reasonable steps to ensure that **you** could fulfil all **your** obligations in accordance with the terms of the contract.

17. **Faulty workmanship**
arising from **damage** to **your** property or **office** caused directly or indirectly by misuse, inadequate or inappropriate maintenance, faulty **workmanship**, defective design, the use of faulty materials or whilst being cleaned, worked on or maintained.

18. **Hazardous devices**
arising directly or indirectly from any product which with **your** knowledge is intended for incorporation into the structure,

machinery or controls of any aircraft, other aerial device, military vehicle, hovercraft, waterborne craft or any medical equipment.

19. **Legal Action**
where action for damages is brought in a court of law outside the territories specified in the Declarations, or where action is brought in a court of law within those territories to enforce a foreign judgement whether by way of reciprocal agreement or otherwise.

20. **Limiting recovery rights**
arising directly or indirectly out of **your** failure to take reasonable steps to ensure that **our** rights of recovery against any third party are not unduly restricted or financially limited by a specific term in any contract or agreement.

21. **Patents**
arising out of the actual or alleged infringement of any patent or inducing the infringement of any patent.

22. **Retroactive Date**
in respect of **INSURING CLAUSES 1** and **2** only, arising out of any actual or alleged **wrongful act** or negligent act, error or omission committed before the date specified as the Retroactive Date in the Declarations.

23. **RICO**
for or arising out of any actual or alleged violation of the Organised Crime Control Act of 1970 (commonly known as the Racketeer Influenced and Corrupt Organisation Act or RICO), as amended, or any regulation promulgated thereunder or any similar federal, state or local law, whether such law is statutory, regulatory or common law.

24. **SEC**
for or arising out of the actual or alleged violation of the Securities Act of 1933, the Securities Exchange Act of 1934, or any similar state or federal law, or any amendment to the above laws or any violation of any order, ruling or regulation issued pursuant to the above laws.

25. **Unjust enrichment**
in respect of **INSURING CLAUSE 1** only, for that part of any **claim** that results in **you** being in a better financial position as a direct result of **your wrongful act** than **you** would have been if **you** had not committed the **wrongful act**.

26. **Water ingress (applicable to British Columbia only)**
arising out of, or relating directly or indirectly to, in whole or in part, the **infiltration of precipitation** into the **building envelope** of a building located in the Province of British Columbia, or into a **multi-unit building** located in the Province of British Columbia.

    For the purposes of this exclusion the following definitions are added to the Policy:

    Multi-unit building means a building containing more than one unit, whether that unit is used for residential, industrial or any other purpose.

    Building envelope means the assemblies, components, and materials of a building which are intended to separate and protect the interior space of a building from the adverse effects of exterior climactic conditions.

    Infiltration of precipitation means, but is not limited to, the actual, alleged, threatened, or possible infiltration, migration, presence, accumulation, condensation or dispersal of water or moisture on, in, or into the **building envelope**.

27. **Wilful or dishonest acts of directors**
in respect of **INSURING CLAUSES 1** and **2** only, arising out of any wilful, malicious, reckless or dishonest act or omission by any director, partner or officer of the company named as the Insured in the Declarations or any **subsidiary**, unless such person had already ceased to be a director, partner or officer of the company named as the Insured in the Declarations and all **subsidiaries** at the time of their first wilful, malicious, reckless or dishonest act or omission, or unless specifically covered under **INSURING CLAUSE 1 SECTION A (e)**. **We** will not provide any cover for any director, partner or officer of the company named as the Insured in the Declarations or any **subsidiary** who commits, condones or ignores any dishonesty.

GENERAL INSURANCE EXCLUSIONS:

28. **Antitrust**
for or arising out of any actual or alleged antitrust violation, restraint of trade, unfair competition, false, deceptive or unfair trade practices, violation of consumer protection laws or false or deceptive advertising unless insurable under the applicable law.

29. **Asbestos**
arising from or contributed to by the manufacturing, mining, use, sale, installation, removal, distribution of or exposure to asbestos, materials or **products** containing asbestos, or asbestos fibres or dust, unless arising directly from a **wrongful act** committed by **you**:
    a) on or after 1st January 1990, or
    b) on or after the date specified as the Retroactive Date in the Declarations,
    c) whichever is the later, in the course of **your business activities**.

30. **Associated companies**
    a) in respect of any **claim** made by any company firm or partnership in which the company named as the Insured in the Declarations has an executive or financial interest, unless such **claim** emanates from an independent **third party**; or
    b) in respect of any **claim** made by any company firm partnership or individual which has an executive or financial interest in the company named as the Insured in the Declarations or any **subsidiary**, unless such **claim** emanates from an independent **third party**; or
    c) arising out of or resulting from any of **your** activities as a trustee, partner, officer, director or **employee** of any **employee** trust, charitable organization, corporation, company or business other than that of the company named as the Insured in the Declarations or any **subsidiary**; or
    d) in respect of any **claim** made by or on behalf of the company named as the Insured in the Declarations or any **subsidiary**.

31. **Earthquake**
in respect of **INSURING CLAUSES 7** and **8** only, caused by earthquake, except for:
    a) ensuing **loss** or **damage** which results directly from fire, explosion, smoke or leakage from fire protective equipment; or
    b) ensuing **damage** to **contents of every description** while in transit.

32. **Electromagnetic fields**
directly or indirectly arising out of, resulting from or contributed to by electromagnetic fields, electromagnetic radiation, electromagnetism, radio waves or noise.

33. **Flood**
in respect of **INSURING CLAUSES 7** and **8** only, caused by flood, including waves, tides, tidal waves, or the rising of, the breaking out, or the overflow, of any body of water whether natural or manmade, but this **EXCLUSION** does not apply to:
    a) ensuing **loss** or **damage** which results directly from fire, explosion, smoke or leakage from fire protective equipment; or
    b) ensuing **damage** to **contents of every description** while in transit.

34. **Fines**
for fines, penalties, civil or criminal sanctions and for punitive, multiple or exemplary damages unless insurable under the applicable law.

35. **Insolvency**
arising out of or relating directly or indirectly from **your** insolvency or bankruptcy, or the insolvency or bankruptcy of any third party. Furthermore, no coverage is provided under **INSURING CLAUSE 8** if **you** become insolvent or bankrupt.

36. **Land or water**
arising directly or indirectly from **damage** to land or water within or

below the boundaries of any land or premises presently or at any time previously owned or leased by **you** or otherwise in **your** care, custody or control.

37. **Miscellaneous property exclusions**
in respect of **INSURING CLAUSES 7** and **8** only, arising directly or indirectly from:
a) wear and tear, inherent defect, rot, vermin or infestation, or any gradually operating cause;
b) dryness or humidity, being exposed to light or extreme temperatures, unless the **damage** is caused by storm or fire;
c) coastal or river erosion;
d) theft from an unattended vehicle unless the item is out of sight;
e) frost, other than **damage** due to water leaking from burst pipes forming part of the permanent internal plumbing provided the **office** is occupied and in use;
f) arising directly or indirectly from unexplained **loss** or disappearance or inventory shortage of **your** property;
g) a **hacking attack** or **virus**.

38. **Nuclear**
arising directly or indirectly from or contributed to by :
a) ionising radiations or contamination by radioactivity from any nuclear fuel or from any nuclear waste from the combustion of nuclear fuel;
b) the radioactive, toxic, explosive or other hazardous properties of any explosive nuclear assembly or nuclear component thereof.

39. **Pollution**
arising directly or indirectly out of :
a) pollution or contamination of the atmosphere, or of any water, land, buildings or other property;
b) any enforcement action in connection with the containment, clean-up, removal or treatment of such pollution or contamination;
but this **EXCLUSION** shall not apply in respect of :
i) **INSURING CLAUSE 1**, **SECTION D**; or
ii) **INSURING CLAUSES 7** and **8** to the backing up of sewers, sumps, septic tanks or drains.

40. **Toxic mould / fungus**
arising directly or indirectly from any loss, **injury**, **damage**, costs or expenses, including, but not limited to, losses, **damage**, costs or expenses related to, arising from or associated with clean-up, remediation, containment, removal or abatement, caused directly or indirectly, in whole or in part, by:
a) any **fungus**, **mould**, mildew or yeast, or
b) any **spore** or toxins created or produced by or emanating from such **fungus**, **mould**, mildew or yeast, or
c) any substance, vapour, gas, or other emission or organic or inorganic body or substance produced by or arising out of any **fungus**, **mould**, mildew or yeast, or
d) any material, product, building component, building or structure, or any concentration of moisture, water or other liquid within such material, product, building component, building or structure, that contains, harbours, nurtures, or acts as a medium for any **fungus**, **mould**, mildew, yeast or **spore** or toxins emanating therefrom,

regardless of any other cause, event, material, product or building component that contributed concurrently or in any sequence to that loss, **injury**, **damage**, cost or expense.

However, this **EXCLUSION** shall not apply in respect of **INSURING CLAUSE 1** where the **loss**, **injury**, **damage**, costs or expenses arose directly from a **wrongful act** committed by **you** in the course of **your business activities**.

For the purposes of this **EXCLUSION** the following definitions are added to the Policy:

Fungus includes, but is not limited to, any plants or organisms belonging to the major group Fungi, lacking chlorophyll, and including **moulds**, rusts, mildews, smuts and mushrooms.

Mould includes, but is not limited to, any superficial growth produced on damp or decaying organic matter or on living organisms, and **fungi** that produced moulds.

Spore means any dormant or reproductive body produced by or arising from or emanating out of any **fungus**, **mould**, mildew, plants, organisms or microorganisms.

41. **Trade Debt**
arising out of or in connection with any trading losses or trading liabilities incurred by any business managed or carried on by **you**, or any **loss** of **your** profit arising from the **loss** of any **client**, account or business.

42. **War and terrorism**
directly or indirectly caused by, resulting from or in connection with any of the following regardless of any other cause or event contributing concurrently or in any other sequence to the **claim**, **loss**, **damage**, **costs and expenses** or **medical expenses**;
a) war, invasion, acts of foreign enemies, hostilities or warlike operations (whether war be declared or not), civil war, rebellion, insurrection, civil commotion assuming the proportions of or amounting to an uprising, military or usurped power; or
b) any **act of terrorism**.

For the purpose of this **EXCLUSION** an **act of terrorism** means an act, including but not limited to the use of force or violence or the threat thereof, of any person or groups of persons, whether acting alone or on behalf of or in connection with any organisations or governments, committed for political, religious, ideological or similar purposes including the intention to influence any government or to put the public, or any section of the public, in fear.

This **EXCLUSION** also excludes **claims**, **losses**, **damage**, **costs and expenses** or **medical expenses** of whatsoever nature directly or indirectly caused by, resulting from or in connection with any action taken in controlling, preventing, suppressing or in any way relating to a) or b) above.

This **EXCLUSION** does not apply to any **claim** or **loss** arising directly from a **hacking attack** or **virus**.

GENERAL CONDITIONS

1. **What you must do in the event of a claim or loss**
Should any director, partner, or senior executive officer of the company named as the Insured in the Declarations and any **subsidiary** become aware of any **claim**, **loss** or **damage** or of any situation that could give rise to a **claim** or **loss** or should an allegation, complaint or **claim** be made or intimated against **you**, the following obligations must be complied with by **you**:
a) **You** must not admit liability for or settle or make or promise any payment in respect of any **claim**, **loss** or **damage** which may be covered under this Policy. Neither must **you** incur any **costs** or **expenses** in connection with such a **claim**, **loss** or **damage** without **our** written consent. However, **you** should arrange for any urgent repairs following **damage** covered under **INSURING CLAUSE 7** to be done immediately. Before any other repair work begins **we** have the right to inspect **your damaged** property. **We** will notify **you** if **we** intend to do this.
b) The Claims Managers, as specified in the Declarations, must be notified as soon as is reasonably possible if during the **period of the policy**:
i) **you** suffer any **loss** or **damage** that could be covered by this Policy or any allegation, complaint or **claim** is made or intimated against **you**, whether verbal or made in writing.
ii) any director, partner, or senior executive officer of the company named as the Insured in the Declarations and any **subsidiary** become aware of the intention of any person to make a complaint allegation or **claim** against **you**, whether verbal or in writing. Once notice has been

made to **us**, **we** will regard any subsequent **claim** that may arise as notified under this Policy.

iii) **you** become aware of an action of yours that could give rise to a **loss**, allegation, complaint or **claim** being made or intimated against **you**. Once notice has been made **we** will regard any subsequent **claim** that may arise as notified under this Policy.

iv) **you** discover reasonable cause for suspicion of fraud or dishonesty whether this could give rise to a **claim** under this Policy or not and **we** shall not be liable under this Policy for any **claim** or **loss** sustained in consequence of any fraudulent or dishonest act or omission committed after the date of such discovery.

We have nominated the Claims Managers to accept notice on **our** behalf.

Due to the nature of the coverage offered by this Policy, any unreasonable delay by any director, partner, or senior executive officer of the company named as the Insured in the Declarations and any **subsidiary** in notifying the Claims Managers of (i), (ii), (iii) or (iv) above could lead to the size of the **claim**, **loss** or **damage** increasing or to **our** rights being restricted. **We** shall not be liable for that portion of any claim that is due to any unreasonable delay in any director, partner, or senior executive officer of the company named as the Insured in the Declarations and any **subsidiary** notifying the Claims Managers of any **claim**, **loss** or **damage** in accordance with this **GENERAL CONDITION**.

c) **We** will expect **you** to provide **us** with full and accurate information about any matter that **you** notify to **us** under **your** obligations set out above. Once notice has been made **you** must give the Claims Managers all the assistance and information that is reasonably required. **You** must follow their advice and do anything that they reasonably require **you** to do to avoid, minimise, settle or defend any **claim**, **loss** or **damage**.

If **you** think a crime has been committed **you** must report it to the appropriate law enforcement authorities. **You** must also permit the Claims Managers and any other parties that are appointed by the Claims Managers to notify the appropriate law enforcement authorities of any **claim**, **loss** or **damage** where this action is deemed necessary, and **you** must comply with the advice given by such authorities.

If any of **your** computer or ancillary equipment is lost or stolen while it is temporarily removed from the **office**, **we** will not make any payment unless **you** report the **loss** to the police within 48 hours after **you** become aware of it.

2. **Continuous cover**

If **you** have neglected, through error or oversight only, to report a **claim** made against **you** during the period of a previous renewal of this Policy issued to **you** by **us**, then provided that **you** have maintained uninterrupted insurance of the same type with **us** since the expiry of that earlier Policy, then, notwithstanding **EXCLUSION 11**, **we** will permit the matter to be reported under this Policy and will indemnify **you**, provided that:

a) the indemnity will be subject to the applicable **aggregate limit of liability** or **limit of liability** of the earlier Policy under which the matter should have been reported or the **aggregate limit of liability** or **limit of liability** of the current Policy, whichever is the lower;

b) **we** may reduce the indemnity entitlement by the monetary equivalent of any prejudice which has been suffered as a result of the delayed notification;

c) the indemnity will be subject in addition, to all of the terms, **CONDITIONS**, **DEFINITIONS** and **EXCLUSIONS**, other than the **aggregate limit of liability** or **limit of liability**, contained in this current Policy.

3. **Fraudulent claims**

If **you** notify **us** of any claim knowing that claim to be false or fraudulent in any way, **we** shall have no responsibility to pay that claim or any other claims under this insurance and the Policy will be treated as if it had not been effected.

4. **Agreement to pay claims**

We have the right and duty to take control of and conduct in **your** name the investigation settlement or defence of any **claim**. **We** shall also pay on **your** behalf **costs and expenses** incurred with **our** prior written consent (subject to the Limits of Liability and applicable Deductible shown in the Declarations) provided that **we** shall not

a) pay for the **costs and expenses** of any part of a **claim** that is not covered by this Policy.

b) incur any **costs and expenses** in the defence of any **claim** unless there is a reasonable prospect of success, taking into account the commercial considerations of the costs of defence.

We shall always endeavour to settle any **claim** through negotiation, mediation or some other form of alternative dispute resolution and shall pay on **your** behalf the amount so agreed by **us** and the claimant. If **we** cannot settle by such means, **we** shall pay the amount which **you** are found liable to pay either in court or through arbitration proceedings, subject always to the **limit of liability** shown in the Declarations.

If **you** refuse to consent to a settlement that **we** recommend and that the claimant will accept, **you** must then defend, investigate or settle the **claim** at **your** own expense. As a consequence of **your** refusal, **our** liability for any **claim** shall not be more than the amount that **we** could have settled the **claim** for had **you** consented, plus any **costs and expenses** incurred prior to the date of such refusal.

5. **Innocent non-disclosure**

We will not seek to avoid the Policy or reject any **claim** on the grounds of non-disclosure or misrepresentation except where the non-disclosure or misrepresentation was reckless or fraudulent or **you** failed to conduct a full inquiry prior to providing the information that forms the basis of this insurance. In the event that **we** seek to avoid the Policy or reject any **claim** on this basis the burden of proving otherwise rests solely with **you**.

6. **Your duty to advise us of changes**

If **you** become aware that any of the information that **you** have given **us** in the Application Form or elsewhere in connection with **your** application for this insurance has materially changed then **you** must advise **us** as soon as is practicable. In this event, **we** reserve the right to amend the terms, conditions or premium of the Policy.

7. **Risk management conditions**

If **we** attach any additional conditions to **your** Policy regarding any risk survey or risk management timetable or any other similar conditions then it is **your** responsibility to ensure that these conditions are complied with by the deadlines shown in the conditions.

8. **Our rights of recovery**

If any payment is made under this Policy in respect of a **claim**, **loss** or **damage** and there is available to **us** any of **your** rights of recovery against any other party then **we** maintain all such rights of recovery. **We** shall not exercise these rights against any past, present or future **employee**, director, officer or partner of the company named as the Insured in the Declarations or any **subsidiary**, unless such payment is in respect of any wilful, malicious or dishonest acts or omissions. **You** must do nothing to impair any rights of recovery. At **our** request **you** will bring proceedings or transfer those rights to **us** and help **us** to enforce them. Any recoveries shall be applied as follows:

a) first, to **us** up to the amount of **our** payment on **your** behalf including **costs and expenses**;

b) then to **you** as recovery of **your** Deductible or other amounts paid as compensation or **costs and expenses**.

9. **Waiver of subrogation**

Notwithstanding **GENERAL CONDITION 8** above **we** agree to waive **our** rights of subrogation against a responsible third party **client** of yours but only if **you** and **your client** have entered into a contract that contains a provision requiring **us** to do this.

10. **Cancellation**
This Policy may be cancelled:
a) by **you** at any time on request; or
b) by **us** if **we** give **you** 30 days written notice, or
c) by **us** if **we** give **you** 15 days written notice, should any amount in default not be paid within 15 days of the due date shown in the Debit Note that accompanies this Policy.

If **you** give **us** notice of cancellation in accordance with a) above, the earned Premium shall be computed at pro rata to the number of days that the Policy is in effect subject to a minimum amount of 30% of the Premium.

If **we** give **you** notice of cancellation in accordance with b) or c) above, the Premium shall be computed at pro rata to the number of days that the Policy is in effect.

The Policy Administration Fee shall be deemed fully earned upon inception of the Policy.

11. **Prior subsidiaries**
In respect of **INSURING CLAUSE 1** only, should an entity cease to be a **subsidiary** after the Inception Date of this Policy, cover in respect of such entity shall continue as if it was still a **subsidiary**, until the termination of this Policy, but only in respect of any **claim** or **loss** that arises out of any act, error or omission committed by that entity prior to the date that it ceased to be a **subsidiary**.

12. **Mergers and acquisitions**
During the **period of the policy**, if the company named as the Insured in the Declarations or any **subsidiary**
a) purchases assets or acquires liabilities from another entity in an amount greater than 10% of the assets of the company named as the Insured in the Declarations as listed in its most recent financial statement; or
b) acquires another entity whose annual revenues are more than 10% of the annual revenues of the company named as the Insured in the Declarations for their last completed financial year;
then **you** shall have no coverage under this Policy for any **claim**, **loss** or **damage** that arises directly or indirectly out of the purchased or acquired entity unless the company named as the Insured in the Declarations gives **us** written notice prior to the purchase or acquisition, obtains **our** written consent to extend coverage to such additional entities, assets or exposures, and agrees to pay any additional premium required by **us**.

If during the **period of the policy** the company named as the Insured in the Declarations consolidates or merges with or is acquired by another entity, then all coverage under this Policy shall terminate at the date of the consolidation, merger or acquisition unless **we** have issued an endorsement extending coverage under this Policy, and the company named as the Insured in the Declarations has agreed to any additional premium and terms of coverage required by **us**.

13. **Extended reporting period**
In respect of **INSURING CLAUSES 1** and **2** only, an Extended Reporting Period of 60 days following the Expiry Date as shown in the Declarations shall be automatically granted hereunder at no additional premium. Such Extended Reporting Period shall cover **claims** first made and reported to **us** during this 60 day Extended Reporting Period but only in respect of any act, error or omission committed prior to the date of cancellation or non-renewal, and subject to all other terms, conditions and exclusions of the policy. No **claim** shall be accepted by **us** in this 60 day Extended Reporting Period if **you** are entitled to indemnity under any other insurance, or would have been entitled to indemnity under such insurance but for the exhaustion thereof.

14. **Optional extended reporting period**
In respect of **INSURING CLAUSES 1** and **2** only, in the event of:
a) cancellation or non-renewal of this Policy by **us**, or
b) cancellation or non-renewal of this Policy by **you** because **you** have ceased to trade as the direct result of the retirement or death of all of **your** directors, officers or partners;

then **you** shall have the right, upon payment of the Optional Extended Reporting Period Premium shown in the Declarations in full and not proportionally or otherwise in part, to have issued an endorsement providing a 365 day Optional Extended Reporting Period from the cancellation or non-renewal date. Such Optional Extended Reporting Period shall cover **claims** first made against the company named as the Insured in the Declarations or any **subsidiary** and notified to **us** during this Optional Extended Reporting Period but only in respect of any **claim** arising out of any act, error or omission committed prior to the date of cancellation or non-renewal, and subject to all other terms, conditions and exclusions of the policy.

In order for **you** to invoke the Optional Extended Reporting Period option, the payment of the Optional Extended Reporting Period Premium shown in the Declarations for this Optional Extended Reporting Period must be paid to **us** within 15 days of the date of the non-renewal or cancellation.

At the commencement of this Optional Extended Reporting Period the entire premium shall be deemed earned and in the event that **you** terminate the Optional Extended Reporting Period for any reason prior to its natural expiration, **we** will not be liable to return any premium paid.

The right to the Extended Reporting Period or the Optional Extended Reporting Period shall not be available to **you** where:
a) Cancellation or non-renewal by **us** is due to non-payment of premium, or
b) Cancellation or non-renewal by **us** is due to **your** failure to pay such amounts in excess of the applicable **Limit of Liability** or within the amount of the applicable Deductible as is required by this Policy in the payment of **claims**.

At the renewal of this Policy, **our** quotation of different premium, Deductible or **Limit of Liability** or changes in policy language shall not constitute non-renewal by **us** for the purposes of granting this Optional Extended Reporting Period.

In no event shall the granting of the Extended Reporting Period or the Optional Extended Reporting Period increase **our Limit of Liability**, including **costs and expenses**, as shown in the Declarations.

15. **Choice of law**
This Policy shall be interpreted under, governed by and construed in all respects in accordance with the law of the jurisdiction of the place of registration of the company named as the Insured in the Declarations and for this purpose, we and you agree to submit to the exclusive jurisdiction of the courts within the territorial limits and jurisdiction of the place of registration of the company named as the Insured in the Declarations.

In any action to enforce our obligations under this Policy we can be designated or named as "Lloyd's Underwriters" and such designation shall be binding on Lloyd's Underwriters liable under this Policy as if we had each been individually named as defendant. Service of such proceedings may validly be made upon the Attorney In Fact in Canada for Lloyd's Underwriters, whose address for such service is 1155, rue Metcalfe, Suite 2220, Montreal, Quebec, H3B 2V6.

STATUTORY CONDITIONS

1. **Misrepresentation**
If a person applying for insurance falsely describes the property to the prejudice of the Insurer, or misrepresents or fraudulently omits to communicate any circumstance that is material to be made known to the Insurer in order to enable it to judge of the risk to be undertaken, the contract is void as to any property in relation to which the misrepresentation or omission is material.

2. **Property of others**
Unless otherwise specifically stated in the contract, the Insurer is not liable for loss or damage to property owned by any person other than the Insured, unless the interest of the Insured therein is stated in the contract.

3. **Change of interest**
The Insurer is liable for loss or damage occurring after an authorized assignment under the Bankruptcy Act or change of title by succession, by operation of law, or by death.

4. **Material change**
Any change material to the risk and within the control and knowledge of the Insured avoids the contract as to the part affected thereby, unless the change is promptly notified in writing to the Insurer or its local agent; and the Insurer when so notified may return the unearned portion, if any, of the premium paid and cancel the contract, or may notify the Insured in writing that, if he desires the contract to continue in force, he must within fifteen (15) days of the receipt of the notice, pay to the Insurer an additional premium; and in default of such payment the contract is no longer in force and the Insurer shall return the unearned portion, if any, of the premium paid.

5. **Termination**
1. This contract may be terminated:
   a) by the Insurer giving to the Insured fifteen (15) days' notice of termination by registered mail or five (5) days' written notice of termination personally delivered;
   b) by the Insured at any time on request.
2. Where this contract is terminated by the Insurer:
   a) the Insurer shall refund the excess of premium actually paid by the Insured over the pro rata premium for the expired time, but in no event, shall the pro rata premium for the expired time be less than any minimum retained premium specified; and
   b) the refund shall accompany the notice unless the premium is subject to adjustment or determination as to amount, in which case the refund shall be made as soon as practicable.
3. Where this contract is terminated by the Insured, the Insurer shall refund as soon as practicable the excess of the premium actually paid by the Insured over the short rate premium for the expired time, but in no event shall the short rate premium for the expired time, be deemed to be less than any minimum retained premium specified.
4. The refund may be made by money, postal or express company money order or cheque payable at par.
5. The fifteen (15) days mentioned in clause (1) (a) of this condition commences to run on the day following the receipt of the registered letter at the post office to which it is addressed.

6. **Requirements after loss**
1. Upon the occurrence of any loss of or damage to the insured property, the Insured shall, if the loss or damage is covered by the contract, in addition to observing the requirements of Conditions 9, 10 and 11:
   a) forthwith give notice thereof in writing to the Insurer;
   b) deliver as soon as practicable to the Insurer a proof of loss verified by a statutory declaration,
      i) giving a complete inventory of the destroyed and damaged property and showing in detail quantities, costs, actual cash value and particulars of amount of loss claimed,
      ii) stating when and how the loss occurred, and if caused by fire or explosion due to ignition, how the fire or explosion originated, so far as the Insured knows or believes,
      iii) stating that the loss did not occur through any wilful act or neglect or the procurement, means or connivance of the Insured,
      iv) showing the amount of other insurance and the names of other Insurers,
      v) showing the interest of the Insured and of all others in the property with particulars of all liens, encumbrances and other charges upon the property,
      vi) showing any changes in title, use, occupation, location, possession or exposures of the property since the issue of the contract,
      vii) showing the place where the property insured was at the time of loss,
   c) if required give a complete inventory of undamaged property and showing in detail quantities, cost, actual cash value;
   d) if required and if practicable, produce books of account, warehouse receipts and stock lists, and furnish invoices and other vouchers verified by statutory declaration, and furnish a copy of the written portion of any other contract.
2. The evidence furnished under Clauses 1 (c) and (d) of this condition shall not be considered proofs of loss within the meaning of Statutory Conditions 12 and 13.

7. **Fraud**
Any fraud or wilfully false statement in a statutory declaration in relation to any of the above particulars, vitiates the claim of the person making the declaration.

8. **Who may give notice and proof**
Notice of loss may be given, and proof of loss may be made, by the agent of the Insured named in the contract in case of absence or inability of the Insured to give the notice or make the proof, and absence or inability being satisfactorily accounted for, or in the like case, or if the Insured refuses to do so, by a person to whom any part of the insurance money is payable.

9. **Salvage**
1. The Insured in the event of any loss or damage to any property insured under the contract, shall take all reasonable steps to prevent further damage to any such property so damaged and to prevent damage to other property insured hereunder including, if necessary, its removal to prevent damage or further damage thereto.
2. The Insurer shall contribute pro rata towards any reasonable and proper expenses in connection with steps taken by the Insured and required under subparagraph 1 of this condition according to the respective interests of the parties.

10. **Entry, control, abandonment**
After loss or damage to insured property, the Insurer has an immediate right of access and entry by accredited agents sufficient to enable them to survey and examine the property, and to make an estimate of the loss or damage, and after the Insured has secured the property, a further right of access and entry sufficient to enable them to make appraisal or particular estimate of the loss or damage, but the Insurer is not entitled to the control or possession of the insured property, and without the consent of the Insurer there can be no abandonment to it of insured property.

11. **Appraisal**
In the event of disagreement as to the value of the property insured, the property saved or the amount of the loss, those questions shall be determined by appraisal as provided under the Insurance Act before there can be any recovery under this contract whether the right to recover on the contract is disputed or not, and independently of all other questions. There shall be no right to an appraisal until a specified demand therefor is made in writing and until after proof of loss has been delivered.

12. **When loss payable**
The loss is payable within sixty (60) days after completion of the proof of loss, unless the contract provides for a shorter period.

13. **Replacement**
1. The Insurer, instead of making payment, may repair, rebuild, or replace the property damaged or lost, giving written notice of its intention so to do within thirty days after receipt of the proofs of loss.
2. In that event the Insurer shall commence to so repair, rebuild or replace the property within forty-five (45) days after receipt of the proofs of loss, and shall thereafter proceed with all due diligence to the completion thereof.

14. **Action**
Every action or proceeding against the Insurer for the recovery of any claim under or by virtue of this contract is absolutely barred unless commenced within one year next after the loss or damage occurs.

15. **Notice**
Any written notice to the Insurer may be delivered at, or sent by registered mail to, the chief agent or head office of the Insurer in the

PRIVACY NOTICE

By purchasing insurance from certain Underwriters at Lloyd's, London ("Lloyd's"), a customer provides Lloyd's with his or her consent to the collection, use and disclosure of personal information, including that previously collected, for the following purposes:

- the communication with Lloyd's policyholders
- the underwriting of policies
- the evaluation of claims
- the detection and prevention of fraud
- the analysis of business results
- purposes required or authorised by law

For the purposes identified, personal information may be disclosed to Lloyd's related or affiliated organisations or companies, their agents/mandataries, and to certain non-related or unaffiliated organisations or companies.

Further information about Lloyd's personal information protection policy may be obtained from the customer's broker or by contacting Lloyd's on 514 861 8361 or through info@lloyds.ca.

ONTARIO COMMERCIAL LIABILITY NOTICE

Notice to Insureds:

Pursuant to the
Freedom Of Information And Protection Of Privacy Act, R.S.O. 1990, c.F.31 (as amended)

Important
The notice below applies to insurance contracts containing non-automobile legal liability coverages in provinces where statistical data relating to such contracts must be reported to the Superintendent of Insurance.

Legal authority for collection
Insurance Act, R.S.O. 1990, c.I.8, section 101(1).

Principal purpose for which personal informtion is intended to be used Information collected by insurers from insureds or supplied to insurers pertaining to the attached document will be used:

- to compile aggregate statistical data to be used in monitoring trends in the insurance industry;
- to develop statistical exhibits to be used in monitoring the insurance industry;
- to respond to requests for customized statistical information on the insurance industry;
- to respond to inquiries on statistical information made to Office of the Superintendent of Insurance; and
- to use and disclose such information for purposes which are consistent with the previous clauses.

The Public Official who can answer questions about the collection is:
Manager, Statistical Services
Financial Services Commission of Ontario
5160 Yonge Street, 17th Floor
Box 85
North York, Ontario M2N 6L9
Telephone: (416) 250-7250

For more information or to submit the facts of your insurance-related dispute, please visit the GIO website at www.gio-scad.org.

Should you be dissatisfied with the outcome of your broker's resolution or with the GIO's / l'Autorité's assistance, please submit your written complaint to:

Lloyd's Canada Inc.
Broker Management Services
1155 rue Metcalfe, Suite 2220
Montreal, Quebec H3B 2V6
Tel: 1-877-4LLOYDS
Fax: (514) 861-0470
E-mail: lineage@lloyds.ca

Your written complaint will be forwarded to Lloyd's Complaints Department in London which ensures that Lloyd's Underwriters and their representatives deal with claims and complaints in an acceptable manner. It acts as an impartial mediator. When undertaking a review this Department takes account of general legal principles, good insurance practice, and whether all events surrounding a given case have been considered fairly.

If you are dissatisfied with Lloyd's final letter, you may ask the GIO to arrange for mediation. Mediation is not available until Lloyd's has issued its final letter of position on your complaint.

In Québec you may also avail yourself of the services of l'Autorité who will study your file and may recommend mediation, if it deems this action appropriate and if both parties agree to it.

GIO - Alberta can be contacted where a policyholder is not satisfied with the basis on which a premium for basic coverage for a private passenger vehicle was determined, or considers that an insurer, directly or indirectly, has taken an adverse contractual action with respect to insurance for basic coverage.

SUBSCRIPTION NOTICE

IN CONSIDERATION OF THE INSURED having paid or agreed to pay each of the INSURERS named in the List of Subscribing Companies forming part hereof, or to INSURERS whose names are substituted therefor or added thereto by endorsement, hereinafter called "THE INSURERS", the Premium set against its name in the List of Subscribing Companies (attached hereto),

THE INSURERS SEVERALLY AND NOT JOINTLY agree, each for the Sum(s) Insured or Percentage(s) and for the Coverage(s) Insured set against its name in the List of Subscribing Companies, and subject always to the terms and conditions of this Policy, that if a loss occurs for which insurance is provided by this Policy at any time while it is in force, they will indemnify the INSURED against the loss so caused; the liability of each insurer individually for such loss being limited to that proportion of the loss payable according to the terms and conditions of this Policy which the Sum Insured or the amount corresponding to the Percentage set against its name in the List of Subscribing Companies, or such other sum or percentage as may be substituted therefor by endorsement, bears to the total of the sums insured or of the amounts corresponding to the percentages of the sums insured respectively set out against the coverage concerned on the Declarations page(s).

Wherever in this Policy, or in any endorsement attached hereto, reference is made to "The Company", "The Insurer", "This Company", "we", "us", or "our", reference shall be deemed to be made to each of the Insurers severally.

This policy is made and accepted subject to the foregoing provisions, and to the other provisions, stipulations and conditions contained herein, which are hereby specially referred to and made a part of this Policy, as well as such other provisions, agreements or conditions as may be endorsed hereon or added hereto.

IN WITNESS WHEREOF THE INSURERS through their representative(s) duly authorized by them for this purpose have executed and signed this Policy.

Abstract

This review aims to cover experimental data on oxidative effects of low-intensity radiofrequency radiation (RFR) in living cells. Analysis of the currently available peer-reviewed scientific literature reveals molecular effects induced by low-intensity RFR in living cells; this includes significant activation of key pathways generating reactive oxygen species (ROS), activation of peroxidation, oxidative damage of DNA and changes in the activity of antioxidant enzymes. It indicates that among 100 currently available peer-reviewed studies dealing with oxidative effects of low-intensity RFR, in general, 93 confirmed that RFR induces oxidative effects in biological systems. A wide pathogenic potential of the induced ROS and their involvement in cell signaling pathways explains a range of biological/health effects of low-intensity RFR, which include both cancer and non-cancer pathologies. In conclusion, our analysis demonstrates that low-intensity RFR is an expressive oxidative agent for living cells with a high pathogenic potential and that the oxidative stress induced by RFR exposure should be recognized as one of the primary mechanisms of the biological activity of this kind of radiation.

Keywords

Cellular signaling, cancer, free radicals, oxidative stress, radiofrequency radiation, reactive oxygen species

History

Accepted 12 April 2015
Published online 7 July 2015

Introduction

Intensive development of wireless technologies during the last decades led to a dramatic increase of background radiofrequency radiation (RFR) in the human environment. Thus, the level of indoor background RFR in industrialized countries increased 5,000-fold from 1985 to 2005 (Maes, 2005). Such significant environmental changes may have a serious impact on human biology and health. As a proof of such impact, a series of epidemiological studies on the increased risk of tumorigenesis in ''heavy'' users of wireless telephony exists (Hardell et al., 2007, 2011; Sadetzki et al., 2008; Sato et al., 2011). Some studies indicate that long-term RFR exposure in humans can cause various non-cancer disorders, e.g., headache, fatigue, depression, tinnitus, skin irritation, hormonal disorders and other conditions (Abdel-Rassoul et al., 2007; Buchner & Eger, 2011; Chu et al., 2011; Johansson, 2006; Santini et al., 2002; Yakymenko et al., 2011). In addition, convincing studies on hazardous effects of RFR in human germ cells have been published (Agarwal et al., 2009; De Iuliis et al., 2009).

All abovementioned studies dealt with the effects of low-intensity RFR. This means that the intensity of radiation was far below observable thermal effects in biological tissues, and far below safety limits of the International Commissions on Non-Ionizing Radiation Protection (ICNIRP) (ICNIRP, 1998). To date, molecular mechanisms of non-thermal effects of RFR are still a bottleneck in the research on the biological/health effects of low-intensity RFR, although recently many studies have been carried out on metabolic changes in living cells under low-intensity RFR, and comprehensive reviews were published (Belyaev, 2010; Consales et al., 2012; Desai et al., 2009; Yakymenko et al., 2011). In the present work, we analyze the results of molecular effects of low-intensity RFR in living cells and model systems, with a special emphasis on oxidative effects and free radical mechanisms. It might seem paradoxical that, despite being non-ionizing, RFR can induce significant activation of free radical processes and overproduction of reactive oxygen species (ROS) in living cells. We believe that the analysis of recent findings will allow recognition of a general picture of the potential health effects of already ubiquitous and ever-increasing RFR.

Radiofrequency radiation

RFR is a part of electromagnetic spectrum with frequencies from 30 kHz to 300 GHz. RFR is classified as non-ionizing,

which means that it does not carry sufficient energy for ionization of atoms and molecules. A part of RFR with the highest frequencies (300 MHz to 300 GHz) is referred to as microwaves (MWs). MW is RFR with the highest energy, which can potentially generate the highest thermal effects in the absorbing matter.

The main indexes of RFR are (i) frequency (Hz); (ii) intensity or power density (PD) of radiation (W/m^2 or $\mu W/cm^2$); (iii) its modulated or non-modulated nature; and (iv) continuous or discontinuous pattern of radiation. For the absorbed RFR energy, a parameter of specific absorption rate (SAR) is used (W/kg). The most common digital standard of RFR for mobile communication is still GSM (Global System for Mobile communication), which utilizes frequencies at about 850, 900, 1800 and 1900 MHz. This radiation is frequency modulated, with channel rotation frequency of 217 Hz, and belongs to the radiation of the pulsed mode (Hyland, 2000).

As to the international safety limits, the ICNIRP recommendations restrict intensity of RFR to 450–1000 $\mu W/cm^2$ (depending on the frequency of radiation) and the SAR value to 2 W/kg, as calculated for human heads and torsos (ICNIRP, 1998). These indexes were adopted by ICNIRP based on the behavioral response of laboratory rats, which were exposed to gradually increased intensities of RFR to determine the point at which the animals became thermally distressed (Gandhi et al., 2012).

Low-intensity RFR is referred to as radiation with intensities which do not induce significant thermal effects in biological tissues. Accordingly, any intensity of RFR under the ICNIRP limits can be referred to as low-intensity. In this paper we will analyze only the effects of low-intensity RFR.

Physical/biophysical effects of low-intensity RFR in living cells

RFR, especially MW, can produce thermal effects in matter due to interaction with charged particles, including free electrons, ions or polar molecules, inducing their oscillations in electromagnetic field. The thermal effect of MW can be seen when warming food in the microwave. The effect strongly depends on the intensity of radiation and is mostly negligible under low-intensity RFR conditions. On the other hand, energy of RFR/MW is insufficient not only for the ionization of molecules, but even for activation of orbital electrons. Hence, RFR was often assessed as a factor producing only thermal effects. Nevertheless, evident biological effects of low-intensity RFR promoted research on physical mechanisms of non-thermal biological effects of this kind of radiation.

A biophysical model of a forced-vibration of free ions on the surface of a cell membrane due to external oscillating electromagnetic field (EMF) was proposed (Panagopoulos et al., 2000, 2002). According to the authors, this vibration of electric charges can cause disruption of the cellular electrochemical balance and functions.

A ''moving charge interaction'' model was proposed for low-frequency EMF (Blank and Soo, 2001). The authors explained activation of genes and synthesis of stress proteins under EMF exposure due to interaction of the field with moving electrons in DNA (Blank and Soo, 2001; Goodman and Blank, 2002). They also demonstrated that EMF increased electron transfer rates in cytochrome oxidase and accelerated charges in the Na,K-ATPase reaction. Moreover, they demonstrated acceleration of the oscillating Belousov–Zhabotinski reaction in homogeneous solutions due to the application of low-frequency EMF (Blank and Soo, 2003).

An ability of low-strength magnetic fields to trigger onset- and offset-evoked potentials was demonstrated (Marino et al., 2009). Effectiveness of a rapid magnetic stimulus (0.2 ms) has led the authors to a conclusion on direct interaction between the field and ion channels in plasma membrane. A plausible mechanism of overproduction of free radicals in living cell due to electron spin flipping in confined free radical pairs in magnetic field of RFR was proposed (Georgiou, 2010).

A significant effect of low-intensity RFR on ferritin, an iron cage protein present in most living organisms from bacteria to humans, was revealed (Céspedes and Ueno, 2009). Exposure of ferritin solution to low-intensity RFR significantly, up to threefold, reduced iron chelation with ferrozine. The authors explained that magnetic field of RFR plays a principle role in the observed effect, and that this effect is strongly non-thermal. The non-thermal mechanism of the interaction of RFR magnetic fields with ferritin is supposedly mediated by an inner super-paramagnetic nanoparticle ($9H_2O \times 5Fe_2O_3$ with up to 4500 iron ions), which is a natural phenomenon intrinsic to the cells. It results in reduction of input of iron chelates into the ferritin cage. The authors underlined the potential role of ferritin malfunction for oxidative processes in living cell due to the participation of Fe^{2+} ions in the Fenton reaction, which produces hydroxyl radicals. In this respect, it is interesting to point to the results of an *in vitro* study with RFR exposure of rat lymphocytes treated by iron ions (Zmyślony et al., 2004). Although RFR exposure (930 MHz) did not induce detectable intracellular ROS overproduction, the same exposure in the presence of $FeCl_2$ in the lymphocyte suspensions induced a significant overproduction of ROS.

Another set of studies indicates on a possibility of changes in protein conformation under RFR exposure. Thus, low-intensity 2.45 MHz RFR accelerated conformational changes in β-lactoglobulin through excitation of so-called collective intrinsic modes in the protein (Bohr and Bohr, 2000a, 2000b), which suggests a principal ability of RFR to modulate the non-random collective movements of entire protein domains. Similarly, a frequency-dependent effect on intrinsic flexibility in insulin structure due to applied oscillating electric field was demonstrated (Budi et al., 2007). Moreover, macromolecular structure of cytoskeleton was significantly altered in fibroblasts of Chinese hamster after the exposure to modulated RFR of the GSM standard (Pavicic and Trosic, 2010). Thus, a 3 h exposure of fibroblasts to modulated RFR (975 MHz) led to significant changes in the structure of microtubules and actin microfilaments, which have polar cytoskeleton structures, while non-polar vimentin filaments reportedly stayed unchanged. Taking into account an extensive regulatory potential of cytoskeleton on cell homeostasis, these data could obviously add to the nature of the biological effects of RFR.

It was shown that ornithine decarboxylase (ODC) can significantly change its activity under low-intensity RFR exposure (Byus et al., 1988; Hoyto et al., 2007; Litovitz et al., 1993, 1997; Paulraj et al., 1999).

In addition, so-called ''calcium effects'' under RFR exposure in living cells have been demonstrated (Dutta et al., 1989; Paulraj et al., 1999; Rao et al., 2008), which include a significant increase in intracellular Ca^{2+} spiking. Taking into account that calcium is a ubiquitous regulator of cellular metabolism, these data point to a possibility that non-thermal RFR can activate multiple Ca^{2+}-dependent signaling cascades.

Finally, an ability of low-intensity MW to dissociate water molecules was demonstrated in model experiments years ago (Vaks et al., 1994). In these experiments, MW of 10 GHz with radiated power 30 mW produced a significant level of H_2O_2 in deionized water (and also in $MgSO_4$ solution) under stable temperature conditions. According to the authors, a kinetic excitation of liquid water associates $C(H_2O)$ upon the absorption of MW leads to subsequent viscous losses due to friction between moving clusters of water molecules. It results in partial irreversible decomposition of water, including breaks of intramolecular bonds (H–OH) due to a mechanochemical reaction, and generation of $H^{\bullet}$; $OH^{\bullet}$; H^+ and OH^- groups. Among these, the hydroxyl radical ($OH^{\bullet}$) is the most aggressive form of ROS, which can break any chemical bond in surrounding molecules (Halliwell, 2007). The authors assessed that this type of mechanochemical transformation in water could be responsible for 10^{-4}–10^{-8} relative parts of the total MW energy absorbed. Given the fact that the water molecules are ubiquitous in living cells, even a subtle chance for dissociation of water molecules under low-intensity RFR exposure could have a profound effect on tissue homeostasis. It is of note here that one $OH^{\bullet}$ radical can initiate irreversible peroxidation of many hundreds of macromolecules, e.g. lipid molecules (Halliwell, 1991). Taken together, these data show that non-thermal RFR can be absorbed by particular charges, molecules and cellular structures, and in this way can potentially induce substantial modulatory effects in living cell.

Generation of reactive oxygen species under RFR exposure in living cells

NADH oxidase of cellular membrane was suggested as a primary mediator of RFR interaction with living cells (Friedman et al., 2007). Using purified membranes from HeLa cells, the authors experimentally proved that the exposure to RFR of 875 MHz, 200 μW/cm^2 for 5 or 10 min significantly, almost threefold, increased the activity of NADH oxidase. NADH oxidases are membrane-associated enzymes that catalyze one-electron reduction of oxygen into superoxide radical using NADH as a donor of electron, thus producing powerful ROS. This enzyme has been traditionally known due to its role in induction of oxidative burst in phagocytes as a part of immune response. Yet, later the existence of non-phagocytic NAD(P)H oxidases was revealed in various types of cells, including fibroblasts, vascular and cardiac cells (Griendling et al., 2000). Obviously, the presence of superoxide-generating enzyme in many types of non-phagocytic cells points to the considerable regulatory roles of ROS in living cells. On the other hand, an ability of low-intensity RFR to modulate the activity of the NADH oxidase automatically makes this factor a notable and potentially dangerous effector of cell metabolism. Notably, the authors pointed out that the acceptor of RFR is different from the peroxide-generating NADPH oxidases, which are also found in plasma membranes (Low et al., 2012).

The other powerful source of ROS in cells is mitochondrial electron transport chain (ETC), which can generate superoxide due to breakdowns in electron transport (Inoue et al., 2003). It was demonstrated that generation of ROS by mitochondrial pathway can be activated under RFR exposure in human spermatozoa (De Iuliis et al., 2009). The authors revealed a dose-dependent effect of 1.8 GHz RFR exposure on ROS production in spermatozoa, particularly in their mitochondria. The significantly increased level of total ROS in spermatozoa was detected under RFR with SAR = 1 W/kg, which is below the safety limits accepted in many countries. It was demonstrated recently in our laboratory that the exposure of quail embryos *in ovo* to extremely low-intensity RFR (GSM 900 MHz, 0.25 μW/cm^2) during the initial days of embryogenesis resulted in a robust overproduction of superoxide and nitrogen oxide radicals in mitochondria of embryonic cells (Burlaka et al., 2013). It is not clear yet which particular part of ETC is responsible for the interaction with RFR. To date, three possible sites of generation of superoxide in ETC have been shown: the ETC complex I (Inoue et al., 2003), complex II (Liu et al., 2002), and complex III (Guzy and Schumacker, 2006). A significant inverse correlation between mitochondrial membrane potential and ROS levels in living cell was found (Wang et al., 2003). As the authors underlined, such a relationship could be due to two mutually interconnected phenomena: ROS causing damage to the mitochondrial membrane, and the damaged mitochondrial membrane causing increased ROS production.

In addition to the well-established role of the mitochondria in energy metabolism, regulation of cell death is a second major function of these organelles. This, in turn, is linked to their role as the powerful intracellular source of ROS. Mitochondria-generated ROS play an important role in the release of cytochrome c and other pro-apoptotic proteins, which can trigger caspase activation and apoptosis (Ott et al., 2007). A few reports indicate on activation of apoptosis due to low-intensity RFR exposure. In human epidermoid cancer KB cells, 1950 MHz RFR induced time-dependent apoptosis (45% after 3 h) that is paralleled by 2.5-fold decrease of the expression of ras and Raf-1 and of the activity of ras and Erk-1/2 (Caraglia et al., 2005). Primary cultured neurons and astrocytes exposed to GSM 1900 MHz RFR for 2 h demonstrated up-regulation of caspase-2, caspase-6 and Asc (apoptosis associated speck-like protein containing a card) (Zhao et al., 2007). Up-regulation in neurons occurred in both "on" and "stand-by" modes, but in astrocytes only in the "on" mode. We should underline that, in that study an extremely high biological sensitivity to RFR was demonstrated, as a cell phone in the ''stand-by'' position emits negligibly low-intensity of radiation (up to hundredths μW/cm^2).

Based on the analysis of available literature data, we identified altogether 100 experimental studies in biological models which investigated oxidative stress due to low-intensity RFR exposures. From these 100 articles, 93 studies (93%) demonstrated significant oxidative effects induced by

low-intensity RFR exposure (Table 1–3), while 7 studies (7%) demonstrated the absence of significant changes (Table 4). The total number includes 18 *in vitro* studies, 73 studies in animals, 3 studies in plants and 6 studies in humans. Majority of the research was done on laboratory rats (58 studies, with 54 positive results), while 4 studies out of 6 in humans were positive. From the *in vitro* studies, 17 were positive (94.4%), including 2 studies on human spermatozoa and 2 studies on human blood cells.

Most of the studies utilized RFR exposure in MW range, including a use of commercial or trial cell phones as sources of radiation. The power densities of RFR applied in positive studies varied from 0.1 μW/cm^2 (Oksay et al., 2014) to 680 μW/cm^2 (Jelodar et al., 2013) and SAR values varied from 3 μW/kg (Burlaka et al., 2013) to the ICNIRP recommended limit of 2 W/kg (Naziroglu et al., 2012a; Xu et al., 2010). Exposure times in positive studies varied from 5 min (Friedman et al., 2007) to 12.5 years, 29.6 h/month (Hamzany et al., 2013).

The most often used indexes of oxidative stress analyzed in the studies were ROS production, levels of lipid peroxidation (LPO)/malondialdehyde (MDA), protein oxidation (PO), nitric oxides (NO_x), glutathione (GSH), activity of antioxidant enzymes (superoxide dismutase (SOD), catalase (CAT), glutathione peroxidase (GSH-Px)). It is important that some studies directly pointed to induction of free radicals (superoxide radical, NO) as a primary reaction of living cells to RFR exposure (Burlaka et al., 2013; Friedman et al., 2007). As we pointed out earlier, direct activation of NADH oxidase (Friedman et al., 2007) and the mitochondrial pathway of superoxide overproduction (Burlaka et al., 2013; De Iuliis et al., 2009) have been experimentally proven. Besides, a significant overproduction of nitrogen oxide was revealed in some studies (Avci et al., 2012; Bilgici et al., 2013; Burlaka et al., 2013), although it is unclear whether an induction of expression of NO-synthases or direct activation of the enzyme took place. It is however clear that significantly increased levels of these free radical species (superoxide and nitrogen oxide) in cells due to RFR exposure result in an activation of peroxidation and repression of activities of key antioxidant enzymes. It is indicative that many studies demonstrated effectiveness of different antioxidants to override oxidative stress caused by RFR exposure. Such effects have been reported for melatonin (Ayata et al., 2004; Lai and Singh, 1997; Oktem et al., 2005; Ozguner et al., 2006; Sokolovic et al., 2008), vitamin E and C (Jelodar et al., 2013; Oral et al., 2006), caffeic acid phenethyl ester (Ozguner et al., 2006), selenium, L-carnitine (Turker et al., 2011) and garlic (Avci et al., 2012; Bilgici et al., 2013).

It is worthwhile to emphasize a strict non-thermal character of ROS overproduction under RFR exposure described in the cited reports. As low as 0.1 μW/cm^2 intensity of RFR and absorbed energy (specific absorption rate, SAR) of 0.3 μW/kg were demonstrated to be effective in inducing significant oxidative stress in living cells (Burlaka et al., 2013; Oksay et al., 2014). This observation is particularly important as the modern international safety limits on RFR exposure are based solely on the thermal effects of radiation and only restrict RFR intensity to 450–1000 μW/cm^2 and SAR to 2 W/kg (ICNIRP, 1998). Moreover, studies where high (thermal) intensities of RFR have been used could not reveal oxidative effects (Hong et al., 2012; Kang et al., 2013; Luukkonen et al., 2009), which might point to the variety of molecular mechanisms for different radiation intensities.

Taken together, the analysis of the contemporary scientific literature on the biological effects of RFR persuasively proves that the exposure to low-intensity RFR in living cells leads to generation of significant levels of ROS and results in a significant oxidative stress.

Oxidative damage of DNA under RFR exposure

To date more than hundred papers have been published on mutagenic effects of RFR and most of them revealed significant effects (Ruediger, 2009). There is a substantial number of studies which demonstrated the formation of micronuclei (Garaj-Vrhovac et al., 1992; Tice et al., 2002; Zotti-Martelli et al., 2005) or structural anomalies of metaphase chromosomes (Garson et al., 1991; Kerbacher et al., 1990; Maes et al., 2000) in living cells due to low-intensity RFR exposure. However, majority of the studies on the mutagenic effects of RFR successfully used a comet assay approach (Baohong et al., 2005; Belyaev et al., 2006; Diem et al., 2005; Kim et al., 2008; Lai and Singh, 1996; Liu et al., 2013a). Particular studies identified specific marker of oxidative damage of DNA, 8-hydroxy-2'-deoxyguanosine (8-OH-dG) (Burlaka et al., 2013; De Iuliis et al., 2009; Guler et al., 2012; Khalil et al., 2012; Xu et al., 2010). Thus, the level of 8-OH-dG in human spermatozoa was shown to be significantly increased after *in vitro* exposure to low-intensity RFR (De Iuliis et al., 2009). Likewise, we demonstrated that the exposure of quail embryos *in ovo* to GSM 900 MHz of 0.25 μW/cm^2 during a few days was sufficient for a significant, two-threefold, increase of 8-OH-dG level in embryonic cells (Burlaka et al., 2013).

It would be logical to assume that most mutagenic effects due to the RFR exposure are caused by oxidative damage to DNA, as the overproduction of ROS in living cells due to RFR exposure was reliably documented. It is known that superoxide itself does not affect DNA. The most aggressive form of ROS, which is able to affect the DNA molecule directly, is hydroxyl radical (Halliwell, 2007). The hydroxyl radicals are generated in cell in the Fenton reaction ($Fe^{2+} + H_2O_2 \rightarrow Fe^{3+} + OH^{\bullet} + OH^-$) and in the Haber–Weiss reaction ($O_2^{\bullet -} + H_2O_2 \rightarrow O_2 + OH^{\bullet} + OH^-$) (Valko et al., 2006). On the other hand, increased concentration of NO in addition to superoxide in the RFR-exposed cells can lead to the formation of other aggressive form of ROS, peroxynitrite ($ONOO^-$), which can also cause DNA damage (Valko et al., 2006).

Free radicals induced under the RFR exposure can perturb cellular signaling

Taking into account the abovementioned data, we can state that the exposure to RFR leads to overproduction of free radicals/ROS in living cell. Certainly, free radicals can induce harmful effects via direct damage due to oxidation of biological macromolecules. To that, it becomes clear nowadays that free radicals/ROS are an intrinsic part of the cellular signaling cascades (Forman et al., 2014). Thus, hydrogen peroxide appears as a second messenger both in

Table 1. Publications which reported positive findings on oxidative stress caused by RFR exposure of cells *in vitro*.

Reference	Biological system exposed	RFR exposure	Statistically significant effects reported*
(Agarwal et al., 2009)	Human spermatozoa	Cell phone RFR, in talk mode, for 1 h	Increase in reactive oxygen species (ROS) level, decrease in sperm motility and viability.
(Campisi et al., 2010)	Rat astroglial cells	900 MHz (continuous or modulated), electric field 10 V/m, for5; 10; 20 min	Increase in ROS levels and DNA fragmentation after exposure to modulated RFR for 20 min.
(De Iuliis et al., 2009)	Human spermatozoa	1.8 GHz, SAR = 0.4–27.5 W/kg	Increased amounts of ROS.
(Friedman et al., 2007)	HeLa membranes	875 MHz, 200 μW/cm^2, for 5 and 10 min	Increased NADH oxidase activity.
(Hou et al., 2014)	Mouse embryonic fibroblasts (NIH/3T3)	1800-MHz GSM-talk mode RFR, SAR = 2 W/kg, intermittent exposure (5 min on/10 min off) for 0.5–8 h	Increased intracellular ROS levels.
(Kahya et al., 2014)	Cancer cell cultures	900 MHz RFR, SAR = 0.36 W/kg, for 1 h	Induced apoptosis effects through oxidative stress, selenium counteracted the effects of RFR exposure.
(Lantow et al., 2006a)	Human blood cells	Continuous wave or GSM signal,SAR = 2 W/kg, for 30 or 45 min of continuous or 5 min ON, 5 min OFF	After continuous or intermittent GSMsignal a different ROS production was detected in human monocytes compared to sham.
(Lantow et al., 2006b)	Human Mono Mac 6 and K562 cells	Continuous wave, GSM speaking only, GSM hearing only, GSM talk, SARs of 0.5, 1.0, 1.5 and 2.0 W/kg.	The GSM-DTX signal at 2 W/kg produced difference in free radical production compared to sham.
(Liu et al., 2013b)	GC-2 cells	1800 MHz, SAR = 1; 2 W/kg,5 min ON, 10 min OFF for 24 h	In the 2 W/kg exposed cultures, the level of ROS was increased.
(Lu et al., 2012)	Human blood mononuclear cells	900 MHz, SAR = 0.4 W/kg, for 1–8 h	The increased level of apoptosis induced through the mitochondrial pathway and mediated by activating ROS and caspase-3.
(Marjanovic et al., 2014)	V79 cells	1800 MHz, SAR = 1.6 W/kg, for 10, 30 and 60 min	ROS level increased after 10 min of exposure. Decrease in ROS level after 30-min treatment indicating antioxidant defense mechanism activation.
(Naziroglu et al., 2012b)	HL-60 cells	2450 MHz, pulsed, SAR = 0.1–2.5 W/kg,for 1; 2; 12 or 24 h	Lipid peroxide (LPO) levels were increased at all exposure times.
(Ni et al., 2013)	Human lens epithelial cells	1800 MHz, SAR = 2; 3; 4 W/kg	The ROS and malondialdehyde (MDA) levels were increased.
(Pilla, 2012)	Neuronal cells and human fibroblasts	27.12 MHz, pulsed, electric field 41 V/m, 2 min prior to lipopolysaccharide administration or for 15 min	Increased level of nitric oxide (NO).
(Sefidbakht et al., 2014)	HEK293T cells	940 MHz, SAR = 0.09 W/kg, for 15, 30, 45, 60 and 90 min	ROS generation increased in the 30 min exposed cells. A sharp rise in catalase (CAT) and superoxide dismutase (SOD) activity and elevation of glutathione (GSH) during the 45 min exposure.
(Xu et al., 2010)	Primary cultured neurons	1800 MHz, pulsed, SAR = 2 W/kg, for 24 h	An increase in the levels of8-hydroxy-2'-deoxyguanosine (8-OH-dG).
(Zmyślony et al., 2004)	Rat lymphocytes	930 MHz, PD of 500 μW/cm^2, SAR = 1.5 W/kg, for 5 and 15 min	Intracellular ROS level increased in exposed $FeCl_2$ treated cells compared with unexposed $FeCl_2$ treated cells.

*All effects were statistically significant (at least $p < 0.05$) as compared to control or sham exposed groups.

insulin signaling and in growth factor-induced signalling cascades (Sies, 2014). These species are also implicated in biochemical mechanism of oxidation of ethanol and in other metabolic processes (Oshino et al., 1975) and is also required for initiation of wound repair (Enyedi and Niethammer, 2013). In addition, ROS at relatively low concentrations can modulate inflammation via activation of NF-kB pathway (Hayden and Ghosh, 2011). Therefore, even subtle exposures to RFR with generation of hardly detectable quantities of free radicals can have their meaningful biological consequences.

We could ascertain the signaling effects of moderate levels of free radicals from our experiments in quail embryos irradiated with the commercial cell phone. Thus, we were able to show that the prolonged exposures of embryos *in ovo* led to robust repression of their development (Tsybulin et al., 2013), which was concomitant with

Table 2. Continued

Reference	Biological system exposed	RFR exposure	Statistically significant effects reported*
(Dasdag et al., 2012)	Head of rats	900 MHz, cell-phones-like, 2 h/day for 10 months	Protein carbonyl level was higher in the brain of exposedrats.
(Dasdag et al., 2008)	Rat whole body	900 MHz, PD of 78 μW/cm^2, 2 h/days for10 months.	Increased levels of MDA and total oxidative status in liver tissue.
(Deshmukh et al., 2013)	Rat whole body	900 MHz, 2 h/day, 5 days a week for 30 days	The levels of LPO and PO were increased.
(Esmekaya et al., 2011)	Rat whole body	900 MHz, pulsed, modulated, SAR = 1.2 W/kg, 20 min/day for 3 weeks	The increased level of MDA and NOx, and decreased levels of GSH in liver, lung, testis and heart tissues.
(Furtado-Filho et al., 2014)	Rat whole body	950 MHz, SAR = 0.01–0.88 W/kg,30 min/day for 21 days during pregnancy (or additionally 6 or 15 days of postnatal period)	Neonatal rats exposed in utero had decreased levels of CAT and lower LPO, and genotoxic effect.
(Guler et al., 2012)	Rabbit infant whole body	GSM 1800 MHz, 15 min/day for 7 days (females) or 14 days (males)	LPO levels in the liver tissues of females and males increased,liver 8-OH-dG levels of females were increased.
(Guney et al., 2007)	Rat whole body	900 MHz, 30 min/day for 30 days	Endometrial levels of NO and MDA increased,endometrial SOD, CAT and GSH-Px activities were decreased.Vitamin E and C treatment prevented these effects.
(Gürler et al., 2014)	Rat whole body	2450 MHz, 3.68 V/m, 1 h/day for 30 days	Increased 8-OH-dG level in both plasma and brain tissue whereas it increased PO level only in plasma. Garlic prevented the increase of 8-OH-dG level in brain tissue and plasma PO levels.
(Ilhan et al., 2004)	Rat whole body	900 MHz, from cell phone,1 h/day for 7 days	Increase in MDA, NO levels, andxanthine oxidase (XO) activity, decrease in SOD and GSH-Px activities in brain. These effects were prevented by Ginkgo bilobaextract treatment.
(Jelodar, et al., 2013)	Rat whole body	900 MHz, PD of 680 μW/cm^2, 4 h/day for 45 days,	The concentration of MDA was increased and activities of SOD, GSH-Px and CAT were decreased in rat eyes. An administration of vitamin C prevented these effects.
(Jelodar et al., 2013)	Rat whole body	900 MHz, daily for 45 days	Increased level of MDA and decreased antioxidant enzymes activity in rat testis.
(Jing et al., 2012)	Rat whole body	Cell phone RFR, SAR = 0.9 W/kg,3 x 10; 30 or 60 min for 20 days during gestation	After 30 and 60 min the level of MDA was increased, the activities of SOD and GSH-Pxwere decreased.
(Kerman & Senol, 2012)	Rat whole body	900 MHz, 30 min/day for 10 days	Tissue MDA levels were increased, SOD, CAT and GSH-Pxactivities were reduced. Melatonin treatment reversed these effects.
(Kesari et al., 2010)	Male rat whole body	Cell phone RFR, SAR = 0.9 W/kg,2 h/day for 35 days	Reduction in protein kinase activity, decrease in sperm count and increase in apoptosis.
(Kesari et al., 2011)	Rat whole body	900 MHz, pulsed, SAR = 0.9 W/kg,2 h/day for 45 days	Increase in the level of ROS, decrease in the activities of SOD and GSH-Px,and in the level of pineal melatonin.
(Kesari et al., 2013)	Rat whole body	2115 MHz, SAR = 0.26 W/kg,2 h/day for 60 days	The level of ROS, DNA damage and theapoptosis rate were increased.
(Khalil et al., 2012)	Rat whole body	1800 MHz, electric field 15–20 V/m, for2 h	Elevations in the levels of 8-OH-dG in urine.

(*continued*)

Table 2. Continued

Reference	Biological system exposed	RFR exposure	Statistically significant effects reported*
(Kismali et al., 2012)	Rabbit whole body (non-pregnant and pregnant)	1800 MHz, GSM modulation, 15 min/day for 7 days	Creatine kinases levels' changes.
(Koc et al., 2013)	Male rat whole body	Cell phone RFR at calling or stand-by	Oxidative stress detected at both calling and stand-by exposures.
(Koylu et al., 2006)	Rat whole body	900 MHz	The levels of LPO in the brain cortex and hippocampus increased.These levels in the hippocampus were decreased by melatonin administration.
(Koyu et al., 2009)	Rat whole body	900 MHz	The activities of XO, CAT and level of LPO increased in liver.XO, CAT activities and LPO levels were decreased by caffeic acid phenethyl ester (CAPE) administration.
(Kumar et al., 2014)	Rat whole body	Cell phone 1910.5 MHz RFR, 2 h/day for 60 days day (6 days a week).	Increase in LPO, damage in sperm cells and DNA damage.
(Lai & Singh, 1997)	Rat whole body	2450 MHz, pulsed, PD = 2 mW/cm^2, SAR = 1.2 W/kg	Melatonin or spin-trap compound blocked DNA strand breaks induced by RFR exposure in rat brain cells.
(Luo et al., 2014)	Rat whole body	900 MHz imitated cell phone RFR, 4 h/day for 12 days	Contents of liver MDA and Nrf2 protein increased, contents of liver SOD and GSH decreased.
(Mailankot et al., 2009)	Rat whole body	900/1800 MHz,GSM,1 h/day for 28 days	Increase in LPO and decreased GSH content in the testis and epididymis.
(Manta et al., 2013)	Drosophila whole body	1880–1900 MHz, DECT modulation, SAR = 0.009 W/kg, for 0.5–96 h	Increase in ROS levels in male and female bodies, a quick response in ROS increase in ovaries.
(Marzook et al., 2014)	Rat whole body	900 MHz from cellular tower, 24 h/day for 8 weeks	SOD and CAT activities were reduced in blood, sesame oil reversed the effect
(Meena et al., 2013)	Rat whole body	2450 MHz, PDof 210 μW/cm^2, SAR = 0.14 W/kg, 2 h/day for 45 days	Increased level of MDA and ROS in testis. Melatonin prevented oxidative stress.
(Megha et al., 2012)	Rat whole body	900; 1800 MHz, PD of 170 μW/cm^2, SAR = 0.6 mW/kg, 2 h/day, 5 days/week for 30 days	The levels of the LPO and PO were increased; the level of GSH was decreased.
(Meral et al., 2007)	Guinea pig whole body	890–915 MHz,from cell phone, SAR = 0.95 w/kg, 12 h/day for 30 days (11 h 45 min stand-by and 15 min spiking mode)	MDA level increased, GSH level and CAT activity weredecreased in the brain. MDA, vitamins A, D_3 and E levels and CAT enzyme activity increased, and GSH level was decreased in the blood.
(Motawi et al., 2014)	Rat whole body	Test cellphone RFR, SAR = 1.13 W/kg, 2 h/day for 60 days	Increments in conjugated dienes, protein carbonyls, total oxidant status and oxidative stress index along with a reduction of total antioxidant capacity levels.
(Naziroglu & Gumral, 2009)	Rat whole body	2450 MHz,60 min/day for 28 days	Decrease of the cortex brain vitamin A, vitamin C and vitamin E levels.
(Naziroglu et al., 2012a)	Rat whole body	2450 MHz, 60 min/day for 30 days	LPO, cell viability and cytosolic Ca^{2+} values in dorsal root ganglion neurons were increased.
(Oksay et al., 2014)	Rat whole body	2450 MHz, pulsed, PD of0.1 μW/cm^2, SAR = 0.1 W/kg, 1 h/day for 30 days	LPO was higher in exposed animals. Melatonin treatment reversed the effect.
(Oktem et al., 2005)	Rat whole body	900 MHz, 30 min/day for 10 days	Renal tissue MDA level increased, SOD, CAT and GSH-Px activities were reduced. Melatonin treatment reversed these effects.
(Oral et al., 2006)	Rat whole body	900 MHz, 30 min/day for 30 days	Increased MDA levels and apoptosis in endometrial tissue.Treatment with vitamins E and C diminished these changes.

(*continued*)

Table 2. Continued

Reference	Biological system exposed	RFR exposure	Statistically significant effects reported*
(Ozguner et al., 2005a)	Rat whole body	900 MHz, 30 min/day for 10 days	Heart tissue MDA and NO levels increased, SOD, CAT and GSH-Px activities were reduced. CAPE treatment reversed these effects.
(Ozguner et al., 2006)	Rat whole body	900 MHz, from cell phone	Retinal levels of NO and MDA increased, SOD, GSH-Px and CAT activities were decreased.Melatonin and CAPE treatment prevented effects.
(Ozguner et al., 2005b)	Rat whole body	900 MHz	Renal tissue MDA and NO levels increased, the activities of SOD, CAT and GSH-Px were reduced. CAPE treatment reversed these effects.
(Ozgur et al., 2010)	Guinea pig whole body	1800 MHz,GSM, SAR = 0.38 W/kg, 10 or 20 min/day for 7 days	Increases in MDA and total NO(x) levels and decreases in activities of SOD, myeloperoxidase and GSH-Px in liver. Extent of oxidative damage was proportional to the duration of exposure.
(Ozgur et al., 2013)	Rabbit whole body	1800 MHz, pulsed, 15 min/day for 7 days in pregnant animals, for 7 or 15 days in infants	The amount of LPO was increased in the prenatal exposure group.
(Özorak et al., 2013)	Rat whole body	900; 1800; 2450 MHz, pulsed, PD of 12 $\mu W/cm^2$.SAR = 0.18; 1.2 W/kg, 60 min/day during gestation and 6 weeks following delivery	At the age of six weeks, an increased LPO in the kidney and testis, and decreased level of GSH and total antioxidant status.
(Qin et al., 2014)	Male mouse whole body	1800 MHz, 208 $\mu W/cm^2$, 30 or 120 min/d for 30 days	Decreased activities of CAT and GSH-Px and increasedlevel of MDA in cerebrum. Nano-selenium decreased MDA level, and increased GSH-Px and CAT activities.
(Ragy, 2014)	Rat whole body	Cell phone 900 MHz RFR, 1 h/d for 60 days	Increase in MDA levels and decrease total antioxidant capacity levels in brain, liver and kidneys tissues. These alterations were corrected by withdrawal of RFR exposure during 30 days.
(Saikhedkar et al., 2014)	Rat whole body	Cell phone 900 MHz RFR, 4 h/d for 15 days	A significant change in level of antioxidant enzymes and non-enzymatic antioxidants, and an increase in LPO.
(Shahin et al., 2013)	Mouse whole body	2450 MHz, PD of 33.5 $\mu W/cm^2$, SAR = 23 mW/kg, 2 h/day for 45 days	An increase in ROS, decrease in NO and antioxidant enzymes activities.
(Sharma et al., 2009)	Plant(mung bean) whole body	900 MHz, from cell phone, PD of 8.55 $\mu W/cm^2$; for 0.5; 1; 2, and 4 h	Increased level of MDA,H_2O_2 accumulation and root oxidizability, upregulation in the activities of SOD, CAT, ascorbate peroxidases, guaiacol peroxidases and GSHreductases in roots.
(Singh et al., 2012)	Plant (mung bean) whole body	900 MHz,from cell phone	The increased level of MDA, hydrogen peroxide and proline content in hypocotyls.
(Sokolovic et al., 2008)	Rat whole body	RFR from cell phone, SAR = 0.043–0.135 W/kg, for 20, 40 and 60 days	An increase in the brain tissue MDA and carbonyl group concentration. Decreased activity of CAT and increased activity of xanthine oxidase (XO). Melatonin treatment prevented the effects.

(*continued*)

Table 2. Continued

Reference	Biological system exposed	RFR exposure	Statistically significant effects reported*
(Sokolovic et al., 2013)	Rat whole body	900 MHz, SAR = 0,043–0.135 W/kg,4 h/day for 29; 40 or 60 days,	The level of LPO and PO, activities of CAT, XO, number of apoptotic cells were increased in thymus tissue. An administration of melatonin prevented these effects.
(Suleyman et al., 2004)	Rat whole body	Cell phoneRFR,SAR = 0.52 W/kg,20 min/day for 1 month	MDA concentration was increased in brains.
(Tkalec et al., 2007)	Plant Lemna minor (duckweed)	400 and 900 MHz, 10, 23, 41 and 120 V/m, for 2 or 4 h	LPO and H_2O_2 content increased: CAT activity increased, pyrogallol peroxidase decreased.
(Tkalec et al., 2013)	Earthworm whole body	900 MHz, PD of 30–3800 μW/cm^2, SAR = 0.13–9.33 mW/kg, for 2 h	The protein carbonyl content was increased in all exposures above 30 μWc/m^2. The level of MDA was increased at 140μW/cm^2.
(Tök et al., 2014)	Rat whole body	2450 MHz, Wi-Fi RFR, 60 min/day for 30 days	Decreased GSH-Px activity. GSH-Px activity and GSH values increased after melatonin treatment.
(Tomruk et al., 2010)	Rabbit whole body	1800 MHz, GSM-like signal, 15 min/day for a week	Increase of MDA and ferrous oxidation in xylenol orange levels.
(Tsybulin et al., 2012)	Quail embryo *in ovo*	900 MHz, fromcell phone, GSM, PD of 0.024–0.21 μW/cm^2, intermittent for 14 days	Increased level of TBARS in brains and livers of hatchlings.
(Turker et al., 2011)	Rat partial body	2450 MHz, pulsed, SAR = 0.1 W/kg,1 h/day for 28 days	The increased level of LPO, the decreased concentrations of vitamin A, vitamin C and vitamin E. There was a protective effect of selenium and L-carnitine.
(Türedi et al., 2014)	Pregnant rat whole body	900 MHz, 13.7 V/m, 50 μW/cm^2, 1 h/day for 13–21 days of pregnancy	MDA, SOD and CAT values increased, GSH values decreased in exposed pups.
(Yurekli et al., 2006)	Rat whole body	945 MHz, GSM, PD of 367 μW/cm^2, SAR = 11.3 mW/kg	MDA level and SOD activity increased, GSH concentration was decreased.

*All effects were statistically significant (at least $p < 0.05$) as compared to control or sham exposed groups.

Table 3. Publications which reported positive findings on oxidative stress caused byRFR exposure of humans.

Reference	Biological system exposed	RFR exposure	Statistically significant effects reported*
(Abu Khadra et al., 2014)	Human male head	GSM 1800 MHz from cell phone, SAR = 1.09 W/kg, for 15 and 30 min	SOD activity in saliva increased.
(Garaj-Vrhovac et al., 2011)	Human whole body	3; 5.5; 9.4 GHz, pulsed, from radars	Increased level of MDA, decreased level of GSH.
(Hamzany et al., 2013)	Human head/whole body	RFR from cell phone a mean time of 29.6 h/month for 12.5 years	Increase in all salivary oxidative stress indices.
(Moustafa et al., 2001)	Human male body	Cell phone in a pocket in standby position, for 1; 2 or 4 h	Plasma level of LPO was increased, activities of SOD and GSH-Px in erythrocytes decreased.

*All effects were statistically significant (at least $p < 0.05$) as compared to control or sham-exposed groups.

significant overproduction of superoxide radical and NO radical, increased rates of lipid peroxidation and oxidative damage of DNA (Burlaka et al., 2013; Tsybulin et al., 2012). Notably, shorter exposures instead led to enhancement in embryonic development (Tsybulin et al., 2012, 2013). We demonstrated the favorable effects of shorter exposures also on the molecular level. Thus, after the short-time RFR exposure the DNA comets in embryonic cells were significantly shorter than in the control non-irradiated embryos, pointing to activation of mechanisms maintaining the integrity of DNA. The ''beneficial'' consequences of the irradiation could be explained by hormesis effect (Calabrese, 2008). However, one could hypothesize that the ''beneficial'' effects of the irradiation could be explained by the signaling action of free radicals induced at levels below the damaging concentrations. Obviously, any seemingly beneficial effect of external environmental impact should be treated with caution and possibly minimized before careful evaluation of the long-term consequences. Altogether, this gives a clear warning of the adverse health effects of

Table 4. Publications which reported no significant oxidative effectsafter RFR exposure.

Reference	Biological system exposed	RFR exposure	Effects reported
(Hook et al., 2004)	Mammalian cells *in vitro*	835.62 MHz (frequency-modulated continuous-wave, FMCW) and 847.74 MHz (code division multiple access, CDMA), SAR = 0.8 W/kg, for 20–22 h	FMCW- and CDMA-modulated RFR did not alter parameters indicative of oxidative stress.
(Ferreira et al., 2006a)	Rat whole body	800–1800 MHz, from cell phone	No changes in lipid and protein damage, and in non-enzymatic anti-oxidant defense in frontal cortex or hippocampus.
(Ferreira et al., 2006b)	Pregnant rat whole body	RFR from cell phone	No differences in oxidative parameter of offspring blood and liver, but increase in erythrocytes micronuclei incidence in offspring.
(Dasdag et al., 2003)	Rat whole body	Cell phone RFR, SAR = 0.52 W/kg, 20 min/day for 1 month	No alteration in MDA concentration.
(Demirel et al., 2012)	Rat whole body	3G cell phone RFR, ''standardized daily dose'' for 20 days	No difference in GSH-Px and CAT activity in eye tissues, in MDA and GSH levels in blood.
(Khalil et al., 2014)	Human head/whole body	Cell phone RFR (talking mode) for 15 or 30 min	No relationship between exposure and changes in the salivary oxidant/anti-oxidant profile.
(de Souza et al., 2014)	Human head/whole body	Cell phone RFR	No difference in the saliva from the parotid gland exposed to cell phone RFR to the saliva from the opposite gland of each individual.

low-intensity RFR, which could be evoked both by the direct oxidative damage and by disturbed cellular signaling.

Oxidative effects and non-cancer health effects of RFR

A new medical condition, so-called electrohypersensitivity (EHS), in which people suffer due to RFR exposure, has been described (Johansson, 2006). Typically, these persons suffer from skin- and mucosa-related symptoms (itching, smarting, pain, heat sensation), or heart and nervous system disorders after exposure to computer monitors, cell phones and other electromagnetic devices. This disorder is growing continuously: starting from 0.06% of the total population in 1985, this category now includes as much as 9–11% of the European population (Hallberg and Oberfeld, 2006). In Sweden, for example, EHS has become an officially recognized health impairment.

To that, a high percentage, up to 18–43% of young people, has recently been described to be suffering from headache/earache during or after cell phone conversations (Chu et al., 2011; Yakymenko et al., 2011). Likewise, a number of psychophysical and preclinical disorders including fatigue, irritation, headache, sleep disorders, hormonal imbalances were detected in high percent of people living nearby cell phone base transceiver stations (Buchner and Eger, 2011; Santini et al., 2002).

An allergy reaction to RFR in humans has been confirmed by a significant increase in the level of mast cells in skin of persons under exposure to electromagnetic devices (Johansson et al., 2001). Likewise, higher level of degranulated mast cells in dermis of EHS persons has been detected (Johansson, 2006). In turn, the activated mast cells can release histamine and other mediators of such reactions which include allergic hypersensitivity, itching, dermatoses, etc. Importantly, an implication of ROS in allergic reactions is rather clear nowadays. For example, in case of airway allergic inflammation, the lung cells generate superoxide in nanomolar concentrations following antigen challenges (Nagata, 2005). Then, mast cells generate ROS following aggregation of FcεRI, a high-affinity IgE receptor (Okayama, 2005). In addition, pollen NADPH oxidases rapidly increase the level of ROS in lung epithelium (Boldogh et al., 2005); and removal of pollen NADPH oxidases from the challenge material reduced antigen-induced allergic airway inflammation. Thus, it seems plausible that EHS-like conditions can be attributed at least partially to ROS overproduction in cells due to RFR exposures.

Oxidative effects and potential carcinogenicity of RFR

During recent years, a number of epidemiological studies indicated a significant increase in incidence of various types of tumors among long-term or ''heavy'' users of cellular phones (Yakymenko et al., 2011). Briefly, reports pointed to the increased risk in brain tumors (Cardis et al., 2010; Hardell and Carlberg, 2009; Hardell et al., 2007), acoustic neuroma (Hardell et al., 2005; Sato et al., 2011), tumors of parotid glands (Sadetzki et al., 2008), seminomas (Hardell et al., 2007), melanomas (Hardell et al., 2011) and lymphomas (Hardell et al., 2005) in these cohorts of people. To that, a significant increase in tumor incidence among people living nearby cellular base transceiver stations was also reported (Eger et al., 2004; Wolf and Wolf, 2007). Similarly, experimental evidences of cancer expansion in rodents caused by long-term low-intensity RFR exposure were published (Chou et al., 1992; Repacholi et al., 1997; Szmigielski et al., 1982; Toler et al., 1997). To that, activation of ODC was detected in RFR-exposed cells (Hoyto et al., 2007). ODC is involved in

processes of cell growth and differentiation, and its activity is increased in tumor cells. Although overexpression of ODC is not sufficient for tumorigenic transformation, an increased activity of this enzyme was shown to promote the development of tumors from pre-tumor cells (Clifford et al., 1995).

Significant overproduction of ROS leads to oxidative stress in living cells, induces oxidative damage of DNA and can cause malignant transformation (Halliwell and Whiteman, 2004; Valko et al., 2007). It is known that in addition to mutagenic effects, ROS play a role as a second messenger for intracellular signaling cascades which can also induce oncogenic transformation (Valko et al., 2006). Earlier we hypothesized (Burlaka et al., 2013) that low-intensity RFR exposure leads to dysfunctions of mitochondria, which result in overproduction of superoxide and NO, and subsequently to ROS-mediated mutagenesis. To that, it is well established that oxidative stress is associated with carcinogenesis; for instance, the oxidative stress elicited by Membrane-Type 1 Matrix Metalloproteinase is implicated in both the pathogenesis and progression of prostate cancer (Nguyen et al., 2011). Similarly, a progressive elevation in mitochondrial ROS production (chronic ROS) under both hypoxia and/or low glucose, which leads to stabilization of cells via increased HIF-2alpha expression, can eventually result in malignant transformation (Ralph et al., 2010). These data, together with the strong experimental evidences on activation of NADH oxidase under RFR exposure (Friedman et al., 2007) suggest that low-intensity RFR is a multifactorial stress factor for living cell, significant feature of which is oxidative effects and potential carcinogenicity as a result.

Conclusions

The analysis of modern data on biological effects of low-intensity RFR leads to a firm conclusion that this physical agent is a powerful oxidative stressor for living cell. The oxidative efficiency of RFR can be mediated via changes in activities of key ROS-generating systems, including mitochondria and non-phagocytic NADH oxidases, via direct effects on water molecules, and via induction of conformation changes in biologically important macromolecules. In turn, a broad biological potential of ROS and other free radicals, including both their mutagenic effects and their signaling regulatory potential, makes RFR a potentially hazardous factor for human health. We suggest minimizing the intensity and time of RFR exposures, and taking a precautionary approach towards wireless technologies in everyday human life.

BRIEFING

European Parliament

Effects of 5G wireless communication on human health

SUMMARY

The fifth generation of telecommunications technologies, 5G, is fundamental to achieving a European gigabit society by 2025.

The aim to cover all urban areas, railways and major roads with uninterrupted fifth generation wireless communication can only be achieved by creating a very dense network of antennas and transmitters. In other words, the number of higher frequency base stations and other devices will increase significantly.

This raises the question as to whether there is a negative impact on human health and environment from higher frequencies and billions of additional connections, which, according to research, will mean constant exposure for the whole population, including children. Whereas researchers generally consider such radio waves not to constitute a threat to the population, research to date has not addressed the constant exposure that 5G would introduce. Accordingly, a section of the scientific community considers that more research on the potential negative biological effects of electromagnetic fields (EMF) and 5G is needed, notably on the incidence of some serious human diseases. A further consideration is the need to bring together researchers from different disciplines, in particular medicine and physics or engineering, to conduct further research into the effects of 5G.

The EU's current provisions on exposure to wireless signals, the Council Recommendation on the limitation of exposure of the general public to electromagnetic fields (0 Hz to 300 GHz), is now 20 years old, and thus does not take the specific technical characteristics of 5G into account.

In this Briefing

PE 646.172 – February 2020

EN

Background

Under the EU digital single market strategy, the European Commission presented new policy measures in its 2016 communication on Connectivity for a Competitive Digital Single Market – Towards a European Gigabit Society. The Commission's aim is to advance the digitalisation of the EU and to increase its competitiveness by launching networks with much higher capacities, with 5G as a building block to achieve a 'gigabit society' by 2025. Its main characteristics would enable the internet of things, which means that billions of connections between devices share information.[1] The Commission has established the following connectivity targets for 2025:

- schools, universities, research centres, hospitals, main providers of public services and digitally intensive enterprises should have access to internet download/upload speeds of one gigabit of data per second;
- urban and rural households should have access to connectivity of download speed of at least 100 megabits per second;
- urban areas, major roads and railways should have uninterrupted 5G coverage.

The '5G for Europe: An action plan' presents measures for timely and coordinated deployment of 5G networks in Europe through a partnership between the Commission, Member States, and industry. This initiative concerns all private and public stakeholders, in all EU Member States.

The connectivity objective has been regulated by the adoption of the European Electronic Communication Code (EECC) at the end of 2018, under which EU Member States have to authorise the use of the new 5G frequency bands at 700 MHz, 3.5 GHz and 26 GHz[2] and reorganise them by the end of 2020,[3] in line with the EECC. This decision enables the take-up of 5G services in the Union.

According to the European 5G observatory, supported by the European Commission, at the end of September 2019, 165 trials had been carried out in the European Union and 11 Member States had already published their national 5G action plans.

Challenges and opportunities of 5G

Advantages

Allowing much larger volumes of data to be transported more quickly, and reducing response time, 5G will enable instantaneous connectivity to billions of devices, the internet of things and a truly connected EU population. Furthermore, millions of jobs and billions of euros could be expected to be gained from the digital economy.

The possibilities that the fifth generation of wireless communication offers, such as downloading or uploading one gigabit of data per second, may provide advantages, for instance, for the military and medical research, which could benefit from having access to such extremely high gigabit connectivity. However, the military, hospitals, the police and banks continue to use wired connections, at least for their most essential communications, mainly for security reasons. Wired networks generally offer a faster internet speed and are considered to be more secure. This is due to the fact that a wired network is only accessible through a physical cable connection, whereas with wireless networks, the signal may be broadcast outside the physical premises. Wired connection offers more control than radio or wifi, because such organisations already provide protection for servers and internal IT facilities within their physical locations, taking advantage of almost 100 % of the bandwidth, which also reduces response times. That also contributes to increased security.

Disadvantages

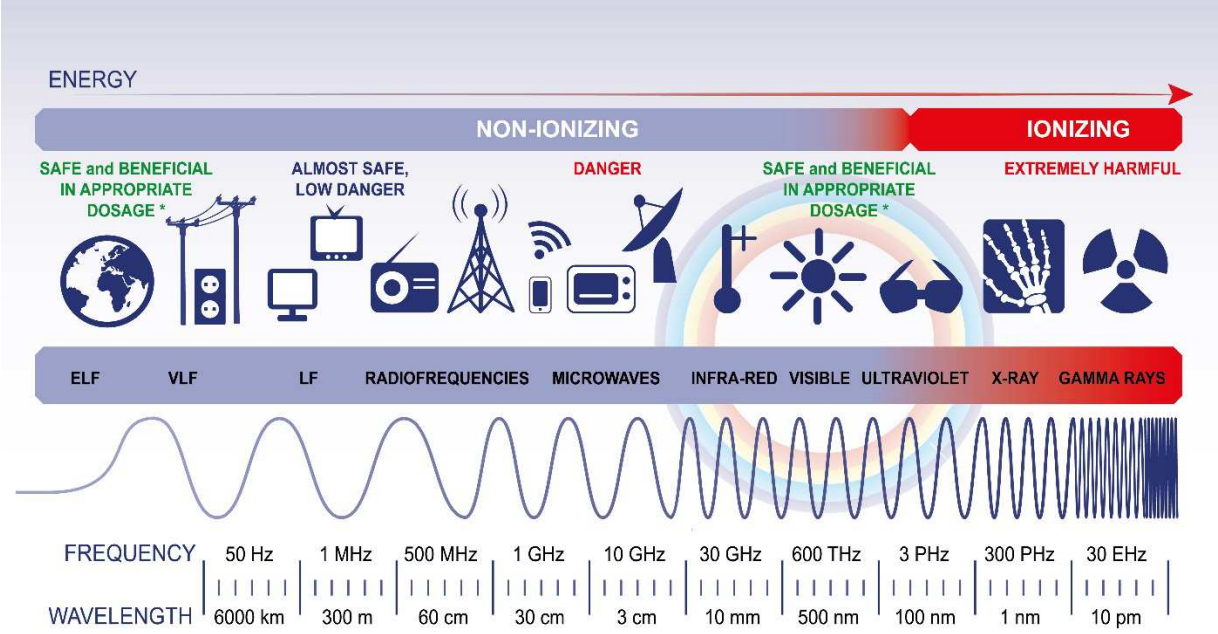
Because it is more complex and requires a denser coverage of base stations[4] to provide the expected capacity, 5G will cost much more to deploy than previous mobile technologies. According to European Commission estimates, to reach the target, including 5G coverage in all urban areas, this cost is estimated at around €500 billion by 2025.

Questions remain unanswered as to what 5G actually is, what it is for, whether it has impacts on human health and environment, whether it is secure, whether it offers good value for money or whether anyone will be prepared to pay for it.[5] As an alternative, according to some experts,[6] fibre optics would be more secure, safe and offer higher speed than 5G. However, fibre optics are not wireless.

Difference between 5G and current technology

Employing millimetre waves and higher frequencies than previous technologies, 5G needs a much more extensive network of antennas and other transmitting devices. Electromagnetic fields (EMF) are invisible areas of energy,[7] measured in hertz (Hz). Longer wavelengths with lower frequency are less powerful in terms of energy, while shorter wavelengths at higher frequencies are more powerful. Depending on the frequency, there are two categories of EMF: ionising and non-ionising radiation (see Figure 1).

Figure 1 – Electromagnetic spectrum



Source: Polina Kudelkina / Shutterstock.com.

Ionising radiation (mid to high-frequency) includes ultraviolet rays, x-rays and gamma rays. The energy from ionising radiation can damage human cells and cause cancer. Non-ionising radiation has lower frequencies and bigger wavelengths. Many experts are of the opinion that non-ionising radiation produces only thermal effects, or tissue heating, and that at high exposure levels, temperature-sensitive biological structures, including humans, and processes can become damaged.

Microwave and millimetre wavelength radiation is non-ionising. Millimetre wave ranges from around 10 to 1 millimetre. This is a very effective spectrum with large bandwidth, but it is also very sensitive to external variables and can be subject to interference from walls, trees or even rain.

For the first time, 5G will use millimetre waves in addition to the microwaves that have been used to date in 2G, 3G and 4G technology. Due to the limited coverage, to implement 5G, cell antennas will have to be installed very close to one another, which will result in constant exposure of the population to millimetre wave radiation. Use of 5G will also require new technologies to be employed, such as active antennas capable of beam-forming, massive inputs and outputs.[8] With higher frequencies and shortened ranges, base stations will be more closely packed into an area, to

provide complete coverage and avoid 'not-spots'. This could mean possible ranges of 20-150 metres with smaller coverage areas per 'small cell.[9] A cell radius of 20 metres would imply about 800 base stations per square kilometre (or 'small area wireless access points' (SAWAPs), the term used in the EECC). This contrasts with 3G and 4G technologies, which use large or 'macro' cells, offering ranges of 2-15 kilometres or more, and therefore covering a larger area but allowing fewer simultaneous users since they have fewer individual channels.[10]

Furthermore, 5G will employ higher frequencies[11] than previous 'G' networks and greater bandwidth which will enable users to transfer wireless data faster.

Regulation of electromagnetic fields and 5G exposure

European Union

Primary responsibility for protecting the population from the potential harmful effects of EMF falls to the governments of EU Member States under Article 168 of the Treaty on the Functioning of the European Union. In 1996, the World Health Organization (WHO) established the International EMF Project to evaluate the scientific evidence of possible health effects of EMF in the frequency range from 0 to 300 GHz. It has elaborated 'model legislation' to offer a legal framework for implementing protection programmes against non-ionising radiation.

The International Commission on Non-Ionising Radiation Protection (ICNIRP), a non-governmental organisation formally recognised by WHO, issues guidelines for limiting exposure to electric, magnetic and electromagnetic fields (EMF), which are revised periodically. In the EU, **Council Recommendation** 1999/519/EC, of 12 July 1999, on the limitation of exposure of the general public to EMF (0 Hz to 300 GHz), follows these guidelines.

As the Council Recommendation is the common protective framework guiding EU Member States and setting basic restrictions and reference levels, depending on frequency, the following physical quantities specify basic restrictions on electromagnetic fields:

- between 0 and 1 Hz, basic restrictions are provided for magnetic flux density for static magnetic fields (0 Hz) and current density for time-varying fields12 up to 1 Hz, to prevent effects on the cardiovascular and central nervous system;
- between 1 Hz and 10 MHz, basic restrictions are provided for current density13 to prevent effects on nervous system functions;
- between 100 kHz and 10 GHz, basic restrictions on the specific absorption rate (SAR) are provided to prevent whole-body heat stress and excessive localised tissue heating. In the 100 kHz to 10 MHz range, restrictions on both current density and SAR are provided;
- between 10 GHz and 300 GHz, basic restrictions on power density are provided to prevent tissue heating on or near the surface of the human body.

While these exposure limits are non-binding on EU Member States, some Member States have nevertheless adopted stricter limits than those recommended above.

The recommendation encourages Member States to establish a common protective framework and inform the public of the health impact of electromagnetic fields, as well as to harmonise national approaches for measurement. The Council suggests that the European Commission keep possible health effects under review.

The **European Environment Agency** (EEA) has long advocated precaution concerning EMF exposure, pointing out that there were cases of failure to use the precautionary principle in the past, which have resulted in often irreversible damage to human health and environments. Appropriate, precautionary and proportionate actions taken now to avoid plausible and potentially serious threats to health from EMF are likely to be seen as prudent and wise from future perspectives. The EEA requests that EU Member States do more to inform citizens about the risks of EMF exposure, especially to children.

In its 2 April 2009 resolution, the European Parliament urged the Commission to review the scientific basis and adequacy of the EMF limits in Recommendation 1999/519/EC and to report back. Parliament also requested that the Scientific Committee on Emerging and Newly Identified Health Risks carry out a review of the EMF limits. Parliament requested consideration of the biological effects, acknowledging the results of studies that reveal harmful effects at lowest levels of electromagnetic radiation, as well as calling for active further research and consequently development of solutions to negate or reduce pulsations used for transmission. It suggested that the Commission elaborate a guide to available technology options for reducing exposure to EMF in coordination with experts from Member States and the industries concerned.

The European Commission **Scientific Committee on Emerging and Newly Identified Health Risks** (SCENIHR) has a mandate to evaluate the risks of electromagnetic fields and periodically reviews the scientific evidence available to assess whether it still supports the exposure limits proposed in Council Recommendation 1999/519/EC. In its latest opinion of January 2015, SCENIHR suggested that there is a lack of evidence that EMF radiation affects cognitive functions in humans or contributes to an increase of the cases of cancer in adults and children. However, the International EMF Alliance (IEMFA) suggested that many members of SCENIHR could have a conflict of interests, as they had professional relationships with or received funding from various telecom companies.

Consequently, the Scientific Committee on Health, Environmental and Emerging Risks (SCHEER), replacing the former Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR), indicated a preliminary estimate of the importance of 5G as high, in a statement in December 2018. Furthermore, it evaluates the scale, urgency and interactions (with ecosystems and species) of possible hazard as high. It suggested that there could be biological consequences from a 5G environment, due to the fact that there is a lack of 'evidence to inform the development of exposure guidelines to 5G technology'.

Council of Europe

Council of Europe Resolution 1815 (2011) points to the potential health effects of the very low frequency of electromagnetic fields surrounding power lines and electrical devices, which are the subject of ongoing research and public debate. It also states that some non-ionising frequencies appear to have more or less potentially harmful, non-thermal, biological effects on humans, other animals and plants, even when exposed to levels that are below the official threshold values. The resolution identifies young people and children as particularly vulnerable groups and suggests that there could be extremely high human and economic costs if early warnings are neglected. The issue of possible environmental and health effects of electromagnetic fields is considered to have clear parallels with other current issues: the licensing of medication, chemicals, pesticides, heavy metals or genetically modified organisms. The resolution highlights that the independence and credibility of the scientific expertise employed is crucial for a transparent and balanced assessment of possible negative effects on human health and environment. The resolution recommends:

- taking all reasonable measures to reduce exposure to EMF (especially from mobile phones) and particularly to protect children and young people who seem to be most at risk of developing head tumours;
- reconsidering the scientific basis for the present standards on exposure to electromagnetic fields set by the International Commission on Non-Ionising Radiation Protection, which have serious limitations;
- distributing information and awareness-raising campaigns on the risks of potentially harmful long-term biological effects on the environment and on human health, especially targeting children, teenagers and young people of reproductive age;
- giving preference to wired internet connections (for children in general and particularly in schools), and strictly regulating the use of mobile phones by schoolchildren on school premises;
- increasing public funding of independent research to evaluate health risks.

European Parliament

A resolution of 2 April 2009 on health concerns associated with electromagnetic fields urged the European Commission to review the scientific basis and adequacy of the EMF limits in Recommendation 1999/519/EC and to report back. It also requested that the Scientific Committee on Emerging and Newly Identified Health Risks carries out a review of the EMF limits.

Research on EMF and 5G effects on human health

The academic literature on EMF exposure effects and 5G in particular is growing rapidly. Some research papers support possible health risks, while others do not.

The WHO[14]/International Agency for Research on Cancer (IARC) classified radiofrequency EMF as possibly carcinogenic to humans in 2011. The IARC has recently prioritised EMF radiation for review in the next five years (2020-2024).

A section of the scientific community – mainly doctors and researchers in medical sciences – argues that there are negative impacts from EMF exposure and that these will increase with the implementation of 5G. A **5G appeal** was presented to the United Nations in 2015, and to the European Union from 2017, with an increasing number of scientists' signing (268 scientists and medical doctors as of 18 December 2019). The signatories state that with the increasingly extensive use of wireless technology, especially when 5G is deployed, nobody could avoid exposure to constant EMF radiation because of the huge number of 5G transmitters with an estimated 10 to 20 billion connections (to self-driving cars, buses, surveillance cameras, domestic appliances, etc.). In addition, the appeal states that a large number of scientific publications illustrate EMF exposure effects such as an elevated risk of cancer, genetic damage, learning and memory deficits, neurological disorders, etc. The appeal points out not only harm to humans, but also to the environment.

The appeal recommends a moratorium on the deployment of 5G for telecommunications until potential hazards for human health and the environment have been fully investigated by scientists independent of industry. They urge the EU to follow Resolution 1815 of the Council of Europe, and demand that a new assessment is carried out by an independent task force.

Ethics in research

The European Code of Conduct for Research Integrity (last revised in 2017) sets out principles of research integrity, criteria for good research practice, and describes how to prevent violations of research integrity.

The principles it states are the following:

- **Reliability** in ensuring the quality of research, reflected in the design, the methodology, the analysis and the use of resources.
- **Honesty** in developing, undertaking, reviewing, reporting and communicating research in a transparent, fair, full and unbiased way.
- **Respect** for colleagues, research participants, society, ecosystems, cultural heritage and the environment.
- **Accountability** for the research from idea to publication, for its management and organisation, for training, supervision and mentoring, and for its wider impacts.

In this regard, some scientists consider it necessary to establish new exposure limits that take account of the new characteristics of exposure. Such limits should be based on the biological effects of EMF radiation, rather than on the energy-based specific absorption rate.

Non-ionising radiation, which includes radiation from mobile phones and 5G, is perceived as harmless in general, due to its lack of potency. However, some of the above-mentioned scientists point out that, in the particular case of 5G, the issue is not the potency, but the pulse,[15] the frequency to which the whole population will be exposed due to the dense network of antennas and the estimated billions of simultaneous connections. As 5G employs a very high level of pulsations, the idea behind 5G is to use higher frequencies, which allows such high levels of pulsation, in order to

carry very large amounts of information per second. Studies show that pulsed EMF are in most cases more biologically active and therefore more dangerous than non-pulsed EMF. Every single wireless communication device communicates at least partially via pulsations, and the smarter the device, the more pulsations. Consequently, even though 5G can be weak in terms of power, its constant abnormal pulse radiation can have an effect. Along with the mode and duration of exposures, characteristics of the 5G signal such as pulsing seem to increase the biologic and health impacts of exposure, including DNA damage, which is considered to be a cause of cancer. DNA damage is also linked to reproductive decline and neurodegenerative diseases.

A 2018 review of more recently published peer-reviewed articles on the biological and health effects of radio frequency EMF, including 5G, also verifies the available evidence on the effects of millimetre waves. The review concludes that evidence of the biological properties of radiofrequency EMF are accumulating progressively and even though they are, in some cases, still preliminary or controversial, point to the existence of multi-level interactions between high-frequency EMF and biological systems, and to the possibility of oncological and non-oncological (mainly reproductive, metabolic, neurological, microbiological) effects. Moreover, it points out that the wide and increasing density of wireless devices and antennas raises particular concerns. Taking this into account, '... although the biological effects of 5G communication systems are very scarcely investigated, an international action plan for the development of 5G networks has started, with a forthcoming increase in devices and density of small cells, and with the future use of millimetre waves'. However, there are indications that millimetre waves can increase skin temperature, promote cellular proliferation, and inflammatory and metabolic processes. According to the review, further studies are necessary to improve independent exploration of the health effects of radio frequency EMF in general and of millimetre waves in particular.[16]

Far less research exists to determine the effects of 5G technologies on humans and the environment, according to another review of studies published in 2018. Considering the already existing complex mix of lower frequencies, it argues that in addition to those, the expected higher frequency 5G radiation would cause negative impacts on physical and mental public health. Concretely in the case of millimetre waves, it analyses the results of studies which find effects on the skin, eyes, and immune system, and bacterial antibiotic resistance. The review suggests that the effects of radiofrequency EMF will be problematic to sort out epidemiologically, as no unexposed control group will remain. The study consequently calls for precaution in the deployment of this new technology. The author argues that while physicists and engineers give assurances that the only measure to harm health is heat, medical scientists indicate that there are other mechanisms whereby cellular functioning can be disrupted by non-thermal exposures to radiofrequency.

A 2016 review of scientific articles, covering experimental data on the oxidative effects of low-intensity radiofrequency radiation in living cells, finds that, among 100 currently available peer-reviewed studies (18 *in vitro* studies, 73 studies in animals, 3 studies in plants and 6 studies in humans), '... dealing with oxidative effects of low-intensity radiofrequency radiation, in general, 93 confirmed that radiofrequency radiation induces oxidative effects in biological systems'. More precisely, in 58 studies of laboratory rats, 54 show positive results, and 4 of 6 studies in humans were positive. In addition, 17 of the 18 of the *in vitro* studies were positive, including two on human spermatozoa and two on human blood cells. According to the authors, 'The analysis of modern data on biological effects of low-intensity radiofrequency radiation (RFR) leads to a firm conclusion that this physical agent is a powerful oxidative stressor for living cells'.

A 2018 study carried out on animals, showed that electromagnetic radiation emitted by wifi networks can lead to hyperglycaemia, increased oxidative stress and impaired insulin secretion in rat pancreatic islets. A method of creating diabetes (which can lead to kidney deficiency in the long term) in laboratory rats is to expose them, even briefly, to 2.4 Ghz.

A 2019 report of the Swedish Radiation Safety Authority's Scientific Council on Electromagnetic Fields considers two large animal studies: the US National Toxicology Program (NTP) study and the

Italian Falcioni et al. study, which analyse the relationship between radio wave exposure and schwannoma of the heart in male rats.[17] The report concludes that there is some inconsistency in the results between the two studies and that no new causal relationship between EMF exposure and health risks was established. It recommends that further research is important, particularly regarding long-term effects and especially since the entire population will be exposed. It points out that a possible relationship between radio wave exposure and oxidative stress should be a subject of further research, as well as the association between weak low-frequency magnetic fields and childhood leukaemia, as observed in epidemiological studies.

The scientific community reaction in response to this report, is illustrated in the recent 'Commentary on the utility of the National Toxicology Program study on cell phone radiofrequency radiation data for assessing human health risks despite unfounded criticisms aimed at minimizing the findings of adverse health effects.' The author states that the NTP study was designed to test the hypothesis that, at non-thermal exposure intensities, mobile phone radiation could not lead to adverse health effects, and to provide data for assessment of health risks caused by any detected toxic or carcinogenic effects, as little was known about long-term exposure to mobile phone radiation health effects. Regarding the NTP study results, among others, the author defends the use of animal studies that can eliminate the need to wait until enough human cancer data are available before implementing strategies to protect public health. According to the author, the intensity of exposure in the brains of rats in the NTP study were similar to potential human mobile phone exposures.

In turn, a 2019 review of 94 articles, funded by Deutsche Telekom, states that the '... available studies do not provide adequate and sufficient information for a meaningful safety assessment, or for the question about non-thermal effects. There is a need for research regarding local heat developments on small surfaces, e.g., skin or the eye, and on any environmental impact. There was no consistent relationship between power density, exposure duration, or frequency, and exposure effects'.

There is no noticeable increase in everyday EMF exposure since 2012, despite the increasing use of wireless communication devices, according to another review of studies from 2019. Nevertheless, it remains unclear how well these studies of everyday exposure represent the population's absorbed radiofrequency EMF dose. This study maintains the urgent need for better quantification of the population's absorbed radiofrequency EMF dose from their own communication devices.

Stakeholders' views

Considering the huge estimated investment, the mobile telecommunications industry needs to convince governments of 5G's economic and social benefits and perform widespread marketing campaigns. 'It suits the industry if policy-makers believe that there is a race between nations to be the first to launch 5G services'.[18]

The EU telecommunications industry continues to state that the weight of evidence regarding harm from EMF exposures is inconclusive. The 5G Infrastructure Public Private Partnership (5G PPP), a joint initiative between the European Commission and European information and telecommunications (ICT) industry (ICT manufacturers, telecommunications operators, service providers, SMEs and research institutions), supports research and innovation to develop 5G networks that comply with international standards and regulations and develops systems designed to operate below the safe health limits of electromagnetic emissions.[19] However, it does not refer to the biological impacts of 5G radiation.

Nevertheless, according to the IEMFA, a need to measure real potential exposure to 5G and update the safety limits of such exposure does exist. The alliance calls for more research and scientific consent along these lines. It maintains that scientists with experience of long research into EMF health effects should be included in the SCENIHR, following the demands of the 2015 IEMFA complaint.[20]

The road ahead for 5G

There is an urgent need for economic recovery and leadership in implementing digital technologies; and for long-lasting economic growth in Europe. However, it is necessary to consider any possible collateral negative impacts. Taking the economic aspects of 5G into account, there are many challenges ahead on the path to achieving a 'gigabit society', such as for instance industry concerns whether the plans for commercial launch of 5G in 2020 will be fulfilled, considering the technical complexity and the necessary investment.

Other concerns relate to the creation of sufficient demand for 5G, security and health, safety and environmental issues.[21] These need wider public awareness and consent, however this is doubly salient regarding the possible negative health impacts due to the inescapability of constant exposure of citizens in a 5G environment. The recent academic literature illustrates that continuous wireless radiation seems to have biological effects especially considering the particular characteristics of 5G: the combination of millimetre waves, a higher frequency, the quantity of transmitters and the quantity of connections. Various studies suggest that 5G would affect the health of humans, plants, animals, insects, and microbes – and as 5G is an untested technology, a cautious approach would be prudent. The UN Universal Declaration of Human Rights, the Helsinki Accords and other international treaties recognise that informed consent prior to interventions that might affect human health is an essential, fundamental human right, which becomes even more controversial when considering children's and young people's exposure.

A certain divergence exists among scientists on the potential negative effects of EMF exposure and 5G. Experts rarely possess complementary backgrounds in both physics or engineering and medicine, therefore more complete scientific expertise could be achieved by combining research teams experienced in all relevant disciplines. Optical fibre technology has been suggested by some experts as a secure alternative to 5G, because the signal is confined within the fibre. Its potential is much higher than that of 5G and there is no comparison between optical fibre and wireless. Investment in optical fibre can be upgraded to superior speeds in the future, whereas it is necessary to change the whole system for wireless technologies.

According to the 2019 study '5G deployment: State of Play in Europe, USA and Asia' prepared for the European Parliament, long-term technology research is essential. 'One key problem is the unusual propagation phenomena, especially controlling and measuring radio frequency EMF exposure with Multiple Input Multiple Output (MIMO) at millimetre wave frequencies for the handset and the base station. The technology presents challenges to the current level of expertise (based on previous generations of mobile cellular radio engineering) both for suppliers and standards organisations who must incorporate the specifications in future 5G standards'. The study states that the main problem seems to be that it is not currently possible to accurately simulate or measure 5G emissions in the real world.

To understand potential mechanisms underlying possible health effects of EMF better and to characterise population levels of exposure, the Generalised EMF Research using Novel Methods (GERoNiMO) project was launched in 2014, funded under the EU's Seventh Framework Programme for Research and Technological Development to address pertinent questions on EMF and health. It proposes an integrated approach using epidemiological studies, exposure assessment techniques, mechanistic and animal models, and expert networks applying novel methods when possible. The project ended in 2018.

The European Commission has not yet conducted studies on the potential health risks of the 5G technology.[22]

ENDNOTES

1 Industry estimates that 5G capacity will be 40 times that offered by current 4G technology. See M. Negreiro, Towards a European gigabit society Connectivity targets and 5G, EPRS, June 2017.

2 A Megahertz (MHz) is a million cycles per second and a Gigahertz (GHz) pulses at a billion cycles per second. In order to carry data at faster speeds, each new generation of telecommunications uses higher frequency radio waves.

3 See 5G deployment agenda.

4 In addition to spectrum licensing costs, a large share of the cost will be due to the much denser network needed, rolling out the small cells necessary to transmit signals in much higher frequency bands.

5 See '5G Deployment: State of Play in Europe, USA and Asia', European Parliament, June 2019.

6 'Fiber is safer, faster, more reliable, and far more cyber secure and energy efficient than wireless.' R. M. Powell. See also similar opinions from experts such as T. Schoechle and P. Héroux.

7 Also known as waves or radiation.

8 Which would make measuring radiation exposures even more difficult.

9 Usually, the longer the wavelength the further it travels. The higher frequency millimetre wavelengths of 5G travel only a few hundred metres.

10 See '5G Deployment: State of Play in Europe, USA and Asia', European Parliament, June 2019.

11 Radio frequency includes a continuum of the electromagnetic spectrum wavelengths from around 3 kHz to 300 GHz. The wavelengths in the radio frequency vary from hundreds of metres to fractions of a centimetre. The frequencies used in current digital communications have shorter wavelengths and faster data transfer. This enables the transfer of more data simultaneously.

12 Time-varying means that as time (t) increases, the magnetic field changes.

13 The amount of charge per unit of time that flows through a unit area of a chosen cross section.

14 According to the WHO, EMFs of all frequencies represent one of the most common and fastest growing environmental influences. Exposure of the whole population to EMFs will continue to increase along with technological advance.

15 An electromagnetic pulse is a short blowout of electromagnetic energy. Its origin can be manmade and can occur as a radiated, electric, or magnetic field or a conducted electric current.

16 Millimetre waves, which will be employed by 5G, are mostly absorbed within a few millimetres of human skin and in the surface layers of the cornea. Short-term exposure can have adverse physiological effects in the peripheral nervous system, the immune system and the cardiovascular system.

Christoffer Johansens habilitetserklæring vedrørende finansiering og data fra industri, der er involveret i produktion, transmission og distribution af elektricitet samt mobiltelefonoperatører og lignende industri, der producerer, forhandler eller anvender genstande som skaber elektromagnetiske felter i hele frekvensområdet.

Finansiering

Jeg har i perioden 1994 til 2004 modtaget midler fra Dansk Energi for at undersøge risiko for en række sygdomme blandt danskere med ansættelse ved danske el-selskaber, samt midler til at undersøge risiko for kræft blandt børn med bopæl tæt på elektriske højspændingsinstallationer.

Jeg har i 2006 fået en fornyet bevilling fra Energinet.dk for perioden 2006 til 2008 med henblik på at opdatere de allerede gennemførte undersøgelser.

Jeg har i 1994/95 modtaget fondsmidler fra det daværende Tele Danmark Mobil og Sonofon med henblik på at gennemføre en undersøgelse af kræftrisiko blandt brugere af mobiltelefoner.

Jeg har fire gang siden 1994 modtaget et personligt honorar for at udfærdige et notat, der i form af en VVM rapport, gennemgår den videnskabelige litteratur inden for forskningsområdet elektromagnetiske felter og helbredseffekter hos mennesker, sidste gang i 2010. Notatet er udarbejdet som en del af en såkaldt VVM rapport i forbindelse med forskellige udbygninger af højspændingsnettet i Danmark.

Data

Jeg har i perioden 1994 - 1996 modtaget information om samtlige ansatte ved de 104 danske elselskaber med oplysning om navn, CPR nummer, arbejdsfunktion, stillingsbetegnelse og ansættelses periode(r).

Jeg har i 1996 modtaget data fra det daværende TeleDanmarkMobil og Sonofon vedrørende samtlige abonnenters navne, adresse, mobiltelefon type og abonnements periode(r).

I 2007/2008 vil vi her på instituttet, fra de største mobiltelefon operatører få oplysninger om mobiltelefon forbrug blandt en større gruppe danskere der indgår i en international forløbsundersøgelse.

Vi vil desuden fra de samme mobiltelefon operatører modtage de samme informationer om børn med hjerne svulster og raske kontrolbørn, der indgår i en nordisk undersøgelse af risiko for hjernetumorer blandt børn og unge.

Jeg er medarbejder i disse to projektgrupper, mens det videnskabelige og økonomiske ansvar ligger hos Dr Joachim Schuez.

World Health Organization

IARC Monographs on the Identification of Carcinogenic Hazards to Humans

Report of the Advisory Group to Recommend Priorities for the *IARC Monographs* during 2020–2024

Non-ionizing radiation (radiofrequency) and extremely low-frequency magnetic fields

Radiofrequency electromagnetic fields (RF-EMF) were evaluated by the *IARC Monographs* as *possibly carcinogenic to humans* (Group 2B) (IARC, 2013e), on the basis of limited evidence of an increased risk of glioma. Extremely low-frequency magnetic fields (ELF-MF) were evaluated as *possibly carcinogenic to humans* (Group 2B) (IARC, 2002), on the basis of *limited evidence* of an increased risk of childhood leukaemia.

Exposure Data

Human exposures to RF-EMF can occur from use of personal devices (e.g. cell phones, cordless phones, and Bluetooth) and from environmental sources such as cell phone base stations, broadcast antennas, and medical applications. More than 5 billion people now have access to cell phone devices, and the technology is constantly evolving. Use has also expanded rapidly in low- and middle-income countries, where more than 75% of adults now report owning a cell phone; in high-income countries, the proportion is 96% (Pew Research Center, 2018).

Cancer in Humans

Since the previous *IARC Monographs* evaluation, several new epidemiological studies have been published on the association between RF-EMF and cancer, although the evidence remains mixed. In the Million Women Study cohort, there was no evidence of increased risk of glioma or meningioma, even among long-term users. There was an increased risk of acoustic neuromas with long-term use and a significant dose–response relationship (Benson et al., 2013). Updated follow-up in the Danish nationwide subscribers study did not find increased risks of glioma, meningioma, or vestibular schwannoma, even among those with subscriptions of 10 years or longer (Frei et al., 2011; Schüz et al., 2011). New reports from case–control studies that assessed long-term use also found mixed results; for example, increased risks of glioma and acoustic neuroma were reported by Hardell & Carlberg (2015) and Hardell et al. (2013), but no evidence of increased risks for these tumours were reported by Yoon et al. (2015) and Pettersson et al. (2014). Röösli et al. (2019) recently reviewed these new data. Several large-scale studies are still in progress and should report results within the next few years. Mobi-Kids is a multicentre case–control study of brain tumours in those aged 10–24 years. Cohort Study of Mobile Phone Use and Health (COSMOS) is a new European cohort of adult cell phone users. There will also be updated results from the Million Women Study.

Cancer in Experimental Animals

New data in experimental animals for exposure to RF-EMF have been published since the previous *IARC Monographs* evaluation. The large study by the United States National Toxicology Program found an increased risk of malignant schwannomas of the heart in male rats with high exposure to radiofrequency radiation at frequencies used by cell phones, as well as possible increased risks of certain types of tumours in

the brain and adrenal glands, but no increased risks in mice or female rats (NTP, 2018a, b). Another study in experimental animals also found an increase in schwannomas of the heart in highly exposed male rats and a possible increase in gliomas in female rats (Falcioni et al., 2018).

Mechanistic Evidence

The previous IARC evaluation concluded that there was weak evidence that radiofrequency radiation was genotoxic but that there was no evidence for mutagenicity (IARC, 2013e). Although there have been many new publications from a wide variety of experiments, uncertainty remains about the mechanisms, and there are few systematic reviews of the new data (Kocaman et al., 2018).

Although a future evaluation could be broadened to consider exposure to all non-ionizing radiation (including ELF-MF), ELF-MF were evaluated by IARC as *possibly carcinogenic to humans* (Group 2B), and the Advisory Group did not recommend an update, because of a lack of new informative epidemiological findings, no toxicological evidence, and little supporting mechanistic evidence.

Key References

The following key references were also identified: Coureau et al. (2014); Carlberg & Hardell (2015); Pedersen et al. (2017).

Recommendation for non-ionizing radiation (radiofrequency): High priority (and ready for evaluation within 5 years)

Recommendation for extremely low-frequency magnetic fields: No evaluation

Nuclear industry work

Different types of ionizing radiation have been evaluated repeatedly by the *IARC Monographs* programme (IARC, 2000b, 2012f), and all types have been classified as *carcinogenic to humans* (Group 1); overall evaluations are based on different evidence streams, often including *sufficient evidence* in humans for several cancer sites. New research in recent years has confirmed increased risks per unit of exposure to ionizing radiation for cancer sites and groups of cancer sites that have already been linked with ionizing radiation. No specific evaluation has been made in respect of work in the nuclear industry, which represents a specific exposure condition for agents already classified as *carcinogenic to humans* (Group 1).

Recommendation: No evaluation

Corte di Cassazione n. 17438/2012 - l'uso massiccio del cellulare può avere "un ruolo almeno concausale" nella genesi di alcuni tumori – 12.10.2012. - - Giudice di Pace

claps carlo

 Con la sentenza n. 17438/2012, la Corte di Cassazione ha stabilito che l'uso massiccio del cellulare, per parecchie ore al giorno, e per un lungo periodo di anni, possa avere "un ruolo almeno concausale" nella genesi di alcuni tumori dei nervi cranici. Gli Ermellini hanno precisato che gli studi indipendenti condotti tra il 2005 e il 2009, che hanno evidenziato un maggiore rischio di insorgenza di neoplasie negli utilizzatori 'forti' di telefonia mobile, sono, correttamente, stati considerati di "maggiore attendibilità" per non essere stati cofinanziati, a differenza di altri, anche dalle stesse ditte produttrici di cellulari".

CORTE DI CASSAZIONE

SEZIONE LAVORO

SENTENZA n. 17438 DEL 12 ottobre 2012

SVOLGIMENTO DEL PROCESSO

Con sentenza del 10 - 22.12.2009 la Corte d'appello di Brescia, in riforma della pronuncia di prime cure, condannò l'Inail a corrispondere a M. I. la rendita per malattia professionale prevista per l'invalidità all'80%.

Il M. aveva agito in giudizio deducendo che, in conseguenza dell'uso lavorativo protratto, per dodici anni e per 5-6 ore al giorno, di telefoni cordless e cellulari all'orecchio sinistro aveva contratto una grave patologia tumorale; le prove acquisite e le indagini medico legali avevano permesso di accertare, nel corso del giudizio, la sussistenza dei presupposti fattuali dedotti, in ordine sia all'uso nei termini indicati dei telefoni ne! corso dell'attività lavorativa, sia all'effettiva insorgenza di un "neurinoma del Ganglio di Gasser" (tumore che colpisce i nervi cranici, in particolare il nervo acustico e, più raramente, come nel caso di specie, il nervo cranico trigemino), con esiti assolutamente severi nonostante le terapie, anche di natura chirurgica, praticate; sulla ricorrenza di tali elementi fattuali, come evidenziato nella sentenza impugnata, non erano state svolte contestazioni in sede di appello, incentrandosi la questione devoluta al Giudice del gravame sul nesso causale tra l'uso dei telefoni e l'insorgenza della patologia.

La Corte territoriale, rinnovata la consulenza medico legale, ritenne dì dover seguire le conclusioni a cui era pervenuto il CTU nominato in grado d'appello, osservando in particolare quanto segue:

- i telefoni mobili (cordless) e i telefoni cellulari funzionano attraverso onde elettromagnetiche e, secondo il CTU, "In letteratura gli studi sui tumori cerebrali per quanto riguarda il neurinoma considerano il tumore con localizzazione al nervo acustico che è il più frequente. Trattandosi del medesimo istotipo è del tutto logico assimilare i dati al neurinoma del trigemino"; in particolare era stato osservato che i due neurinomi appartengono al medesimo distretto corporeo, in quanto entrambi i nervi interessati si trovano nell'angolo

ponto-cerebellare, che è una porzione ben definita e ristretta dello spazio endocranico, certamente compresa nel campo magnetico che si genera dall'utilizzo dei telefoni cellulari e cordless;

nella CTU erano stati riassunti con una tabella alcuni studi effettuati dal 2005 al 2009 ed in tre, effettuati dall'Hardell group, era stato evidenziato un aumento significativo de! rischio relativo di neurinoma (intendendosi per rischio relativo la misura di associazione fra l'esposizione ad un particolare fattore di rischio e l'insorgenza di una definita malattia, calcolata come il rapporto fra i tassi di incidenza negli esposti [numeratore] e nei non esposti [denominatore]);

- un lavoro del 2009 del medesimo gruppo aveva considerato anche altri elementi quali età dell'esposizione, l'ipsilateralità e il tempo di esposizione, indicando, per quanto riguarda il neurinoma dell'acustico, un Odd ratio per l'uso dei cordless di 1,5 e per il telefono cellulare di 1,7;

considerando l'uso maggiore di 10 anni, gli Odd ratio erano rispettivamente di 1,3 e di 1,9, intendendosi per Odd ratio il rapporto tra la frequenza con la quale un evento si verifica in un gruppo di pazienti e la frequenza con la quale lo stesso evento si verifica in un gruppo di pazienti di controllo, onde se il valore dell'Odd ratio è superiore a 1 significa che la probabilità che si verifichi l'evento considerato (per esempio una malattia) in un gruppo (per esempio tra gli esposti) è superiore rispetto a quella di un altro gruppo (per esempio tra i non esposti), mentre significato opposto ha un valor inferiore a 1;

- una recente review della The International Commission on Non- lonizing Radiation Protection aveva evidenziato i limiti degli studi epidemiologici fino ad allora attuati, concludendo che, allo stato attuale, non vi era una convincente evidenza del ruolo delle radiofrequenze nella genesi dei tumori, ma aggiungendo che gli studi non ne avevano escluso l'associazione;

- un'ulteriore autorevole review (Kundi nel 2009) aveva confermato i dubbi che gli studi epidemiologici inducono per quanto riguarda il tempo di esposizione e concluso per un rischio individuale basso, ma presente; l'esposizione poteva incidere sulla storia naturale della neoplasia in vari modi: interagendo nella fase iniziale di induzione, intervenendo sul tempo di sviluppo dei tumori a lenta crescita, come i neurinomi, accelerandola ed evitando la possibile naturale involuzione;

- l'analisi della letteratura non portava quindi ad un giudizio esaustivo, ma, con tutti i limiti insiti nella tipologia degli studi, un rischio aggiuntivo per i tumori cerebrali, ed in particolare per il neurinoma, era documentato dopo un'esposizione per più di 10 anni a radiofrequenze emesse da telefoni portatili e cellulari;

- tale tempo di esposizione era un elemento valutativo molto rilevante, poiché, nello studio del 2006, l'esposizione per più di 10 anni comportava un rischio relativo calcolato di 2,9 sicuramente significativo;

- si trattava quindi di una situazione "individuale" che gli esperti riconducevano al "modello probabilistico-induttivo" ed alla "causalità debole", avente comunque valenza in sede previdenziale;

- doveva dunque riconoscersi, secondo il CTU, un ruolo almeno concausale delle radiofrequenze nella genesi della neoplasia subita dall'assicurato, configurante probabilità qualificata:

- la censura dell'lnail relativa agli studi utilizzati dal CTU non coglieva nel segno, poiché lo studio del 2000 dell'OMS, che aveva escluso effetti negativi per la salute, si era basato su dati ancor più risalenti, non tenendo quindi conto dell'uso più recente, ben più massiccio e diffuso, di tali apparecchi e del fatto che si tratta di tumori a lenta insorgenza, risultando quindi più attendibili gli studi svolti nel 2009;

- inoltre, come osservato dal CT di parte M., gli studi del 2009 non erano stati condotti su un basso numero di casi, ma, al contrario, sul numero totale dei casi (679) che si erano verificati in un anno in Italia; inoltre, a differenza dello studio della IARC, co-finanziato dalla ditte produttrici di telefonicellulari, gli studi citati dal CTU erano indipendenti;

- ancora, secondo quanto osservato dal CT di parte M., confrontando il dato di rischio individuale calcolato dal CTU (2,9) con quello rilevato per il fattore di rischio, universalmente riconosciuto, dell'esposizione alle radiazioni ionizzanti, doveva considerarsi come per i sopravvissuti alle esplosioni atomiche giapponesi di Hiroshima e Nagasaki fosse stato accertato un rischio relativo di tipo oncologico di 1,39 per "tutti i tumori" con un minimo di 1,22 per i tumori di "utero e cervice" ed un massimo di 4,92 per la "leucemia", il che stava a significare che il rischio oncogeno medio delle radiazioni ionizzanti era inferiore a quello che si aveva per l'esposizione alle radio frequenze in riferimento ai neurinomi endocranici, ciò che rendeva ancora più evidente la reale portata di quanto affermato dal CTU;

- secondo l'insegnamento della giurisprudenza di legittimità, nel caso di malattia professionale non tabellata, come anche in quello di malattia ad eziologia multifattoriale, la prova della causa di lavoro, che grava sul lavoratore, deve essere valutata in termini di ragionevole certezza, nel senso che, esclusa la rilevanza della mera possibilità dell'origine professionale, questa può essere invece ravvisata in presenza di un rilevante grado di probabilità; e, a tale riguardo, il giudice deve non solo consentire all'assicurato di esperire i mezzi di prova ammissibili e ritualmente dedotti, ma deve altresì valutare le conclusioni probabilistiche del consulente tecnico in tema di nesso causale, considerando che la natura professionale della malattia può essere desunta con elevato grado di probabilità dalla tipologia delle lavorazioni svolte, dalla natura dei macchinari presenti nell'ambiente di lavoro, dalla durata della prestazione lavorativa e dall'assenza di altri fattori extralavorativi, alternativi o concorrenti che possano costituire causa della malattia;

- doveva quindi ritenersi la sussistenza del requisito di elevata probabilità che integra il nesso causale richiesto dalla normativa. Avverso la suddetta sentenza della Corte territoriale rinati ha proposto ricorso fondato su due motivi e illustrato con memoria L'intimato M. I. ha resistito con controricorso, illustrato con memoria.

Motivi della decisione1. Con il primo motivo l'Istituto ricorrente denuncia violazione dell'art. 3 dpr n. 1124/65, rilevando che, secondo i principi di diritto elaborati in materia dalla giurisprudenza di legittimità, la corretta applicazione della norma suddetta richiede, in particolare, l'accertamento sulla base di dati

epidemiologici e di letteratura ritenuti affidabili dalla comunità scientifica, che l'agente dedotto in giudizio sia dotato di efficienza patogenetica, quanto meno probabile, per la specifica malattia allegata e diagnosticata; la suddetta relazione causale non poteva dunque essere suffragata "dalla personale valutazione dell'ausiliario del giudice, fondata sulla preferenza per taluni dati epidemiologici rispetto ad altri, ma deve essere supportata da un giudizio di affidabilità dei dati stessi espresso dalla comunità scientifica"; nel caso di specie il CTU si era soffermato esclusivamente sui risultati del gruppo Hardell, in contrasto con quelli della comunità scientifica;

inoltre il CTU aveva del tutto arbitrariamente utilizzato la contabilità tra esposizioni a radiofrequenze e neurinoma del nervo acustico, ipotizzata dal gruppo Hardeil, per affermare la relazione causale, addirittura con giudizio di probabilità qualificata, tra tali radiofrequenze e il neurinoma del trigemino; doveva al riguardo rilevarsi che la Commissione scientifica per l'elaborazione e la revisione periodica delle malattie di cui è obbligatoria la segnalazione ai sensi dell'art. 139 dpr n. 1124/65, in occasione dell'aggiornamento dell'elenco approvato con decreto ministeriale 11.12.2009, non aveva ritenuto di dover includere i tumori dei nervi cranici, indotti da esposizione alle radiofrequenze, tra le malattie di possibile origine professionale. 1.2Secondo la

giurisprudenza di questa Corte, nel caso di malattia professionale non tabellata, come anche in quello di malattia ad eziologia multifattoriale, la prova della causa di lavoro, che grava sul lavoratore, deve essere valutata in termini di ragionevole certezza, nel senso che, esclusa la rilevanza della mera possibilità dell'origine professionale, questa può essere invece ravvisata in presenza di un rilevante grado di probabilità; a tale riguardo, il giudice deve non solo consentire all'assicurato di esperire i mezzi di prova ammissibili e ritualmente dedotti, ma deve altresì valutare le conclusioni probabilistiche del consulente tecnico in tema di nesso causale, facendo ricorso ad ogni iniziativa ex officio diretta ad acquisire ulteriori elementi in relazione all'entità ed

all'esposizione del lavoratore ai fattori di rischio ed anche considerando che la natura professionale della malattia può essere desunta con elevato grado di probabilità dalla tipologia delle lavorazioni svolte, dalia natura dei macchinari presenti nell'ambiente di lavoro, dalla durata della prestazione lavorativa e dall'assenza di altri fattori extralavorativi, alternativi o concorrenti, che possano costituire causa della malattia (cfr, ex plurimis, Cass., nn. 6434/1994; 5352/2002; 11128/2004;15080/2009).

La sentenza impugnata ha fatto applicazione di tali principi, ravvisando, in base alle considerazioni diffusamente esposte nello storico di lite, la sussistenza del requisito di elevata probabilità che integra il nesso causale.

Non è quindi ravvisabile il denunciato vizio di violazione di legge, che si fonda infatti su una

pretesa erronea valutazione (da parte del CTU e della Corte territoriale) della affidabilità dei dati

presi in considerazione al fine di suffragare tale requisito e, pertanto, sostanzialmente su un vizio di

motivazione (in effetti dedotto con il secondo motivo di ricorso).

Il motivo all'esame va pertanto disatteso.

2. Con il secondo motivo l'Istituto ricorrente denuncia appunto vizio di motivazione, assumendo

che:

- il CTU di secondo grado, dopo avere evidenziato che la review della The International

Commission on Non-lonizing Radiation Protection aveva concluso che, allo stato attuale, non vi era

una convincente evidenza del ruolo delle radiofrequenze nella genesi dei tumori, pur non

escludendosene l'associazione, senza consequenzialità logica e senza motivazione aveva tratto la

conclusione della probabilità qualificata di un ruolo almeno concausale delle radiofrequenze nella

genesi della neoplasia per cui è causa;

- doveva ritenersi priva dì qualsivoglia fondamento scientifico la ritenuta assimilabilità, sul piano

eziopatogenetico, del neurinoma del nervo acustico e di quello del trigemino, essendo "nozione

comune" della scienza medica che tumori dello stesso istotipo, ma con localizzazione diversa, anche se nell'ambito dello stesso distretto anatomico, riconoscono cause diverse e che qualsiasi potenziale

agente cancerogeno che venga in contatto con il corpo umano modifica la sua azione a seconda dei

tessuti che attraversa o con cui viene in contatto; e, in effetti, il nervo acustico e il nervo trigemino,

in particolare il ganglio di Gasser, hanno una diversa collocazione nella teca cranica e diverse sono

le strutture anatomiche che li separano dall'esterno e fra loro;

la Corte territoriale non aveva risposto alle osservazioni svolte dall'Istituto, anche con riferimento

alla circostanza che era "in corso" uno studio epidemiologico internazionale "interphone",

coordinato dalla IARC e che l'OMS, in base al principio di precauzione, aveva suggerito "una politica di gestione del rischio che viene applicata in una situazione di "incertezza scientifica"":
- doveva ritenersi inconferente sul piano scientifico l'affermazione della Corte territoriale circa l'attendibilità, perché indipendente, dello studio del gruppo Hardell, a fronte del cofinanziamento della ricerca "interphone" da parte dei produttori di telefoni cellulari, trascurando che tale ricerca è finanziata dalla Unione Europea e diretta e coordinata dalla IARC (Agenzia internazionale ricerca sul cancro dell'OMS);
- neppure la Corte territoriale aveva ritenuto di chiamare il CTU a chiarimenti a fronte delle ricordate osservazioni critiche. 2.1 La giurisprudenza di legittimità ha reiteratamente affermato che nei giudizi in cui sia stata esperita CTU di tipo medico-legale, nei caso in cui il giudice del merito si basi sulle conclusioni dell'ausiliario giudiziario, affinché i lamentati errori e lacune della consulenza tecnica determinino un vizio di motivazione della sentenza denunciabile in cassazione, è necessario che i relativi vizi logico -formali si concretino in una palese devianza dalle nozioni della scienza medica o si sostanzino in affermazioni illogiche o scientificamente errate, con il relativo onere, a carico della parte interessata, di indicare le relative fonti, senza potersi la stessa limitare a mere considerazioni sulle prospettazioni operate dalla controparte, che si traducono in una inammissibile critica del convincimento del giudice di merito che si sia fondato, per l'appunto, sulla consulenza tecnica (cfr, ex plurimis, Cass., nn. 16392/2004; 17324/2005; 7049/2007; 18906/2007).
Nel caso all'esame l'Istituto ricorrente, nel contestare la ritenuta assimilabilità, sul piano eziopatogenetico, del neurinoma del nervo acustico e di quello del trigemino, non specifica - rifugiandosi nel concetto di "nozione comune" - le fonti scientifiche, ritualmente dedotte ed acquisite al giudizio, in base alle quali avrebbero dovuto ritenersi scientificamente errate le affermazioni rese al riguardo dal CTU e seguite dalla sentenza impugnata, finendo per richiedere al riguardo a questa Corte una valutazione di merito inammissibile in sede di legittimità.
Neppure è dato rilevare il preteso e denunciato vizio di mancanza di consequenzialità logica e di motivazione in ordine alle conclusioni della probabilità qualificata di un ruolo almeno concausale delle radiofrequenze nella genesi della neoplasia per cui è causa, posto che tale giudizio, come diffusamente esposto nello storico di lite, non discende dalla mera indicazione delle conclusioni

(evidentemente difformi) a cui era pervenuta la ricordata review della The International Commission on Non-lonizing Radiation Protection, ma, piuttosto, dai riscontri di altri studi a carattere epidemiologico svolti al riguardo.

Inoltre, e significativamente, la sentenza impugnata, seguendo le osservazioni del CTU, ha ritenuto di dover ritenere di particolare rilievo quegli studi che avevano preso in considerazione anche altri elementi, quali l'età dell'esposizione, l'ipsilateralità e il tempo di esposizione, atteso che, nella specie, doveva valutarsi la sussistenza del nesso causale in relazione ad una situazione fattuale dei tutto particolare, caratterizzata da un'esposizione alle radiofrequenze per un lasso temporale continuativo molto lungo (circa 12 anni), per una media giornaliera di 5 - 6 ore e concentrata principalmente sull'orecchio sinistro dell'assicurato (che, com'è di piana evidenza, concretizza una situazione affatto diversa da un normale uso non professionale del telefono cellulare).

L'ulteriore rilievo circa la maggiore attendibilità proprio di tali studi, stante la loro posizione di indipendenza, ossia per non essere stati cofinanziati, a differenza di altri, anche dalle stesse ditte produttrici di cellulari, costituisce ulteriore e non illogico fondamento delle conclusioni accolte.Né è stato dedotto - e tanto meno, dimostrato - che le indagini epidemiologiche Se cui conclusioni sono state prese in particolare considerazione provengano da gruppi di lavoro privi di serietà ed autorevolezza e, come tali, sostanzialmente estranei alla comunità scientifica.

L'asserita prevalenza che, secondo il ricorrente, dovrebbe essere attribuita alle conclusioni di altri gruppi di ricerca (le cui indagini, peraltro, secondo quanto dedotto, almeno all'epoca del giudizio di merito erano ancora "in corso"), si risolvono anch'essi nella richiesta di un riesame del merito, non consentito in sede di legittimità. Avendo inoltre la Corte territoriale riscontrato nelle considerazioni già svolte dal CTU e dal CT di parte M. elementi ritenuti sufficienti a confutare le osservazioni critiche dell'Istituto, non sussisteva la necessità di investire ulteriormente il CTU di una richiesta a chiarimenti.

Anche il secondo motivo di ricorso va quindi disatteso.

3. In definitiva il ricorso va rigettato

L'esito fra loro difforme dei giudizi di merito e la novità, sotto il profilo della peculiarità fattuale, della vicenda dedotta in causa, consigliano la compensazione delle spese.

P.Q.M.

Rigetta il ricorso; spese compensate.

Planetary electromagnetic pollution: it is time to assess its impact

As the Planetary Health Alliance moves forward after a productive second annual meeting, a discussion on the rapid global proliferation of artificial electromagnetic fields would now be apt. The most notable is the blanket of radiofrequency electromagnetic radiation, largely microwave radiation generated for wireless communication and surveillance technologies, as mounting scientific evidence suggests that prolonged exposure to radiofrequency electromagnetic radiation has serious biological and health effects. However, public exposure regulations in most countries continue to be based on the guidelines of the International Commission on Non-Ionizing Radiation Protection[1] and Institute of Electrical and Electronics Engineers,[2] which were established in the 1990s on the belief that only acute thermal effects are hazardous. Prevention of tissue heating by radiofrequency electromagnetic radiation is now proven to be ineffective in preventing biochemical and physiological interference. For example, acute non-thermal exposure has been shown to alter human brain metabolism by NIH scientists,[3] electrical activity in the brain,[4] and systemic immune responses.[5] Chronic exposure has been associated with increased oxidative stress and DNA damage[6,7] and cancer risk.[8] Laboratory studies, including large rodent studies by the US National Toxicology Program[9] and Ramazzini Institute of Italy,[10] confirm these biological and health effects in vivo. As we address the threats to human health from the changing environmental conditions due to human activity,[11] the increasing exposure to artificial electromagnetic radiation needs to be included in this discussion.

Due to the exponential increase in the use of wireless personal communication devices (eg, mobile or cordless phones and WiFi or Bluetooth-enabled devices) and the infrastructure facilitating them, levels of exposure to radiofrequency electromagnetic radiation around the 1 GHz frequency band, which is mostly used for modern wireless communications, have increased from extremely low natural levels by about 10^{18} times (figure). Radiofrequency electromagnetic radiation is also used for radar, security scanners, smart meters, and medical equipment (MRI, diathermy, and radiofrequency ablation). It is plausibly the most rapidly increasing anthropogenic environmental exposure since the mid-20th century, and levels will surge considerably again, as technologies like the Internet of Things and 5G add millions more radiofrequency transmitters around us.

Unprecedented human exposure to radiofrequency electromagnetic radiation from conception until death has been occurring in the past two decades. Evidence of its effects on the CNS, including altered neurodevelopment[14] and increased risk of some neurodegenerative diseases,[15] is a major concern considering the steady increase in their incidence. Evidence exists for an association between neurodevelopmental or

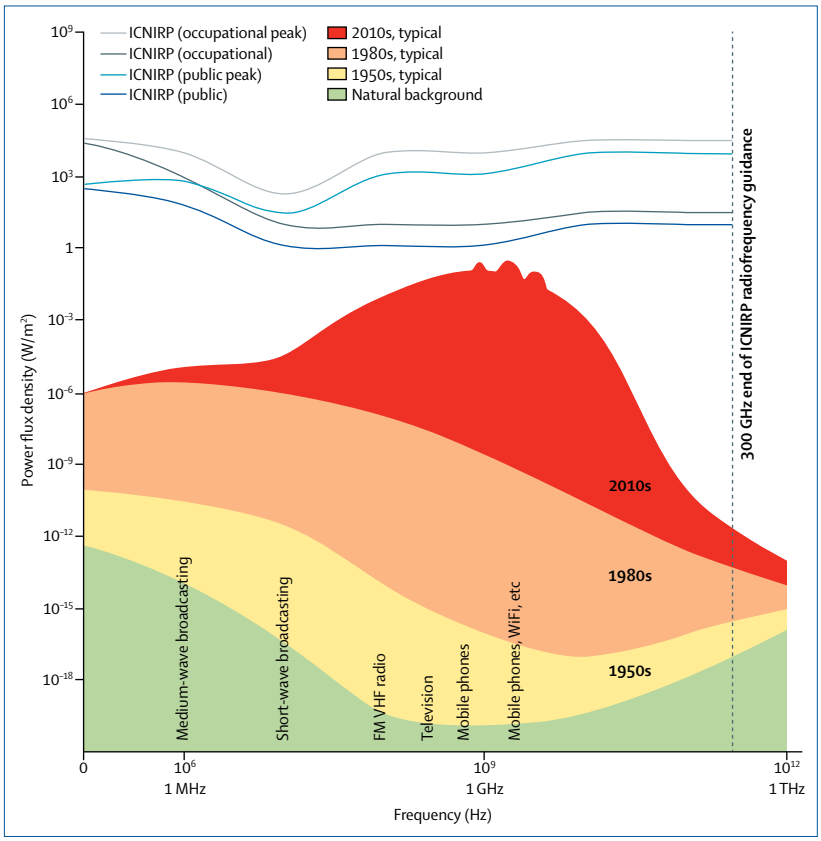

***Figure*: Typical maximum daily exposure to radiofrequency electromagnetic radiation from man-made and natural power flux densities in comparison with International Commission on Non-Ionizing Radiation Protection safety guidelines[1]**

Anthropogenic radiofrequency electromagnetic radiation levels are illustrated for different periods in the evolution of wireless communication technologies. These exposure levels are frequently experienced daily by people using various wireless devices. The levels are instantaneous and not time-averaged over 6 minutes as specified by International Commission on Non-Ionizing Radiation Protection for thermal reasons. Figure modified from Philips and Lamburn[12] with permission. Natural levels of radiofrequency electromagnetic radiation were based on the NASA review report CR-166661.[13]

behavioural disorders in children and exposure to wireless devices,[14] and experimental evidence, such as the Yale finding, shows that prenatal exposure could cause structural and functional changes in the brain associated with ADHD-like behaviour.[16] These findings deserve urgent attention.

For the **Oceania Radiofrequency Scientific Advisory Association** see www.orsaa.org

At the Oceania Radiofrequency Scientific Advisory Association, an independent scientific organisation, volunteering scientists have constructed the world's largest categorised online database of peer-reviewed studies on radiofrequency electromagnetic radiation and other man-made electromagnetic fields of lower frequencies. A recent evaluation of 2266 studies (including in-vitro and in-vivo studies in human, animal, and plant experimental systems and population studies) found that most studies (n=1546, 68·2%) have demonstrated significant biological or health effects associated with exposure to anthropogenic electromagnetic fields. We have published our preliminary data on radiofrequency electromagnetic radiation, which shows that 89% (216 of 242) of experimental studies that investigated oxidative stress endpoints showed significant effects.[7] This weight of scientific evidence refutes the prominent claim that the deployment of wireless technologies poses no health risks at the currently permitted non-thermal radiofrequency exposure levels. Instead, the evidence supports the International EMF Scientist Appeal by 244 scientists from 41 countries who have published on the subject in peer-reviewed literature and collectively petitioned the WHO and the UN for immediate measures to reduce public exposure to artificial electromagnetic fields and radiation.

For the **International EMF Scientist Appeal** see www.emfscientist.org

Evidence also exists of the effects of radiofrequency electromagnetic radiation on flora and fauna. For example, the reported global reduction in bees and other insects is plausibly linked to the increased radiofrequency electromagnetic radiation in the environment.[17] Honeybees are among the species that use magnetoreception, which is sensitive to anthropogenic electromagnetic fields, for navigation.

Man-made electromagnetic fields range from extremely low frequency (associated with electricity supplies and electrical appliances) to low, medium, high, and extremely high frequency (mostly associated with wireless communication). The potential effects of these anthropogenic electromagnetic fields on natural electromagnetic fields, such as the Schumann Resonance that controls the weather and climate, have not been properly studied. Similarly, we do not adequately understand the effects of anthropogenic radiofrequency electromagnetic radiation on other natural and man-made atmospheric components or the ionosphere. It has been widely claimed that radiofrequency electromagnetic radiation, being non-ionising radiation, does not possess enough photon energy to cause DNA damage. This has now been proven wrong experimentally.[18,19] Radiofrequency electromagnetic radiation causes DNA damage apparently through oxidative stress,[7] similar to near-UV radiation, which was also long thought to be harmless.

At a time when environmental health scientists tackle serious global issues such as climate change and chemical toxicants in public health, there is an urgent need to address so-called electrosmog. A genuine evidence-based approach to the risk assessment and regulation of anthropogenic electromagnetic fields will help the health of us all, as well as that of our planetary home. Some government health authorities have recently taken steps to reduce public exposure to radiofrequency electromagnetic radiation by regulating use of wireless devices by children and recommending preferential use of wired communication devices in general, but this ought to be a coordinated international effort.

THE LARGEST UNETHICAL MEDICAL EXPERIMENT IN HUMAN HISTORY

Ronald N. Kostoff, Ph.D.

Research Affiliate, School of Public Policy, Georgia Institute of Technology

KEYWORDS

Unethical Research; Electromagnetic Fields; Wireless Radiation; Radiofrequency Radiation; RF; Non-Ionizing Radiation; Mobile Networking Technology; 5G; Adverse Health Effects

ABSTRACT

This monograph describes the largest unethical medical experiment in human history: the implementation and operation of non-ionizing non-visible EMF radiation (hereafter called wireless radiation) infrastructure for communications, surveillance, weaponry, and other applications. It is unethical because it violates the key ethical medical experiment requirement for "informed consent" by the overwhelming majority of the participants.

The monograph provides background on unethical medical research/experimentation, and frames the implementation of wireless radiation within that context. The monograph then identifies a wide spectrum of adverse effects of wireless radiation as reported in the premier biomedical literature for over seven decades. Even though many of these reported adverse effects are extremely severe, the ***true extent of their severity has been grossly underestimated***.

Most of the reported laboratory experiments that produced these effects are not reflective of the real-life environment in which wireless radiation operates. Many experiments do not include pulsing and modulation of the carrier signal, and most do not account for synergistic effects of other toxic stimuli acting in concert with the wireless radiation. These two additions ***greatly exacerbate the severity of the adverse effects from wireless radiation***, and their neglect in current (and past) experimentation results in substantial under-estimation of the breadth and severity of adverse effects to be expected in a real-life situation. This lack of credible safety testing, combined with depriving the public of the opportunity to provide informed consent, contextualizes the wireless radiation infrastructure operation as an unethical medical experiment.

Addition of the nascent fifth generation of mobile networking technology (5G) globally to the existing mobile technology network will contribute further to the largest unethical medical experiment in human history!

This monograph consists of four chapters and eight appendices. Chapter 1 focuses on unethical research, showing how wireless radiation infrastructure implementation fits into the

framework of unethical medical experimentation, and providing many examples of other types of unethical medical experimentation.

Chapter 2 is the main technical chapter, focusing on adverse health effects of wireless radiation. It describes:

- adverse effects from past research, and what additional adverse effects can be expected when 5G is implemented fully
- lack of full consensus among key stakeholders on adverse effects from wireless radiation, and the role played by conflicts-of-interest in this lack of consensus
- the main reason that this unethical medical experiment was allowed to take place:

The Federal government that ***promotes*** accelerated implementation of wireless radiation technology also 1) ***sponsors*** research examining the technology's potential adverse effects and 2) ***regulates*** the technology's potentially adverse impacts on the public. This unethical promotion-sponsorship-regulation conflict-of-interest lays the groundwork for unethical medical experimentation!

Chapter 3 contains the references for the main text, and Chapter 4 contains the eight appendices.

Appendix 1 presents more details about unethical medical experiments, including examples and many references for further study.

Appendix 2 contains a manual taxonomy of a representative adverse EMF effects database; Appendix 3 contains a factor analysis taxonomy of the same database; and, Appendix 4 contains a text clustering taxonomy of the same database. All three taxonomies contain links between the categories in the summary tables and the titles of papers associated with each category.

Appendix 5 shows the ***potential contribution of wireless radiation to the opioid crisis*** and ***potential contribution of wireless radiation to exacerbation of the coronavirus pandemic***.

Appendix 6 shows the ***link between funding source and research outcomes***, and presents many references on the topic of funding source-driven bias.

Appendix 7 describes the under-recognized adverse effects of wireless radiation related to ***medical implants*** (pacemakers, defibrillators, cochlear implants, dental implants, bone pins, etc) and metal appendages (metal jewelry, etc), and potential ***micro/nano***-implant analogues.

Appendix 8 shows ***adverse effects of wireless radiation on automotive vehicle occupants*** (and bystanders), and the under-advertised on-board and external sources of this radiation.

DISCLAIMERS

The views in this monograph are solely those of the author, and do not represent the views of the Georgia Institute of Technology.

PREFACE

Humanity is racing along two parallel paths to self-destruction: 1) accelerating irreversible climate change, and 2) rapidly increasing exposure to health and life-threatening mixtures of toxic stimuli. The most ubiquitous constituent of these toxic mixtures is wireless radiation, which is proceeding to blanket humanity and its ecological life support chain.

A small fraction of the population has given informed consent to wireless radiation exposure, gambling (like users of cigarettes, cocaine, fentanyl) that they can escape the severe adverse consequences of exposure. Another small fraction of the population has not given informed consent, but receives harmful second-hand exposure because of the broad-scale transmission of wireless radiation from terrestrial and satellite sources. The vast majority of the population has given ***Mis-***informed Consent to this exposure. This ***mis-***information is supplied by the telecommunications industry, its lobbyists, its government partners, its political enablers, its marketing arm (the mainstream media), and even some academic enablers.

While research over the past seventy+ years has shown hard evidence of severe adverse effects from wireless radiation, the full extent of the damage from existing wireless radiation infrastructure is not known, much less the damage expected from 4G/5G infrastructure being implemented rapidly today. Attempting to identify the full extent of these adverse effects is the global medical experiment being conducted today. The fact that this experiment is being conducted with ***mis***-informed consent makes it an unethical medical experiment. Because of the magnitude of this experiment, it is the *largest unethical medical experiment in human history!*

Chapter 1 of this monograph presents the case for wireless radiation infrastructure implementation without credible safety testing being not only an unethical medical experiment, but the largest in human history. It presents wireless radiation infrastructure implementation in the context of other recent examples of unethical medical experiments, and shows how these others pale in comparison to the projected suffering and lethality from wireless radiation exposure based on even the incomplete biomedical data gathered to date.

Chapter 2 is the main technical chapter in this monograph. It covers a broad scope of adverse health and life-supporting ecological effects from wireless radiation, mainly at communications frequencies. Some of these adverse effects are not well-known to the general public, but they are important nevertheless. While the majority of the chapter is technical, its initial section provides the context for evaluating the biomedical literature results. In particular, it emphasizes the conflicts-of-interest operable in all aspects of the wireless radiation biomedical research process, ranging from the initial health-effects research sponsorship to the final research results dissemination in the premier technical literature and other forums. As Chapter 2 shows, we have known about the adverse health and ecological effects of wireless radiation exposure for seventy+ years, but decision-makers of all stripes have nevertheless chosen to impose this health and life-threatening toxic stimulus on an unsuspecting global populace.

Additionally, there are eight appendices. The copious material contained in the appendices supports the statements made in the main text (Chapters 1 and 2). Three sub-appendices, while grounded in hard evidence, are somewhat more hypothetical than the rest. They include 1) linkages between wireless radiation exposure and exacerbation of the opioid crisis and the coronavirus pandemic, and 2) potentially enhanced heating and temperature increases to thermally-damaging levels from short RF pulses and tissue-imbedded nanoparticles. My purpose in presenting these three more hypothetical sub-appendices is to stimulate more discussion, and especially more research, on the nature and validity of these linkages.

Finally, it is my hope that this monograph receives the widest distribution, especially among those who have 1) been the targets of this decades-long mis-information campaign and 2) given their consent to wireless radiation exposure based upon mis-information. It is this segment of the public whose informed actions could reverse the increasing implementation of wireless radiation infrastructure, and prevent the infliction of even more damage, since the other stakeholders involved in the promotion of wireless radiation infrastructure have shown little desire to protect the public against the known and projected ravages of wireless radiation.

Ronald N. Kostoff, Gainesville, VA, 15 February 2020

TABLE OF CONTENTS

EXECUTIVE SUMMARY

ES-1. Overview

We are in the midst of the largest unethical medical experiment in human history. This experiment is the implementation and operation of a global wireless network for communications, surveillance, and other purposes. It is a ***medical experiment*** because we do not know the full extent of the adverse health effects that will result from this wireless network implementation and operation. It is an ***unethical*** medical experiment because it violates the key ethical medical experiment requirement of ***'informed consent'*** from the participants.

Even though the adverse health effects of wireless radiation reported over the past seventy+ years span the range of severity from discomfort to lethality, we do not know the full extent of adverse health effects from this technology because:

Most laboratory experiments aimed at identifying wireless radiation health effects bear no relation to real-life exposures, and are performed under the most benign conditions of

- single stressors (wireless radiation only)
- no pulsing and modulation of the carrier signal
- no synergistic effects of other toxic stimuli acting in concert with the wireless radiation

These experimental deficiencies are compounded by

- lack of access to the global classified literature on adverse health effects from wireless radiation
- lack of knowledge of proprietary basic and advanced studies on adverse health effects from wireless radiation.

The adverse wireless radiation health effects that have been identified already from the incomplete literature openly available are massive in scope and magnitude. They support the conclusion that ***wireless radiation as already implemented is extremely dangerous to human health***. It acts as both a ***promoter/accelerator*** and ***initiator*** of adverse health effects. Addition of the missing elements described above and more wireless radiation infrastructure will exacerbate further the adverse effects from wireless radiation on

- human health directly through contribution to chronic disease and
- human health indirectly through degradation of the food chain ecosystem.

ES-2. Adverse Impacts of Wireless Radiation on the Most Vulnerable Members of Society

In the spirit of the 'unethical' medical experiments described in this monograph,

it is the poor and dispossessed who will suffer the most from wireless radiation exposure.

This is because wireless radiation plays a dual role of ***initiator*** and ***promoter/accelerator*** of serious disease. In its ***promoter/accelerator*** role, it can accelerate the progression of existing serious diseases such as cancer, and/or, through synergy, can produce serious adverse health effects when combined with other toxic stimuli that neither constituent of the combination could produce in isolation.

Many toxic stimuli, such as harsh chemicals, biotoxins, ionizing radiation sources, vibrating machinery, prolonged sitting doing repetitive tasks, high air pollution, etc, are used/experienced by the poorest members of society in their occupations, and many toxic stimuli, such as air pollutants, toxic wastes, etc, are very prevalent in their residential environments. Thus, people who spray pesticides in farm labor or household applications, people who do cleaning with harsh chemicals, people who dispose of hazardous materials, basically, ***people who do the dirty work in our society and live in dirty environments***, are already leading candidates for higher risk of serious diseases. Adding a wireless radiation ***promoter/accelerator*** to their residential and occupational environments will radically increase their chances for developing serious diseases. Closing the 'digital divide' for them will translate to increased suffering and reduced longevity!

ES-3. Role of Conflicts-of-Interest in the Sponsorship, Conduct, and Dissemination of Wireless Radiation Research

The results shown in the literature cannot be separated from the context in which this research has been sponsored, conducted, and disseminated!

In the USA (and in most, if not all, countries), the two major sponsors of wireless radiation health and safety research are the Federal government and the wireless radiation industry, in that order. Both of these organizations have a strong intrinsic conflict-of-interest with respect to wireless radiation.

The Federal government is a strong promoter of wireless radiation infrastructure development and rapid expansion, most recently supporting accelerated implementation of 5G infrastructure.

The Federal government that ***promotes*** accelerated implementation of wireless radiation technology also 1) ***sponsors*** research examining the technology's potential adverse effects and 2) ***regulates*** the technology's potentially adverse impacts on the public. The fact that these development, regulation, and safety functions may be assigned to different Executive Agencies within the Federal government is irrelevant from an independence perspective. ***The separate Executive Agencies in the Federal government are like the tentacles of an Octopus; they operate synchronously under one central command.***

The wireless promoters' main objectives of developing and implementing the technology rapidly are enabled by suppressing knowledge (to the public) of potential adverse effects from the technology's operation. These fundamental conflicts impact the objectivity of the health and safety R&D sponsors and performers. Any ***Federal research sponsor*** of wireless radiation technology safety would be highly conflicted between 1) a desire to satisfy Executive and Legislative objectives of accelerating expansion of wireless radiation technology and implementation and 2) sponsoring objective research focused on identifying and reporting adverse effects of wireless radiation expected under real-life conditions. Likewise, any ***sponsored research performer*** addressing wireless radiation technology safety would be highly conflicted between 1) reporting the actual adverse effects expected under real-life conditions and 2) the desire to satisfy wireless radiation promotional objectives of the research sponsors in order to maintain long-range funding.

ES-4. Adverse Health Effects from Wireless Radiation Exposure.

In aggregate, for the high frequency (radiofrequency-RF) part of the spectrum, expert reviews show that RF radiation below the FCC (Federal Communications Commission) exposure guidelines can result in:

-carcinogenicity (brain tumors/glioma, breast cancer, acoustic neuromas, leukemia, parotid gland tumors),

-genotoxicity (DNA damage, DNA repair inhibition, chromatin structure),

-mutagenicity, teratogenicity,

-neurodegenerative diseases (Alzheimer's Disease, Amyotrophic Lateral Sclerosis),

-neurobehavioral problems, autism,

-reproductive problems, pregnancy outcomes,

-oxidative stress, inflammation, apoptosis, blood-brain barrier disruption,

-pineal gland/melatonin production, sleep disturbance, headache,

-irritability, fatigue, concentration difficulties, depression, dizziness, tinnitus,

-burning and flushed skin, digestive disturbance, tremor, cardiac irregularities, and can

-adversely impact the neural, circulatory, immune, endocrine, and skeletal systems.

The effects range from myriad feelings of discomfort to life-threatening diseases. From this perspective, RF exposure is a highly pervasive cause of disease!

ES-5. Adverse Impacts of Wireless Radiation on the Food Chain

The struggle for survival of human life on Earth is dependent on the logistical food supply chain. At the foundation of this supply chain (before the farmers become involved in harvesting its bounty) are the insects, seeds, flora, trees, etc, that enable the bountiful growth of the myriad potential foods. If the integrity of this foundational logistical supply chain is threatened in any way, then both the animals and plant products we consume become unavailable.

There is a substantial literature on the adverse impacts of wireless radiation on this foundational logistical supply chain. These adverse effects are from the pre-5G wireless radiation exposures, and would include enhanced coupling from the higher frequency harmonics of the RF signal. Many of these supply chain elements (e.g., insects, seeds, larvae, etc) are very small, and we could expect enhanced resonance/energy coupling with the shorter-wavelength 5G radiation when implemented. This indirect impact of wireless radiation may turn out to be at least as (if not more) important as the direct impact of wireless radiation on human survival!

From a broader perspective, most of the laboratory experiment component of the wireless radiation adverse effects literature can be viewed as related to the foundational food supply chain. Much of this research is focused on mice, rats, insects, small birds, small fish, etc. These species tend to be prey of larger animals/fowl/fish, and eventually make their way to the human food table. Any environmental factor that affects the health of these species adversely will eventually impact the humans who are at the end of that chain. In reality, we have accumulated a massive literature describing the adverse impacts of wireless radiation on myriad contributing components to our food supply, and the results do not bode well for our future ability to feed the growing world's population!

ES-6. Adverse Impacts of Wireless Radiation on Medical and Non-Medical Implants

There were two major types of medical implants covered by the database articles showing adverse effects: active implants that produced electrical signals mainly for controlling heart irregularities (e.g., pacemakers, defibrillators) and hearing deficiencies (e.g., cochlear implants), and passive metallic implants for structural support (e.g., dental implants, bone pins, plates, etc). Additionally, there are articles addressing adverse effects from wireless radiation in the vicinity of metallic appendages (e.g., metallic eyeglasses, metallic jewelry, etc).

The external EMF (electromagnetic fields) from microwaves (and other sources) could 1) impact the electrical operation of the active medical implants adversely, 2) increase the Specific Absorption Rate (SAR) values of tissue in the vicinity of the passive implants substantially because of resonance effects, and 3) increase the flow and acidity of saliva in the vicinity of dental structures. While the EMF effects on the cochlear implants could adversely affect auditory capability, EMF effects on the heart-related implants could potentially be life-threatening. The increased SAR values around the passive metal implants could result in increased tissue temperatures, and could adversely impact integration and longevity of the passive metallic implants.

In the mouth, the combination of 1) increased tissue temperatures in proximity to the implant or other orthodontic structures and 2) increased flow rate and acidity of saliva could lead to 3) increased leaching of heavy metals (a known contributor to serious diseases). This also raises the question: what other adverse health effects from the exposure of both the active and passive implants to increasing levels of wireless radiation have not been identified or addressed?

There is a third class of structures whose interaction physics with RF are related to those of the passive implants. These are termed implant analogues, and include myriad exogenous particles (mainly nanoparticles) that penetrate, and imbed in, the skin. The resultant nanoparticle-imbedded tissues have the potential for increased energy absorption from the incoming RF signal, thereby resulting in potentially increased thermal damage over and above the thermal damage resulting from the pulsed high-peak-to-average power of the RF signal. Additionally, more research needs to be done to ascertain the magnitudes of these thermal transients and associated stresses, in order to estimate the levels of enhanced potential damage from RF radiation.

ES-7. Studies in the USSR on Wireless Radiation Health Effects

Much research examining potential adverse effects from wireless radiation, especially in the athermal parameter range, was performed in the USSR as far back as seventy+ years ago. Their results confirm the wide scope of adverse effects reported in recent years and summarized in the present monograph. Unfortunately, their results appear to have had little effect in influencing wireless radiation safety standards in the USA and many other countries.

ES-8. Adverse Effects Expected from Addition of 5G to Existing Communications Networks

The potential 5G adverse health effects derive from the intrinsic nature of the radiation, and how this radiation interacts with tissue and other target structures. 4G networking technology was associated mainly with carrier frequencies in the range of ~1-2.5 GHz (cell phones, WiFi). The wavelength of 1 GHz radiation is 30 cm, and the penetration depth in human tissue is a few centimeters. The highest performance 5G networking technology (millimeter wave) is mainly associated with carrier frequencies at least an order of magnitude above the 4G frequencies, although, as stated in Chapter 2, "ELFs (0–3000Hz) are always present in all telecommunication EMFs in the form of pulsing and modulation". Penetration depths for the high-performance carrier frequency component of 5G radiation (aka high-band) will be on the order of a few millimeters.

For much of the early implementation of 5G, and perhaps later, 5G will be integrated with 4G. Some vendors will start out/have started out with 'low-band' 5G (~600-900 MHz); some will start out with 'mid-band' 5G (~2.5 GHz-4.2 GHz); and some will start out with 'high band' 5G (~24-47 GHz). All these modes are associated with potentially severe adverse health effects, and none have been tested for safety in any credible manner.

At the millimeter carrier wavelengths characteristic of high-band high-performance 5G, one can expect resonance phenomena with small-scale human structures, as well as resonances with insects/insect components, seeds, etc.

The common 'wisdom' being presented in the literature and the broader media is that, if there are adverse impacts resulting from millimeter-wave 5G, the main impacts will be focused on near-surface phenomena, such as skin cancer, cataracts, and other skin conditions, because of shallow RF penetration depths. However, there is evidence that biological responses to millimeter-wave irradiation can be initiated within the skin, and the subsequent systemic signaling in the skin can result in physiological effects on the nervous system, heart, and immune system. There is additional evidence that adverse effects from millimeter-wave radiation can occur in organs and tissue well below the skin surface. This should not be surprising, since there are myriad signaling conduits connecting the skin to deeper structures in the body.

ES-9. Lack of Full Consensus on Wireless Radiation Adverse Effects

Not all studies of wireless radiation have shown adverse effects on health. There are many possibilities to explain this.

1) There could be 'windows' in parameter space where adverse effects occur, and the studies/experiments were conducted outside these 'windows'. Operation outside these windows could show
    - no effects or
    - hormetic effects or
    - therapeutic effects.

The single stressor studies that constitute most of wireless radiation laboratory health research, and indeed constitute most of the laboratory medical research literature, essentially yield very narrow windows. Adverse effects are identified over very limited parameter ranges, and adverse effects shown by many combinations of stressors are not revealed when these stressors are tested in isolation over the same parametric ranges.

One could conclude that, whether by design or accident, ***the real-world impact of single stressor studies is to conceal, rather than reveal, many of the more serious adverse health effects of wireless radiation***.

The stressor variables to be used for health studies should not be limited to single stressors in isolation, but should include to the extent possible combinations of toxic stimuli stressors, since these combinations reflect more accurately real-life exposures.

2) Research quality could be poor, and adverse effects were overlooked.

3) Or, the research team could have had a preconceived agenda

where finding no adverse effects from wireless radiation was the main objective of the research!

ES-10. Potential Links of Wireless Radiation to Enhancement of Opioid Crisis

The previous findings reported in this Executive Summary are based on hard evidence and have been validated in numerous studies. The present section is based on hard evidence as well, but the link of wireless radiation to the opioid crisis is not as far along in the validation process. It should be viewed as a hypothesis at this point, and serve as a basis for discussion and further research.

It has been shown many times that one impact of wireless radiation (at myriad frequencies) is release of endogenous opioids. This release of endogenous opioids can enable analgesic effects by itself, or can enhance the analgesic effects of exogenous analgesics. This has been demonstrated at pulsed millimeter-wave frequencies, WiFi frequencies, mobile phone frequencies, radiofrequencies, and extremely low frequencies. Additionally, as has been demonstrated by the results of the current monograph, wireless radiation at all the above frequencies has resulted in serious mid-term and especially long-term adverse health effects.

Therefore, wireless radiation exposure, especially at cell phone, WiFi, and millimeter-wave pulsed and modulated frequencies, generates ***1) analgesic and pleasurable short-term effects and 2) serious adverse mid- and long-term effects***. There would be some exceptions for the short-term, such as electrohypersensitivity (EHS) sufferers, who are immediately affected adversely and strongly by wireless radiation exposure.

For most people, the enhanced analgesic short-term effects of the wireless radiation would in effect mask the long-term damage from this radiation.

As time proceeds, the increasing discomfort from the adverse mid-and long-term effects of wireless radiation requires increasingly stronger analgesics to suppress, and the increasing use of exogenous analgesics becomes necessary. This potentially enhanced use of exogenous analgesics could lead to opioid and/or other analgesic addictions.

ES-11. Potential Links of Wireless Radiation to Current Coronavirus Pandemic

The previous findings reported in this Executive Summary are based on hard evidence and have been validated in numerous studies. The present section is based on hard evidence as well, but the link of wireless radiation to the coronavirus pandemic is not as far along in the validation process. It should be viewed as a hypothesis at this point, and serve as a basis for discussion and further research.

There are on the order of 300,000 viruses, many/most of which have zoonotic potential. To develop vaccines for all of these viruses (before an epidemic or pandemic strikes) is unreasonable (based on present technology) because of the sheer numbers involved. To develop vaccines for any specific virus during an epidemic or pandemic (which was the mainstream approach taken for the coronavirus during the SARS pandemic of 2002-2003) is completely unrealistic, because of the lead times required for vaccine development, efficacy testing, credible mid-and long-term safety testing, and implementation.

Those who succumbed during the SARS pandemic had 1) myriad co-morbidities and 2) weakened immune systems unable to neutralize the SARS coronavirus. ***Having a strong immune system that allowed a smooth transition from innate immune system operation to adaptive immune system operation was the one intrinsic defense that worked!*** The SARS experience showed that the best and most realistic approach for defense against any potential viral attack is ***reversing immune-degrading lifestyles*** well before any pandemic or epidemic outbreaks. In that case, the immune system would be sufficiently strong to be able to handle viral exposure on its own without the emergence of serious symptoms, as was the case with those exposed to the SARS coronavirus (with coronavirus antibodies in their serum) who exhibited no (or minimal) symptoms.

This gets to the link between wireless radiation exposure and the latest coronavirus pandemic. To the degree that non-ionizing radiation exposure, superimposed on the myriad toxic stimuli to which many people are exposed by choice or imposition, degrades the operation of the innate and adaptive immune systems, it would increase the likelihood that the immune system could not counteract the exposure to the coronavirus (or any virus) as nature intended. Thus, ***it would contribute to the exacerbation of adverse effects from coronavirus exposure***. The bottom line is that exposures to essentially ALL the exogenous immune-damaging toxic stimuli (including, but not limited to, wireless radiation) need to be removed before resistance to viral exposures of any type can be improved substantially.

ES-12. Adverse Effects of Wireless Radiation in Automotive Sector

The modern automobile is a powerful source of wireless radiation at myriad frequencies, and is subject to external wireless radiation at myriad frequencies as well. The trend has not been to reduce these sources, but rather to add equipment both to the vehicle and to the external environment that will substantially increase the wireless radiation flux associated with the vehicle. The numbers and types of sources are not well-known, even among those experts and laymen concerned about adverse effects from wireless radiation.

An interesting diagram (and narrative) showing radars and other wireless sensors in modern cars can be found at the following link: (http://www.radiationdangers.com/automotive-radiation/automotive-radiation/). I would recommend the reader study that diagram in detail, to better appreciate how ubiquitous are these sources of wireless radiation. Not all the wireless radiation enters the cabin, since some/much is outward-directed, but some/much of it will enter the cabins of other cars on the road.

However, that diagram tells only part of the story. Assume there is a car pool commuting to work from the suburbs of a major city. It is not uncommon (in today's world) for a one-way trip to take from one-two hours, or more. Even in a regular car, or mid-size SUV, there might be four or so passengers. They may be using cell phones, WiFi, or both, thereby adding to the radiation from the automotive-based sensors/transmitters.

There will be cell towers lining the sides of a major highway, thereby increasing the radiation to the occupants substantially. Depending on conditions, there may be substantial air pollution to which the occupants are exposed. Additionally, the prolonged sitting is very dangerous, and is a contributing factor to many serious diseases. If the vehicle is new, there may be substantial out-gassing of toxic chemicals from the interior materials. Combined exposure to the wireless radiation, air pollution and other toxic substances, coupled with prolonged sitting and continual impacts from the car's motions, produces a synergistic effect that substantially exacerbates adverse impacts from any of the constituent components.

Chapter 1 – Unethical Research

1A. Monograph Overview

We are in the midst of the largest unethical medical experiment in human history. This experiment is the implementation and operation of a global wireless network for communications, surveillance, and other purposes. It is a ***medical experiment*** because we do not know the full extent of the adverse health effects that will result from this wireless network implementation and operation. It is an ***unethical*** medical experiment because it violates the key ethical medical experiment requirement of ***'informed consent'*** from the participants.

The current chapter provides 1) some background on the requirements for ethical medical research/experimentation and 2) examples of how those requirements have been violated in the past century. It places wireless radiation implementation and operation in the context of these other examples of unethical medical experiments.

Chapter 2 presents a detailed description of some of the adverse health effects of wireless radiation as reported in the unclassified open literature. Even though the adverse health effects of wireless radiation reported over the past seventy+ years span the range of severity from discomfort to lethality, we do not know the full extent of adverse health effects from this technology because:

Most laboratory experiments aimed at identifying wireless radiation health effects bear no relation to real-life exposures, and are performed under the most benign conditions of

- single stressors (wireless radiation only)
- no pulsing and modulation of the carrier signal
- no synergistic effects of other toxic stimuli acting in concert with the wireless radiation

These experimental deficiencies are compounded by

- lack of access to the global classified literature on adverse health effects from wireless radiation
- lack of knowledge of proprietary basic and advanced studies on adverse health effects from wireless radiation.

As Chapter 2 shows, the adverse wireless radiation health effects that have been identified already from the incomplete literature openly available are massive in scope and magnitude. They support the conclusion that ***wireless radiation as already implemented is extremely dangerous to human health***. It acts as both a ***promoter/accelerator*** and ***initiator*** of adverse health effects. Addition of the missing elements described above and more wireless radiation infrastructure will exacerbate further the adverse effects from wireless radiation on

- human health directly through contribution to chronic disease and
- human health indirectly through degradation of the food chain ecosystem.

Chapter 3 contains the references for the main text.

Chapter 4 contains eight Appendices:

- Appendix 1 contains examples of unethical medical experiments conducted in the last century, mainly (not entirely) in the USA or under USA auspices;
- Appendix 2 contains a manual taxonomy of the adverse health and biomedical effects component of a representative wireless radiation literature, and is derived in part from the taxonomies in Appendices 3 and 4;
- Appendix 3 contains a taxonomy based on factor analysis of the same representative wireless radiation literature;
- Appendix 4 contains a taxonomy based on text clustering of the same representative wireless radiation literature;
- Appendix 5 shows ***potential links between wireless radiation exposure and 1) expansion of the opioid crisis*** and ***2) exacerbation of coronavirus pandemic***;
- Appendix 6 lists references showing ***effects of industry funding on research outcomes*** for myriad (mainly biomedical) research disciplines;
- Appendix 7 overviews the oft-neglected topics of wireless radiation adverse effects on regions containing ***medical implants*** (e.g., pacemakers, defibrillators, cochlear implants, dental implants, bone pins, plates, etc) and appendages (e.g., metal eyeglasses, earrings, metal jewelry, etc), as well as other ***micro/nano*** exogenous implant analogues;
- Appendix 8 describes ***adverse effects of automotive-based wireless radiation***.

1B. Unethical Research

1B1. Broad Definition

There are myriad definitions for 'unethical' research (e.g., http://icahn.mssm.edu/about-us/services-and-resources/faculty-resources/handbooks-and-policies/faculty-handbook/research-environment/research-integrity; https://oprs.usc.edu/training/booklets/; https://history.nih.gov/about/timelines_laws_human.html).

These definitions of 'unethical' research encompass a broad spectrum of actions. Much reporting of 'unethical' medical research in myriad media tends to focus on one aspect only: biomedical experiments performed on subjects who did not give 'informed consent'. The classic example reflects the experiments performed on concentration camp inmates by the Nazi-regime doctors during WWII, and the lesser-known experiments performed by their Japanese counterparts during WWII. These experiments were certainly horrific, but not unique. The test subjects in these experiments were neither ***informed*** about the nature and consequences of these experiments, nor did they give ***consent***.

1B2. Informed Consent

A comprehensive discussion of the importance of 'informed consent' in medical experimentation was presented in a journal Special Issue [Goodwin, 2016]. An excellent overview and rationale for informed consent in human experiments is shown in the following box (obtained from a booklet titled Informed Consent in Human Subjects Research), prepared by the Office for Protection of Research Subjects, University of Southern California (https://oprs.usc.edu/training/booklets/).

> Informed Consent is a voluntary agreement to participate in research. It is not merely a form that is signed but is a process, in which the subject has an understanding of the research and its risks. Informed consent is essential before enrolling a participant and ongoing once enrolled. Informed Consent must be obtained for all types of human subjects' research including; diagnostic, therapeutic, interventional, social and behavioral studies, and for research conducted domestically or abroad. Obtaining consent involves informing the subject about his or her rights, the purpose of the study, the procedures to be undergone, and the potential risks and benefits of participation. Subjects in the study must participate willingly. Vulnerable populations (i.e. prisoners, children, pregnant women, etc.) must receive extra protections. The legal rights of subjects may not be waived and subjects may not be asked to release or appear to release the investigator, the sponsor, the institution or its agents from liability for negligence.

There are three important concepts in this definition: research, informed, and consent.

Research

What is a research experiment? According to myriad Web sources, an experiment is a set of actions undertaken to

- make a discovery or
- test a hypothesis or
- demonstrate a known fact.

The first two of these can be classified as **research** experiments, and the third is a **demonstration** experiment. A further breakdown would be informative. There are ***proactive*** experiments, where established rules and procedures (the scientific approach) are used to plan, conduct, and report the experiment. There are ***reactive*** experiments, where the experiment is secondary to higher priority actions, and consequently is conducted and reported under more constrained conditions. The proactive experiments can be viewed generally as explicit or 'a priori', and the reactive experiments can be viewed generally as implicit or 'a posteriori'.

Where does wireless technology implementation and operation fit in this research experiment categorization? Wireless technology implementation has two major characteristics: development and operation of a technology to achieve targeted technical goals (***explicit***), and conduct of an experiment that may result in serious adverse health impacts (***implicit***). Of interest in the current document is the experiment (***implicit***) component.

Identification of wireless radiation health effects will result from both proactive and reactive experiments. The proactive experiments are (mainly) the thousands of laboratory-based studies (performed to estimate wireless radiation health impacts) that have been reported in the biomedical literature. The reactive experiments are (mainly) those studies that have been done after the previous generations of mobile networking technologies have been implemented (usually epidemiology), and those studies that will be done after 5G is implemented.

Thus, 5G implementation can be viewed mainly as an implicit reactive ***research*** experiment with respect to identifying myriad adverse health effects on the exposed population. It will also have a ***demonstration*** component, confirming thousands of pre-5G research studies that have shown adverse health effects from wireless radiation in 5G and non-5G frequency ranges. Because these studies tend to under-estimate real-life effects of wireless radiation, the full scope of adverse health effects from 5G operation under real-life conditions are currently unknown. Ascertainment of these adverse health effects will require 'a posteriori' reactive research experiments after 5G implementation, under today's 5G implementation scenario. A major concern, especially in the current environment of accelerating 5G implementation, is that serious longer-term latent health effects will be discovered ***only after 5G has been fully implemented***.

Informed

There is much information available in the open literature detailing the adverse health effects of wireless radiation. These adverse effects reflect the role of wireless radiation both as a ***promotor/accelerator and/or initiator*** of myriad biomedical abnormalities and serious diseases. However, the vast public is not informed (or is misinformed) of these adverse health effects by the:

- developers of wireless radiation systems,
- vendors of these systems,
- mainstream media
- government regulators of these systems, and
- Federal, State, and Local politicians who pass laws that accelerate implementation of these systems.

These stakeholders 1) **do not inform** the public of the demonstrated adverse effects of wireless radiation and, in many cases, 2) **misinform** the public that wireless radiation is safe from a health perspective.

Consent

Many segments of the public **do provide** consent to be exposed to wireless radiation, because of its perceived benefits to them. A small amount of this consent may be informed, and the providers of this consent may be gambling that they can escape the adverse health effects. Most of the consent is probably not informed, since most people will not do the independent research required to gather in the relevant information on adverse health effects, but will rely on the government's and mainstream media's misleading assurances that wireless radiation is safe.

However, other segments of the public **do not provide** consent to be exposed to wireless radiation from these implemented technologies. Unlike other forms of toxic stimuli (e.g., cigarettes, cocaine, alcohol, etc), where exposures may be individual or very local, wireless radiation exposure is very large in extent. With the advent of the latest generation of wireless radiation (5G), there may be 1) small cell towers erected outside of every few houses, with the consequent radiation blanketing the environment, and 2) thousands of satellites blanketing the Earth's surface with wireless radiation. There are Federal laws that essentially prevent opposition to construction and operation of these small cell towers, and prevent opposition to the launching and operation of these satellites. Forcing exposure to this harmful wireless radiation on members of the public who do not provide consent is the cornerstone of wireless radiation implementation and operation being labeled unethical medical experimentation.

Its context differs from some other technologies with serious adverse effects, such as automotive technology and cigarette smoking. For the most part, users of these other technologies have been informed about potential serious consequences, and non-users are impacted minimally (at least today). Those users are able to make a more informed choice.

1B3. Examples of Unethical Medical Experimentation

Many books and articles have been written concerning horrific medical experiments (that were performed in the USA over the past century) without obtaining 'informed consent' from the test subjects. These books describe a wide spectrum of experiments. Individual readers could have different opinions on whether any of the individual experiments reported are more or less 'unethical' than those in the Nazi concentration camps, or whether they are 'unethical' at all. Appendix 1 contains references to books and journal articles that describe some of these experiments (mainly, but not entirely, conducted in the USA or under USA auspices), based on Medline searches and Web sources. Like most research of this type, the conduct of the experiments and the experimental results are not advertised widely. I was not aware of most of these experiments prior to conducting the analysis on under-reporting of adverse events in my 2015 eBook "Pervasive Causes of Disease" [Kostoff, 2015].

The experiments reported in Appendix 1 cover the full spectrum of toxic stimuli, including biological, chemical, and nuclear. These are the three types of toxic stimuli that constitute the core of Weapons of Mass Destruction (WMD). Interestingly, with all of the USA's concern about potential WMD attacks from Russia, China, Iran, and North Korea, we have completely overlooked the ongoing and exponentially increasing WMD attack on the Homeland that has been occurring for at least two decades: 24/7 spewing of harmful wireless radiation in almost every corner of the USA, with far more to come if 5G is implemented!

The copious references identified in Appendix 1 are not the result of an exhaustive search; they were obtained after a very brief survey. There are undoubtedly many other examples (of 'unethical' medical experiments) published already that were missed by the survey. Given the odious nature of these experiments, there are probably far more experiments whose disclosure has not yet seen the light of day. As shown in the tobacco and asbestos examples in section 9C of Kostoff [2015], most of this information comes to light either from 1) whistleblowers or 2) 'discovery' resulting from lawsuits. In addition, some investigators may stumble across evidence of this type of 'unethical' research while doing relatively unrelated types of investigations.

Documentation of many types of 'unethical' medical experiments may:

- not have been done, or
- have been done and destroyed, or
- have been done but distorted to protect the miscreants.

This is why retrospective analysis of this type of 'research', which in many cases relies heavily on the printed word as 'proof', may be highly under-reflective of the full spectrum of what was actually done in these experiments (e.g., Stephen Kinzer's description of the records destroyed by the Head of the CIA's MK-Ultra program https://www.c-span.org/video/?464648-1/poisoner-chief).

While there are many stages of the medical research process that could be subjected to 'unethical' practices (e.g., those outlined in Chapter 9 of Kostoff [2015], including selection of the most important research problems for funding, conducting the research, disseminating the results of the research, etc), conducting the medical research experiments 'unethically' has received the most attention by far. The references in Appendix 1, and additional books and journal and magazine articles on unethical medical research experiments, are testimony to this imbalance.

Books and articles only tell part of the larger story. A more representative reporting on the damage from any type of 'unethical' medical research would reflect the pain, suffering, and premature mortality resulting from the medical research experimentation. A simple estimate of the experiment's damage could be obtained by integrating the number of people affected by the 'unethical' medical experimentation and the degree of damage experienced by each person. This could be viewed as a 'weighted' impact of the adverse effects of the unethical medical experimentation.

In the most widely reported examples of 'unethical' medical research (the medical experiments performed in the Nazi concentration camps during WWII), perhaps a few thousand prisoners were involved; it is difficult to find accurate information for actual numbers of prisoners involved. Further, it is difficult to separate out the 1) many thousands of German citizens subjected to forced sterilization procedures starting in 1933 and 2) many deliberately exterminated in the concentration camps, from 3) those who suffered from the medical experiments in the camps and died as a result of the experiments alone.

In the references in Appendix 1

- some of the 'unethical' medical experiments described involved under a hundred test subjects,
- many of the 'unethical' medical experiments described tended to involve on the order of hundreds of test subjects (who did not provide 'informed consent'), and
- in some rarer cases, perhaps thousands of test subjects were involved.

Many of these experiments, in parallel with the spirit of the Nazi concentration camp experiments, involved people confined in large institutions who were (usually) not told the full story of the nature of the experiments, or, if they were told, either did not 1) understand it or 2) give 'informed consent'. These people were confined in prisons, the military service, mental institutions, children's institutions, etc.

How do the above odious procedures in these references differ conceptually from the recent trend toward government effectively promoting/mandating implementation of wireless radiation infrastructure whose safety has not been demonstrated, but (a fraction of) whose adverse health effects have been widely demonstrated?

Based on what has been reported in the experiments referenced in Appendix 1 (which could in fact be the tip of a much larger unreported iceberg), perhaps on the order of 10,000-30,000 people may have been subjected to 'unethical' medical experiments in the past century (excluding those who unwittingly participated in clinical trials that were "off-shored" to (typically) developing countries with knowingly less stringent test subject protections [Kostoff, 2015, section 9D3]). A few thousand of these test subjects would have died prematurely, and most would have suffered unnecessarily. These, of course, are horrific numbers. Unfortunately, they pale in comparison to what can be expected if wireless radiation infrastructure is expanded domestically and globally to satisfy the requirements of 5G. The following box shows one estimate of potential adverse effects from wireless radiation.

One of the many adverse health effects of wireless radiation is cancer of the brain, especially gliomas. What approximate increases in glioma incidence can be expected from widespread expansion of wireless radiation?

There are different estimates of glioma incidence and trends in glioma incidence. For an approximate estimate, Rasmussen et al [2017] estimates the glioma incidence in the Danish population at about 7/100,000, a figure in line with other national and global estimates. Additionally, Phillips et al [2018] presents evidence of a 100% increase in Glioblastoma Multiforme from 1995-2015, a major component of glioma. Some of this increase may have been due to wireless radiation exposure, since that time period was associated with a major expansion of cell phone and other wireless device use. For approximate estimation purposes, assume the wireless-free glioma incidence to be about 5/100,000.

Hardell et al [2011] showed, in a case-controlled study, that glioma incidence doubled for those who starting using cell phones as adults (>20 years old), were 'heavy' users (>30 minutes per day), and used cell phones for more than ten years. Hardell also showed glioma incidence quadrupled for those who started using cell phones younger than twenty years old, were heavy users, and used cell phones for more than ten years.

If we apply Hardell's conservative doubling estimate to all potential users, then we can expect an increased glioma incidence per year of about 5/100,000. By the time 5G is rolled out, the global population will be at least eight billion. If we assume ¾ of the global population will be cell phone users and/or exposed to cell towers and other sources of wireless radiation, then about six billion people would be the pool for potential glioma victims from wireless radiation. Multiplying 5/100,000 by 6,000,000,000 yields 300,000 new cases of glioma/year.

In one year, the deaths from glioma alone attributed to wireless radiation will swamp all the deaths from all the horrific unethical medical experiments of the twentieth century referenced in Appendix 1!

This number was obtained using the most conservative estimates of Hardell and the incidence data, and it didn't take into account the increase in glioma incidence that would be expected as latency times increase. For smoking, the average latency period between initiation of smoking and lung cancer is between twenty and thirty years, depending on which database was examined. The fact that glioma incidence shows measurable increases after only a ten-year latency period should be most disturbing, and does not bode well for glioma incidences after a twenty, thirty, or forty-year latency!

Again, glioma is but one of the large numbers of adverse health effects potentially resulting from exposure to wireless radiation. Integrating over all the adverse health effects potentially resulting from the wireless radiation experiment would yield numbers of ***experiment-based*** premature deaths and enhanced suffering unparalleled in human history!

Given the magnitude of 5G projected global implementation, the numbers of people that will be exposed to this radiation, the numbers of people expected to suffer myriad adverse effects from this technology, and the lack of credible 'informed consent' from the vast majority of these people, we are well justified in calling global implementation of mobile networking technology **The Largest Unethical Medical Experiment in Human History!**

Finally, in the spirit of the 'unethical' medical experiments referenced in Appendix 1,

it is the poor and dispossessed who will suffer the most from wireless radiation exposure.

This is because wireless radiation plays a dual role of ***initiator*** and ***promoter/accelerator*** of serious disease, as will be shown in the next chapter. In its ***promoter/accelerator*** role, it can accelerate the progression of existing serious diseases such as cancer, and/or, through synergy, can produce serious adverse health effects when combined with other toxic stimuli that neither constituent of the combination could produce in isolation.

Many toxic stimuli, such as harsh chemicals, biotoxins, ionizing radiation sources, vibrating machinery, prolonged sitting doing repetitive tasks, high air pollution, etc, are used/experienced by the poorest members of society in their occupations, and many toxic stimuli, such as air pollutants, toxic wastes, etc, are very prevalent in their residential environments. Thus, people who spray pesticides in farm labor or household applications, people who do cleaning with harsh chemicals, people who dispose of hazardous materials, basically, ***people who do the dirty work in our society and live in dirty environments***, are already leading candidates for higher risk of serious diseases. Adding a wireless radiation ***promoter/accelerator*** to their residential and occupational environments will radically increase their chances for developing serious diseases. Closing the 'digital divide' for them will translate to increased suffering and reduced longevity!

Chapter 2 – Adverse Impacts of Wireless Radiation

2A. Overview

Wireless communications have been expanding globally at an exponential rate. The latest imbedded version of mobile networking technology is called 4G (fourth generation), and the next generation (5G) is in the early implementation stage. Neither 4G nor 5G have been tested for safety in any credible real-life scenarios. The current chapter assesses the medical and biological studies that have been performed and then published in the biomedical literature, and shows why they are deficient relative to identifying adverse health and safety effects.

However, even in the absence of the missing real-life components (which tend to exacerbate the adverse effects of the wireless radiation shown in the biomedical literature), the published literature shows there is much valid reason for concern about potential adverse health effects from both 4G and 5G technology. The studies reported in the literature should be viewed as extremely conservative, underestimating the adverse impacts substantially.

2A1. The Context of Wireless Radiation Health and Safety Research

Before addressing the technical and biological details of wireless radiation health and safety research shown in the published literature, the context in which this literature has been generated will be discussed.

The results shown in the literature cannot be separated from the context in which this research has been sponsored, conducted, and disseminated!

In the USA (and in most, if not all, countries), the two major sponsors of wireless radiation health and safety research are the Federal government and the wireless radiation industry, in that order. Both of these organizations have a strong intrinsic conflict-of-interest with respect to wireless radiation.

2A1a. Intrinsic Federal government wireless radiation conflict-of-interest

The Federal government is a strong **promoter** of wireless radiation infrastructure development and rapid expansion, most recently supporting accelerated implementation of 5G infrastructure. Every

- Congressional evaluation of 5G I have heard (or read),
- Congressperson's statement on 5G I have heard (or read),
- Presidential proclamation on 5G I have heard (or read), and
- FCC proclamation on 5G I have heard (or read),

has unabashedly supported the ***most accelerated implementation of 5G infrastructure***.

The Federal government that ***promotes*** accelerated implementation of wireless radiation technology also 1) ***sponsors*** research examining the technology's potential adverse effects and 2) ***regulates*** the technology's potentially adverse impacts on the public. The fact that these development, regulation, and safety functions may be assigned to different Executive Agencies within the Federal government is irrelevant from an independence perspective. ***The separate Executive Agencies in the Federal government are like the tentacles of an Octopus; they operate synchronously under one central command.***

The wireless promoters' main objectives of developing and implementing the technology rapidly are enabled by suppressing knowledge (to the public) of potential adverse effects from the technology's operation. These fundamental conflicts impact the objectivity of the health and safety R&D sponsors and performers. Any ***Federal research sponsor*** of wireless radiation technology safety would be highly conflicted between 1) a desire to satisfy Executive and Legislative objectives of accelerating expansion of wireless radiation technology and implementation and 2) sponsoring objective research focused on identifying and reporting adverse effects of wireless radiation expected under real-life conditions. Likewise, any ***sponsored research performer*** addressing wireless radiation technology safety would be highly conflicted between 1) reporting the actual adverse effects expected under real-life conditions and 2) the desire to satisfy wireless radiation promotional objectives of the research sponsors in order to maintain long-range funding.

2A1b. Intrinsic wireless radiation industry conflict-of-interest

The wireless radiation industry is obviously a strong promoter of accelerated development and implementation of wireless radiation devices and infrastructure, and is a sponsor of wireless radiation and safety research. ***Trillions of dollars in revenues are potentially at stake in successful promotion and adoption of wireless radiation infrastructure and technology!*** The industry's conflicts with respect to promotion and safety research are similar to those of the Federal government listed above.

The wireless industry's role in suppressing information about the adverse impacts of wireless radiation was described eloquently in a 2018 Nation article (https://www.thenation.com/article/how-big-wireless-made-us-think-that-cell-phones-are-safe-a-special-investigation/). As this exposé shows, studies on health effects were commissioned by the wireless radiation industry in the 1990s under the management of Dr. George Carlo. The adverse effects shown were downgraded and suppressed, in the spirit of similar suppression by the tobacco and fossil energy industries, as stated in the Nation article:

"Carlo's story underscores the need for caution, however, particularly since it evokes eerie parallels with two of the most notorious cases of corporate deception on record: the campaigns by the tobacco and fossil-fuel industries to obscure the dangers of smoking and climate change, respectively. Just as tobacco executives were privately told by their own scientists (in the 1960s) that smoking was deadly, and fossil-fuel executives were privately told by their own scientists (in the 1980s) that burning oil, gas, and coal would cause a "catastrophic" temperature rise, so Carlo's testimony reveals that wireless executives were privately told by their own scientists (in the 1990s) that cell phones could cause cancer and genetic damage…..Like their tobacco and fossil-fuel brethren, wireless executives have chosen not to publicize what their own scientists have said about the risks of their products. On the contrary, the industry—in America, Europe, and Asia—has spent untold millions of dollars in the past 25 years proclaiming that science is on its side, that the critics are quacks, and that consumers have nothing to fear. This, even as the industry has worked behind the scenes—again like its Big Tobacco counterpart—to deliberately addict its customers. Just as cigarette companies added nicotine to hook smokers, so have wireless companies designed cell phones to deliver a jolt of dopamine with each swipe of the screen."

While the wireless radiation industry doesn't play a formal role in regulating the safety aspects of wireless radiation, it plays a strong de facto role. In addition to its lobbying efforts to minimize regulations on wireless radiation exposure levels, it plays a revolving-door role with respect to regulation.

The previous FCC Chairman had been President of the National Cable & Telecommunications Association (NCTA) and CEO of the Cellular Telecommunications & Internet Association (CTIA) before assuming his FCC Chairmanship. In recognition of his work in promoting the wireless industry, he was inducted into the Wireless Hall of Fame in 2003 and in 2009 (https://en.wikipedia.org/wiki/Tom_Wheeler). The present FCC Chairman served as Associate General Counsel at Verizon Communications Inc., where he handled competition matters, regulatory issues, and counseling of business units on broadband initiatives (https://en.wikipedia.org/wiki/Ajit_Pai#cite_note-Bio-2). As is the case with so many other Federal regulatory agencies [Kostoff, 2015-Chapter 9; 2016], the FCC is essentially an agency captured by industry [Alster, 2015]!

So, in the two most recent Administrations, under two supposedly very different Presidents, the FCC Chairmen had been, in different ways, lobbyists for the wireless radiation technology industry. Both were (and are) extremely ardent promoters of the most rapid acceleration of implementation of 5G infrastructure and associated devices and technologies.

2A1c. Relation of wireless radiation health and safety research to sponsors' and performers' conflicts-of-interest

The incentives for ***sponsors*** of wireless radiation health and safety research to fund studies that will help promote accelerated expansion of wireless radiation devices and infrastructure are many and the disincentives are essentially non-existent. Likewise, incentives for ***performers*** of wireless radiation health and safety research to conduct studies that will help promote accelerated expansion of wireless radiation devices and infrastructure are many and the disincentives are few. Because of this unfortunate reality,

EVERY wireless radiation health and safety study/experiment whose results support the wireless radiation promotion objectives of the organization(s) that sponsor these studies must receive the highest level of scrutiny.

There is not a credibility symmetry between studies whose results 1) support the promotional objectives of their sponsors or 2) do not support the promotional objectives of their sponsors. For studies/experiments of equally high research/scientific quality, those studies that do not support the promotional objectives of their sponsors should be assigned relatively higher credibility priority than those that do support the promotional objectives of their sponsors. This should not be interpreted as a lack of absolute credibility for studies that support the promotional objectives of their sponsors. Many may very well be credible, as discussed further in section 2F.

However, research findings opposing the promotional objectives of the sponsors may result in termination of further funding for the project, and adverse career and financial consequences for the performer(s). Conversely, research findings supporting the promotional objectives of the sponsors will most likely lead to continued and enhanced funding for the project, and very positive career and financial impacts for the performer(s). Therefore, high quality research studies whose results could impose serious career and financial risks for their performers should rank higher in the credibility chain.

These conflicts-of-interest of researchers who accept funding from wireless radiation promoters extend well beyond the papers and studies they publish. This category of wireless radiation researchers tends to populate the Advisory Committees that help set the exposure safety studies imposed by government regulatory agencies. Hardell has done a comprehensive evaluation of some of the more influential Advisory Committees [Hardell, 2017], especially ICNIRP and WHO, and has shown clearly the inter-locking linkages among these proxies of the wireless radiation promoters.

Operationally, the wireless radiation regulatory commissions, their advisory committees, their health and safety research sponsors, and some of the researchers sponsored by the wireless radiation promoters, along with the mainstream media, serve as ***the de facto marketing arm of the wireless radiation promoters***, in their attempts to mislead the public into believing wireless radiation under present day exposure limits is safe!

2A1d. Relation of wireless radiation health and safety research to publishers' conflicts-of-interest

Some journal publishers of articles concerning health and safety effects of wireless radiation have similar conflicts of interest. Many journals are not independent from government or industry sponsorship, in whole or in part, directly or indirectly. This conflict-of-interest is addressed further in section 2F. These journals control the review process by which articles are selected for publication, and it is extremely easy for a journal to select articles for publication that will align strongly with the promotional interests of the organizations or people that contribute to their revenue stream. These direct or indirect journal sponsors include:

- Promotional organizations that contribute directly to the journals;
- Promotional organizations that contribute directly to professional societies that sponsor many of the 'leading' journals;
- Individuals who receive funding from industrial or governmental organizations promoting wireless radiation technology and who
    - contribute directly to the journals and/or
    - contribute to professional societies that sponsor many of the 'leading' journals

Anyone who has read thousands of wireless radiation journal article abstracts on health and safety would have little problem in identifying those journals that rarely publish results opposing the promotional objectives of government and industry (see Slesin [2006] for ***allegations*** of possible bias in one journal's publication patterns of microwave-induced genotoxic results). Equally, they would have little problem in identifying those authors or author institutions that even more rarely publish results opposing the promotional objectives of government and industry. If we take into account the credibility asymmetry between studies whose results 1) support the promotional objectives of their sponsors or 2) do not support the promotional objectives of their sponsors, then a much different picture of the wireless radiation health and safety research literature emerges. Many of the so-called conflicting results disappear when credibility weightings are applied, and the true serious adverse effects resulting from this harmful technology are shown in detail. The reader should keep this credibility asymmetry in mind when evaluating the myriad adverse health effects shown in sections 2D and 2E.

2B. Wireless Radiation/Electromagnetic Spectrum

This section overviews the electromagnetic spectrum, and delineates the parts of the spectrum on which this monograph will focus. The electromagnetic spectrum encompasses the entire span of electromagnetic radiation. The spectrum includes: ionizing radiation (gamma rays, x-rays, and the extreme ultraviolet, with wavelengths below ~10^{-7} m and frequencies above ~$3x10^{15}$ Hz); non-ionizing visible radiation (wavelengths from ~$4x10^{-7}$ m to ~$7x10^{-7}$ m and frequencies between ~$4.2x10^{14}$ Hz and ~$7.7x10^{14}$ Hz); non-ionizing non-visible radiation (short wavelength radio waves and microwaves, with wavelengths between ~10^{-3} m and ~10^{5} m and frequencies between ~$3x10^{11}$ to ~$3x10^{3}$ Hz; long wavelengths, ranging between ~10^{5} m and ~10^{8} m and frequencies ranging between $3x10^{3}$ and 3 Hz).

The low frequencies (3 Hz–300 KHz) are used for electrical power line transmission (60 Hz in the U.S.) as well as maritime and submarine navigation and communications. Medium frequencies (300 KHz–900 MHz) are used for AM/FM/TV broadcasts in North America. Lower microwave frequencies (900 MHz–5 GHz) are used for telecommunications such as microwave devices/communications, radio astronomy, mobile/cell phones, and wireless LANs. Higher microwave frequencies (5 GHz– 300GHz) are used for radar and proposed for microwave WiFi, and will be used for 'high-band' 5G communications. Terahertz frequencies (300 GHz–3000 GHz) are used increasingly for imaging to supplement X-rays in some medical and security scanning applications [Kostoff and Lau, 2017; Kostoff, 2019a; Kostoff et al, 2020].

In the study of non-ionizing EMF radiation health effects reported in this monograph, the frequency spectrum ranging from 3 Hz to 300 GHz is covered, with particular emphasis on the high frequency communications component ranging from ~1 GHz to ~300 GHz. A previous review found that pulsed electromagnetic fields applied for relatively short periods of time could sometimes be used for therapeutic purposes, whereas chronic exposure to electromagnetic fields in the power frequency range (~60 Hz) and microwave frequency range (~1 GHz-tens GHz) tended to result in detrimental health effects [Kostoff and Lau, 2013, 2017]. Because of present concerns about the rapid expansion of new communications systems without adequate safety testing, more emphasis will be placed on the communications frequencies in this monograph.

2C. Modern Non-Ionizing EMF Radiation Exposures

In ancient times, sunlight and its lunar reflections provided the bulk of the visible spectrum for human beings (with fire a distant second and lightning a more distant third). Now, many varieties of artificial light (incandescent, fluorescent, and light emitting diode) have replaced the sun as the main supplier of visible radiation during waking hours. Additionally, EMF radiation from other parts of the non-ionizing spectrum has become ubiquitous in daily life, such as from wireless computing and telecommunications. In the last two or three decades, the explosive growth in the cellular telephone industry has placed many residences in metropolitan areas within less than a mile of a cell tower. Future implementation of the next generation of mobile networking technology, 5G, will increase the cell tower geographical densities by an

order of magnitude. Health concerns have been raised about non-ionizing EMF radiation from (1) mobile communication devices, (2) occupational exposure, (3) residential exposure, (4) wireless networks in homes, businesses, and schools, and (5) other non-ionizing EMF radiation sources such as 'smart meters' and 'Internet of Things'.

2D. Demonstrated Biological and Health Effects from Prior Generations of Wireless Networking Technology

2D1. Limitations of Previous Wireless Radiation Health Effects Studies

There have been two major types of studies performed to ascertain biological and health effects of non-ionizing radiation: laboratory and epidemiology. The laboratory tests provide the best scientific understanding of the effects of wireless radiation, but do not reflect the real-life operating environment in which wireless radiation is embedded. There are three main reasons that laboratory tests do not reflect real-life exposure conditions for human beings.

First, the laboratory tests have been performed mainly on animals, especially rats and mice. Because of physiological differences, there have been continual concerns about extrapolating small animal results to human beings. Additionally, while inhaled or ingested substances can be scaled from small animals to human beings relatively straight-forwardly, radiation may be more problematical. For non-ionizing radiation, penetration depth is a function of frequency, tissue, and other parameters, and radiation of a given wavelength could penetrate much deeper into the (small) animal's interior than similar wavelength radiation in humans. Different organs and tissues would be affected, with different power densities.

Second, the typical incoming EMF signal for many/most laboratory tests performed in the past consisted of the single carrier wave frequency; the lower frequency superimposed signal containing the information was not always included. This omission may be important. As Panagopoulos states: "It is important to note that except for the RF/microwave carrier frequency, Extremely Low Frequencies – ELFs (0–3000Hz) are always present in all telecommunication EMFs in the form of pulsing and modulation. There is significant evidence indicating that the effects of telecommunication EMFs on living organisms are mainly due to the included ELFs…. While ~50% of the studies employing simulated exposures do not find any effects, studies employing real-life exposures from commercially available devices display an almost 100% consistency in showing adverse effects". [Panogopoulos, 2019]. These effects may be exacerbated further with 5G: "with every new generation of telecommunication devices…..the amount of information transmitted each moment…..is increased, resulting in higher variability and complexity of the signals with the living cells/ organisms even more unable to adapt [Panogopoulos, 2019]"

Third, these laboratory tests typically involved one stressor (wireless radiation) and were performed under pristine conditions. This contradicts real-life exposures, where humans are exposed to multiple toxic stimuli, in parallel or over time. In perhaps five percent of the wireless radiation studies reported in the literature, a second stressor (mainly biological or chemical toxic stimuli) was added, to ascertain whether additive, synergistic, potentiative, or antagonistic effects were generated by the combination [Kostoff and Lau, 2013, 2017; Juutilainin et al, 2008; Juutilainin et al, 2006].

Combination experiments are extremely important because, when other toxic stimuli are considered in combination with non-ionizing EMF radiation, the synergies tend to enhance the adverse effects of each stimulus in isolation. In other words, combined exposure to 1) toxic stimuli and 2) non-ionizing EMF radiation translates into much lower levels of tolerance for each toxic stimulus in the combination relative to its exposure levels that produce adverse effects in isolation. So, the regulatory exposure limits for non-ionizing EMF radiation when examined in combination with other potentially toxic stimuli should be far lower for safety purposes than those derived from non-ionizing EMF radiation exposures in isolation [Kostoff et al, 2020].

Thus, almost all of the laboratory tests that have been performed are flawed with respect to demonstrating the full adverse impact of the wireless radiation. Either 1) non-inclusion of signal information or 2) using single stressors only 3) tends to underestimate the seriousness of the adverse effects from non-ionizing radiation. Excluding ***both*** of these phenomena from experiments, as was done in the vast majority of cases, tends to amplify this underestimation substantially. Therefore, the results (of adverse effects from wireless radiation exposure) reported in the biomedical literature should be viewed as 1) extremely conservative and 2) the very low 'floor' of the seriousness of the adverse effects, not the 'ceiling'.

The epidemiology studies typically involved human beings who had been subjected to myriad known and unknown stressors prior to (and during) the study. The wireless radiation exposure levels from e.g. the cell tower studies reported in Kostoff and Lau [2017] associated with increased cancer incidence tended to be orders of magnitude lower than e.g. those exposure levels generated in the recent highly-funded NTP studies [Melnick, 2019] and other laboratory studies associated with increased cancer incidence. The inclusion of real-world effects in the cell tower studies most likely accounted for the orders of magnitude wireless radiation exposure level decreases that were associated with the initiation of increased cancer incidence.

Thus, the laboratory tests were conducted under very controlled conditions not reflective of the real-world, while the epidemiology studies were performed in the presence of many stressors, known and unknown, reflective of the real-world. The exposure levels of the epidemiology studies were, for the most part, uncontrolled.

2D2. Adverse Health Effects Identified in Major Review Studies

Many thousands of papers have been published over the past sixty+ years showing adverse effects from wireless radiation applied in isolation or as part of a combination with other toxic stimuli. Extensive reviews of these wireless radiation biological and health effects have been published, including [Belpomme et al, 2018; Desai et al, 2009; Di Ciaula, 2018; Doyon and Johansson, 2017; Havas, 2017; Kaplan et al, 2016; Kostoff and Lau, 2013, 2017; Kostoff et al, 2020; Lerchl et al, 2015; Levitt and Lai, 2010; Miller et al, 2019; Pall, 2016, 2018; Panagopoulos, 2019; Panagopoulos et al, 2015; Russell, 2018; Sage and Burgio, 2018; Van Rongen et al, 2009; Yakymenko et al, 2016; Bioinitiative, 2019].

In aggregate, for the high frequency (radiofrequency-RF) part of the spectrum, these reviews show that RF radiation below the FCC guidelines can result in:

-carcinogenicity (brain tumors/glioma, breast cancer, acoustic neuromas, leukemia, parotid gland tumors),

-genotoxicity (DNA damage, DNA repair inhibition, chromatin structure),

-mutagenicity, teratogenicity,

-neurodegenerative diseases (Alzheimer's Disease, Amyotrophic Lateral Sclerosis),

-neurobehavioral problems, autism,

-reproductive problems, pregnancy outcomes,

-oxidative stress, inflammation, apoptosis, blood-brain barrier disruption,

-pineal gland/melatonin production, sleep disturbance, headache,

-irritability, fatigue, concentration difficulties, depression, dizziness, tinnitus,

-burning and flushed skin, digestive disturbance, tremor, cardiac irregularities, and can

-adversely impact the neural, circulatory, immune, endocrine, and skeletal systems.

The effects range from myriad feelings of discomfort to life-threatening diseases. From this perspective, RF exposure is a highly pervasive cause of disease!

2D3. Adverse Health Effects from Open Literature Analysis

2D3a. Overview

To corroborate the findings from the major review studies of the previous section, an analysis of a representative sample of the wireless radiation adverse health effects literature was performed. A relatively simple query was used to retrieve records related to adverse health effects from wireless radiation. Some filtering was done to remove records that did not identify adverse health effects, but because of extensive use of titles (and sometimes abstracts) that discuss methodologies rather than results, some/many records were retrieved that did not demonstrate adverse health effects.

In all, 5311 records with abstracts were retrieved from Medline (Pubmed), and these records were categorized by three different methods: manual taxonomy; factor analysis taxonomy; text clustering taxonomy. The three methods and their results will be briefly summarized here, and the more detailed results, including category record titles, will be presented in Appendices 2-4.

2D3b. Manual taxonomy results

Based on the factor analysis (section 2D3c) and text clustering (2D3d) results, as well as reading thousands of abstracts from the full database, a manual taxonomy of adverse health effects from wireless radiation was constructed. Appendix 2 presents this taxonomy (Table A2-1), and the titles of the records that were assigned to each category in the taxonomy. The record titles give a better appreciation for the contents of each category than the brief category heading.

This ***manual taxonomy is the most relevant*** (of the three taxonomies presented) to the main objective of identifying and categorizing specific adverse health effects from wireless technology, since it was not dependent on any algorithm to determine adverse effects categories and received a ***higher level of title filtering*** than the other two. Table A2-1 (reproduced in the following) presents the categories in the taxonomy, and a strong condensation of the key phrases 1) used to define the category and 2) link to the record titles shown in Appendix 2. A more detailed manual taxonomy, with orders-of-magnitude more phrases, is shown in Appendix 2.

The adverse effects identified in the manual taxonomy cover those summarized in the comprehensive review analyses described previously, and go well beyond. While all the categories shown are problematical and harmful, the most researched categories with perhaps the most serious adverse effects are ***cancer/tumors, neurodegenerative diseases, reproduction problems, and genotoxicity***. Thus, even confining these results to the non-classified open literature, many of which are based on single stressor experiments that tend to downplay greatly real-life adverse effects, there is more than enough hard evidence that wireless radiation 1) ***can be extremely harmful in real-life environments***, and 2) ***needs to be subjected to orders-of-magnitude harsher exposure limitations*** than is the case today. In Appendix 2, the categories in Table A2-1 are hyperlinked to their respective record title sections.

Table A2-1 – Manual Taxonomy

CATEGORY	KEY PHRASES
Cancer/Tumors	cancer, leukemia, glioma, lymphoma, melanoma, Hodgkin's disease, tumor, acoustic neuroma, meningioma
Neurodegenerative	memory, central nervous system, learning, neurodegenerative, Alzheimer's disease, cognition, amyotrophic lateral sclerosis, dementia, epilepsy, multiple sclerosis, cognitive impairment, seizures, autism
Reproduction	pregnancy, reproductive, sperm, embryos, testicular, fertility, embryo, testosterone, infertility
Genotoxicity	DNA damage, genotoxic, micronuclei, mutagenic, strand breaks, chromatin, mutation, chromosome aberrations,
Cardiovascular	Cardiac, cardiovascular, pacemaker, implanted, Cardiovascular disease, arrhythmia, arterial blood pressure, ventricular fibrillation
Immunity	lymphocytes, immune system, immunity, leukocytes, antibodies, neutrophils, autoimmune, macrophage,
Biomarkers	apoptosis, oxidative stress, Malondialdehyde, reactive oxygen species, superoxide dismutase, lipid peroxidation, inflammation, oxidation, ornithine decarboxylase, barrier permeability, atrophy, C-reactive protein, oxidative damages
Sensory Disorders	auditory, acoustic, hypersensitivity, electromagnetic hypersensitivity, cataract, tinnitus, dermatitis, cataractogenic, pain sensitivity, pain threshold
Discomfort Symptoms	depression, anxiety, headache, dizziness, depressed, vertigo, nausea, low back pain
Congenital Abnormalities	malformations, teratogenic, congenital malformations, cleft palate,
Circadian Rhythym and Melatonin	melatonin, sleep, circadian, insomnia, pineal function
Chronic Conditions	metabolism, glucose, endocrine, cholesterol, Diabetes, calcium homeostasis, obesity

2D3b1. Adverse effects of wireless radiation on food chain

The above taxonomy (and its associated records) focuses on the direct linkage between wireless radiation exposure and biomarkers, symptoms, and diseases. As such, these effects can be viewed as direct effects. Equally important, but usually overlooked in any discussions of adverse effects of wireless radiation, are the indirect effects, especially those on the ecological infrastructure that supports human life.

An analogy to war and conflict may be instructive. When one examines the great wars and battles of human history, especially those that persisted for more than very short periods, the critical role of logistics in determining the outcome becomes obvious. Many wars/battles have been won or lost by the adequacy and timeliness of logistical supplies and support.

The struggle for survival of human life on Earth is similarly dependent on the logistical food supply chain. At the foundation of this supply chain (before the farmers become involved in harvesting its bounty) are the insects, seeds, flora, trees, etc, that enable the bountiful growth of the myriad potential foods. If the integrity of this foundational logistical supply chain is threatened in any way, then both the animals and plant products we consume become unavailable.

There is a substantial literature on the adverse impacts of wireless radiation on this foundational logistical supply chain. These adverse effects are from the pre-5G exposures, and would include enhanced coupling from the higher frequency harmonics. Many of these supply chain elements (e.g., insects, seeds, larvae, etc) are very small, and we could expect enhanced resonance/energy coupling from the shorter-wavelength 5G radiation when implemented. This indirect impact of wireless radiation may turn out to be at least as important (if not more important) as the direct impact of wireless radiation on human survival! At the end of Chapter 3 are a few references showing the harmful effects of wireless radiation on the foundational food supply chain. They are the tip of the iceberg of a much larger literature on adverse effects of wireless radiation on the foundational food supply chain.

From a broader perspective, most of the laboratory experiment component of the wireless radiation adverse effects literature can be viewed as related to the foundational food supply chain. Much of this research is focused on mice, rats, insects, small birds, small fish, etc. These species tend to be prey of larger animals/fowl/fish, and eventually make their way to the human food table. Any environmental factor that affects the health of these species adversely will eventually impacts the humans who are at the end of that chain. In reality, we have accumulated a massive literature describing the adverse impacts of wireless radiation on myriad contributing components to our food supply, and the results do not bode well for our future ability to feed the existing world's population, much less the growing world's population!

2D3b2. Implants and Appendages

The adverse impacts of wireless radiation on myriad medical implants don't get much discussion in the literature, especially passive implants (defined below), and especially with regard to radiofrequency radiation. A number of articles in the database addressed non-organic implants, which are foreign bodies inserted into humans and animals for medical purposes. Non-organic implants addressed in the present database are typically not rejected by the immune system like organic foreign substances (although some adjuvants such as metal could induce autoimmune responses [Loyo et al, 2013]). Non-rejection does not mean they are safe, especially from exposure to wireless radiation.

There were two major types of implants covered by the database articles showing adverse effects: active implants that produced electrical signals mainly for controlling heart irregularities (e.g., pacemakers, defibrillators) and hearing deficiencies (e.g., cochlear implants), and passive metallic implants for structural support (e.g., dental implants, bone pins, plates, etc). Additionally, there are articles addressing adverse effects from wireless radiation in the vicinity of metallic appendages (e.g., metallic eyeglasses, metallic jewelry, etc).

The external EMF from microwaves (and other sources) could 1) impact the electrical operation of the active implants adversely, 2) increase the Specific Absorption Rate (SAR) values of tissue in the vicinity of the passive implants substantially because of resonance effects, and 3) increase the flow and acidity of saliva in the vicinity of dental structures. While the EMF effects on the cochlear implants could adversely affect auditory capability, EMF effects on the heart-related implants could potentially be life-threatening. The increased SAR values around the passive metal implants could result in increased tissue temperatures, and could adversely impact integration and longevity of the passive metallic implants.

In the mouth, the combination of 1) increased tissue temperatures in proximity to the implant or other orthodontic structures and 2) increased flow rate and acidity of saliva could lead to 3) increased leaching of heavy metals. Exposure to heavy metals is a major contributor to myriad chronic diseases [Kostoff, 2015]. The question then becomes: what other adverse health effects from the exposure of both the active and passive implants to increasing levels of wireless radiation have not been identified or addressed?

Appendix 7 addresses this issue of wireless radiation adverse effects related to medical implants and appendages in more detail, and additionally addresses potential wireless radiation adverse effects on tissues imbedded (deliberately or inadvertently) with exogenous-based nanoparticles that effectively act as micro/nano-implants. These nanoparticle-imbedded tissues may have the potential for enhanced energy absorption from the incoming RF signal, and may exhibit potentially harmful thermal transients (over and above the potential thermal transients resulting from the pulsed high peak-to-average power of the RF signal) that would be camouflaged under the wide averaging time periods in the FCC Guidelines.

2D3c. Factor analysis taxonomy results

The 5,311 records in the retrieved and ***partially*** filtered adverse health effects database were imported into the VP software [VP, 2019], and a factor analysis was performed. Thousands of MeSH Headings extracted by the VP software were inspected visually, and those directly applicable to adverse health effects were selected. The software then used these selected MeSH Headings to generate a factor matrix, which identified the main adverse health effects themes of the database. Appendix 3 presents this taxonomy (Table A3-1), and the titles of the records that were assigned to each category in the taxonomy. The titles give a better appreciation for the contents of each category than the brief category heading.

Table A3-1 (reproduced from Appendix 3) follows. It presents the factors/categories in the taxonomy, and the key MeSH Headings used to define the factor/category and link to the record titles shown in Appendix 3. In Appendix 3, the factors in Table A3-1 are hyperlinked to their respective record titles.

Table A3-1 - Factor Analysis Taxonomy

FACTOR THEME	MESH HEADINGS
1 Electromagnetic hypersensitivity and inflammation	C-Reactive Protein, Liver Diseases, Thyroid Diseases, Inflammation, Tonsillitis, Hypersensitivity
2 Coronary artery disease	Plaque, Atherosclerotic, Coronary Artery Disease, Diabetes Mellitus, Carotid Artery Diseases, Inflammation, Hypertension
3A Congenital abnormalities	Cleft Lip, Cleft Palate, Calcification, Physiologic, Congenital Abnormalities
3B Mammary tumors	Fibroadenoma, Adenoma, Mammary Neoplasms, Animal, Mammary Neoplasms, Experimental, Adenocarcinoma
4 Male infertility	Sperm Count, Spermatozoa, Sperm Motility, Semen, Testis, Infertility, Male, Spermatogenesis, Testosterone, Fertility
5 Brain neoplasms	Meningioma, Glioma, Meningeal Neoplasms, Neuroma, Acoustic, Brain Neoplasms, Glioblastoma, Neoplasms, Radiation-Induced, Neuroma, Cranial Nerve Neoplasms, Parotid Neoplasms, Central Nervous System Neoplasms
6 Sensory disorders	Burning Mouth Syndrome, Taste Disorders, Skin Diseases, Mouth Diseases, Dizziness, Vision Disorders, Hypersensitivity, Delayed, Fatigue
7 Breast neoplasms	Carcinoma, Lobular, Carcinoma, Ductal, Breast, Breast Neoplasms, Male, Adenoma
8 Oxidative stress	Oxidative Stress, Malondialdehyde, Glutathione Peroxidase, Lipid Peroxidation, Reactive Oxygen Species, Apoptosis, DNA Damage, Nitric Oxide, Protein Carbonylation
9 Neurodegenerative diseases	Parkinson Disease, Neurodegenerative Diseases, Alzheimer Disease, Amyotrophic Lateral Sclerosis, Motor Neuron Disease, Occupational Diseases, Dementia, Brain Diseases, Dementia, Vascular
10 Cerebrovascular disorders	Cerebrovascular Disorders, Dementia, Migraine Disorders, Tinnitus, Headache, Sleep Wake Disorders, Carotid Artery Diseases, Alzheimer Disease, Dementia, Vascular

11 Congenital abnormalities and glandular-based tumors	Cleft Lip, Cleft Palate, Fibroadenoma, Adenoma, Calcification, Physiologic, Mammary Neoplasms, Animal, Mammary Neoplasms, Experimental, Adenocarcinoma
12 Skin neoplasms	Carcinoma, Basal Cell, Carcinoma, Squamous Cell, Skin Neoplasms, Cocarcinogenesis, Neoplasms, Experimental, Neoplasms, Radiation-Induced, Colonic Neoplasms
13 Leukemia	Leukemia, Myeloid, Acute, Leukemia, Lymphocytic, Chronic, B-Cell, Leukemia, Myelogenous, Chronic, BCR-ABL Positive, Leukemia, Myeloid, Leukemia, Multiple Myeloma, Lymphoma, Leukemia, Radiation-Induced, Acute Disease, Liver Neoplasms, Experimental, Central Nervous System Neoplasms
14 Precancerous conditions	Atrophy, Precancerous Conditions, Hyperplasia, Hypersensitivity, Delayed, Thymus Gland, Capillary Permeability, Lymphoma
15 Circadian Rhythm	Melatonin, Circadian Rhythm, Pineal Gland
16 Eye diseases	Eye Diseases, Cataract, Vision Disorders, Sensation Disorders, Neurotic Disorders, Lens, Crystalline, Corneal Diseases, Edema, Hematologic Diseases
17 Electromagnetic interference in implanted electronic devices	Tachycardia, Ventricular, Ventricular Fibrillation, Death, Sudden, Cardiac, Arrhythmias, Cardiac
18 Liver Neoplasms	Liver Neoplasms, Carcinoma, Hepatocellular, Neoplasm Recurrence, Local, Lymphatic Metastasis
19 Symptoms of discomfort	Headache, Dizziness, Fatigue, Depression, Anxiety, Tremor, Sleep Wake Disorders, Neurotic Disorders, Stress, Psychological, Anxiety Disorders, Nervous System Diseases
20 Neoplasms	Lung Neoplasms, Ovarian Neoplasms, Pituitary Neoplasms, Lymphoma, Prostatic Neoplasms, Colonic Neoplasms, Carcinoma, Breast Neoplasms, Hematologic Neoplasms, Neoplasms, Liver Neoplasms, Cell Transformation, Neoplastic, Nervous System Neoplasms

2D3d. Text clustering taxonomy results

The 5,311 records in the retrieved and ***partially*** filtered adverse health effects database were imported into the CLUTO software [CLUTO, 2019], and a text clustering was performed. Forty-eight lowest level clusters were selected, based on theme resolution desired (average ~100 records per lowest level category). Appendix 4 presents this taxonomy (Table A4-1, Table A4-2), and the titles of the records that were assigned to each lowest-level category in the taxonomy. The titles give a better appreciation for the contents of each category than the brief category theme shown.

Table A4-1 (reproduced from the Appendix) presents the high-level clusters in the taxonomy, and the cluster themes. In Appendix 4, the fourth-level clusters in Table A4-2 (repeated from the fourth level shown in Table A4-1) are hyperlinked to their respective record titles.

Table A4-1 - CLUTO-Based Text Clustering Taxonomy – Top Levels

SECOND LEVEL	FOURTH LEVEL
Cluster 92 (2561) – Adverse effects of wireless radiation at cellular level, including radiation absorption at different frequencies	Cluster 78 (912) - Adverse impacts of wireless radiation, especially on cataracts, cells, and cognitive functions
	Cluster 79 (428) - Microwave radiation absorption at different frequencies
	Cluster 82 (529) - Adverse effects of mobile phone radiation, especially oxidative stress
	Cluster 84 (692) - Genotoxic effects of radiofrequency radiation
Cluster 93 (2750) – Adverse health effects of EMF on humans, especially cancer and neurodegenerative diseases, and on implanted electronic devices	Cluster 81 (673) - Adverse impacts of power-line EMF
	Cluster 85 (540) - Adverse impacts of low-frequency EMF, emphasizing cancer and neurodegenerative diseases
	Cluster 83 (668) – Adverse effects of mobile phone use, especially brain tumors, and brain and neural function
	Cluster 89 (869) - Human health risks from electromagnetic radiation, including adverse effects on implanted electronic devices, and possible protections

Note: Numbers in parentheses reflect numbers of records in cluster

2D3e. Wireless radiation adverse health effects in closed literatures

It should be re-emphasized at this point that almost all of the wireless radiation findings reported above reflect what is published in the open literature. That tends to emphasize basic research, and tends to be produced by academia, with its strong incentives for publication.

There's a much larger world of effort centered around wireless radiation technology and engineering development (for surveillance, communications, and weaponry) performed in organizations that have 1) few incentives to publish and 2) many prohibitions against publication due to classification and/or proprietary issues. Publication of adverse effects of these wireless systems could have severe financial consequences for all the stakeholders involved, and could result in potential military operational constraints as well.

The Federal government and industry who sponsor and many times conduct these advanced wireless radiation technology studies and demonstrations have 1) strong incentives to classify and proprietarize any results detrimental to their promotional activities and 2) no incentives to release results showing serious adverse health effects from wireless radiation to the public!

Consider the example shown in section 2D4 concerning the Zalyubovskaya [1977] reference, derived from Kostoff [2019a]. It shows some 1970s Soviet studies on EMF effects, including millimeter-wave effects, that were classified for 35 years until declassification in 2012. If relatively benign studies like those were classified for 35 years, one can only imagine the more serious studies that remain classified until this day. Or, Soviet studies that were not presented in an open forum because of their sensitivity. Or, USA studies that were performed decades ago (or recently), and remain classified to this day.

Also, consider the following example, which came to light relatively recently.

On 30 October 2019, an article was published suggesting the presence of cancer clusters among military pilots [https://www.mcclatchydc.com/news/nation-world/national/national-security/article236413708.html]. This may be the tip of the iceberg, since there are latency periods preceding the emergence of these cancers. It is unclear how well the health conditions of these pilots are tracked once they leave the service (according to the article), or, more specifically, ***how well the public is informed*** as to how well the health conditions of these pilots are tracked once they leave the service, and, if they are tracked, what the results of this tracking are. If there is tracking, who is funding the tracking, and what is its objectivity?

Severe recruiting consequences would result if it were shown that these serious diseases are in fact associated with exposures to on-board avionics and other stressors unique to the aircraft environment (EMF in combinations with other unique stressors [chemicals, psychological stress, high and low-G forces, etc] that performance aircraft crews face). It would be valuable to get EMF exposure data (***using an independent assessment***) under myriad flight conditions for many different military aircraft, with all the onboard avionics in full operation.

A similar article generated by the same organization addressing RF exposures of military pilots [https://www.mcclatchydc.com/news/nation-world/national/national-security/article237797304.html] complements the information contained in the above example, as shown in the following:

The largest Grumman measurement reported in the article translates to ***300 million microwatts/square meter***! This is thirty times today's FCC general public exposure limit, which itself is three-four orders-of-magnitude above levels shown by the cell tower studies to increase cancer incidence substantially. In parallel, the pilots are also being exposed to myriad other toxic stimuli, including EMF of other frequencies, cosmic radiation, perhaps fuel odors, etc, increasing the possibility of adverse effect synergies.

These may be the tip of the iceberg of RF exposure measurements done in the aircraft cabin, and there is no evidence that these were the highest occurring exposures. These types of exposure measurements rarely, if ever, see the light of day in the open literature, and are not advertised (for obvious purposes) by government-industry.

Additionally, while the gold coating mentioned may have kept a substantial amount of external RF from entering the cabin, it also would have delayed RF (that was internally generated or entered the cabin through non-gold coated non-metallic avenues) from leaving the cockpit, mirroring a hohlraum effect.

This cockpit problem reflects a disturbing trend. The military services became network-centric decades ago. They are almost completely dependent on wireless communications and wireless detection/surveillance for all their operations. If they were to allow their labs and contractors to report the possible damage from the levels of exposures happening in the field and at their facilities, potentially resulting in much lower wireless radiation exposure limits, they would be forced to eliminate many decades of so-called advances in their weaponry and operations. It could also impact their recruitment efforts adversely. No different in kind from their civilian counterparts, although the military may be operating at higher exposure levels because of their ultra-high-performance requirements.

So, while the adverse health effects of wireless radiation listed above in the monograph are very serious in their own right, they may be just the tip of the iceberg of the totality of adverse health effects that have actually been demonstrated if the non-published or classified studies had been taken into account.

2D4. Adverse Wireless Radiation Health Effects from Former USSR Literature Analysis

2D4a. Overview

The Former Soviet Union/USSR was a major player in biomedical research on health effects of non-ionizing radiation (both adverse and therapeutic) since at least the 1950s, and perhaps well before. Some/much of the work was published in the Soviet open literature, and available in Russian. Some/much of it was translated by USA intelligence agencies, and later declassified. Some may still be classified. The major difference between the USA and Soviet research on adverse effects of wireless radiation appears to be emphasis on thermal (USA) vs athermal (Soviet) effects. This difference is reflected in the different wireless radiation exposure limits imposed by each government.

2D4b. Glaser and Dodge review of East European radiofrequency literature

Glaser and Dodge addressed this issue within a comprehensive review of East European radiofrequency and microwave radiation literature [Glaser and Dodge, 1976], as follows:

THERMAL VS ATHERMAL EFFECTS – USA-USSR

"The most significant difference between East and West relative to biological mechanisms of effects of microwaves concerns the question of thermogenic versus nonthermogenic (or athermal) effects…..The traditional Soviet and East European view from the earliest publications of bio-studies has been that microwave and radio frequency fields can functionally, and even morphologically in some cases, alter the organism at field flux or power densities below those which cause measureable heating in tissues or biological substrates. Thus, reversible changes in behavior, physiological function, and microstructures are frequently reported at power densities of microwatts per square centimeter (muW/cm2), well below the Western world's "safe" exposure level of 10 milliwatts per square centimeter (10 mW/cm2)…..In contrast, the prevailing Western view, particularly in the United States, is that the effects of microwave and radio frequency fields are attributable only to the heating mechanism of those fields which are generally encountered at power densities in excess of 10 mW/cm2…..

The disparity between Eastern and Western views in this respect finds its most eloquent expression in daily occupational exposure standards for microwaves. In the Soviet Union and some East European countries, the standard for an occupational exposure day is 0.01 mW/cm2…..In the United States and some Western European countries, the value for continuous exposure is 10 mW/cm2.

Prior to 1953, it was believed that 100 mW/cm2 was the lowest level at which significant biological damage would occur…..Thus, 10 mW/cm2 is approximately one tenth the level calculated to cause significant heating in human tissues, and agrees with physiologic and metabolIc calculations . Intermediate standards between these values are practiced by some European countries….."

This conclusion, presented 43 years ago in print, is particularly disheartening. Despite all the evidence of adverse athermal effects of wireless radiation that was generated prior to 1976 (especially in the USSR, but in the USA as well), and the voluminous evidence (of adverse athermal effects of wireless radiation) that has been reported from global research since 1976, the USA government (along with many others) has refused to recognize the credibility of these athermal wireless radiation effects in the setting of regulatory exposure standards.

2D4c. Glaser review of global radiofrequency literature circa 1972

What was the state of the open literature on adverse health effects of wireless radiation in the 1970s, including what was known about Soviet and East European research? One partial answer can be gleaned from a very comprehensive review of the global radiofrequency and microwave biomedical effects literature published as a DTIC report in 1972 [Glaser, 1972]. The abstract of this report states in part:

> "More than 2300 references on the biological responses to radio frequency and microwave radiation, published up to April 1972, are included in this bibliography of the world literature. Particular attention has been paid to the effects on man on non-ionizing radiation at these frequencies. The citations are arranged alphabetically by author, and contain as much information as possible so as to assure effective retrieval of the original documents. ***Soviet and East European literature is included in detail***. An outline of the effects which have been attributed to radio frequency and microwave radiation is included as Chapter 1."

The effects mentioned in the last sentence have been converted to a more readable form by Dr. Magda Havas on her outstanding Web site (describing decades of global research on wireless radiation health effects) [Havas, 2019]. As stated on her Web site, Dr. Havas has obtained hard copies of Dr. Glaser's references from Dr. Glaser, and is in the process of scanning them and making them available to a wider audience. Dr. Havas' summary of the effects mentioned in the last sentence of the box above is repeated in the following table:

CATEGORY	ADVERSE EFFECTS
A. Heating of Organs* [Applications: Diathermy, Electrosurgery, Electrocoagulation, Electrodesiccation, Electrotomy]	This includes heating of the whole body or part of the body like the skin, bone and bone marrow, lens of the eye with cataracts and damage to the cornea; genitalia causing tubular degeneration of testicles; brains and sinuses; metal implants causing burns near hip pins etc. These effects are reversible except for damage to the eye.

B. Changes in Physiologic Function	This includes contraction of striated muscles; altered diameter of blood vessels (increased vascular elasticity), dilation; changes in oxidative processes in tissues and organs; liver enlargement; altered sensitivity to drugs; decreased spermatogenesis leading to decreased fertility and to sterility; altered sex ratio of births in favor of girls; altered menstrual activity; altered fetal development; decreased lactation in nursing mothers; reduction in diuresis resulting in sodium excretion via urine output; altered renal function; changes in conditioned reflexes; decreased electrical resistance of skin; changes in the structure of skin receptors; altered rate of blood flow; altered biocurrents in cerebral cortex in animals; changes in the rate of clearance of tagged ions from tissues; reversible structural changes in the cerebral cortex and diencephalon; changes in electrocardiographs; altered sensitivity to light, sound, and olfactory stimuli; functional and pathological changes in the eyes; myocardial necrosis; hemorrhage in lungs, liver, gut and brain and generalized degeneration of body tissue at fatal levels of radiation; loss of anatomical parts; death; dehydration; altered rate of tissue calcification.
C. Central Nervous System Effects	This includes headaches; insomnia; restlessness (daytime and during sleep); changes in brain wave activity (EEG); cranial nerve disorders; pyramidal tract lesions; disorders of conditioned reflexes; vagomimetic and sympathomimetic action of the heart; seizure and convulsions.
D. Autonomic Nervous System Effects	Altered heart rhythm; fatigue, structural alterations in synapses of the vagus nerve; stimulation of the parasympathetic nervous system leading to Bradycardia and inhibition of the sympathetic nervous system.
E. Peripheral Nervous System Effects	Effects on locomotor nerves.
F. Psychological Disorders	Symptoms include neurasthenia (general bad feeling); depression; impotence; anxiety; lack of concentration; hypochondria; dizziness; hallucinations; sleepiness or insomnia; irritability; decreased appetite; loss of memory; scalp sensations; fatigue; chest pain, tremors.
G. Behavioral Changes in Animals Studies	Effects include changes in reflexive, operant, avoidance and discrimination behaviors
H. Blood Disorders	Effects include changes in blood and bone marrow; increased phagocytic and bactericidal functions; increased rate of hemolysis (shorter lifespan of cells); increased blood sedimentation rate;

	decreased erythrocytes; increased blood glucose concentrations; altered blood histamine content; changes in lipids and cholesterol; changes in Gamma Globulin and total protein concentration; changes in number of eosinophils; decrease in albumin/globulin ratio; altered hemopoiesis (rate of blood corpuscles formation); leukopenia (increased number of white blood cells and leukocytosis; reticulocytosis (increase in immature red blood cells).
I. Vascular Disorders	This includes thrombosis and hypertension.
J. Enzyme and Other Biochemical Changes (in vitro)	Changes in the activity of cholinesterase (also in vivo); phosphatase; transaminase; amylase, carboxydismutase; denaturation of proteins; inactivation of fungi, viruses, and bacteria; killed tissue cultures; alterated rate of cell division; increased concentration of RNA in lymphocytes and decreased concentration of RNA in brain, liver and spleen; changes in pyruvic acid, lactic acid and creatinine excretions; changes in concentration of glycogen in liver (hyperglycemia); altered concentrationsof 17-ketosteroids in urine.
K. Metabolic Disorders	Effects include glycosuria (sugar in urne); increase in urinary phenols; altered processing of metabolic enzymes; altered carbohydrate metabolism.
L. Gastro-Intestinal Disorders	Effects include anorexia; epigastric pan; constipation; altered secretion of stomach digestive juices.
M. Endocrine Gland Changes	Effects include altered functioning of pituitary gland, thyroid gland (hyper-thyroidism and enlarged thyroid, increased uptake of radioactive iodine), and adrenal cortex; decreased corticosteroids in blood; decreased glucocorticoidal activity; hypogonadism (with decreased production of testosterone).
N. Histological Changes	Changes in tubular epithelium of testicles and gross changes.
O. Genetic and Chromosomal Changes	Effects include chromosomal aberrations (shortening, pseudochiasm, diploid structures, amitotic divisions, bridging, “stickiness”; irregularities in chromosomal envelope); mutations; mongolism; somatic alterations (not involving nucleus or chromosomes); neoplastic diseases (tumors).
P. Pearl Chain Effect	This refers to intracellular orientation of subcellular particles and orientation of cellular and other (non-biologic particles, i.e. mini magnetics) affecting orientation of animals, birds, and fish in electromagnetic fields.
Q. Miscellaneous Effects	These include sparking between dental fillings; metallic taste in mouth; changes in optical activity of colloidal solutions; treatment for

	syphilis, poliomyelitis, skin diseases; loss and brittleness of hair; sensations of buzzing, vibrations, pulsations, and tickling about head and ears; copious perspiration, salivation, and protrusion of tongue; changes in the operation of implanted cardiac pacemakers; changes in circadian rhythms.

Thus, much was known about the adverse health effects of both thermal and athermal high-frequency wireless radiation even in the early 1970s (Glaser's review did not address lower frequency radiation effects, although we now know these lower frequency effects could be equally damaging as those from high frequency), but this long-standing knowledge has not translated into adequate protections for the public from wireless radiation, both in the USA and the rest of the world.

2D4d. Joint Publications Research Service translations of East European research

Another avenue of insight into Soviet and East European research in the 1970s era was provided by the Joint Publications Research Service (JPRS). A description of this organization follows [https://guides.library.harvard.edu/jprs]:

> The United States Joint Publications Research Service is a government agency which translates foreign language books, newspapers, journals, unclassified foreign documents and research reports. Approximately 80% of the documents translated are serial publications. JPRS is the largest single producer of English language translations in the world. More than 80,000 reports have been issued since 1957, and currently JPRS produces over 300,000 pages of translations per year.
>
> **In its early years JPRS concentrated heavily on scientific and technical material from communist countries. Gradually coverage has broadened to include more non-scientific materials.**

2D4d1. Maritime occupational radiofrequency exposures in USSR

One of the Soviet technical books translated by the JPRS is listed on Dr. Havas' Web site [https://magdahavas.com/pick-of-the-week-15-russian-translations-on-biological-effects-of-magnetic-fields-and-radio-frequency-radiation/]. This book [Kulikovskaya, 1970] is important because it shows the levels of wireless radiation to which Soviets in some occupations were exposed fifty years ago, numbers that many wireless radiation proponent countries do not readily advertise. Whether these exposures are greater or less today is unclear; powers may be higher, but shielding may be better.

In the introductory section of Chapter IV (Biological Effect of Radio Waves – p.70), the following statement is made:

"Foreign researchers are giving basic attention to the effect of electromagnetic radio waves beginning with the thermal effect, that is, heating the animate organism by the field energy.

The research performed in our country, in contrast to foreign research, is based on a complex of dynamic studies of the reactions of the organism to the effect of low irradiation intensities, and, especially, in the superhighfrequency range, recognition of the cumulative biological effect in the case of chronic explosure to low power flux densities."

This quoted statement confirms the statement of Glaser and Dodge in section 2D4b above. Since the bulk of the references in Kulikovskaya's book are from the 1950s and 1960s, one can surmise that *a decision was made by the Western powers (especially the USA, who led the Western powers at that time) seventy years ago to downplay the adverse effects of athermal wireless radiation, and promote the false concept that only the thermal effects of wireless radiation are responsible for biomedical damage*. The decision-makers from the Western powers recognized seventy years ago that *wide-ranging wireless communications and surveillance were not possible if biologically protective exposure limits were promulgated*. Through countless Administrations and Legislatures since the days of President Eisenhower, all USA (and most foreign) decision-makers have presented a consistent and unified front promoting increased exposure to wireless radiation at the expense of the health of the nation's citizens!

The following table shows examples (from Kulikovskaya [1970]) of maximum levels of exposure to wireless radiation for Soviet citizens working in the marine environment. The maximum electric field exposure levels exceed the Soviet regulatory limits at that time (which were up to an order-of-magnitude lower than the USA regulatory limits) by up to two orders-of-magnitude!

To place these numbers in perspective, the Building Biologists' recommendations for safe long-term exposure limits in these frequency ranges is less than one volt per meter (https://mdsafetech.org/conversion-and-exposure-limits-emr-emf/). Thus, the reported exposures exceed safe levels by two-three orders of magnitude.

The research was performed at the Laboratory of Physical Factors of the State Scientific Research Insitute of Labor Hygiene and Professional Diseases. The exposure levels reported are what the Soviet government was willing to release to the public. Whether they were the most severe exposures experienced by members of the civilian and military fleets remains unknown. In terms of personnel recruitment for these jobs, it was/is not in the government's (Soviet or otherwise, including USA) best interests to release to the public exposure levels that would show these jobs to be highly dangerous to health. The book attempts to make the point that most exposures experienced by maritime personnel are much lower than the maximum, probably to assuage the public. The results are disturbing nevertheless, and should be viewed as the 'floor' of exposures to be expected relative to measurements made by an 1) ***independent objective group*** 2) ***on location during operations*** 3) ***without having given advanced notice***!

REGION	FREQ RANGE MHz	MAX EXPOS V/m	EXP LIMIT V/m
Electromagnetic Fields Near Tube Generators for High-Frequency Heating of Metals (P.23)	.06-.8	1,000+	20
Electromagnetic Waves Near Tube Generators for High-Frequency Heating of Dielectrics (P.26)	10-30	500+	20
Electromagnetic Fields in the Radio Rooms of Ships (P. 29)	.3-23		
Passenger Ships (P. 32)	.4-.8	2,000	20
Ships of the Tanker Fleet (P. 36)	.4-.8	2,000	20
Dry Cargo Ships (P. 37)	.4-.8	1,600	20
Ships of the Auxiliary Fleet (P. 40)	.4-.8	420	20
Electromagnetic Fields of Radio Communications Antennas on the Decks and Superstructures of Ships (P. 44)	.3-3	880	20
"In conclusion, it can be stated that the highest intensity of an electric field up to hundreds and sometimes ***thousands and more volts per meter*** occurs near the antenna drops and metal masses on the top bridges and decks during operation of a medium wave radio. Here, the magnetic component of the field can reach ***ten and even fifteen amps/meter***." P. 52)			
Superhigh Frequency Electromagnetic Fields of Radar Antennas on the Decks of Ships (P. 52)	3,000-15,000		
"Studies of the conditions of irradiation of the deck crew with superhigh-frequency fields performed on ships for various purposes show that when the radar antennas are installed on co1umns 1.2-2.5 meters above the deck of the top bridge, the power flux density can be hundreds and sometimes ***thousands of microwatts per square centimeter***." (P. 54)			
Some Adverse Health Effects of Marine Radio Operators (P. 80) "The conditions of labor of marine radio operators are least favorable….. a relatively large number of people with various diseases appear among radio operators. Thus, out of 215 radio operators, 50 had chronic diseases (23.2 percent)…..The primary disruption of the state of health of ship radio operators is damage to the organs of sight…..Among the diseases of the cardiovascular system occurring in ship radio operators, hypertonic disease. myocardial distrophy and disruption of the blood circulation in the brain play the leading role. All radio operators suffering from diseases of the cardiovascular system are young (from 30 to 35 years old) with five to 10 years of service. Among the diseases of the nervous system encountered in them, functional disorders of the central nervous system, vegetative neurosis, and neurasthenic syndrome are noted…..Thus, it is possible to consider it established that the largest number of people with health impairments occur among ship radio operators as compared to other marine professions."			

2D4d2. Biomedical effects of millimeter-wave exposures in some USSR research

Additionally, consider the following USSR reference [Zalyubovskaya, 1977] translated by the JPRS and published as a classified document in 1977.

SYSTEMIC ADVERSE EFFECTS FROM MILLIMETER-WAVE RADIATION

This is one of many translations of articles produced in the Former Soviet Union on wireless radiation (also, see reviews of Soviet research on this topic by McRee [1979, 1980], Glazer and Dodge [1976], Kositsky et al [2001]). On p. 57 of the pdf link, the article by Zalyubovskaya addresses biological effects of millimeter radiowaves. Zalyubovskaya ran experiments using power fluxes of 10,000,000 microwatts/square meter (the FCC guideline limit for the general public today), and frequencies on the order of 60 GHz. Not only was skin impacted adversely, but also heart, liver, kidney, spleen tissue as well, and blood and bone marrow properties. These results reinforce the conclusion of Russell (see section 2E) that systemic results may occur from millimeter-wave radiation. And, to re-emphasize, for Zalyubovskaya's experiments, the incoming signal was unmodulated carrier frequency only, and the experiment was single stressor only. Thus, the expected real-world results (when human beings are impacted, the signals are pulsed and modulated, and there is exposure to many toxic stimuli) would be far more serious and would be initiated at lower (perhaps much lower) power fluxes.

The Zalyubovskaya paper was published in 1977. What national security concerns caused it (and the other papers in the linked pdf reference) to be classified in the first place, and then kept classified for 35 years until declassification in 2012? What other papers on this topic with similar findings were published in the USSR (and the USA) at that time, or even earlier, and how many such papers never saw the light of day in the USSR (and the USA) at that time? It appears that we have known about the potentially damaging effects of millimeter-wave radiation on the skin (and other major systems in the body) for well over forty years, yet the discourse today only revolves around the possibility of modest potential effects on the skin and perhaps cataracts from millimeter-wave radiation.

2D4d3. Health effects from millimeter-wave exposures in Russian and Ukrainian literature

The review by Kositsky referenced in section 2D4d2 [Kositsky et al, 2001] appears to be based on 1) open literature publication of 2) wireless radiation biological effects 3) by Russian and Ukrainian researchers, covering the publication time period of 1968-2000. It appears to be quite comprehensive, and addresses both wireless radiation 1) adverse health effects and 2) therapeutics. It covers millimeter-wave frequencies almost exclusively. Some important takeaways from the Kositsky review are shown in the following box.

BIOLOGICAL EFFECTS FROM MILLIMETER-WAVE RADIATION

"there is a large probability of harmful effects from incidental generalized exposure, as confirmed in experiments on animals"

"Since living organisms have evolved under conditions of low natural background EHF EMR, they lack a ready-made mechanism of evolutionary adaptation to heightened levels of radiation resulting from technogenic factors"

"The results of clinical research showed that prolonged contact with EMF in the SHF band can lead to development of diseases, the clinical profile of which is determined above all by changes in the functional condition of the nervous and cardiovascular systems"

"Under EFD of 60 μW/cm2, disturbance of female cycles; reduction in fertility, number and weight of offspring; increase in postnatal deaths of the rat pups by a factor of 2.5; and dystrophic changes in the reproductive organs of the animals were noted"

"The results obtained give evidence that a single exposure to low-intensity EHF EMR without modulation, and with modulation at low frequencies of 5-10 Hz, induce opposite effects in red bone marrow (RBM). In the former case, we have pronounced stimulation of proliferative processes in the RBM, which are reversible. In the latter case—progressive depression of the process of blood production, right down to the formation of hypo- and aplastic conditions in the RBM on the sixth day of observation."

"biological effects of millimeter waves (BEF MMW):…They do not depend on the intensity of EMR, starting from the threshold to noticeable heating of tissue…..Irreversible BEF occur only during prolonged or cyclical exposure…..During amplitude or frequency modulation of MMW, bioeffects are maintained or strengthened as the power of exposure is significantly reduced…..The body "remembers" the effect of EMR for a relatively long time……In some cases, EMR influences sensitivity to other factors (chemicals, ionizing radiation, etc.), and the effects may persist through time."

"In epidemiological studies of the population of Ukraine, a connection was established between leukemia in children and cancer in adults, and exposure to EMF at industrial frequencies."

"Specific injuries under radiowave exposure are development of cataracts, instability in leukocyte make-up of peripheral blood, and vegeto-vascular disorder"

"the likelihood of cancer was three times greater under SHF exposure"

"It can be proposed that the current increase in electromagnetic pollution of the environment exceeds human adaptational capacities"

"The danger of mobile telephones consists of the fact that in addition to direct effects on the brain, the whole body is irradiated via the biologically active points of the concha of the ear"

"Observed higher resonance frequencies of a living cell coincide with frequencies of radiation of communications satellites. The power densities and duration of irradiation created by these satellites will significantly exceed…..the energetic doses inducing changes in living cells…… there will be a likelihood of changes (including negative changes) in the genetic apparatus of living cells during prolonged exposure to low-energy electromagnetic radiation from communications satellites"

"Combination with other deleterious factors: ionizing radiation, toxic substances, geomagnetic anomalies and stress significantly increase the effects of HF EMR."

"Occurrence of a narcotic-type dependency (by stimulating production of endorphins) is possible under regular irradiation with HF EMR."

"in animals irradiated with EMF, the nature of the infectious process changes—the course of the infectious process is aggravated"

"Absorption of EMF in biologically active points is many times more effective than in other parts of the skin, and this energy influences the internal organs and the body as a whole through the system of Chinese meridians."

In summary, these excerpts show that

- adverse effects can be initiated with very low doses of EMR,
- millimeter-wave radiation can impact regions below the skin, and
- adverse effects may be exacerbated when the EMR is combined with other toxic stimuli.

Given Kositsky's statement in section 2D4 about the potential of a narcotic-type dependency from exposure to EMR through stimulating production of endorphins, could EMR be effectively serving as one of the gateway 'drugs' to the increased opioid use we observe today? Appendix 5 addresses the potential impact of wireless radiation exposure on the opioid crisis, and shows that wireless radiation could indeed be a contributing factor to the overuse of opioids we are seeing today!

Particularly troubling are Kositsky's statements about the potential adverse effects of communications satellites. He bases his conclusions on the matching of communications satellites' frequencies with living cell resonances, as follows:

> "Observed higher resonance frequencies of a living cell coincide with frequencies of radiation of communications satellites. The power densities and duration of irradiation created by these satellites will significantly exceed (by ten or more orders of magnitude—such irradiation is possible over the course of a whole lifetime) the energetic doses inducing changes in living cells."

From some perspectives, the concept is counter-intuitive. Hormetic behavior of toxic substances and vaccines tends to be observed at extremely low doses of toxic stimuli. The average power fluxes from communications satellites are extremely low at the Earth's surface, and one would not expect adverse effects based on these low numbers. In the NTP experiments that many people cite as the wireless radiation experimental Gold Standard [Melnick, 2019], serious adverse effects were not observed until the power fluxes approached the FCC limit.

While his statements may seem counter-intuitive to some people, that does not mean they are incorrect. The issue needs to be resolved, sooner rather than later. At this time, 5G satellites are in fact being launched, and there are projections that tens of thousands of these satellites will eventually be launched to complete the global terrestrial and space 5G network. Launching of this number of satellites without the demonstrated evidence of safety would add to the unethical and harmful nature of the mobile networking experiment already observed.

2D4d4. "Confirmation" of Soviet microwave effects studies forty years later

The Soviet studies on adverse health effects from athermal radiofrequency exposures performed 40++ years ago showed clearly the dangers to human health from this toxic stimulus. Even though there was voluminous non-Soviet research showing a wide spectrum of adverse health effects from radiofrequency during that 40++ year period, some researchers undertook studies under 'similar' conditions to purportedly 'confirm' or validate the results from the Soviet studies [e.g., de Gannes et al, 2009; Repacholi et al, 2011; Grigoriev et al, 2010; Grigoriev, 2011]. This would require "validation" of health and safety research findings that were generated forty years ago in a ***completely different sponsorship and motivational context*** than has existed in the past decade. As one would expect, given the history of wireless radiation health and safety research, the results were mixed.

What type of independence and objectivity would one expect from 'confirmation' research sponsored by the promoters of 2G, 3G, 4G and now 5G mobile networking technology? Trillions of dollars in revenues are at stake in maintaining the fiction of wireless radiation safety under current exposure limit regulations. While the results could be correct, they should be interpreted with this context in mind.

2E. Potential Adverse Health Effects Expected from 5G Mobile Networking Technology

The potential 5G adverse health effects derive from the intrinsic nature of the radiation, and how this radiation interacts with tissue and other target structures. 4G networking technology was associated mainly with carrier frequencies in the range of ~1-2.5 GHz (cell phones, WiFi). The wavelength of 1 GHz radiation is 30 cm, and the penetration depth in human tissue is a few centimeters. The highest performance 5G networking technology is mainly associated with carrier frequencies at least an order of magnitude above the 4G frequencies, although, as stated previously, "ELFs (0–3000Hz) are always present in all telecommunication EMFs in the form of pulsing and modulation". Penetration depths for the high-performance carrier frequency component of 5G radiation will be on the order of a few millimeters.

For much of the early implementation of 5G, and perhaps later, 5G will be integrated with 4G. Some vendors will start out/have started out with 'low-band' 5G (~600-900 MHz); some will start out with 'mid-band' 5G (~2.5 GHz-4.2 GHz); and some will start out with 'high band' 5G (~24-47 GHz). All these modes are associated with potentially severe adverse health effects, and none have been tested for safety in any credible manner.

At the millimeter carrier wavelengths characteristic of high-band high performance 5G, one can expect resonance phenomena with small-scale human structures [Betzalel, 2018; Appendix 7B-3], as well as resonances with insects/insect components [Thielens et al, 2018].

The common 'wisdom' being presented in the literature and the broader media is that, if there are adverse impacts resulting from millimeter-wave 5G, the main impacts will be focused on near-surface phenomena, such as skin cancer, cataracts, and other skin conditions, because of shallow RF penetration depths. However, there is evidence that biological responses to millimeter-wave irradiation can be initiated within the skin, and the subsequent systemic signaling in the skin can result in physiological effects on the nervous system, heart, and immune system [Russell, 2018]. There is additional evidence that adverse effects from millimeter-wave radiation can occur in organs and tissue well below the skin surface (e.g., consider the example shown in section 2D4d2 in the box titled SYSTEMIC ADVERSE EFFECTS FROM MILLIMETER-WAVE RADIATION, or the example shown in section 2D4d3 in the box titled BIOLOGICAL EFFECTS FROM MILLIMETER-WAVE RADIATION) This should not be surprising, since there are myriad signaling conduits connecting the skin to deeper structures in the body.

2F. Why is there not Full Consensus on Adverse Effects from Wireless Radiation?

2F1. Reasons for Lack of Full Consensus

Not all studies of wireless radiation have shown adverse effects. There are many possibilities to explain this [Kostoff et al, 2020].

1) There could be 'windows' in parameter space where adverse effects occur, and the studies/experiments were conducted outside these 'windows'. Operation outside these windows could show i) no effects or ii) hormetic effects or iii) therapeutic effects.

For example, assume information content of the signal is a strong contributor to adverse health effects [Panagopoulus, 2019]. Experiments that involve only the carrier frequencies may be outside the 'window' where adverse health effects occur, and no adverse effects would be identified. Alternatively, in this specific example, the carrier signal and the information signal could be viewed as a combination of potentially toxic stimuli, where the adverse effects of each component are enabled because of the synergistic effects of the combination. If only one of the members of the combination were studied, again, adverse effects would not be identified.

As another example, an adverse health impact on one strain of rodent was shown for a combination of 50 Hz EMF and DMBA, while no adverse health impact was shown on another rodent strain for the same toxic stimuli combination [Fedrowitz et al, 2004]. From a higher-order combination perspective, if genetics are viewed conceptually as potentially equivalent to a toxic stimulus for combination purposes, then a synergistic three-constituent combination of 50 Hz EMF, DMBA, and genetics was required to elicit adverse health impacts in the above experiment. If these results can be extrapolated across species, then human beings could exhibit different responses to the same electromagnetic stimuli based on their genetic predispositions.

This particular experiment may be one of the most important conducted in wireless radiation toxicology. It shows that adverse effects from wireless radiation could depend on species/strain selection for the test subjects. This raises the question: which species or strain is most representative of human populations with respect to mirroring the adverse effects of wireless radiation. Is it rats; if so, is it Sprague-Dawley rats; if so, which strain of Sprague-Dawley rats? Or, are myriad strains of rats required to simulate effects on human populations with different genetic and other makeups? If not rats, is it dogs; if so, which species/strains of dogs. For setting regulatory exposure limits, should laboratory tests be conducted on a wide variety of species and strains, to determine which are the most representative of human responses to wireless radiation? Would the optimal species differ for different types of wireless radiation (e.g., high-frequency/low-frequency; high-power/low-power; pulsed/continuous, etc) and/or different types of other toxic stimuli?

The single stressor studies that constitute most of wireless radiation laboratory health research, and indeed constitute most of the laboratory medical research literature, essentially yield very narrow windows. Adverse effects are shown over very limited parameter ranges. As the above examples show, as well as the examples in Kostoff and Lau [2017] and Kostoff et al [2018], adverse effects shown by many combinations of stressors are not revealed when these stressors are tested in isolation over the same parametric ranges.

One could conclude that, whether by design or accident, ***the real-world impact of single stressor studies is to conceal, rather than reveal, many of the more serious adverse health effects of wireless radiation***.

The stressor variables to be used for health studies should not be limited to single stressors in isolation, but should include to the extent possible combinations of toxic stimuli stressors, since these combinations reflect more accurately real-life exposures.

2) Research quality could be poor, and adverse effects were overlooked.

3) Or, the research team could have had a preconceived agenda

where finding no adverse effects from wireless radiation was the main objective of the research.

2F2. The Role of Conflicts-of-Interest in Lack of Full Consensus

At this point, the reader would be well-advised to re-read section 2A1 on conflicts-of-interest relative to wireless radiation health and safety studies.

These conflicts pollute the well of knowledge relevant to health and safety, and are the ***largest contributor to mis-informing the public about the serious adverse health and safety impacts from wireless radiation***.

For example, studies have shown that industry-funded research of wireless radiation adverse health effects is far more likely to show no effects than funding from non-industry sources [Huss et al, 2007; Slesin, 2006; Carpenter, 2019]. Studies in disciplines other than wireless radiation have shown that, for products of high military, commercial, and political sensitivity, 'researchers'/organizations are hired to publish articles that conflict with the credible science (aka 'product defense' companies (https://www.fastcompany.com/1139299/manufacturing-doubt-product-defense), 'hired guns', etc), and therefore create doubt as to whether the product of interest is harmful [Michaels, 2008, 2020; Oreskes and Conway, 2011; Ong and Glantz, 2000; McGarity and Wagner, 2008; Walker, 2017].

Section 3.2.2 in a 2016 article on under-reporting of adverse effects of myriad substances in the biomedical literature [Kostoff, 2016] shows clearly the collusion of the USA government

and industry (and academia in some cases) in concealing harm of toxic substances (whose continued use is of importance to one or both organizations). These examples, and many others in the large USA government-industry candidate pool from which they were selected, show that

government-industry collusion to suppress adverse effects from technologies is endemic across technologies; ***it is not an aberration, but may be closer to the norm for technologies that are sensitive commercially, militarily, and politically.***

A comprehensive article in The New Yorker magazine (https://www.newyorker.com/magazine/2014/02/10/a-valuable-reputation?verso=true) details the travails that Prof. Tyrone Hays had to endure from industry in his quest to show that the herbicide Atrazine contributes to severe adverse effects. While the European Union banned the use of Atrazine almost two decades ago, the EPA has allowed its use to continue in the USA.

Finally, Appendix 6 lists study references showing effects of industry funding on research outcomes for myriad research disciplines (mainly within biomedical). What these references don't show (for the most part) is how industry convinced the regulators to incorporate the results of these studies in setting the lax regulations we see in practice today [e.g., Kostoff, 2018a]. Given that the sponsor and performer incentives of those studies are no different from the sponsor-performer incentives of wireless radiation health effects studies, there is little reason for expecting less concealment of adverse effects in the wireless radiation studies. Given the magnitude of revenues at stake for wireless radiation technology implementation, there is much reason for expecting more concealment and/or neutralization of adverse effects in the wireless radiation studies!

2F3. Interpreting Wireless Radiation Health Study Findings

Wireless radiation can play two roles as a contributor to adverse health effects: **initiator** and/or **promoter/accelerator**. The **initiator** role is reflected by single stressor studies (EMF alone) that show adverse health effects. The **promoter/accelerator** role is reflected by 1) combination studies that show no adverse effects from any of the constituents when tested in isolation, but show adverse effects (synergies) when tested in combination or 2) accelerating emergence of serious diseases. There can also be **initiator and promoter/accelerator** roles shown by combination studies, where each constituent tested in isolation shows a modest adverse effect, but the combination shows a much larger (i.e., synergistic) effect [Kostoff and Lau, 2013, 2017; Kostoff et al, 2018; Kostoff, 2018b].

So, if a study shows an adverse health effect from wireless radiation, and if it passes the criteria for high quality research, then that specific adverse effect for the parameter range shown could be accepted as credible. If a study shows no adverse health effects from wireless radiation in a single stressor experiment, the study MAY reflect no **initiator** role ***in the parameter window selected***, if the study is deemed to be of high research quality. However, such an experiment

offers little insight as to the **promoter/accelerator** role of the wireless radiation *in the parameter range selected*. The same would hold true for no adverse effects shown in combination experiments; there is no reason to believe that, even if wireless radiation serves as a promoter/accelerator for some combinations, it would therefore serve as a promoter/accelerator for all combinations.

In summary, the adverse effects of wireless radiation that result from credible high-quality studies published in the biomedical literature form the 'floor' for total adverse impacts of this wireless radiation. Given the insights of synergies from toxic stimuli combination studies evidenced in [Kostoff and Lau, 2013, 2017, Kostoff et al, 2018b, Juutiliin, 2006, 2008], many more adverse impacts from wireless radiation can be expected if the parameter range of single stressor studies is expanded and the numbers of combination studies are greatly expanded.

Further, there is little doubt that the biological effects of wireless radiation studies that have been classified (by the organization promoting the expansion of this technology, the Federal government, for alleged 'national security' purposes) show substantially more harmful effects from this technology in real-life situations.

Even the Gold Standard for research credibility – **independent replication of research results** – is questionable in politically, commercially, and militarily sensitive areas like wireless radiation safety. Suppose there are two research groups (funded by the same government agency) who both arrive at the same conclusion that just coincidentally coincides with what the government sponsor wanted. Would this be considered independent? Or, these two research groups received funding from different agencies of the same government. Would that be considered independent? Or, these two research groups received funding from two different governments that both had the same accelerated development objectives for the technology of interest. Review articles tend to treat these types of cases as independent, and don't make the distinction as long as the validation doesn't arise from within the performer group/organization.

Given the broad support exhibited today by the USA Federal government, military, and industry for the rapid implementation of 5G (and, indeed, the governments of most, if not all, the major developed countries globally), all these organizations must present a united front in declaring 5G (and previous generations of mobile networking technology) to be safe. If one government lab, or one highly-funded performer, were to perform a credible real-life simulation of wireless radiation effects and show the potential damage that might result, then the government's and industry's current fast-track effort to ***implement 5G before the full extent of the damage becomes known*** would be derailed.

It is unrealistic that any government would allow this to happen!

Even reporting of conflict-of-interest in wireless radiation research papers or evaluation panels leaves much to be desired. Currently, potential research performer conflicts of interest are identified by listing of funding sources in the published papers, or other formal documented evidence of conflicts of interest. However, there are many potential conflicts of interest that may not be as formal, but could be at least as influential as the formal conflicts in determining the outcome of the research or proposal. To ascertain these other less formal conflicts of interest would require vetting:

1) any elements of the researchers'/evaluators' investment portfolio that would profit from operation and expansion of the mobile telecommunications network, including impacts on related industries;

2) any elements of their present business endeavors that would profit from operation and expansion of this network, including impacts on related industries;

3) any elements of present or future pensions that would profit from operation and expansion of this network, including impacts on related industries;

4) any proposals or future employment offers in the pipeline or being considered that would profit from operation and expansion of this network, including impacts on related industries;

5) any other conflicts of interest by which they could profit from operation and expansion of the mobile telecommunications network, including impacts on related industries.

2G. Conclusions

Wireless radiation offers the promise of improved 1) remote sensing, 2) communications and data transfer, and 3) connectivity. Unfortunately, there is a large body of data from laboratory and epidemiological studies showing that previous generations of wireless networking technology have significant adverse health impacts. Much of this data was obtained under conditions not reflective of the real-world. When real-world considerations are added, such as 1) including the information content of signals along with the carrier frequencies, and 2) including other toxic stimuli in combination with the wireless radiation, ***the adverse effects are increased substantially***. Superimposing 5G mobile networking technology on an imbedded toxic wireless radiation environment (4G, 3G, etc) will exacerbate the myriad adverse health effects already shown to exist. Far more research and testing of potential 5G health effects is required before further rollout can be justified. Without this additional testing and demonstrated safety of potential 5G health effects, we will be even further along in **The Largest Unethical Medical Experiment in Human History!**

Chapter 4 – Appendices

Appendix 1 – Unethical Medical Experiments

A1-A. Overview

The biomedical literature reflects much good research. However, the world today is also awash in unethical medical experiments. There are two major types. The first type is classical unethical medical experiments, where test subjects are explicitly/proactively selected for experiments on biological effects of drugs or potentially harmful substances, and participate in these experiments without having given 'informed consent'. The second type may be far more prevalent. Here, potentially harmful substances are introduced into commercial, military, or other government practice without adequate demonstration of safety. Then, test subjects are implicitly/reactively selected 'a posteriori' to participate in these de facto experiments, again without having given informed consent. These latter studies are usually epidemiological studies.

In parallel with the burgeoning conduct of unethical medical experiments is production of a literature that addresses the ethics of, and in many cases bemoans the prevalence and conduct of, these myriad unethical medical experiments. The experiments and the accompanying ethics literature form a symbiosis, where the literature feeds off the experiments, and the experiments spawn an additional literature. It is not clear how much, if any, impact the ethics literature has had/does have/will have on the conduct of the unethical medical experiments, especially those unethical medical experiments of the second type defined above.

Appendix 1A provides a few examples of mainly classical unethical medical experiments, and Appendix 1B provides a few references that reflect the medical experiment ethics literature.

Appendix 1A – Unethical Medical Experiments - Examples

This Sub-Appendix provides examples of unethical medical experiments, conducted mainly 1) over the last 100 years and 2) within the USA or under its auspices. The list is not exhaustive, since an abbreviated search approach was used, covering both Medline and the Web. Some of the more useful Web sources of information are shown in the following table:

https://en.wikipedia.org/wiki/Unethical_human_experimentation;
https://en.wikipedia.org/wiki/Human_subject_research;
https://en.wikipedia.org/wiki/Unethical_human_experimentation_in_the_United_States;
https://en.wikipedia.org/wiki/Medical_torture;
https://abuse.wikia.org/wiki/Unethical_human_experimentation_in_the_United_States;
https://www.amazon.com/s?k=human+experimentation&i=stripbooks&page=2&gclid=Cj0KCQiA89zvBRDoARIsAOIePbBy8acwX6tfMZcGkZyi_UTov1I7_PxcFYDAgDWiAgHVc7anOyx57slaAgtNEALw_wcB&hvadid=241915884190&hvdev=c&hvlocphy=9007578&hvnetw=g&hvpos=2o1&hvqmt=b&hvrand=12610529676369552 69&hvtargid=kwd-1053626641&hydadcr=22561_10346245&qid=1576539483&ref=sr_pg_2;
https://www.bibliotecapleyades.net/ciencia/ciencia_industryweapons173.htm.

It should be noted that information of this type is not easy to obtain. The research performers and their sponsors are not motivated to reveal such odious experiments to any oversight organizations, and therefore tend to conceal these experiments to the largest extent possible. There are three main routes by which this information eventually gets to the public: whistle-blowers; discovery in legal lawsuits; inadvertent access by researchers examining other topics. While we don't know the extent of these types of experiments that have not been reported, it is probably a good assumption that there are huge numbers.

Following are some of the books and journal/magazine articles that describe these experiments. It is by no means a complete list, and the interested reader would be well-advised to read the articles with the Web links provided in the box.

Appendix 2 – Manual Taxonomy of Adverse EMF Health Effects Database

A2-A. Category Themes

A query to retrieve Medline records showing adverse health effects of wireless radiation was generated. The query was entered into the Medline search engine, and ~15,000 records were retrieved. Filtering was applied to the retrieval to remove records not associated with adverse health effects of wireless radiation, and 5311 records remained. Thousands of the highest frequency title and abstract phrases were read, the categories from the factor analysis and text clustering approaches of Appendices 3 and 4 were evaluated, and a manual taxonomy of main categories in the database was generated. The ~10,000 highest frequency abstract phrases were visually inspected, and assigned to the appropriate categories in the taxonomy.

The following table (A2-1) shows the categories in the taxonomy, and the phrases associated with each category. For each category, the records associated with the phrases identified were highlighted, and the titles of those records were extracted. Following the table, each category and representative record titles are shown in order to display the breadth of coverage of the category.

In the process of selecting the record titles to represent the category's theme, a second level of filtering was done (visual inspection). Strong emphasis was placed on 1) records associated with microwave frequencies; 2) exposures not exceeding FCC and ICNIRP-based limits; 3) records that clearly showed adverse effects. This meant that ***large numbers of records showing adverse health effects from especially i) power/ELF frequencies and ii) high microwave power exposures that had both thermal and athermal effects were not shown***.

> In the latter case (high microwave power exposures), where thermal effects exist, the assumption is usually made that any adverse effects shown are due to thermal effects. This may or may not be correct. Adverse effects could be due to thermal effects, they could be due to higher radiation intensity athermal effects, or they could be due to some (potentially synergistic) combination of thermal and athermal effects. In the record selection process, I used the conservative approach of not selecting records where the radiation flux was associated with increased temperatures.

The categories are not orthogonal; there is some overlap, especially among categories that cover different levels of detail (e.g., cancer-genotoxicity, reproduction-biomarkers, etc). Therefore, some representative record titles may appear in more than one category.

The major adverse effects are listed in the first column (Category), and the phrases associated with the theme are listed in the second column (Key Phrases). These adverse effects are self-explanatory. Each category in the taxonomy is hyper-linked to its respective record titles. To obtain the full record, insert title into Pubmed, or similar Medline search engine.

Table A2-1 – Manual Taxonomy

CATEGORY	KEY PHRASES
Cancer/Tumors	cancer, leukemia, cancers, carcinogenic, breast cancer, malignant, leukaemia, cancer risk, glioma, brain cancer, carcinogenesis, brain tumours, lymphoma, carcinogen, childhood cancer, childhood leukaemia, carcinoma, brain tumor, cancer incidence, carcinogenicity, lymphoblastic, acute lymphoblastic, melanoma, gliomas, neoplasms, acute lymphoblastic leukemia, breast cancer risk, carcinogens, lymphoblastic leukemia, neoplastic, glioblastoma, leukemia risk, malignancy, leukemias, malignancies, neuroblastoma, cancer risks, lung cancer, childhood cancers, lymphomas, astrocytoma, malignant brain, Acute leukemia, mammary gland, brain cancers, glioma risk, Malignant melanoma, malignant neoplasms, neoplasia, hyperplasia, myeloid leukemia, carcinomas, neuroblastoma cells, testicular cancer, leukaemias, neoplasm, mammary cancer, myeloma, nervous system cancers, adenocarcinoma, cocarcinogenic, colorectal, glioblastoma multiforme, Hodgkin's disease, multiple myeloma, non-Hodgkin's lymphoma, seminoma, breast carcinoma, colon cancer, glioma meningioma, larynx, neoplastic transformation, Non-Hodgkin lymphoma, tumor, tumors, tumours, brain tumors, tumour, neuroma, acoustic neuroma, meningioma, brain tumour, tumor risk, tumor growth, tumor incidence, mammary tumors, tumor promotion, intracranial tumors, tumor promoter, gland tumors, meningiomas, tumorigenesis, tumour risk, benign tumors, nervous system tumors, neuromas, acoustic neuromas, breast tumors, gland tumours, parotid gland tumors, tumor-promoting
Neurodegenerative	memory, cognitive, central nervous system, learning, neurodegenerative, Alzheimer's, learning and memory, Alzheimer's disease, cognition, amyotrophic lateral sclerosis, neurodegenerative diseases, cognitive function, cognitive functions, neurobehavioral, dementia, spatial learning, acetylcholine, Parkinson's disease, epilepsy, Glial fibrillary, motor activity, multiple sclerosis, cognitive impairment, spatial learning and memory, neurodegenerative disease, neuronal damage, Alzheimer disease, cognitive effects, seizure, seizures, autism, cognitive functioning, cognitive processing, memory function, memory impairment, memory loss, neurological diseases, neuronal excitability, cognitive dysfunction, memory deficit, memory functions, neurocognitive, neuronal degeneration, spatial working memory
Reproduction	pregnancy, reproductive, pregnant, sperm, embryos, testicular, fertility, embryo, testis, embryonic, fetuses, testosterone, motility, infertility, reproduction, testes, semen, spermatozoa,

	spermatogenesis, reproductive system, sperm motility, male fertility, sperm count, embryogenesis, abortion, male reproductive, spermatogenic, embryonic development, mating, male infertility, birth defects, serum testosterone, adverse reproductive, miscarriage, reproductive organs, semen parameters, sperm concentration, sperm parameters, testicular function, testosterone level, epididymis, male reproductive system, spermatogenic cells, spermatogonia, fertilized eggs, ovaries, reproductive capacity, reproductive outcomes, sperm cells, sperm morphology, fertile, pregnancies, reproductive function, testicular tissue, rat testes, rat testis, reproductive functions, reproductive systems, sperm DNA, spermatogonial, testis tissue, embryogeny, reproductive health, sperm cell, miscarriages, offsprings, oocyte, oogenesis, preterm birth, seminal vesicles, Sperm head, spermatids, sperms, testicles, fetal loss, genital, gonads, reproductive hormones, semen analysis
Genotoxicity	DNA damage, genotoxic, micronuclei, chromosomal, micronucleus, chromosome, genotoxicity, genotoxic effects, mutagenic, strand breaks, chromatin, mutation, DNA strand, Chromatid, mutations, chromosome aberrations, chromosomes, DNA fragmentation, double-strand, chromosomal aberrations, DNA repair, DNA strand breaks, micronucleus (MN), genetic damage, micronuclei (MN), Sister Chromatid, genome, blood leukocytes, double-strand breaks, oxidative DNA, chromosomal damage, DNA synthesis, mutant, cellular stress, chromosome aberration, oxidative DNA damage, Purkinje cells, DNA breaks, cell cycle arrest, clastogenic, genotoxic potential, keratinocytes, micronucleated, single strand, cell division, chromatid exchange, Chromatid Exchanges, genetic material, micronucleus test, Mutagenesis, cell cycle progression, cellular DNA, Cytochrome c, double strand, genetic effects, genomic instability, micronucleus frequency, DNA single-strand, DNA-damaging, Mutagen, mutagenicity, single strand breaks, chromatin condensation, chromosomal aberration, double-strand breaks (DSBs), strand breakage, cell cycle distribution, cell DNA, genetically, strand DNA
Cardiovascular	Cardiac, cardiovascular, pacemaker, pacemakers, implanted, blood pressure, implantable, vascular, heart rate variability, myocardial, heart rate variability (HRV), implants, cardiac pacemakers, implantation, defibrillators, implant, cardioverter, myocardium, cardiovascular system, implantable cardioverter, Cardiovascular disease, defibrillator, fibrillation, arrhythmia, arterial blood pressure, autonomic nervous system, cardioverter defibrillators, implanted pacemakers, cardiac pacemaker, hypertension, arrhythmias, cardioverter-defibrillators, implantable cardioverter defibrillators, implantable cardioverter-defibrillators, pacemaker function, heart disease, implanted cardiac, tachycardia, cardiac devices, circulatory system, microcirculation, blood vessels,

	cardiomyocytes, cardiovascular effects, vascular permeability, atherosclerosis, cardiovascular diseases, ventricular fibrillation, arterial pressure, Atrial fibrillation, cardiac output, cardiovascular function, Implantable cardioverter defibrillator (ICD), implantable devices, arrhythmic, carotid artery, pacemaker dysfunction, pacemaker malfunction
Immunity	lymphocytes, immune, lymphocyte, immune system, immunity, blood lymphocytes, leukocytes, antibodies, immune response, human lymphocytes, antibody, peripheral blood lymphocytes, immunological, leukocyte, neutrophils, lymphocytic, immune functions, immunoreactivity, autoimmune, immunization, monocytes, neutrophil, antigens, macrophage, immune parameters, immune responses, immunocompetent, natural killer cells, spleen lymphocytes, immunologic, immunoreactive, micronucleated cells, monoclonal antibodies, spleen cells, splenocytes, T lymphocytes, antibody production, antibody-forming, monoclonal antibody
Biomarkers	apoptosis, oxidative stress, Malondialdehyde, reactive oxygen species, apoptotic, superoxide dismutase, lipid peroxidation, permeability, catalase, MDA, ROS, ROS), reactive oxygen species (ROS), Malondialdehyde (MDA), SOD), cell death, glutathione peroxidase, inflammatory, erythrocytes, oxidative damage, SOD, caspase-3, free radical, nitric oxide, free radicals, biomarkers, bcl-2, catalase (CAT), inflammation, corticosterone, edema, glutathione peroxidase (GSH-Px), cytokine, cytokines, alkaline phosphatase, cell apoptosis, protein kinase, ATP, glutathione (GSH), oxidation, TNF-alpha, Bax, Ca2+, estrogen, ornithine decarboxylase, red blood cells, intracellular calcium, cell damage, apoptotic cell, hemoglobin, lactate dehydrogenase, cerebral blood flow, glutamate, hydrogen peroxide, IL-1beta, Purkinje, serotonin, apoptotic cell death, barrier permeability, carbonyl, hormone levels, ornithine decarboxylase (ODC), acetylcholinesterase, calcium ion, Calcium ions, endothelial cells, GABA, MDA levels, ODC, xanthine oxidase, creatinine, intracellular ROS, cholinesterase, lipid peroxidation levels, pro-inflammatory, protein kinase C, adrenocorticotropic hormone, alanine aminotransferase, aspartate aminotransferase, caspase 3, caspase-9, catalase activity, glutathione levels, NF-kappaB, atrophy, nitric oxide synthase, cAMP, acid phosphatase, adenosine deaminase, adrenocorticotropic hormone (ACTH), blood cell count, blood platelets, Ca++, adrenaline, C-reactive protein, oxidative damages, Reactive Oxygen Species), vascular endothelial growth factor
Sensory Disorders	auditory, acoustic, ear, hypersensitivity, EHS), EHS, electromagnetic hypersensitivity, otoacoustic, vestibular, hypersensitive, cataract, cochlea, auditory system, inner ear, lens epithelial, corneal, tinnitus, vision, lenses, otoacoustic emissions, hearing loss, otoacoustic emission, epidermis, rabbit lens,

	dermatitis, auditory stimuli, cataractogenic, Auditory brainstem response (ABR), auditory evoked, electrohypersensitive, electrosensitivity, vestibular system, cochlear implants, dermatological, hearing function, hearing thresholds, pain sensitivity, pain threshold, skin complaints
Discomfort Symptoms	depression, anxiety, headache, headaches, dizziness, depressed, depressive, vertigo, cataracts, behavioral effects, nausea, headache dizziness, low back pain, behavioural effects,
Congenital Abnormalities	malformations, teratogenic, congenital, congenital malformations, teratogenicity, malformation, teratogens, teratologic, cleft palate, congenital anomalies, malformed, teratological
Circadian Rhythym and Melatonin	melatonin, sleep, circadian, melatonin production, sleep disturbances, insomnia, melatonin levels, melatonin secretion, sleep disorders, sleep EEG, poor sleep, pineal function
Chronic Conditions	metabolism, metabolic, glucose, endocrine, cholesterol, Diabetes, calcium homeostasis, glucose levels, homeostatic, metabolic activity, metabolic heat production, Diabetes Mellitus, diabetic, glucose metabolism, obesity

All the records shown in this Appendix, and their relevant citing papers, were analyzed further for most frequent keywords relating to serious symptoms/disease. In order of frequency, they are: oxidative stress; Apoptosis; DNA damage; melatonin; Reactive oxygen species; glioma; Testis; cancer; liver; Malondialdehyde; Brain cancer; testosterone; Anxiety; Depression; Lipid peroxidation; ROS; Chromosomal aberrations; Learning and memory; oxidative damage; sperm; testes; Infertility; spermatogenesis; Breast cancer; Cell cycle; Genotoxicity; Kidney; Leukemia; Male infertility; micronuclei; Pregnancy; Sleep; sperm motility; acoustic neuroma; carcinogenesis; carcinogenicity; Cognitive function; fertility; Heart rate variability; Micronucleus; Reproduction; Spatial memory; Stress; Alzheimer's disease; astrocytoma; Autophagy; Cognition; Cytotoxicity; free radicals.

These match well with the prior results shown for this strongly filtered database.

A2-B. Category Record Titles

CANCER/TUMORS

Keywords – cancer, leukemia, cancers, carcinogenic, breast cancer, malignant, leukaemia, cancer risk, glioma, brain cancer, carcinogenesis, brain tumours, lymphoma, carcinogen, childhood cancer, childhood leukaemia, carcinoma, brain tumor, cancer incidence, carcinogenicity, lymphoblastic, acute lymphoblastic, melanoma, gliomas, neoplasms, acute lymphoblastic leukemia, breast cancer risk, carcinogens, lymphoblastic leukemia, neoplastic, glioblastoma, leukemia risk, malignancy, leukemias, malignancies, neuroblastoma, cancer risks, lung cancer, childhood cancers, lymphomas, astrocytoma, malignant brain, Acute leukemia, mammary gland, brain cancers, glioma risk, Malignant melanoma, malignant neoplasms, neoplasia, hyperplasia, myeloid leukemia, carcinomas, neuroblastoma cells, testicular cancer, leukaemias, neoplasm, mammary cancer, myeloma, nervous system cancers, adenocarcinoma, cocarcinogenic, colorectal, glioblastoma multiforme, Hodgkin's disease, multiple myeloma, non-Hodgkin's lymphoma, seminoma, breast carcinoma, colon cancer, glioma meningioma, larynx, neoplastic transformation, Non-Hodgkin lymphoma, tumor, tumors, tumours, brain tumors, tumour, neuroma, acoustic neuroma, meningioma, brain tumour, tumor risk, tumor growth, tumor incidence, mammary tumors, tumor promotion, intracranial tumors, tumor promoter, gland tumors, meningiomas, tumorigenesis, tumour risk, benign tumors, nervous system tumors, neuromas, acoustic neuromas, breast tumors, gland tumours, parotid gland tumors, tumor-promoting

Titles

2.45-Gz wireless devices induce oxidative stress and proliferation through cytosolic Ca(2)(+) influx in human leukemia cancer cells.

A case-case study of mobile phone use and acoustic neuroma risk in Japan.

A cluster of male breast cancer in office workers.

A cross-sectional case control study on genetic damage in individuals residing in the vicinity of a mobile phone base station.

A new electromagnetic exposure metric: high frequency voltage transients associated with increased cancer incidence in teachers in a California school.

A population-based case-control study of radiofrequency exposure in relation to childhood neoplasm.

Acceleration of the development of benzopyrene-induced skin cancer in mice by microwave radiation.

Adult and childhood leukemia near a high-power radio station in Rome, Italy.

Association between exposure to pulsed electromagnetic fields and cancer in electric utility workers in Quebec, Canada, and France.

Association between number of cell phone contracts and brain tumor incidence in nineteen U.S. States.

Association between radiation from mobile phones and tumour risk in adults].

Association between vestibular schwannomas and mobile phone use.

Biological effects from electromagnetic field exposure and public exposure standards.

Brain cancer and occupational exposure to magnetic fields among men: results from a Canadian population-based case-control study.

Cancer in radar technicians exposed to radiofrequency/microwave radiation: sentinel episodes.

Cancer incidence and mortality and proximity to TV towers.

Cancer incidence near radio and television transmitters in Great Britain. I. Sutton Coldfield transmitter.

Cancer incidence vs. FM radio transmitter density.

Cancer morbidity in subjects occupationally exposed to high frequency (radiofrequency and microwave) electromagnetic radiation.

Cancer versus FM radio polarization types.

Case-control study of the association between malignant brain tumours diagnosed between 2007 and 2009 and mobile and cordless phone use.

Case-control study on the use of cellular and cordless phones and the risk for malignant brain tumours.

Causes of death among Belgian professional military radar operators: a 37-year retrospective cohort study.

Cell phone radiation exposure on brain and associated biological systems.

Cell phone use and acoustic neuroma: the need for standardized questionnaires and access to industry data.

Cell phone use and risk of thyroid cancer: a population-based case-control study in Connecticut.

Cell phones and brain tumors: a review including the long-term epidemiologic data.

Cellular and cordless telephone use and the association with brain tumors in different age groups.

Cellular and cordless telephones and the risk for brain tumours.

Cellular neoplastic transformation induced by 916 MHz microwave radiation.

Cellular phone use and risk of benign and malignant parotid gland tumors--a nationwide case-control study.

Cellular telephones and their relay stations: a health risk?].

Commentary on the utility of the National Toxicology Program study on cell phone radiofrequency radiation data for assessing human health risks despite unfounded criticisms aimed at minimizing the findings of adverse health effects.

Connection between Cell Phone use, p53 Gene Expression in Different Zones of Glioblastoma Multiforme and Survival Prognoses.

Current Understanding of the Health Effects of Electromagnetic Fields.

Danger of cellular telephones and their relay stations].

Decreased survival for childhood leukemia in proximity to television towers.

Decreased survival of glioma patients with astrocytoma grade IV (glioblastoma multiforme) associated with long-term use of mobile and cordless phones.

Delayed biological effect of electromagnetic fields action].

Determining health policy for sensible mobile phone use--current world status].

Dirty electricity, chronic stress, neurotransmitters and disease.

Does cell phone use increase the chances of parotid gland tumor development? A systematic review and meta-analysis.

Ecological study on residences in the vicinity of AM radio broadcasting towers and cancer death: preliminary observations in Korea.

Effect of cell-phone radiofrequency on angiogenesis and cell invasion in human head and neck cancer cells.

Effect of Exposure to 900 MHz GSM Mobile Phone Radiofrequency Radiation on Estrogen Receptor Methylation Status in Colon Cells of Male Sprague Dawley Rats.

Effect of Mobile Phone-Induced Electromagnetic Field on Brain Hemodynamics and Human Stem Cell Functioning: Possible Mechanistic Link to Cancer Risk and Early Diagnostic Value of Electronphotonic Imaging.

Effects of Mobile Phones on Children's and Adolescents' Health: A Commentary.

Effects of the microwave radiation from the cellular phones on humans and animals].

Electromagnetic field exposure and male breast cancer risk: a meta-analysis of 18 studies.

Prenatal and postnatal exposure to cell phone use and behavioral problems in children.

Probing the Origins of 1,800 MHz Radio Frequency Electromagnetic Radiation Induced Damage in Mouse Immortalized Germ Cells and Spermatozoa in vitro.

Protective effect of Liuweidihuang Pills against cellphone electromagnetic radiation-induced histomorphological abnormality, oxidative injury, and cell apoptosis in rat testes].

Protective effects of luteolin on rat testis following exposure to 900 MHz electromagnetic field.

Protective Effects of Zinc on 2.45 GHz Electromagnetic Radiation-Induced Oxidative Stress and Apoptosis in HEK293 Cells.

Pulsed magnetic field from video display terminals enhances teratogenic effects of cytosine arabinoside in mice.

Pulsed or continuous electromagnetic field induce p53/p21-mediated apoptotic signaling pathway in mouse spermatogenic cells in vitro and thus may affect male fertility.

Radar radiation damages sperm quality].

Radiations and male fertility.

Radio frequency electromagnetic radiation (RF-EMR) from GSM (0.9/1.8GHz) mobile phones induces oxidative stress and reduces sperm motility in rats.

Radiofrequency electromagnetic radiation from cell phone causes defective testicular function in male Wistar rats.

Radiofrequency radiation (900 MHz)-induced DNA damage and cell cycle arrest in testicular germ cells in swiss albino mice.

Relationship between millimeter wave irradiation in pregnant mice and c-Fos protein expression in hippocampus and learning and memory functions in their offsprings].

Scientific evidence contradicts findings and assumptions of Canadian Safety Panel 6: microwaves act through voltage-gated calcium channel activation to induce biological impacts at non-thermal levels, supporting a paradigm shift for microwave/lower frequency electromagnetic field action.

Selenium supplementation ameliorates electromagnetic field-induced oxidative stress in the HEK293 cells.

Towards 5G communication systems: Are there health implications?

Wi-Fi (2.45 GHz)- and mobile phone (900 and 1800 MHz)-induced risks on oxidative stress and elements in kidney and testis of rats during pregnancy and the development of offspring.

GENOTOXICITY

Keywords – DNA damage, genotoxic, micronuclei, chromosomal, micronucleus, chromosome, genotoxicity, genotoxic effects, mutagenic, strand breaks, chromatin, mutation, DNA strand, Chromatid, mutations, chromosome aberrations, chromosomes, DNA fragmentation, double-strand, chromosomal aberrations, DNA repair, DNA strand breaks, micronucleus (MN), genetic damage, micronuclei (MN), Sister Chromatid, genome, blood leukocytes, double-strand breaks, oxidative DNA, chromosomal damage, DNA synthesis, mutant, cellular stress, chromosome aberration, oxidative DNA damage, Purkinje cells, DNA breaks, cell cycle arrest, clastogenic, genotoxic potential, keratinocytes, micronucleated, single strand, cell division, chromatid exchange, Chromatid Exchanges, genetic material, micronucleus test, Mutagenesis, cell cycle progression, cellular DNA, Cytochrome c, double strand, genetic effects, genomic instability, micronucleus frequency, DNA single-strand, DNA-damaging, Mutagen, mutagenicity, single strand breaks, chromatin condensation, chromosomal aberration, double-strand breaks (DSBs), strand breakage, cell cycle distribution, cell DNA, genetically, strand DNA

Titles

1800 MHz mobile phone irradiation induced oxidative and nitrosative stress leads to p53 dependent Bax mediated testicular apoptosis in mice, Mus musculus.

1950MHz Radio Frequency Electromagnetic Radiation Inhibits Testosterone Secretion of Mouse Leydig Cells.

2.45 GHz microwave irradiation-induced oxidative stress affects implantation or pregnancy in mice, Mus musculus.

2.45 GHz radiofrequency fields alter gene expression in cultured human cells.

60 Hz magnetic field exposure induces DNA crosslinks in rat brain cells.

8-Oxo-7, 8-dihydro-2'-deoxyguanosine as a biomarker of DNA damage by mobile phone radiation.

8-oxoG DNA glycosylase-1 inhibition sensitizes Neuro-2a cells to oxidative DNA base damage induced by 900 MHz radiofrequency electromagnetic radiation.

915 MHz microwaves and 50 Hz magnetic field affect chromatin conformation and 53BP1 foci in human lymphocytes from hypersensitive and healthy persons.

954 MHz microwaves enhance the mutagenic properties of mitomycin C.

A cross-sectional case control study on genetic damage in individuals residing in the vicinity of a mobile phone base station.

A non-thermal effect of millimeter wave radiation on the puffing of giant chromosomes.

Acute low-intensity microwave exposure increases DNA single-strand breaks in rat brain cells.

Assessment of cytogenetic damage and oxidative stress in personnel occupationally exposed to the pulsed microwave radiation of marine radar equipment.

Assessment of DNA sensitivity in peripheral blood leukocytes after occupational exposure to microwave radiation: the alkaline comet assay and chromatid breakage assay.

Assessment of radio-frequency electromagnetic radiation by the micronucleus test in bovine peripheral erythrocytes.

Biochemical and histological studies on adverse effects of mobile phone radiation on rat's brain.

Biochemical modifications and neuronal damage in brain of young and adult rats after long-term exposure to mobile phone radiations.

Biological effects from electromagnetic field exposure and public exposure standards.

Biophysical evaluation of radiofrequency electromagnetic field effects on male reproductive pattern.

Cell phone radiation exposure on brain and associated biological systems.

Chromosomal damage in human diploid fibroblasts by intermittent exposure to extremely low-frequency electromagnetic fields.

Chromosome damage and micronucleus formation in human blood lymphocytes exposed in vitro to radiofrequency radiation at a cellular telephone frequency (847.74 MHz, CDMA).

Cognitive impairment and neurogenotoxic effects in rats exposed to low-intensity microwave radiation.

Combinative exposure effect of radio frequency signals from CDMA mobile phones and aphidicolin on DNA integrity.

Combined exposure of ELF magnetic fields and x-rays increased mutant yields compared with x-rays alone in pTN89 plasmids.

Commentary on the utility of the National Toxicology Program study on cell phone radiofrequency radiation data for assessing human health risks despite unfounded criticisms aimed at minimizing the findings of adverse health effects.

Comparison of biological effects between continuous and intermittent exposure to GSM-900-MHz mobile phone radiation: Detection of apoptotic cell-death features.

Comparison of chromosome aberrations in peripheral blood lymphocytes from people occupationally exposed to ionizing and radiofrequency radiation.

Connection between Cell Phone use, p53 Gene Expression in Different Zones of Glioblastoma Multiforme and Survival Prognoses.

Cytogenetic changes induced by low-intensity microwaves in the species Triticum aestivum].

Cytogenetic consequences of microwave irradiation on mammalian cells incubated in vitro.

Cytogenetic damage in human lymphocytes following GMSK phase modulated microwave exposure.

Cytotoxic and genotoxic effects of high-frequency electromagnetic fields (GSM 1800 MHz) on immature and mature rats.

DNA Damage of Lymphocytes in Volunteers after 4 hours Use of Mobile Phone.

Effect of 2.45 GHz microwave radiation on the fertility pattern in male mice.

Effect of 3G cell phone exposure with computer controlled 2-D stepper motor on non-thermal activation of the hsp27/p38MAPK stress pathway in rat brain.

Effect of 900-, 1800-, and 2100-MHz radiofrequency radiation on DNA and oxidative stress in brain.

Effect of 950 MHz UHF electromagnetic radiation on biomarkers of oxidative damage, metabolism of UFA and antioxidants in the livers of young rats of different ages.

Effect of acute exposure to microwave from mobile phone on DNA damage and repair of cultured human lens epithelial cells in vitro].

Effect of early pregnancy electromagnetic field exposure on embryo growth ceasing].

Effect of electromagnetic irradiation produced by 3G mobile phone on male rat reproductive system in a simulated scenario.

Effect of electromagnetic radiation of millimetric wave band on genome of somatic cells].

Effect of exposure to radio frequency radiation emitted by cell phone on the developing dorsal root ganglion of chick embryo: a light microscopic study.

Effect of GSTM1 and GSTT1 Polymorphisms on Genetic Damage in Humans Populations Exposed to Radiation From Mobile Towers.

Effect of Low Level Subchronic Microwave Radiation on Rat Brain.

Effect of low power microwave on the mouse genome: a direct DNA analysis.

Effect of low-intensity microwave radiation on proliferation of cultured epithelial cells of rabbit lens].

Effect of Mobile Phone Radiation on Cardiovascular Development of Chick Embryo.

Effect of Radiofrequency Radiation Emitted from 2G and 3G Cell Phone on Developing Liver of Chick Embryo - A Comparative Study.

Effect of Radiofrequency Radiation on Human Hematopoietic Stem Cells.

Effect of whole-body exposure to high-frequency electromagnetic field on the brain electrogeny in neurodefective and healthy mice.

Effects of GSM 1800 MHz radiofrequency electromagnetic fields on DNA damage in Chinese hamster lung cells].

Effects of low-intensity extremely high frequency electromagnetic radiation on chromatin structure of lymphoid cells in vivo and in vitro].

Effects of microwave radiation on thymocytes in mice at different power densities].

Effects of radiofrequency electromagnetic wave exposure from cellular phones on the reproductive pattern in male Wistar rats.

Effects of radiofrequency electromagnetic waves (RF-EMW) from cellular phones on human ejaculated semen: an in vitro pilot study.

Effects of the Effect of Ultra High Frequency Mobile Phone Radiation on Human Health.

Electromagnetic fields and health: DNA-based dosimetry.

Electromagnetic fields at a mobile phone frequency (900 MHz) trigger the onset of general stress response along with DNA modifications in Eisenia fetida earthworms.

Electromagnetic fields enhance chemically-induced hyperploidy in mammalian oocytes.

Electromagnetic noise inhibits radiofrequency radiation-induced DNA damage and reactive oxygen species increase in human lens epithelial cells.

Electromagnetic radiation at 900 MHz induces sperm apoptosis through bcl-2, bax and caspase-3 signaling pathways in rats.

Epidemiologic evidence relevant to radar (microwave) effects.

Erythropoietic changes in rats after 2.45 GJz nonthermal irradiation.

Evaluation of basal DNA damage and oxidative stress in Wistar rat leukocytes after exposure to microwave radiation.

Evaluation of genotoxic and/or co-genotoxic effects in cells exposed in vitro to extremely-low frequency electromagnetic fields].

Evaluation of selected biochemical parameters in the saliva of young males using mobile phones.

Evaluation of the cytogenotoxic damage in immature and mature rats exposed to 900 MHz radiofrequency electromagnetic fields.

Evaluation of the genotoxicity of cell phone radiofrequency radiation in male and female rats and mice following subchronic exposure.

Exposure of human peripheral blood lymphocytes to electromagnetic fields associated with cellular phones leads to chromosomal instability.

Exposure to 1800 MHz radiofrequency electromagnetic radiation induces oxidative DNA base damage in a mouse spermatocyte-derived cell line.

Exposure to 915 MHz radiation induces micronuclei in Vicia faba root tips.

Exposure to global system for mobile communication (GSM) cellular phone radiofrequency alters gene expression, proliferation, and morphology of human skin fibroblasts.

Exposure to low-intensive superhigh frequency electromagnetic field as a factor of carcinogenesis in experimental animals.

Exposure to non-ionizing electromagnetic fields emitted from mobile phones induced DNA damage in human ear canal hair follicle cells.

Exposure to non-ionizing electromagnetic radiation of public risk prevention instruments threatens the quality of spermatozoids.

Fifty-gigahertz microwave exposure effect of radiations on rat brain.

GSM-like radiofrequency exposure induces apoptosis via caspase-dependent pathway in infant rabbits.

Immunohistopathologic demonstration of deleterious effects on growing rat testes of radiofrequency waves emitted from conventional Wi-Fi devices.

Impact of radio frequency electromagnetic radiation on DNA integrity in the male germline.

Increased levels of numerical chromosome aberrations after in vitro exposure of human peripheral blood lymphocytes to radiofrequency electromagnetic fields for 72 hours.

Increased ornithine decarboxylase activity in cultured cells exposed to low energy modulated microwave fields and phorbol ester tumor promoters.

Influence of 1.8 GHz microwave on DNA damage induced by 4 chemical mutagens].

Influence of electromagnetic fields on reproductive system of male rats.

Interference of vitamin E on the brain tissue damage by electromagnetic radiation of cell phone in pregnant and fetal rats].

Long-term microwave radiation affects male reproduction in rats].

Low intensity microwave radiation induced oxidative stress, inflammatory response and DNA damage in rat brain.

Maternal exposure to a continuous 900-MHz electromagnetic field provokes neuronal loss and pathological changes in cerebellum of 32-day-old female rat offspring.

Melatonin attenuates radiofrequency radiation (900 MHz)-induced oxidative stress, DNA damage and cell cycle arrest in germ cells of male Swiss albino mice.

Melatonin protects rat thymus against oxidative stress caused by exposure to microwaves and modulates proliferation/apoptosis of thymocytes.

Microwaves from Mobile Phones Inhibit 53BP1 Focus Formation in Human Stem Cells More Strongly Than in Differentiated Cells: Possible Mechanistic Link to Cancer Risk.

Mobile phone radiation induces mode-dependent DNA damage in a mouse spermatocyte-derived cell line: a protective role of melatonin.

Mobile phone radiation induces reactive oxygen species production and DNA damage in human spermatozoa in vitro.

Mobile phones, heat shock proteins and cancer.

Mutagenic and morphologic impacts of 1.8GHz radiofrequency radiation on human peripheral blood lymphocytes (hPBLs) and possible protective role of pre-treatment with Ginkgo biloba (EGb 761).

Mutagenic response of 2.45 GHz radiation exposure on rat brain.

Neural cell apoptosis induced by microwave exposure through mitochondria-dependent caspase-3 pathway.

Oxidative and mutagenic effects of low intensity GSM 1800 MHz microwave radiation.

Oxidative changes and apoptosis induced by 1800-MHz electromagnetic radiation in NIH/3T3 cells.

Probing the Origins of 1,800 MHz Radio Frequency Electromagnetic Radiation Induced Damage in Mouse Immortalized Germ Cells and Spermatozoa in vitro.

Protective effects of Genistein on human renal tubular epithelial cells damage of microwave radiation].

Pulsed or continuous electromagnetic field induce p53/p21-mediated apoptotic signaling pathway in mouse spermatogenic cells in vitro and thus may affect male fertility.

Purkinje cell number decreases in the adult female rat cerebellum following exposure to 900 MHz electromagnetic field.

Quantitative patterns in the cytogenetic action of microwaves].

Radiofrequency electromagnetic fields (UMTS, 1,950 MHz) induce genotoxic effects in vitro in human fibroblasts but not in lymphocytes.

Radiofrequency radiation (900 MHz)-induced DNA damage and cell cycle arrest in testicular germ cells in swiss albino mice.

Radioprotective effects of honeybee venom (Apis mellifera) against 915-MHz microwave radiation-induced DNA damage in wistar rat lymphocytes: in vitro study.

RAPD Profiling, DNA Fragmentation, and Histomorphometric Examination in Brains of Wistar Rats Exposed to Indoor 2.5 Ghz Wi-Fi Devices Radiation.

Reactive oxygen species levels and DNA fragmentation on astrocytes in primary culture after acute exposure to low intensity microwave electromagnetic field.

Risks to Health and Well-Being From Radio-Frequency Radiation Emitted by Cell Phones and Other Wireless Devices.

RKIP Regulates Neural Cell Apoptosis Induced by Exposure to Microwave Radiation Partly Through the MEK/ERK/CREB Pathway.

Scientific evidence contradicts findings and assumptions of Canadian Safety Panel 6: microwaves act through voltage-gated calcium channel activation to induce biological impacts at non-thermal levels, supporting a paradigm shift for microwave/lower frequency electromagnetic field action.

Significance of micronuclei in buccal smears of mobile phone users: A comparative study.

Single- and double-strand DNA breaks in rat brain cells after acute exposure to radiofrequency electromagnetic radiation.

Single strand DNA breaks in rat brain cells exposed to microwave radiation.

Single-strand DNA breaks in human hair root cells exposed to mobile phone radiation.

Status quo of the researches on the biological effect of electromagnetic radiation on the testis and epididymal sperm].

Study of low-intensity 2450-MHz microwave exposure enhancing the genotoxic effects of mitomycin C using micronucleus test and comet assay in vitro.

Studying the synergistic damage effects induced by 1.8 GHz radiofrequency field radiation (RFR) with four chemical mutagens on human lymphocyte DNA using comet assay in vitro.

Terahertz radiation increases genomic instability in human lymphocytes.

The effect of mobile phone on the number of Purkinje cells: a stereological study.

The effect of radiofrequency radiation on DNA and lipid damage in female and male infant rabbits.

The Effects of Melatonin on Oxidative Stress Parameters and DNA Fragmentation in Testicular Tissue of Rats Exposed to Microwave Radiation.

The effects of radiofrequency electromagnetic radiation on sperm function.

The effects of radiofrequency fields on cell proliferation are non-thermal.

The genomic effects of cell phone exposure on the reproductive system.

The genotoxic effect of radiofrequency waves on mouse brain.

The influence of 1800 MHz GSM-like signals on hepatic oxidative DNA and lipid damage in nonpregnant, pregnant, and newly born rabbits.

The influence of direct mobile phone radiation on sperm quality.

The link between radiofrequencies emitted from wireless technologies and oxidative stress.

The therapeutic effect of a pulsed electromagnetic field on the reproductive patterns of male Wistar rats exposed to a 2.45-GHz microwave field.

Tinnitus and cell phones: the role of electromagnetic radiofrequency radiation.

Wi-Fi is an important threat to human health.

X-rays, microwaves and vinyl chloride monomer: their clastogenic and aneugenic activity, using the micronucleus assay on human lymphocytes.

CARDIOVASCULAR

Keywords – Cardiac, cardiovascular, pacemaker, pacemakers, implanted, blood pressure, implantable, vascular, heart rate variability, myocardial, heart rate variability (HRV), implants, cardiac pacemakers, implantation, defibrillators, implant, cardioverter, myocardium, cardiovascular system, implantable cardioverter, Cardiovascular disease, defibrillator, fibrillation, arrhythmia, arterial blood pressure, autonomic nervous system, cardioverter defibrillators, implanted pacemakers, cardiac pacemaker, hypertension, arrhythmias, cardioverter-defibrillators, implantable cardioverter defibrillators, implantable cardioverter-defibrillators, pacemaker function, heart disease, implanted cardiac, tachycardia, cardiac devices, circulatory system, microcirculation, blood vessels, cardiomyocytes, cardiovascular effects, vascular permeability, atherosclerosis, cardiovascular diseases, ventricular fibrillation, arterial pressure, Atrial fibrillation, cardiac output, cardiovascular function, Implantable cardioverter defibrillator (ICD), implantable devices, arrhythmic, carotid artery, pacemaker dysfunction, pacemaker malfunction

Titles

2.45 GHz microwave irradiation-induced oxidative stress affects implantation or pregnancy in mice, Mus musculus.

5-HT contents change in peripheral blood of workers exposed to microwave and high frequency radiation].

Activation of VEGF/Flk-1-ERK Pathway Induced Blood-Brain Barrier Injury After Microwave Exposure.

AduoLa Fuzhenglin down-regulates microwave-induced expression of beta1-adrenergic receptor and muscarinic type 2 acetylcholine receptor in myocardial cells of rats.

An update on mobile phones interference with medical devices.

Analysis of ECG on the staffs exposed to microwave in the radio calling signal station].

Biochemical and histological studies on adverse effects of mobile phone radiation on rat's brain.

Biological effects and health risks of electromagnetic fields at levels classified by INCRIP ans admissible among occupationally exposed workers: a study of the Nofer Institute of Occupational Medicine, Lodz].

Biological effects from electromagnetic field exposure and public exposure standards.

Biosomatic effects of the electromagnetic fields on view of the physiotherapy personnel health.

Cardiac devices and electromagnetic interference revisited: new radiofrequency technologies and implications for dermatologic surgery.

Cardiovascular risk in operators under radiofrequency electromagnetic radiation.

IMMUNITY

Keywords – lymphocytes, immune, lymphocyte, immune system, immunity, blood lymphocytes, leukocytes, antibodies, immune response, human lymphocytes, antibody, peripheral blood lymphocytes, immunological, leukocyte, neutrophils, lymphocytic, immune functions, immunoreactivity, autoimmune, immunization, monocytes, neutrophil, antigens, macrophage, immune parameters, immune responses, immunocompetent, natural killer cells, spleen lymphocytes, immunologic, immunoreactive, micronucleated cells, monoclonal antibodies, spleen cells, splenocytes, T lymphocytes, antibody production, antibody-forming, monoclonal antibody

Titles

954 MHz microwaves enhance the mutagenic properties of mitomycin C.

Cellphone electromagnetic radiation damages the testicular ultrastructure of male rats].

Electromagnetic fields may act via calcineurin inhibition to suppress immunity, thereby increasing risk for opportunistic infection: Conceivable mechanisms of action.

Exposure to 1.8 GHz electromagnetic fields affects morphology, DNA-related Raman spectra and mitochondrial functions in human lympho-monocytes.

Exposure to 900 MHz radiofrequency radiation induces caspase 3 activation in proliferating human lymphocytes.

Exposure to radiation from single or combined radio frequencies provokes macrophage dysfunction in the RAW 264.7 cell line.

Gene expression changes in the skin of rats induced by prolonged 35 GHz millimeter-wave exposure.

Immune responses of a wall lizard to whole-body exposure to radiofrequency electromagnetic radiation.

Immunobiological effect of bitemporal exposure of rabbits to microwaves].

Immunomorphologic changes in the testes upon exposure to a microwave electromagnetic field].

Immunosuppressive effect of the decimeter-band electromagnetic field].

Impact of radiofrequency radiation on DNA damage and antioxidants in peripheral blood lymphocytes of humans residing in the vicinity of mobile phone base stations.

Increased levels of numerical chromosome aberrations after in vitro exposure of human peripheral blood lymphocytes to radiofrequency electromagnetic fields for 72 hours.

Individual responsiveness to induction of micronuclei in human lymphocytes after exposure in vitro to 1800-MHz microwave radiation.

Influence of 1.8 GHz microwave on DNA damage induced by 4 chemical mutagens].

Morphological changes in the thyroid and adrenals under the bitemporal action of a UHF electrical field and decimeter waves (experimental research)].

Mutagenic and morphologic impacts of 1.8GHz radiofrequency radiation on human peripheral blood lymphocytes (hPBLs) and possible protective role of pre-treatment with Ginkgo biloba (EGb 761).

Radiofrequency radiation and the immune system. Part 3. In vitro effects on human immunoglobin and on murine T- and B-lymphocytes.

Radiofrequency-induced carcinogenesis: cellular calcium homeostasis changes as a triggering factor.

Radioprotective effects of honeybee venom (Apis mellifera) against 915-MHz microwave radiation-induced DNA damage in wistar rat lymphocytes: in vitro study.

Reaction of the immune system to low-level RF/MW exposures.

Study of low-intensity 2450-MHz microwave exposure enhancing the genotoxic effects of mitomycin C using micronucleus test and comet assay in vitro.

Studying the synergistic damage effects induced by 1.8 GHz radiofrequency field radiation (RFR) with four chemical mutagens on human lymphocyte DNA using comet assay in vitro.

Terahertz radiation increases genomic instability in human lymphocytes.

The effect of electromagnetic radiation with extremely high frequency and low intensity on cytotoxic activity of human natural killer cells].

The effects of 2100-MHz radiofrequency radiation on nasal mucosa and mucociliary clearance in rats.

The immune response of women with prolonged exposure to electromagnetic fields produced by radiotelevision broadcasting stations.

Effect of electromagnetic radiation on T-lymphocyte subpopulations and immunoglobulin level in human blood serum after occupational exposure].

Effect of electromagnetic waves from mobile phone on immune status of male rats: possible protective role of vitamin D.

Effect of extremely high frequency electromagnetic radiation of low intensity on parameters of humoral immunity in healthy mice].

Effect of low intensity and very high frequency electromagnetic radiation on occupationally exposed personnel].

Effect of low-intensity microwave of on mitomycin C-induced genotoxicity in vitro].

Effect of microwave radiation on cellular immunity indices in conditions of chronic exposure].

Effect of wide-band modulated electromagnetic fields on the workers of high-frequency telephone exchanges].

Effects of 2000 muW/cm2; electromagnetic radiation on expression of immunoreactive protein and mRNA of NMDA receptor 2A subunit in rats hippocampus].

Effects of electromagnetic radiation on health and immune function of operators].

Effects of GSM 1800 MHz radiofrequency electromagnetic fields on DNA damage in Chinese hamster lung cells].

BIOMARKERS

Keywords – apoptosis, oxidative stress, Malondialdehyde, reactive oxygen species, apoptotic, superoxide dismutase, lipid peroxidation, permeability, catalase, MDA, ROS, ROS), reactive oxygen species (ROS), Malondialdehyde (MDA), SOD), cell death, glutathione peroxidase, inflammatory, erythrocytes, oxidative damage, SOD, caspase-3, free radical, nitric oxide, free radicals, biomarkers, bcl-2, catalase (CAT), inflammation, corticosterone, edema, glutathione peroxidase (GSH-Px), cytokine, cytokines, alkaline phosphatase, cell apoptosis, protein kinase, ATP, glutathione (GSH), oxidation, TNF-alpha, Bax, Ca2+, estrogen, ornithine decarboxylase, red blood cells, intracellular calcium, cell damage, apoptotic cell, hemoglobin, lactate dehydrogenase, cerebral blood flow, glutamate, hydrogen peroxide, IL-1beta, Purkinje, serotonin, apoptotic cell death, barrier permeability, carbonyl, hormone levels, ornithine decarboxylase (ODC), acetylcholinesterase, calcium ion, Calcium ions, endothelial cells, GABA, MDA levels, ODC, xanthine oxidase, creatinine, intracellular ROS, cholinesterase, lipid peroxidation levels, pro-inflammatory, protein kinase C, adrenocorticotropic hormone, alanine aminotransferase, aspartate aminotransferase, caspase 3, caspase-9, catalase activity, glutathione levels, NF-kappaB, atrophy, nitric oxide synthase, cAMP, acid phosphatase, adenosine deaminase, adrenocorticotropic hormone (ACTH), blood cell count, blood platelets, Ca++, adrenaline, C-reactive protein, oxidative damages, Reactive Oxygen Species), vascular endothelial growth factor

Titles

1800 MHz mobile phone irradiation induced oxidative and nitrosative stress leads to p53 dependent Bax mediated testicular apoptosis in mice, Mus musculus.

1950MHz Radio Frequency Electromagnetic Radiation Inhibits Testosterone Secretion of Mouse Leydig Cells.

2.45 GHz microwave irradiation-induced oxidative stress affects implantation or pregnancy in mice, Mus musculus.

2.45 GHz Microwave Radiation Impairs Learning and Spatial Memory via Oxidative/Nitrosative Stress Induced p53-Dependent/Independent Hippocampal Apoptosis: Molecular Basis and Underlying Mechanism.

2.45 GHz microwave radiation induced oxidative and nitrosative stress mediated testicular apoptosis: Involvement of a p53 dependent bax-caspase-3 mediated pathway.

2.45-GHz microwave irradiation adversely affects reproductive function in male mouse, Mus musculus by inducing oxidative and nitrosative stress.

8-oxoG DNA glycosylase-1 inhibition sensitizes Neuro-2a cells to oxidative DNA base damage induced by 900 MHz radiofrequency electromagnetic radiation.

900 MHz pulse-modulated radiofrequency radiation induces oxidative stress on heart, lung, testis and liver tissues.

900 MHz radiofrequency-induced histopathologic changes and oxidative stress in rat endometrium: protection by vitamins E and C.

900-MHz microwave radiation enhances gamma-ray adverse effects on SHG44 cells.

900-MHz microwave radiation promotes oxidation in rat brain.

915 MHz microwaves and 50 Hz magnetic field affect chromatin conformation and 53BP1 foci in human lymphocytes from hypersensitive and healthy persons.

Activation of VEGF/Flk-1-ERK Pathway Induced Blood-Brain Barrier Injury After Microwave Exposure.

Acute ocular injuries caused by 60-Ghz millimeter-wave exposure.

Alterations of cognitive function and 5-HT system in rats after long term microwave exposure.

Alternating magnetic field damages the reproductive function of murine testes].

Apoptosis is induced by radiofrequency fields through the caspase-independent mitochondrial pathway in cortical neurons.

Biochemical and histological studies on adverse effects of mobile phone radiation on rat's brain.

Biochemical and pathological changes in the male rat kidney and bladder following exposure to continuous 900-MHz electromagnetic field on postnatal days 22-59<sup/>.

Biochemical changes in rat brain exposed to low intensity 9.9 GHz microwave radiation.

Biochemical modifications and neuronal damage in brain of young and adult rats after long-term exposure to mobile phone radiations.

Bioeffects induced by exposure to microwaves are mitigated by superposition of ELF noise.

Bioeffects of mobile telephony radiation in relation to its intensity or distance from the antenna.

Biological effects from electromagnetic field exposure and public exposure standards.

Biological effects of continuous exposure of embryos and young chickens to electromagnetic fields emitted by video display units.

Biological oxidation in cells exposed to microwaves in the millimeter range].

Blood-brain barrier permeability and nerve cell damage in rat brain 14 and 28 days after exposure to microwaves from GSM mobile phones.

Calreticulin attenuated microwave radiation-induced human microvascular endothelial cell injury through promoting actin acetylation and polymerization.

Cell phone electromagnetic field radiations affect rhizogenesis through impairment of biochemical processes.

Cellphone electromagnetic radiation damages the testicular ultrastructure of male rats].

Changes in mitochondrial functioning with electromagnetic radiation of ultra high frequency as revealed by electron paramagnetic resonance methods.

Changes in serum alkaline phosphatase activity during in vitro exposure to amplitude-modulated electromagnetic field of ultrahigh frequency (2375 MHz) in guinea pigs].

Comparison of biological effects between continuous and intermittent exposure to GSM-900-MHz mobile phone radiation: Detection of apoptotic cell-death features.

Cytotoxic and genotoxic effects of high-frequency electromagnetic fields (GSM 1800 MHz) on immature and mature rats.

DNA Damage of Lymphocytes in Volunteers after 4 hours Use of Mobile Phone.

Effect of 2.45 GHz microwave radiation on the fertility pattern in male mice.

Effect of 3G cell phone exposure with computer controlled 2-D stepper motor on non-thermal activation of the hsp27/p38MAPK stress pathway in rat brain.

Effect of 835 MHz radiofrequency radiation exposure on calcium binding proteins in the hippocampus of the mouse brain.

Effect of 900 MHz Electromagnetic Radiation on the Induction of ROS in Human Peripheral Blood Mononuclear Cells.

Effect of 900 MHz radio frequency radiation on beta amyloid protein, protein carbonyl, and malondialdehyde in the brain.

Effect of 900 MHz radiofrequency radiation on oxidative stress in rat brain and serum.

Effect of 900-, 1800-, and 2100-MHz radiofrequency radiation on DNA and oxidative stress in brain.

Effect of 900Mhz electromagnetic fields on energy metabolism in postnatal rat cerebral cortical neurons].

Effect of 910-MHz electromagnetic field on rat bone marrow.

Effect of American Ginseng Capsule on the liver oxidative injury and the Nrf2 protein expression in rats exposed by electromagnetic radiation of frequency of cell phone].

Effect of cell phone use on salivary total protein, enzymes and oxidative stress markers in young adults: a pilot study.

Effect of Exposure to 900 MHz GSM Mobile Phone Radiofrequency Radiation on Estrogen Receptor Methylation Status in Colon Cells of Male Sprague Dawley Rats.

Effect of Guilingji Capsule on the fertility, liver functions, and serum LDH of male SD rats exposed by 900 mhz cell phone].

Effect of low level microwave radiation exposure on cognitive function and oxidative stress in rats.

Effect of Low-Intensity Microwave Radiation on Monoamine Neurotransmitters and Their Key Regulating Enzymes in Rat Brain.

Effect of mobile phone electromagnetic emission on characteristics of cerebral blood circulation and neurohumoral regulations in humans].

Effect of Mobile Phone-Induced Electromagnetic Field on Brain Hemodynamics and Human Stem Cell Functioning: Possible Mechanistic Link to Cancer Risk and Early Diagnostic Value of Electronphotonic Imaging.

Effect of radiofrequency electromagnetic field exposure on in vitro models of neurodegenerative disease.

Effect of Short-term 900 MHz low level electromagnetic radiation exposure on blood serotonin and glutamate levels.

Effects of 1800 MHz GSM-like exposure on the gonadal function and hematological parameters of male mice].

Effects of 2.4 GHz radiofrequency radiation emitted from Wi-Fi equipment on microRNA expression in brain tissue.

Effects of 2.45 GHz microwave exposures on the peroxidation status in Wistar rats.

Effects of 900-MHz electromagnetic field emitted from cellular phone on brain oxidative stress and some vitamin levels of guinea pigs.

Effects of 900-MHz electromagnetic fields exposure throughout middle/late adolescence on the kidney morphology and biochemistry of the female rat.

Effects of acute exposure to the radiofrequency fields of cellular phones on plasma lipid peroxide and antioxidase activities in human erythrocytes.

Effects of cell phone radiation on lipid peroxidation, glutathione and nitric oxide levels in mouse brain during epileptic seizure.

Electromagnetic fields (1.8 GHz) increase the permeability to sucrose of the blood-brain barrier in vitro.

Electromagnetic fields (UHF) increase voltage sensitivity of membrane ion channels; possible indication of cell phone effect on living cells.

Electromagnetic fields at a mobile phone frequency (900 MHz) trigger the onset of general stress response along with DNA modifications in Eisenia fetida earthworms.

Electromagnetic fields may act via calcineurin inhibition to suppress immunity, thereby increasing risk for opportunistic infection: Conceivable mechanisms of action.

Electromagnetic fields, such as those from mobile phones, alter regional cerebral blood flow and sleep and waking EEG.

Electromagnetic pulse exposure induces overexpression of beta amyloid protein in rats.

Electromagnetic radiation (Wi-Fi) and epilepsy induce calcium entry and apoptosis through activation of TRPV1 channel in hippocampus and dorsal root ganglion of rats.

Electromagnetic radiation 2450 MHz exposure causes cognition deficit with mitochondrial dysfunction and activation of intrinsic pathway of apoptosis in rats.

Electromagnetic radiation at 900 MHz induces sperm apoptosis through bcl-2, bax and caspase-3 signaling pathways in rats.

Electromagnetic-pulse-induced activation of p38 MAPK pathway and disruption of blood-retinal barrier.

Enhanced cytotoxic and genotoxic effects of gadolinium following ELF-EMF irradiation in human lymphocytes.

Enhancement of X-ray Induced Apoptosis by Mobile Phone-Like Radio-Frequency Electromagnetic Fields in Mouse Spermatocyte-Derived Cells.

Evaluation of health risks caused by radio frequency accelerated carcinogenesis: the importance of processes driven by the calcium ion signal.

Evidence for mobile phone radiation exposure effects on reproductive pattern of male rats: role of ROS.

Evidence of oxidative stress in American kestrels exposed to electromagnetic fields.

Exposure to 1800 MHz radiofrequency electromagnetic radiation induces oxidative DNA base damage in a mouse spermatocyte-derived cell line.

Exposure to 1800 MHz radiofrequency radiation induces oxidative damage to mitochondrial DNA in primary cultured neurons.

Exposure to 1950-MHz TD-SCDMA electromagnetic fields affects the apoptosis of astrocytes via caspase-3-dependent pathway.

Exposure to 900 MHz radiofrequency radiation induces caspase 3 activation in proliferating human lymphocytes.

Exposure to a 900 MHz electromagnetic field for 1 hour a day over 30 days does change the histopathology and biochemistry of the rat testis.

Exposure to cell phone induce oxidative stress in mice preantral follicles during in vitro cultivation: An experimental study.

Exposure to cell phone radiation up-regulates apoptosis genes in primary cultures of neurons and astrocytes.

Exposure to ELF-pulse modulated X band microwaves increases in vitro human astrocytoma cell proliferation.

Exposure to global system for mobile communication (GSM) cellular phone radiofrequency alters gene expression, proliferation, and morphology of human skin fibroblasts.

Exposure to GSM 900-MHz mobile radiation impaired inhibitory avoidance memory consolidation in rat: Involvements of opioidergic and nitrergic systems.

Exposure to pulse-modulated radio frequency electromagnetic fields affects regional cerebral blood flow.

Exposure to radiation from single or combined radio frequencies provokes macrophage dysfunction in the RAW 264.7 cell line.

Exposure to radiofrequency radiation induces oxidative stress in duckweed Lemna minor L.

Extremely low-frequency electromagnetic field exposure enhances inflammatory response and inhibits effect of antioxidant in RAW 264.7 cells.

From the Cover: 2.45-GHz Microwave Radiation Impairs Hippocampal Learning and Spatial Memory: Involvement of Local Stress Mechanism-Induced Suppression of iGluR/ERK/CREB Signaling.

GSM 900 MHz microwave radiation affects embryo development of Japanese quails.

GSM-like radiofrequency exposure induces apoptosis via caspase-dependent pathway in infant rabbits.

Histological and histochemical study of the protective role of rosemary extract against harmful effect of cell phone electromagnetic radiation on the parotid glands.

Immunohistopathologic demonstration of deleterious effects on growing rat testes of radiofrequency waves emitted from conventional Wi-Fi devices.

Immunomorphologic changes in the testes upon exposure to a microwave electromagnetic field].

Impact of electromagnetic radiation emitted by monitors on changes in the cellular membrane structure and protective antioxidant effect of vitamin A - In vitro study.

In vivo exposure of rats to a weak alternating magnetic field increases ornithine decarboxylase activity in the mammary gland by a similar extent as the carcinogen DMBA.

Increased ornithine decarboxylase activity in cultured cells exposed to low energy modulated microwave fields and phorbol ester tumor promoters.

Interference of vitamin E on the brain tissue damage by electromagnetic radiation of cell phone in pregnant and fetal rats].

Japanese encephalitis virus (JEV): potentiation of lethality in mice by microwave radiation.

Lipid peroxide damage in retinal ganglion cells induced by microwave].

Long term and excessive use of 900 MHz radiofrequency radiation alter microRNA expression in brain.

Long term exposure to cell phone frequencies (900 and 1800 MHz) induces apoptosis, mitochondrial oxidative stress and TRPV1 channel activation in the hippocampus and dorsal root ganglion of rats.

Long-term exposure of 2450MHz electromagnetic radiation induces stress and anxiety like behavior in rats.

Long-term exposure to electromagnetic radiation from mobile phones and Wi-Fi devices decreases plasma prolactin, progesterone, and estrogen levels but increases uterine oxidative stress in pregnant rats and their offspring.

Long-term exposure to microwave radiation provokes cancer growth: evidences from radars and mobile communication systems.

Low intensity microwave radiation induced oxidative stress, inflammatory response and DNA damage in rat brain.

Low power density microwave radiation induced early changes in rabbit lens epithelial cells.

Magnetic-field-induced DNA strand breaks in brain cells of the rat.

Maternal exposure to a continuous 900-MHz electromagnetic field provokes neuronal loss and pathological changes in cerebellum of 32-day-old female rat offspring.

Maternal mobile phone exposure adversely affects the electrophysiological properties of Purkinje neurons in rat offspring.

Microwave exposure impairs synaptic plasticity in the rat hippocampus and PC12 cells through over-activation of the NMDA receptor signaling pathway.

Microwave radiation (2.45 GHz)-induced oxidative stress: Whole-body exposure effect on histopathology of Wistar rats.

Microwave radiation induced oxidative stress, cognitive impairment and inflammation in brain of Fischer rats.

Microwave radiation induces injury to GC-2spd cells].

Microwave-induced Apoptosis and Cytotoxicity of NK Cells through ERK1/2 Signaling.

Mobile phone (1800MHz) radiation impairs female reproduction in mice, Mus musculus, through stress induced inhibition of ovarian and uterine activity.

Mobile phone affects cerebral blood flow in humans.

Mobile phone radiation induces reactive oxygen species production and DNA damage in human spermatozoa in vitro.

Mobile phone radiation-induced free radical damage in the liver is inhibited by the antioxidants N-acetyl cysteine and epigallocatechin-gallate.

Neural cell apoptosis induced by microwave exposure through mitochondria-dependent caspase-3 pathway.

Neurodegenerative changes and apoptosis induced by intrauterine and extrauterine exposure of radiofrequency radiation.

Non-thermal activation of the hsp27/p38MAPK stress pathway by mobile phone radiation in human endothelial cells: molecular mechanism for cancer- and blood-brain barrier-related effects.

Overproduction of free radical species in embryonal cells exposed to low intensity radiofrequency radiation.

Oxidative stress-mediated alterations on sperm parameters in male Wistar rats exposed to 3G mobile phone radiation.

Oxidative stress-mediated skin damage in an experimental mobile phone model can be prevented by melatonin.

p25/CDK5 is partially involved in neuronal injury induced by radiofrequency electromagnetic field exposure.

Pathological study of testicular injury induced by high power microwave radiation in rats].

Permeability of the blood-brain barrier induced by 915 MHz electromagnetic radiation, continuous wave and modulated at 8, 16, 50, and 200 Hz.

Pernicious effects of long-term, continuous 900-MHz electromagnetic field throughout adolescence on hippocampus morphology, biochemistry and pyramidal neuron numbers in 60-day-old Sprague Dawley male rats.

Protective effect of Liuweidihuang Pills against cellphone electromagnetic radiation-induced histomorphological abnormality, oxidative injury, and cell apoptosis in rat testes].

Protective effects of beta-glucan against oxidative injury induced by 2.45-GHz electromagnetic radiation in the skin tissue of rats.

Protective effects of Genistein on human renal tubular epithelial cells damage of microwave radiation].

Protective effects of luteolin on rat testis following exposure to 900 MHz electromagnetic field.

Pulse modulated 900 MHz radiation induces hypothyroidism and apoptosis in thyroid cells: a light, electron microscopy and immunohistochemical study.

Pulsed electromagnetic fields accelerate apoptotic rate in osteoclasts.

Pulsed or continuous electromagnetic field induce p53/p21-mediated apoptotic signaling pathway in mouse spermatogenic cells in vitro and thus may affect male fertility.

Radio frequency electromagnetic radiation (RF-EMR) from GSM (0.9/1.8GHz) mobile phones induces oxidative stress and reduces sperm motility in rats.

Radiofrequency electromagnetic radiation from cell phone causes defective testicular function in male Wistar rats.

Radiofrequency radiation (900 MHz)-induced DNA damage and cell cycle arrest in testicular germ cells in swiss albino mice.

Radiofrequency radiation emitted from Wi-Fi (2.4 GHz) causes impaired insulin secretion and increased oxidative stress in rat pancreatic islets.

Radiofrequency-induced carcinogenesis: cellular calcium homeostasis changes as a triggering factor.

Reactive oxygen species formation and apoptosis in human peripheral blood mononuclear cell induced by 900 MHz mobile phone radiation.

Reactive oxygen species levels and DNA fragmentation on astrocytes in primary culture after acute exposure to low intensity microwave electromagnetic field.

Reduction of phosphorylated synapsin I (ser-553) leads to spatial memory impairment by attenuating GABA release after microwave exposure in Wistar rats.

Role of Mitochondria in the Oxidative Stress Induced by Electromagnetic Fields: Focus on Reproductive Systems.

Selenium reduces mobile phone (900 MHz)-induced oxidative stress, mitochondrial function, and apoptosis in breast cancer cells.

Selenium supplementation ameliorates electromagnetic field-induced oxidative stress in the HEK293 cells.

Ten gigahertz microwave radiation impairs spatial memory, enzymes activity, and histopathology of developing mice brain.

Testicular apoptosis and histopathological changes induced by a 2.45 GHz electromagnetic field.

The antioxidant effect of Green Tea Mega EGCG against electromagnetic radiation-induced oxidative stress in the hippocampus and striatum of rats.

Ultrastructural change of rabbit lens epithelial cells induced by low power level microwave radiation].

Vitamin C protects rat cerebellum and encephalon from oxidative stress following exposure to radiofrequency wave generated by a BTS antenna model.

Zinc supplementation ameliorates electromagnetic field-induced lipid peroxidation in the rat brain.

SENSORY DISORDERS

Keywords – auditory, acoustic, ear, hypersensitivity, EHS, electromagnetic hypersensitivity, otoacoustic, vestibular, hypersensitive, cataract, cochlea, auditory system, inner ear, lens epithelial, corneal, tinnitus, vision, lenses, otoacoustic emissions, hearing loss, otoacoustic emission, epidermis, rabbit lens, dermatitis, auditory stimuli, cataractogenic, Auditory brainstem response (ABR), auditory evoked, electrohypersensitive, electrosensitivity, vestibular system, cochlear implants, dermatological, hearing function, hearing thresholds, pain sensitivity, pain threshold, skin complaints

Titles

A quantitative study on early changes in rabbit lens capsule epithelium induced by low power density microwave radiation].

A study on the effect of prolonged mobile phone use on pure tone audiometry thresholds of medical students of Sikkim.

Acceleration of the development of benzopyrene-induced skin cancer in mice by microwave radiation.

Alteration of glycine receptor immunoreactivity in the auditory brainstem of mice following three months of exposure to radiofrequency radiation at SAR 4.0 W/kg.

Assessment of intermittent UMTS electromagnetic field effects on blood circulation in the human auditory region using a near-infrared system.

Association between vestibular schwannomas and mobile phone use.

Audiologic disturbances in long-term mobile phone users.

Blocking 1800 MHz mobile phone radiation-induced reactive oxygen species production and DNA damage in lens epithelial cells by noise magnetic fields].

Cell phone use and acoustic neuroma: the need for standardized questionnaires and access to industry data.

Changes in gap junctional intercellular communication in rabbits lens epithelial cells induced by low power density microwave radiation.

Cognitive and neurobiological alterations in electromagnetic hypersensitive patients: results of a case-control study.

Contribution of physical factors to the complex anthropogenic load in an industrial town].

Decrease in the intensity of the cellular immune response and nonspecific inflammation upon exposure to extremely high frequency electromagnetic radiation].

DNA damage and repair induced by acute exposure of microwave from mobile phone on cultured human lens epithelial cells].

EEG Changes Due to Experimentally Induced 3G Mobile Phone Radiation.

Effect Of Electromagnetic Waves Emitted From Mobile Phone On Brain Stem Auditory Evoked Potential In Adult Males.

Effect of low-intensity microwave radiation on proliferation of cultured epithelial cells of rabbit lens].

Effect of superposed electromagnetic noise on DNA damage of lens epithelial cells induced by microwave radiation.

Effect of wide-band modulated electromagnetic fields on the workers of high-frequency telephone exchanges].

Effects of 2.45-GHz microwaves on primate corneal endothelium.

Effects of different dose microwave radiation on protein components of cultured rabbit lens].

Effects of exposure to 2100MHz GSM-like radiofrequency electromagnetic field on auditory system of rats.

Effects of GSM-like radiofrequency on distortion product otoacoustic emissions in pregnant adult rabbits.

Effects of intensive and moderate cellular phone use on hearing function.

Effects of low level electromagnetic field exposure at 2.45 GHz on rat cornea.

Effects of microwave radiation on the eye: the occupational health perspective.

Effects of mobile phones on oxidant/antioxidant balance in cornea and lens of rats.

Effects of pulsed electromagnetic fields on cognitive processes - a pilot study on pulsed field interference with cognitive regeneration.

Electromagnetic field induced biological effects in humans.

Electromagnetic hypersensitivity--an increasing challenge to the medical profession.

Experimental studies on the influence of millimeter radiation on light transmission through the lens].

Increased sensitivity of the non-human primate eye to microwave radiation following ophthalmic drug pretreatment.

Intraoperative observation of changes in cochlear nerve action potentials during exposure to electromagnetic fields generated by mobile phones.

Is human saliva an indicator of the adverse health effects of using mobile phones?

Low power density microwave radiation induced early changes in rabbit lens epithelial cells.

Mobile phone induced sensorineural hearing loss.

Mobile phone related-hazards and subjective hearing and vision symptoms in the Saudi population.

Non-thermal electromagnetic radiation damage to lens epithelium.

Occupational safety: effects of workplace radiofrequencies on hearing function.

Reliable disease biomarkers characterizing and identifying electrohypersensitivity and multiple chemical sensitivity as two etiopathogenic aspects of a unique pathological disorder.

Replication of heart rate variability provocation study with 2.4-GHz cordless phone confirms original findings.

Single-strand DNA breaks in human hair root cells exposed to mobile phone radiation.

Some ocular symptoms and sensations experienced by long term users of mobile phones.

Some ocular symptoms experienced by users of mobile phones.

The acute auditory effects of exposure for 60 minutes to mobile`s electromagnetic field.

The effect of radiofrequency radiation generated by a Global System for Mobile Communications source on cochlear development in a rat model.

The effect of very low dose pulsed magnetic waves on cochlea.

The effects of pulsed low-level EM fields on memory processes].

The electromagnetic fields of cellular phones and the health of children and of teenagers (the situation requiring to take an urgent measure)].

Tinnitus and cell phones: the role of electromagnetic radiofrequency radiation.

Tinnitus and mobile phone use.

Ultrastructural change of rabbit lens epithelial cells induced by low power level microwave radiation].

DISCOMFORT SYMPTOMS

Keywords – depression, anxiety, headache, headaches, dizziness, depressed, depressive, vertigo, cataracts, behavioral effects, nausea, headache dizziness, low back pain, behavioural effects

Titles

A study on the biological effects of exposure mobile-phone frequency EMF].

A survey study on some neurological symptoms and sensations experienced by long term users of mobile phones.

Adverse effects of excessive mobile phone use.

Anxiogenic effect of chronic exposure to extremely low frequency magnetic field in adult rats.

Association of mobile phone radiation with fatigue, headache, dizziness, tension and sleep disturbance in Saudi population.

Chronic exposure to ELF fields may induce depression.

Clinical features of headache associated with mobile phone use: a cross-sectional study in university students.

Effect of electromagnetic radiations from mobile phone base stations on general health and salivary function.

Effect of high-frequency EMF on public health and its neuro-chemical investigations].

Effect of low intensity and very high frequency electromagnetic radiation on occupationally exposed personnel].

Effects of electromagnetic radiation from cellular telephone handsets on symptoms of neurasthenia].

Effects of electromagnetic radiation on health and immune function of operators].

Effects of GSM-Frequency Electromagnetic Radiation on Some Physiological and Biochemical Parameters in Rats.

Effects of low intensity radiofrequency electromagnetic fields on electrical activity in rat hippocampal slices.

Effects of microwave radiation on the eye: the occupational health perspective.

Effects of mobile phone radiation (900 MHz radiofrequency) on structure and functions of rat brain.

Exposure to mobile phone electromagnetic field radiation, ringtone and vibration affects anxiety-like behaviour and oxidative stress biomarkers in albino wistar rats.

Exposure to radio-frequency electromagnetic waves alters acetylcholinesterase gene expression, exploratory and motor coordination-linked behaviour in male rats.

Long-term exposure of 2450MHz electromagnetic radiation induces stress and anxiety like behavior in rats.

Magnetic fields of transmission lines and depression.

Microwave radiation and chlordiazepoxide: synergistic effects on fixed-interval behavior.

Microwave sickness: a reappraisal.

Mobile phone use and health symptoms in children.

Mobile Phone Use and The Risk of Headache: A Systematic Review and Meta-analysis of Cross-sectional Studies.

Mobile phone use, school electromagnetic field levels and related symptoms: a cross-sectional survey among 2150 high school students in Izmir.

Motor activity of rabbits in conditions of chronic low-intensity pulse microwave irradiation].

MRI magnetic field stimulates rotational sensors of the brain.

Neurobehavioral effects among inhabitants around mobile phone base stations.

Postnatal development and behavior effects of in-utero exposure of rats to radiofrequency waves emitted from conventional WiFi devices.

Preliminary report: symptoms associated with mobile phone use.

Prevalence of headache among handheld cellular telephone users in Singapore: a community study.

Radiofrequency electromagnetic radiation-induced behavioral changes and their possible basis.

Scientific evidence contradicts findings and assumptions of Canadian Safety Panel 6: microwaves act through voltage-gated calcium channel activation to induce biological impacts at non-thermal levels, supporting a paradigm shift for microwave/lower frequency electromagnetic field action.

Self-reported symptoms associated with exposure to electromagnetic fields: a questionnaire study.

Self-reporting of symptom development from exposure to radiofrequency fields of wireless smart meters in victoria, australia: a case series.

Subjective complaints of people living near mobile phone base stations in Poland.

Subjective symptoms, sleeping problems, and cognitive performance in subjects living near mobile phone base stations.

CONGENITAL ABNORMALITIES

Keywords – malformations, teratogenic, congenital, congenital malformations, teratogenicity, teratogens, teratologic, cleft palate, congenital anomalies, malformed, teratological

Titles

Are microwaves a co-teratogen? Experimental model concept and its verification].

Effect of early pregnancy electromagnetic field exposure on embryo growth ceasing].

Effects of continuous low-level exposure to radiofrequency radiation on intrauterine development in rats.

Effects of GSM-like radiofrequency irradiation during the oogenesis and spermiogenesis of Xenopus laevis.

Effects of MR exposure at 1.5 T on early embryonic development of the chick.

First cell cycles of sea urchin Paracentrotus lividus are dramatically impaired by exposure to extremely low-frequency electromagnetic field.

Lethal and teratogenic effects of long-term low-intensity radio frequency radiation at 428 MHz on developing chick embryo.

Microwave radiation enhances teratogenic effect of cytosine arabinoside in mice.

Morinda officialis how extract improves microwave-induced reproductive impairment in male rats].

MRI effects on craniofacial size and crown-rump length in C57BL/6J mice in 1.5T fields.

Pathological study of testicular injury induced by high power microwave radiation in rats].

Pulsed magnetic field from video display terminals enhances teratogenic effects of cytosine arabinoside in mice.

Reproductive hazards among workers at high voltage substations.

Studies of the teratogenic potential of exposure of rats to 6000-MHz microwave radiation. I. Morphologic analysis at term.

Studies of the teratogenic potential of exposure of rats to 6000-MHz microwave radiation. II. Postnatal psychophysiologic evaluations.

Teratogenic effects of sinusoidal extremely low frequency electromagnetic fields on morphology of 24 hr chick embryos.

Teratogenic, biochemical, and histological studies with mice prenatally exposed to 2.45-GHz microwave radiation.

VDT pulse magnetic field enhances teratogenic effect of ara-c in mice.

CIRCADIAN RHYTHYM AND MELATONIN

Keywords – melatonin, sleep, circadian, melatonin production, sleep disturbances, insomnia, melatonin levels, melatonin secretion, sleep disorders, sleep EEG, poor sleep, pineal function

Titles

900-MHz microwave radiation promotes oxidation in rat brain.

A 50-Hz electromagnetic field impairs sleep.

Association between Excessive Use of Mobile Phone and Insomnia and Depression among Japanese Adolescents.

Association between overuse of mobile phones on quality of sleep and general health among occupational health and safety students.

Association of mobile phone radiation with fatigue, headache, dizziness, tension and sleep disturbance in Saudi population.

Bedtime mobile phone use and sleep in adults.

Biological effects of continuous exposure of embryos and young chickens to electromagnetic fields emitted by video display units.

Breast cancer and electric power.

Cellular phones: are they detrimental?

Chronic exposure to ELF fields may induce depression.

Chronotoxicity of 1800 MHz microwave radiation on sex hormones and spermatogenesis in male mice].

Circadian rhythmicity of antioxidant markers in rats exposed to 1.8 GHz radiofrequency fields.

Direct suppressive effects of weak magnetic fields (50 Hz and 16 2/3 Hz) on melatonin synthesis in the pineal gland of Djungarian hamsters (Phodopus sungorus).

Do magnetic fields cause increased risk of childhood leukemia via melatonin disruption?

Effect of electromagnetic radiations from mobile phone base stations on general health and salivary function.

Effect of low intensity and very high frequency electromagnetic radiation on occupationally exposed personnel].

Effects of 1800-MHz radiofrequency fields on circadian rhythm of plasma melatonin and testosterone in male rats.

Effects of electromagnetic fields exposure on plasma hormonal and inflammatory pathway biomarkers in male workers of a power plant.

Effects of melatonin on Wi-Fi-induced oxidative stress in lens of rats.

Effects of Mobile Phones on Children's and Adolescents' Health: A Commentary.

Effects of prenatal 900 MHz electromagnetic field exposures on the histology of rat kidney.

EUROPAEM EMF Guideline 2016 for the prevention, diagnosis and treatment of EMF-related health problems and illnesses.

Exposure to electromagnetic fields and suicide among electric utility workers: a nested case-control study.

Health effects of living near mobile phone base transceiver station (BTS) antennae: a report from Isfahan, Iran.

Individual differences in the effects of mobile phone exposure on human sleep: rethinking the problem.

Investigation on the health of people living near mobile telephone relay stations: I/Incidence according to distance and sex].

Melatonin and a spin-trap compound block radiofrequency electromagnetic radiation-induced DNA strand breaks in rat brain cells.

Melatonin attenuates radiofrequency radiation (900 MHz)-induced oxidative stress, DNA damage and cell cycle arrest in germ cells of male Swiss albino mice.

Melatonin modulates 900 Mhz microwave-induced lipid peroxidation changes in rat brain.

Melatonin protects rat thymus against oxidative stress caused by exposure to microwaves and modulates proliferation/apoptosis of thymocytes.

Melatonin reduces oxidative stress induced by chronic exposure of microwave radiation from mobile phones in rat brain.

Microwave frequency electromagnetic fields (EMFs) produce widespread neuropsychiatric effects including depression.

Mitochondrial DNA damage and oxidative damage in HL-60 cells exposed to 900MHz radiofrequency fields.

Mobile phone radiation induces mode-dependent DNA damage in a mouse spermatocyte-derived cell line: a protective role of melatonin.

Mobile phone use, school electromagnetic field levels and related symptoms: a cross-sectional survey among 2150 high school students in Izmir.

Mobile phones: time to rethink and limit usage.

Modulation of wireless (2.45 GHz)-induced oxidative toxicity in laryngotracheal mucosa of rat by melatonin.

Neurobehavioral effects among inhabitants around mobile phone base stations.

Neuroprotective effects of melatonin and omega-3 on hippocampal cells prenatally exposed to 900 MHz electromagnetic fields.

Non-thermal biomarkers of exposure to radiofrequency/microwave radiation.

Non-thermal continuous and modulated electromagnetic radiation fields effects on sleep EEG of rats.

Oxidative stress-mediated skin damage in an experimental mobile phone model can be prevented by melatonin.

CHRONIC CONDITIONS

Keywords - metabolism, metabolic, glucose, endocrine, cholesterol, Diabetes, calcium homeostasis, glucose levels, homeostatic, metabolic activity, metabolic heat production, Diabetes Mellitus, diabetic, glucose metabolism, obesity

Titles

Assessment of biological changes of continuous whole-body exposure to static magnetic field and extremely low frequency electromagnetic fields in mice.

Association of exposure to radio-frequency electromagnetic field radiation (RF-EMFR) generated by mobile phone base stations with glycated hemoglobin (HbA1c) and risk of Type 2 Diabetes Mellitus.

Biological accounts emerging from some kinds of electromagnetic waves in the environment.

Calreticulin attenuated microwave radiation-induced human microvascular endothelial cell injury through promoting actin acetylation and polymerization.

Cardiovascular risk in operators under radiofrequency electromagnetic radiation.

Cell oxidation-reduction imbalance after modulated radiofrequency radiation.

Changes in mitochondrial functioning with electromagnetic radiation of ultra high frequency as revealed by electron paramagnetic resonance methods.

Common behaviors alterations after extremely low-frequency electromagnetic field exposure in rat animal model.

Dirty electricity, chronic stress, neurotransmitters and disease.

Disordered redox metabolism of brain cells in rats exposed to low doses of ionizing radiation or UHF electromagnetic radiation.

Disturbances of glucose tolerance in workers exposed to electromagnetic radiation].

Dynamics of metabolic parameters in rats during repeated exposure to modulated low-intensity UHF radiation.

Effect of a 20 kHz sawtooth magnetic field exposure on the estrous cycle in mice.

Effect of coherent extremely high-frequency and low-intensity electromagnetic radiation on the activity of membrane systems in Escherichia coli].

Effect of discontinuous short-wave electromagnetic field irradiation on the state of the endocrine glands].

Effect of Exposure to 900 MHz GSM Mobile Phone Radiofrequency Radiation on Estrogen Receptor Methylation Status in Colon Cells of Male Sprague Dawley Rats.

Effects of continuous low-level exposure to radiofrequency radiation on intrauterine development in rats.

Effects of continuous-wave, pulsed, and sinusoidal-amplitude-modulated microwaves on brain energy metabolism.

Effects of electromagnetic fields on the immune systems of occupationally exposed humans and mice.

Effects of electromagnetic radiation exposure on bone mineral density, thyroid, and oxidative stress index in electrical workers.

Effects of exposure to electromagnetic field radiation (EMFR) generated by activated mobile phones on fasting blood glucose.

Effects of extremely low frequency electromagnetic field and its combination with lead on the antioxidant system in mouse].

Effects of microwave radiation on the eye: the occupational health perspective.

Effects of RF-EMF Exposure from GSM Mobile Phones on Proliferation Rate of Human Adipose-derived Stem Cells: An In-vitro Study.

Endocrine mechanism of placental circulatory disturbances induced by microwave in pregnant rats].

Evidence that dirty electricity is causing the worldwide epidemics of obesity and diabetes.

Exposure to GSM 900 MHz electromagnetic fields affects cerebral cytochrome c oxidase activity.

Functional activity and metabolism of blood neutrophils exposed to low-intensity microwaves].

Glucose administration attenuates spatial memory deficits induced by chronic low-power-density microwave exposure.

GSM mobile phone radiation suppresses brain glucose metabolism.

High-frequency electromagnetic field exposure on reproductive and endocrine functions of female workers].

Hippocampal lipidome and transcriptome profile alterations triggered by acute exposure of mice to GSM 1800 MHz mobile phone radiation: An exploratory study.

Long-term exposure to microwave radiation provokes cancer growth: evidences from radars and mobile communication systems.

Metabolic changes in cells under electromagnetic radiation of mobile communication systems].

Occupations with exposure to electromagnetic fields: a possible risk factor for Alzheimer's disease.

Pulse modulated 900 MHz radiation induces hypothyroidism and apoptosis in thyroid cells: a light, electron microscopy and immunohistochemical study.

Radio frequency electromagnetic radiation (RF-EMR) from GSM (0.9/1.8GHz) mobile phones induces oxidative stress and reduces sperm motility in rats.

Radiofrequency radiation emitted from Wi-Fi (2.4 GHz) causes impaired insulin secretion and increased oxidative stress in rat pancreatic islets.

Towards 5G communication systems: Are there health implications?

Wi-Fi is an important threat to human health.

A2-C. Citing Papers

Essentially all the papers referenced in A2-B show adverse effects. The papers that cite these adverse effects papers (and some associated papers) were retrieved, and were filtered by visual inspection. The references to these citing papers that also show adverse effects from wireless radiation are presented in the following. The combination of relevant papers in A2-B and their citing papers in A2-C constitutes a representative sample of the wireless radiation adverse effects literature.

The actual literature is far larger. The query used to retrieve relevant papers for A2-B was quite simple, and mainly the citing papers component of the citation network (citing papers, cited papers, related records, etc) was used to expand the relevant papers.

Appendix 3 – Factor Analysis of Adverse EMF Effects Database

A3-A. Factor Themes

A query to retrieve Medline records showing adverse health effects of wireless radiation was generated. The query was entered into the Medline search engine, and ~15,000 records were retrieved. Filtering was applied to the retrieval to remove records not associated with adverse health effects of wireless radiation, and 5311 records remained. These records did not receive the further filtering as the database in Appendix 2.

Thousands of the highest frequency MeSH terms were read, and those strongly related to adverse health effects of wireless radiation were selected. A factor analysis was performed using these terms, and a 21-factor taxonomy was generated.

The following table (A3-1) shows the categories/factors in the taxonomy, and the highest weighted (most influential in determining the factor theme) MeSH Headings associated with each category/factor. For each category, the records associated with the highest weighted MeSH Headings identified were highlighted, and the titles of those records were extracted. Following the table, each category and associated record titles are shown in order to display the breadth of coverage of the category. The categories in Table A3-1 are hyperlinked to their respective titles. Because of the limitations on record filtering, most of the records show adverse health effects, but not all do. Some of the records go beyond the FCC exposure limits, and some address frequencies much lower than microwave. There is some overlap among factors, since some MeSH Headings may be influential in determining the themes of multiple factors.

Major themes from the table include cancer, breast cancer, liver cancer, skin cancer, brain cancer, leukemia, tumors, precancerous conditions, neurodegenerative diseases, cardiovascular disease, electronic implant dysfunction, cerebrovascular disorders, inflammation, oxidative stress, male infertility, electrohypersensitivity, sleep, congenital abnormalities, sensory disorders, symptoms of discomfort, eye diseases.

Table A3-1 - Factor Analysis Taxonomy

FACTOR THEME	MESH HEADINGS
1 **Electromagnetic hypersensitivity and inflammation**	C-Reactive Protein, Liver Diseases, Thyroid Diseases, Inflammation, Tonsillitis, Hypersensitivity
2 **Coronary artery disease**	Plaque, Atherosclerotic, Coronary Artery Disease, Diabetes Mellitus, Carotid Artery Diseases, Inflammation, Hypertension
3A **Congenital abnormalities**	Cleft Lip, Cleft Palate, Calcification, Physiologic, Congenital Abnormalities
3B **Mammary tumors**	Fibroadenoma, Adenoma, Mammary Neoplasms, Animal, Mammary Neoplasms, Experimental, Adenocarcinoma
4 **Male infertility**	Sperm Count, Spermatozoa, Sperm Motility, Semen, Testis, Infertility, Male, Spermatogenesis, Testosterone, Fertility
5 **Brain neoplasms**	Meningioma, Glioma, Meningeal Neoplasms, Neuroma, Acoustic, Brain Neoplasms, Glioblastoma, Neoplasms, Radiation-Induced, Neuroma, Cranial Nerve Neoplasms, Parotid Neoplasms, Central Nervous System Neoplasms
6 **Sensory disorders**	Burning Mouth Syndrome, Taste Disorders, Skin Diseases, Mouth Diseases, Dizziness, Vision Disorders, Hypersensitivity, Delayed, Fatigue
7 **Breast neoplasms**	Carcinoma, Lobular, Carcinoma, Ductal, Breast, Breast Neoplasms, Male, Adenoma
8 **Oxidative stress**	Oxidative Stress, Malondialdehyde, Glutathione Peroxidase, Lipid Peroxidation, Reactive Oxygen Species, Apoptosis, DNA Damage, Nitric Oxide, Protein Carbonylation
9 **Neurodegenerative diseases**	Parkinson Disease, Neurodegenerative Diseases, Alzheimer Disease, Amyotrophic Lateral Sclerosis, Motor Neuron Disease, Occupational Diseases, Dementia, Brain Diseases, Dementia, Vascular
10 **Cerebrovascular disorders**	Cerebrovascular Disorders, Dementia, Migraine Disorders, Tinnitus, Headache, Sleep Wake Disorders, Carotid Artery Diseases, Alzheimer Disease, Dementia, Vascular

11 **Congenital abnormalities and glandular-based tumors**	Cleft Lip, Cleft Palate, Fibroadenoma, Adenoma, Calcification, Physiologic, Mammary Neoplasms, Animal, Mammary Neoplasms, Experimental, Adenocarcinoma
12 **Skin neoplasms**	Carcinoma, Basal Cell, Carcinoma, Squamous Cell, Skin Neoplasms, Cocarcinogenesis, Neoplasms, Experimental, Neoplasms, Radiation-Induced, Colonic Neoplasms
13 **Leukemia**	Leukemia, Myeloid, Acute, Leukemia, Lymphocytic, Chronic, B-Cell, Leukemia, Myelogenous, Chronic, BCR-ABL Positive, Leukemia, Myeloid, Leukemia, Multiple Myeloma, Lymphoma, Leukemia, Radiation-Induced, Acute Disease, Liver Neoplasms, Experimental, Central Nervous System Neoplasms
14 **Precancerous conditions**	Atrophy, Precancerous Conditions, Hyperplasia, Hypersensitivity, Delayed, Thymus Gland, Capillary Permeability, Lymphoma
15 **Circadian Rhythm**	Melatonin, Circadian Rhythm, Pineal Gland
16 **Eye diseases**	Eye Diseases, Cataract, Vision Disorders, Sensation Disorders, Neurotic Disorders, Lens, Crystalline, Corneal Diseases, Edema, Hematologic Diseases
17 **Electromagnetic interference in implanted electronic devices**	Tachycardia, Ventricular, Ventricular Fibrillation, Death, Sudden, Cardiac, Arrhythmias, Cardiac
18 **Liver Neoplasms**	Liver Neoplasms, Carcinoma, Hepatocellular, Neoplasm Recurrence, Local, Lymphatic Metastasis
19 **Symptoms of discomfort**	Headache, Dizziness, Fatigue, Depression, Anxiety, Tremor, Sleep Wake Disorders, Neurotic Disorders, Stress, Psychological, Anxiety Disorders, Nervous System Diseases
20 **Neoplasms**	Lung Neoplasms, Ovarian Neoplasms, Pituitary Neoplasms, Lymphoma, Prostatic Neoplasms, Colonic Neoplasms, Carcinoma, Breast Neoplasms, Hematologic Neoplasms, Neoplasms, Liver Neoplasms, Cell Transformation, Neoplastic, Nervous System Neoplasms

A3-B. Factor Record Titles

FACTOR 1

Theme – Electromagnetic hypersensitivity and inflammation

Key MeSH Headings - C-Reactive Protein, Liver Diseases, Thyroid Diseases, Inflammation, Tonsillitis, Hypersensitivity

Titles

915 MHz microwaves and 50 Hz magnetic field affect chromatin conformation and 53BP1 foci in human lymphocytes from hypersensitive and healthy persons.

A cognitive-behavioral treatment of patients suffering from "electric hypersensitivity". Subjective effects and reactions in a double-blind provocation study.

A systematic review of treatments for electromagnetic hypersensitivity.

Activation of TLR signalling regulates microwave radiation-mediated impairment of spermatogenesis in rat testis.

Analysis of the effect of a 60 Hz AC field on histamine release by rat peritoneal mast cells.

Are thyroid dysfunctions related to stress or microwave exposure (900 MHz)?

Bilateral symmetry of local inflammatory activation in human carotid atherosclerotic plaques.

Biological effects of low-level environmental agents.

Blood laboratory findings in patients suffering from self-perceived electromagnetic hypersensitivity (EHS).

Changes in antioxidant capacity of blood due to mutual action of electromagnetic field (1800 MHz) and opioid drug (tramadol) in animal model of persistent inflammatory state.

Changes in the chromatin structure of lymphoid cells under the influence of low-intensity extremely high-frequency electromagnetic radiation against the background of inflammatory process].

Clinical significance of tonsillar provocation test in diagnosis of tonsillar focal infection--by indirect irradiation of ultra-micro waves].

Controversies around electromagnetic fields and electromagnetic hypersensitivity. The construction of "low noise" public problems].

Decrease in the intensity of the cellular immune response and nonspecific inflammation upon exposure to extremely high frequency electromagnetic radiation].

Dependence of anti-inflammatory effects of high peak-power pulsed electromagnetic radiation of extremely high frequency on exposure parameters].

Description of persons with symptoms presumed to be caused by electricity or visual display units--oral aspects.

Development and evaluation of the electromagnetic hypersensitivity questionnaire.

Earthing: health implications of reconnecting the human body to the Earth's surface electrons.

Effect of high frequency electromagnetic wave stimulation on muscle injury in a rat model.

Effect of mobile phone use on salivary concentrations of protein, amylase, lipase, immunoglobulin A, lysozyme, lactoferrin, peroxidase and C-reactive protein of the parotid gland.

Effect of quinacrine on inflammatory reaction of blood system induced by microwave irradiation].

Effect of the pulsed electromagnetic field on the release of inflammatory mediators from adipose-derived stem cells (ADSCs) in rats.

Effects of low-intensity ultrahigh frequency electromagnetic radiation on inflammatory processes.

Effects of personalised exposure on self-rated electromagnetic hypersensitivity and sensibility - A double-blind randomised controlled trial.

Effects of RF fields emitted from smart phones on cardio-respiratory parameters: a preliminary provocation study.

Electrical hypersensitivity in humans--fact or fiction?

Electrohypersensitivity: a functional impairment due to an inaccessible environment.

Electromagnetic fields (EMF): do they play a role in children's environmental health (CEH)?

Electromagnetic fields and health outcomes.

Electromagnetic fields hypersensitivity].

Electromagnetic hypersensitivity (EHS) and subjective health complaints associated with electromagnetic fields of mobile phone communication--a literature review published between 2000 and 2004.

Electromagnetic hypersensitivity--an increasing challenge to the medical profession.

Electromagnetic hypersensitivity: biological effects of dirty electricity with emphasis on diabetes and multiple sclerosis.

Electromagnetic hypersensitivity: fact or fiction?

Epidemiology and etiology of gliomas.

Extremely low-frequency electromagnetic field exposure enhances inflammatory response and inhibits effect of antioxidant in RAW 264.7 cells.

Features of anti-inflammatory effects of modulated extremely high-frequency electromagnetic radiation.

Functional brain MRI in patients complaining of electrohypersensitivity after long term exposure to electromagnetic fields.

Heavy metal exposure in patients suffering from electromagnetic hypersensitivity.

Hsp70 is an independent stress marker among frequent users of mobile phones.

Hypersensitivity symptoms associated with exposure to cellular telephones: no causal link.

Hypersensitivity syndrome].

Hypersensitivity to electricity: working definition and additional characterization of the syndrome.

Idiopathic environmental intolerance attributed to electromagnetic fields (formerly 'electromagnetic hypersensitivity'): An updated systematic review of provocation studies.

Increased mercury release from dental amalgam restorations after exposure to electromagnetic fields as a potential hazard for hypersensitive people and pregnant women.

Induction of macrophage migration inhibitory factor precedes the onset of acute tonsillitis.

Microwaves from GSM mobile telephones affect 53BP1 and gamma-H2AX foci in human lymphocytes from hypersensitive and healthy persons.

Mobile-phone-based home exercise training program decreases systemic inflammation in COPD: a pilot study.

Physiological variables and subjective symptoms by 60 Hz magnetic field in EHS and non-EHS persons.

Prevalence of self-reported hypersensitivity to electric or magnetic fields in a population-based questionnaire survey.

Provocation of electric hypersensitivity under everyday conditions.

Provocation study of persons with perceived electrical hypersensitivity and controls using magnetic field exposure and recording of electrophysiological characteristics.

Provocation with stress and electricity of patients with "sensitivity to electricity".

Reliable disease biomarkers characterizing and identifying electrohypersensitivity and multiple chemical sensitivity as two etiopathogenic aspects of a unique pathological disorder.

Sensitivity of spiral ganglion neurons to damage caused by mobile phone electromagnetic radiation will increase in lipopolysaccharide-induced inflammation in vitro model.

Some ocular symptoms and sensations experienced by long term users of mobile phones.

The amelioration of phagocytic ability in microglial cells by curcumin through the inhibition of EMF-induced pro-inflammatory responses.

The effect of melatonin on the liver of rats exposed to microwave radiation.

The implications of non-linear biological oscillations on human electrophysiology for electrohypersensitivity (EHS) and multiple chemical sensitivity (MCS).

The microwave syndrome or electro-hypersensitivity: historical background.

The role of fatty acids in anti-inflammatory effects of low-intensity extremely high-frequency electromagnetic radiation.

The role of microwave radiometry in carotid artery disease. Diagnostic and clinical prospective.

Thermal and non-thermal health effects of low intensity non-ionizing radiation: An international perspective.

Thermal Response of In Vivo Human Skin to Fractional Radiofrequency Microneedle Device.

Use of terahertz electromagnetic radiation at nitric oxide frequencies for the correction of thyroid functional state during stress].

Wireless communication fields and non-specific symptoms of ill health: a literature review.

Women growing older with environmental sensitivities: A grounded theory model of meeting one's needs.

FACTOR 2

Theme – Coronary artery disease

Key MeSH Headings - Plaque, Atherosclerotic, Coronary Artery Disease, Diabetes Mellitus, Carotid Artery Diseases, Inflammation, Hypertension

Titles

A study on the biological effects of exposure mobile-phone frequency EMF].

A survey on diabetes mellitus in the staff of electric power system in Baotou city].

Activation of TLR signalling regulates microwave radiation-mediated impairment of spermatogenesis in rat testis.

Analysis of the effect of a 60 Hz AC field on histamine release by rat peritoneal mast cells.

Bilateral symmetry of local inflammatory activation in human carotid atherosclerotic plaques.

Blood laboratory findings in patients suffering from self-perceived electromagnetic hypersensitivity (EHS).

Cardiovascular risk in operators under radiofrequency electromagnetic radiation.

Changes in antioxidant capacity of blood due to mutual action of electromagnetic field (1800 MHz) and opioid drug (tramadol) in animal model of persistent inflammatory state.

Changes in the chromatin structure of lymphoid cells under the influence of low-intensity extremely high-frequency electromagnetic radiation against the background of inflammatory process].

Decrease in the intensity of the cellular immune response and nonspecific inflammation upon exposure to extremely high frequency electromagnetic radiation].

Dependence of anti-inflammatory effects of high peak-power pulsed electromagnetic radiation of extremely high frequency on exposure parameters].

Development of hypertension after long-term exposure to static magnetic fields among workers from a magnetic resonance imaging device manufacturing facility.

Earthing: health implications of reconnecting the human body to the Earth's surface electrons.

Effect of electromagnetic irradiation of the millimetric range on hemodynamics in patients with arterial hypertension].

Effect of high frequency electromagnetic wave stimulation on muscle injury in a rat model.

Effect of quinacrine on inflammatory reaction of blood system induced by microwave irradiation].

Effect of the pulsed electromagnetic field on the release of inflammatory mediators from adipose-derived stem cells (ADSCs) in rats.

Effects of low-intensity ultrahigh frequency electromagnetic radiation on inflammatory processes.

Electromagnetic effects on people.

Electromagnetic hypersensitivity: biological effects of dirty electricity with emphasis on diabetes and multiple sclerosis.

Epidemiological risk assessment of pathology development in occupational exposure to radiofrequency electromagnetic fields].

Evaluation of occupational risk caused by exposure to electromagnetic rays].

Evidence that dirty electricity is causing the worldwide epidemics of obesity and diabetes.

Exacerbation of hypertension and disturbances of the geomagnetic field].

Exposure to radio-frequency radiation from an aircraft radar unit.

Extremely low-frequency electromagnetic field exposure enhances inflammatory response and inhibits effect of antioxidant in RAW 264.7 cells.

Features of anti-inflammatory effects of modulated extremely high-frequency electromagnetic radiation.

Health care utilisation and attitudes towards health care in subjects reporting environmental annoyance from electricity and chemicals.

Mobile-phone-based home exercise training program decreases systemic inflammation in COPD: a pilot study.

Psychological symptoms and intermittent hypertension following acute microwave exposure.

Radiofrequency Scanning for Retained Surgical Items Can Cause Electromagnetic Interference and Pacing Inhibition if an Asynchronous Pacing Mode Is Not Applied.

Reliable disease biomarkers characterizing and identifying electrohypersensitivity and multiple chemical sensitivity as two etiopathogenic aspects of a unique pathological disorder.

Role of ultrasonic dopplerography in monitoring the effectiveness of treatment of patients who have sustained a stroke with decimeter-range electromagnetic waves].

Sensitivity of spiral ganglion neurons to damage caused by mobile phone electromagnetic radiation will increase in lipopolysaccharide-induced inflammation in vitro model.

Some ocular symptoms and sensations experienced by long term users of mobile phones.

The amelioration of phagocytic ability in microglial cells by curcumin through the inhibition of EMF-induced pro-inflammatory responses.

The heliogeophysical aspects of circumpolar health.

The role of fatty acids in anti-inflammatory effects of low-intensity extremely high-frequency electromagnetic radiation.

The role of microwave radiometry in carotid artery disease. Diagnostic and clinical prospective.

Thermal Response of In Vivo Human Skin to Fractional Radiofrequency Microneedle Device.

FACTOR 3A

Theme – Congenital abnormalities

Key MeSH Headings - Cleft Lip, Cleft Palate, Calcification, Physiologic, Congenital Abnormalities

Titles

A confirmation study of Russian and Ukrainian data on effects of 2450 MHz microwave exposure on immunological processes and teratology in rats.

Adverse human reproductive outcomes and electromagnetic fields: a brief summary of the epidemiologic literature.

Age diseases depending on geomagnetic field activity inside the womb period].

Alternative functional relationships between ELF field exposure and possible health effects: report on an expert workshop.

An evaluation of the mutagenic, carcinogenic and teratogenic potential of microwaves.

An international project to confirm Soviet-era results on immunological and teratological effects of RF field exposure in Wistar rats and comments on Grigoriev et al. [2010].

Anesthesia as an effective agent against the production of congenital anomalies in mouse fetuses exposed to electromagnetic radiation.

Are microwaves a co-teratogen? Experimental model concept and its verification].

Case-control study on maternal residential proximity to high voltage power lines and congenital anomalies in France.

Chick embryo development can be irreversibly altered by early exposure to weak extremely-low-frequency magnetic fields.

Clinical teratology.

Congenital anomalies in the offspring of rats after exposure of the testis to an electrostatic field.

Contribution of physical factors to the complex anthropogenic load in an industrial town].

Development of chicken embryos in a pulsed magnetic field.

Development of preincubated chicken eggs following exposure to 50 Hz electromagnetic fields with 1.33-7.32 mT flux densities.

Developmental changes in Drosophila melanogaster following exposure to alternating electromagnetic fields.

Developmental toxicity interactions of salicylic acid and radiofrequency radiation or 2-methoxyethanol in rats.

Effects of 2.45 GHz CW microwave radiation on embryofetal development in mice.

Effects of gestational exposure to 1.95-GHz W-CDMA signals for IMT-2000 cellular phones: Lack of embryotoxicity and teratogenicity in rats.

Effects of noise and electromagnetic fields on reproductive outcomes.

Electromagnetic poles and reproduction].

EMF and health.

Epidemiological studies of work with video display terminals and adverse pregnancy outcomes (1984-1992).

Evaluation of the developmental toxicity of 60 Hz magnetic fields and harmonic frequencies in Sprague-Dawley rats.

Interaction of static and extremely low frequency electric and magnetic fields with living systems: health effects and research needs.

Joint actions of environmental nonionizing electromagnetic fields and chemical pollution in cancer promotion.

Maternal exposure to magnetic fields from high-voltage power lines and the risk of birth defects.

Maternal proximity to extremely low frequency electromagnetic fields and risk of birth defects.

Mouse early embryos obtained by natural breeding or in vitro fertilization display a differential sensitivity to extremely low-frequency electromagnetic fields.

Mutagenic, carcinogenic and teratogenic effects induced by radiofrequency electromagnetic field of mobile phone].

Neural and behavioral teratological evaluation of rats exposed to ultra-wideband electromagnetic fields.

Paternal work in the power industry: effects on children at delivery.

Possible effects of electric blankets and heated waterbeds on fetal development.

Prospective study of pregnancy outcomes after parental cell phone exposure: the Norwegian Mother and Child Cohort Study.

Pulsed magnetic field from video display terminals enhances teratogenic effects of cytosine arabinoside in mice.

Recent advances in research on radiofrequency fields and health.

Reproductive and teratologic effects of electromagnetic fields.

Risk of birth defects by parental occupational exposure to 50 Hz electromagnetic fields: a population based study.

Search for teratogenic risks with the aid of malformation registries.

Some effects of exposure of the Japanese quail embryo to 2.45-GHz microwave radiation.

Teratogenic effects of sinusoidal extremely low frequency electromagnetic fields on morphology of 24 hr chick embryos.

Teratology, survival, and reversal learning after fetal irradiation of mice by 2450-MHz microwave energy.

The effects of ionizing radiation, microwaves, and ultrasound on the developing embryo: clinical interpretations and applications of the data.

The influence of electromagnetic radiation generated by a mobile phone on the skeletal system of rats.

VDT pulse magnetic field enhances teratogenic effect of ara-c in mice].

Video display terminal use during pregnancy and reproductive outcome--a meta-analysis.

Video display terminals: risk of electromagnetic radiation.

FACTOR 3B

Theme – Mammary tumors

Key MeSH Headings - Fibroadenoma, Adenoma, Mammary Neoplasms, Animal, Mammary Neoplasms, Experimental, Adenocarcinoma

Titles

A histopathological study on alterations in DMBA-induced mammary carcinogenesis in rats with 50 Hz, 100 muT magnetic field exposure.

Acceleration of mammary tumorigenesis by exposure of 7,12-dimethylbenz[a]anthracene-treated female rats in a 50-Hz, 100-microT magnetic field: replication study.

Bioelectromagnetic field effects on cancer cells and mice tumors.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in F344/N rats.

Chronic, low-level (1.0 W/kg) exposure of mice prone to mammary cancer to 2450 MHz microwaves.

Do cocarcinogenic effects of ELF electromagnetic fields require repeated long-term interaction with carcinogens? Characteristics of positive studies using the DMBA breast cancer model in rats.

Effect of 13 week magnetic field exposures on DMBA-initiated mammary gland carcinomas in female Sprague-Dawley rats.

Effect of 26 week magnetic field exposures in a DMBA initiation-promotion mammary gland model in Sprague-Dawley rats.

Effect of a 9 mT pulsed magnetic field on C3H/Bi female mice with mammary carcinoma. A comparison between the 12 Hz and the 460 Hz frequencies.

Effects of 50- or 60-hertz, 100 microT magnetic field exposure in the DMBA mammary cancer model in Sprague-Dawley rats: possible explanations for different results from two laboratories.

Effects of 900 MHz GSM wireless communication signals on DMBA-induced mammary tumors in rats.

Effects of GSM-900 microwaves on DMBA-induced mammary gland tumors in female Sprague-Dawley rats.

Effects of magnetic fields on mammary tumor development induced by 7,12-dimethylbenz(a)anthracene in rats.

Effects of mobile-phone microwave on dimethylbenz (a) anthracene induced mammary carcinoma development in rats].

Effects of weak alternating magnetic fields on nocturnal melatonin production and mammary carcinogenesis in rats.

Evaluation of health risks caused by radio frequency accelerated carcinogenesis: the importance of processes driven by the calcium ion signal.

Evaluation of the potential carcinogenicity of 60 Hz linear sinusoidal continuous-wave magnetic fields in Fischer F344 rats.

Low-frequency electromagnetic radiation enhances the induction of rat mammary tumors by nitrosomethyl urea.

Magnetic fields and mammary cancer in rodents: a critical review and evaluation of published literature.

Male breast tumors in railway engine drivers: investigation of 5 cases].

Microwave absorption by normal and tumor cells.

Modifying effect of light and electromagnetic field on development of mammary tumors induced by N-nitrosomethyl urea in female rats].

Non dietetic environmental risk factors in prostate cancer].

Occupational exposure to magnetic fields in relation to male breast cancer and testicular cancer: a Swedish case-control study.

On the role of the interactions of ions with external magnetic fields in physiologic processes and their importance in chronobiology.

Repeated exposure of C3H/HeJ mice to ultra-wideband electromagnetic pulses: lack of effects on mammary tumors.

Significant differences in the effects of magnetic field exposure on 7,12-dimethylbenz(a)anthracene-induced mammary carcinogenesis in two substrains of Sprague-Dawley rats.

Study on potential effects of "902-MHz GSM-type Wireless Communication Signals" on DMBA-induced mammary tumours in Sprague-Dawley rats.

The effect of low-frequency electromagnetic fields on the development of experimental mammary tumors].

Transferrin receptors and natural killer cell lysis. A study using Colo 205 cells exposed to 60 Hz electromagnetic fields.

FACTOR 4

Theme – Male infertility

Key MeSH Headings - Sperm Count, Spermatozoa, Sperm Motility, Semen, Testis, Infertility, Male, Spermatogenesis, Testosterone, Fertility

Titles

1800 MHz mobile phone irradiation induced oxidative and nitrosative stress leads to p53 dependent Bax mediated testicular apoptosis in mice, Mus musculus.

1950MHz Radio Frequency Electromagnetic Radiation Inhibits Testosterone Secretion of Mouse Leydig Cells.

2.45 GHz microwave radiation induced oxidative and nitrosative stress mediated testicular apoptosis: Involvement of a p53 dependent bax-caspase-3 mediated pathway.

2.45-GHz microwave irradiation adversely affects reproductive function in male mouse, Mus musculus by inducing oxidative and nitrosative stress.

900 MHz pulse-modulated radiofrequency radiation induces oxidative stress on heart, lung, testis and liver tissues.

A 50-Hz electromagnetic field impairs sleep.

Abnormal physical architecture of the lipophilic domains of human sperm membrane in oligospermia: a logical cause for low fertility profiles.

Action of UHF microwaves on the germ and somatic cells of mammals].

Activation of TLR signalling regulates microwave radiation-mediated impairment of spermatogenesis in rat testis.

Acute, whole-body microwave exposure and testicular function of rats.

Adolescent in-school cellphone habits: a census of rules, survey of their effectiveness, and fertility implications.

Alternating magnetic field damages the reproductive function of murine testes].

An evaluation of the effects of long-term cell phone use on the testes via light and electron microscope analysis.

An ultrastructural analysis of the testes in mice subjected to long-term exposure to a 17-kHz electrical field].

Analysis of Gene Expression in Mice Testes Exposed to 1.765 GHz Microwave in Utero.

Are men talking their reproductive health away?

Association between mobile phone use and semen quality: a systemic review and meta-analysis.

Biologic effects of prolonged exposure to ELF electromagnetic fields in rats: II. 50 Hz magnetic fields.

Biological and morphological effects on the reproductive organ of rats after exposure to electromagnetic field.

Biological effects of non-ionizing electromagnetic fields: Two sides of a coin.

Biophysical evaluation of radiofrequency electromagnetic field effects on male reproductive pattern.

Cell phones and male infertility: a review of recent innovations in technology and consequences.

Cell phones and male infertility: dissecting the relationship.

Cell phones: modern man's nemesis?

Cellphone electromagnetic radiation damages the testicular ultrastructure of male rats].

Challenging cell phone impact on reproduction: a review.

Changes of rat testicular germ cell apoptosis after high power microwave radiation].

Chronotoxicity of 1800 MHz microwave radiation on sex hormones and spermatogenesis in male mice].

Combined effects of traffic and electromagnetic fields on the immune system of fertile atopic women.

Combined effects of varicocele and cell phones on semen and hormonal parameters.

Comparative effectiveness of different tests to determine the mutagenicity of certain factors in mammals. II. Frequency of anomalous sperm head in mice exposed to different factors].

Comparison of native and microwave irradiated DNA.

Congenital anomalies in the offspring of rats after exposure of the testis to an electrostatic field.

Cytogenetic effects of microwave irradiation on male germ cells of the mouse.

Cytokines produced by microwave-radiated Sertoli cells interfere with spermatogenesis in rat testis.

DNA damage, cell kinetics and ODC activities studied in CBA mice exposed to electromagnetic fields generated by transmission lines.

Does exposure to computers affect the routine parameters of semen quality?

Does prolonged radiofrequency radiation emitted from Wi-Fi devices induce DNA damage in various tissues of rats?

Does static electric field from ultra-high voltage direct-current transmission lines affect male reproductive capacity? Evidence from a laboratory study on male mice.

Dominant lethal studies in male mice after exposure to 2.45 GHz microwave radiation.

Dominant lethal studies in male mice after exposure to a 50 Hz magnetic field.

Dominant lethal studies in male mice after exposure to a 50-Hz electric field.

Dosimetry for a study of effects of 2.45-GHz microwaves on mouse testis.

Effect of 2.45 GHz microwave radiation on the fertility pattern in male mice.

Effect of 2450 MHz microwaves on the fertility of Swiss female mice].

Effect of cell phone usage on semen analysis in men attending infertility clinic: an observational study.

Effect of discontinuous short-wave electromagnetic field irradiation on the state of the endocrine glands].

Effect of electromagnetic irradiation produced by 3G mobile phone on male rat reproductive system in a simulated scenario.

Effect of Electromagnetic Waves from Mobile Phones on Spermatogenesis in the Era of 4G-LTE.

Effect of Guilingji Capsule on the fertility, liver functions, and serum LDH of male SD rats exposed by 900 mhz cell phone].

Effect of long-term exposure of 2.4 GHz radiofrequency radiation emitted from Wi-Fi equipment on testes functions.

Effect of low power microwave on the mouse genome: a direct DNA analysis.

Effect of low-intensity extremely high frequency radiation on reproductive function in wistar rats.

Effect of mobile telephones on sperm quality: a systematic review and meta-analysis.

Effect of Modified Wuzi Yanzong Pill () on Tip60-Mediated Apoptosis in Testis of Male Rats after Microwave Radiation.

Effect of rosmarinic acid on sertoli cells apoptosis and serum antioxidant levels in rats after exposure to electromagnetic fields.

Effect of whole-body 1800MHz GSM-like microwave exposure on testicular steroidogenesis and histology in mice.

Effects of 1800-MHz radiofrequency fields on circadian rhythm of plasma melatonin and testosterone in male rats.

Effects of 2.45 GHz CW microwave radiation on embryofetal development in mice.

Effects of 2.45 GHz microwave radiation and heat on mouse spermatogenic epithelium.

Effects of 2.45 GHz microwaves on meiotic chromosomes of male CBA/CAY mice.

Effects of 60 Hz electromagnetic field exposure on testicular germ cell apoptosis in mice.

Effects of a unique electromagnetic field system on the fertility of rats.

Effects of cellular phone emissions on sperm motility in rats.

Effects of electromagnetic fields exposure on plasma hormonal and inflammatory pathway biomarkers in male workers of a power plant.

Effects of electromagnetic fields on fecundity in the chicken.

Effects of electromagnetic fields on the reproductive success of American kestrels.

Effects of electromagnetic pulses on apoptosis and TGF-beta3 expression of mouse testis tissue].

Effects of electromagnetic radiation from a cellular phone on human sperm motility: an in vitro study.

Effects of electromagnetic radiation on morphology and TGF-beta3 expression in mouse testicular tissue.

Effects of electromagnetic waves emitted from 3G+wi-fi modems on human semen analysis.

Effects of exposure to a mobile phone on sexual behavior in adult male rabbit: an observational study.

Effects of exposure to a mobile phone on testicular function and structure in adult rabbit.

Effects of exposure to electromagnetic field (1.8/0.9 GHz) on testicular function and structure in growing rats.

Effects of extremely low-frequency electromagnetic fields (ELF-EMF) exposure on B6C3F1 mice.

Effects of GSM-like radiofrequency irradiation during the oogenesis and spermiogenesis of Xenopus laevis.

Effects of high power microwave on the expressions of Bcl-2 and C-myc proteins in the rat testis].

Effects of microwaves (950 MHZ mobile phone) on morphometric and apoptotic changes of rabbit epididymis.

Effects of mobile phone radiation on serum testosterone in Wistar albino rats.

Effects of radiofrequency electromagnetic fields (UMTS) on reproduction and development of mice: a multi-generation study.

Effects of radiofrequency electromagnetic fields on mammalian spermatogenesis].

Effects of radiofrequency electromagnetic wave exposure from cellular phones on the reproductive pattern in male Wistar rats.

Effects of radiofrequency electromagnetic waves (RF-EMW) from cellular phones on human ejaculated semen: an in vitro pilot study.

Effects of the exposure to mobile phones on male reproduction: a review of the literature.

Effects of whole-body 50-Hz magnetic field exposure on mouse Leydig cells.

Effects on rat testis of 1.95-GHz W-CDMA for IMT-2000 cellular phones.

Electric power, pineal function, and the risk of breast cancer.

Electromagnetic radiation at 900 MHz induces sperm apoptosis through bcl-2, bax and caspase-3 signaling pathways in rats.

Environmental risk factors in the history of male patients of an infertility clinic.

Evaluation of changes in electrophysiological and hormonal parameters in rabbits resulting from short-term low-intensity ultra-high-frequency irradiation].

Evaluation of testicular degeneration induced by low-frequency electromagnetic fields.

Evaluation of the effect of using mobile phones on male fertility.

Evidence for mobile phone radiation exposure effects on reproductive pattern of male rats: role of ROS.

Examination of electric field effects on tissues by using back propagation neural network.

Exercise testing in the evaluation of human responses to powerline frequency fields.

Experimental research on the biological action of the pulse-modulated microwave radiation created by shipboard radar stations].

Exposure to a 900 MHz electromagnetic field for 1 hour a day over 30 days does change the histopathology and biochemistry of the rat testis.

Exposure to magnetic fields and the risk of poor sperm quality.

Exposure to non-ionizing electromagnetic radiation of public risk prevention instruments threatens the quality of spermatozoids.

Extremely low frequency electromagnetic field exposure affects fertilization outcome in swine animal model.

Extremely low-frequency magnetic fields can impair spermatogenesis recovery after reversible testicular damage induced by heat.

Flow cytometric analysis of the effects of 50 Hz magnetic fields on mouse spermatogenesis].

Germ cell degeneration in normal and microwave-irradiated rats: potential sperm production rates at different developmental steps in spermatogenesis.

Growing concern over the safety of using mobile phones and male fertility.

Habits of cell phone usage and sperm quality - does it warrant attention?

Health problems among workers of iron welding machines: an effect of electromagnetic fields.

Histological and cytological examination of rat reproductive tissue after short-time intermittent radiofrequency exposure.

How does long term exposure to base stations and mobile phones affect human hormone profiles?

Human disease resulting from exposure to electromagnetic fields.

Hygienic standardization of electromagnetic radiation from two-channel meteorological radar stations].

Hypospermatogenesis and spermatozoa maturation arrest in rats induced by mobile phone radiation.

Immunohistopathologic demonstration of deleterious effects on growing rat testes of radiofrequency waves emitted from conventional Wi-Fi devices.

Immunomorphologic changes in the testes upon exposure to a microwave electromagnetic field].

Impact of 2.45 GHz microwave radiation on the testicular inflammatory pathway biomarkers in young rats: The role of gallic acid.

Impact of cell phone radiation on male reproduction].

Impact of cell phone use on men's semen parameters.

Impact of microwave at X-band in the aetiology of male infertility.

Impact of mobile phone radiation on the quality and DNA methylation of human sperm in vitro].

Impact of radio frequency electromagnetic radiation on DNA integrity in the male germline.

In vitro effect of pulsed 900 MHz GSM radiation on mitochondrial membrane potential and motility of human spermatozoa.

In vitro effects of radiofrequency electromagnetic waves on bovine spermatozoa motility.

In vitro fertilization of mouse ova by spermatozoa exposed isothermally to radio-frequency radiation.

Influence of a 50 hz extra low frequency electromagnetic field on spermatozoa motility and fertilization rates in rabbits.

Influence of electromagnetic fields emitted by GSM-900 cellular telephones on the circadian patterns of gonadal, adrenal and pituitary hormones in men.

Influence of electromagnetic fields on reproductive system of male rats.

Influence of in vitro microwave radiation on the fertilizing capacity of turkey sperm.

Influence of microwave exposure on fertility of male rats.

Influence of radiofrequency-electromagnetic waves from 3rd-generation cellular phones on fertilization and embryo development in mice.

Inhibition by Egb761 of the effect of cellphone radiation on the male reproductive system.

Inhibitory effects of low doses of melatonin on induction of preneoplastic liver lesions in a medium-term liver bioassay in F344 rats: relation to the influence of electromagnetic near field exposure.

Interaction of microwave radiation with turkey sperm.

Is there a relationship between cell phone use and semen quality?

Long-term effects of 900 MHz radiofrequency radiation emitted from mobile phone on testicular tissue and epididymal semen quality.

Long-term exposure of male and female mice to 50 Hz magnetic field: effects on fertility.

Long-term exposure to low intensity microwave radiation affects male reproductivity].

Long-term microwave radiation affects male reproduction in rats].

Low frequency electromagnetic waves increase human sperm motility - A pilot study revealing the potent effect of 43 kHz radiation.

Mechanisms of biological effects of radiofrequency electromagnetic fields: an overview.

Melatonin attenuates radiofrequency radiation (900 MHz)-induced oxidative stress, DNA damage and cell cycle arrest in germ cells of male Swiss albino mice.

Metabolic and ultrastructural adaptation mechanisms during the primary prophylactic action of low-intensity electromagnetic radiation under normal and radiation conditions].

Microwave emissions from police radar.

Microwave exposure affecting reproductive system in male rats.

Microwave radiation decreases the expressions of occludin and JAM-1 in rats].

Mobile phone radiation induces reactive oxygen species production and DNA damage in human spermatozoa in vitro.

Mobile phone usage and male infertility in Wistar rats.

Morinda officialis how extract improves microwave-induced reproductive impairment in male rats].

Multigeneration reproductive toxicity assessment of 60-Hz magnetic fields using a continuous breeding protocol in rats.

Occupational exposures obtained by questionnaire in clinical practice and their association with semen quality.

Occupational hazards for the male reproductive system.

Occupational influences on male fertility and sexuality. I.

Oxidative effects of extremely low frequency magnetic field and radio frequency radiation on testes tissues of diabetic and healthy rats.

Oxidative stress-mediated alterations on sperm parameters in male Wistar rats exposed to 3G mobile phone radiation.

PARAMETERS OF SPERMATOGENESIS IN MEN EXPOSED TO DIFFICULT ENVIRONMENTS].

Pathological study of testicular injury induced by high power microwave radiation in rats].

Poly ADP ribosylation as a possible mechanism of microwave--biointeraction.

Prospective study of pregnancy outcomes after parental cell phone exposure: the Norwegian Mother and Child Cohort Study.

Protective effect of Liuweidihuang Pills against cellphone electromagnetic radiation-induced histomorphological abnormality, oxidative injury, and cell apoptosis in rat testes].

Protective effects of luteolin on rat testis following exposure to 900 MHz electromagnetic field.

Proteomic analysis of continuous 900-MHz radiofrequency electromagnetic field exposure in testicular tissue: a rat model of human cell phone exposure.

Pulsed or continuous electromagnetic field induce p53/p21-mediated apoptotic signaling pathway in mouse spermatogenic cells in vitro and thus may affect male fertility.

Quantitative changes in testicular structure and function in rat exposed to mobile phone radiation.

Radar radiation damages sperm quality].

Radiations and male fertility.

Radio frequency electromagnetic radiation (RF-EMR) from GSM (0.9/1.8GHz) mobile phones induces oxidative stress and reduces sperm motility in rats.

Radiofrequency electromagnetic fields; male infertility and sex ratio of offspring.

Radiofrequency electromagnetic radiation from cell phone causes defective testicular function in male Wistar rats.

Radiofrequency radiation (900 MHz)-induced DNA damage and cell cycle arrest in testicular germ cells in swiss albino mice.

Rat fertility and embryo fetal development: influence of exposure to the Wi-Fi signal.

Reaction of Reproductive System and Epididymal Spermatozoa .of Rats to Electromagnetic Radiation from Mobile Phone (1745 MHz) of Various Duration].

Recent reports of Wi-Fi and mobile phone-induced radiation on oxidative stress and reproductive signaling pathways in females and males.

Reproduction in male Japanese quail exposed to microwave radiation during embryogeny.

Reproductive hazards among workers at high voltage substations.

Response of Caenorhabditis elegans to wireless devices radiation exposure.

Response of the seminiferous epithelium of the mouse exposed to low dose high energy (HZE) and electromagnetic radiation.

Scientometric study of the effects of exposure to non-ionizing electromagnetic fields on fertility: A contribution to understanding the reasons of partial failure.

Self-reported mobile phone use and semen parameters among men from a fertility clinic.

Semen analysis of military personnel associated with military duty assignments.

Sperm count and sperm abnormality in male mice after exposure to 2.45 GHz microwave radiation.

State of the reproductive systemin in male rats of 1st generation obtained from irradiated parents and exposed to electromagnetic radiation (897 MHz) during embryogenesis and postnatal development].

Status quo of the researches on the biological effect of electromagnetic radiation on the testis and epididymal sperm].

Structural and ultrastructural study of rat testes influenced by electromagnetic radiation.

Studies of the induction of dominant lethals and translocations in male mice after chronic exposure to microwave radiation.

Studies of the teratogenic potential of exposure of rats to 6000-MHz microwave radiation. II. Postnatal psychophysiologic evaluations.

Study of bioeffects of ship-borne microwave navigation radar in chronic experiments].

Testicular apoptosis and histopathological changes induced by a 2.45 GHz electromagnetic field.

Testicular development evaluation in rats exposed to 60 Hz and 1 mT electromagnetic field.

Testicular function of rats following exposure to microwave radiation.

Tests of mutagenesis and reproduction in male rats exposed to 2,450-MHz (CW) microwaves.

The biological effects of radiofrequency radiation: a critical review and recommendations.

The combined action of drinking mineral water and low-intensity electromagnetic radiation under the immobilization stress conditions (an experimental study)].

The effect of acute far field exposure at 2.45 GHz on the mouse testis.

The effect of alternating electric field of industrial frequency on testicles of white mice].

The effect of low-intensity prolonged impulse electromagnetic irradiation in the UHF range on the testes and the appendages of the testis in rats].

The effect of male occupational exposure in infertile couples in Norway.

The effect of prenatal exposure to 900-MHz electromagnetic field on the 21-old-day rat testicle.

The effect of pulsed 900-MHz GSM mobile phone radiation on the acrosome reaction, head morphometry and zona binding of human spermatozoa.

The effects of an electromagnetic field on the boundary tissue of the seminiferous tubules of the rat: A light and transmission electron microscope study.

The effects of electromagnetic waves emitted by the cell phones on the testicular tissue.

The effects of extremely low frequency electromagnetic field exposure on the pH of the adult male semen and the motoricity parameters of spermatozoa in vitro].

The Effects of Melatonin on Oxidative Stress Parameters and DNA Fragmentation in Testicular Tissue of Rats Exposed to Microwave Radiation.

The effects of radiofrequency electromagnetic radiation on sperm function.

The effects of simultaneous combined exposure to CDMA and WCDMA electromagnetic fields on rat testicular function.

The genomic effects of cell phone exposure on the reproductive system.

The influence of electromagnetic radiation of industrial frequency on Daphnia magna (Straus)].

The influence of ultrasound and constant magnetic field on gametes, zygotes, and embryos of the sea urchin].

The interaction of changes in the genitalia in the pathogenesis of sterility in men].

The mobile phone decreases fructose but not citrate in rabbit semen: a longitudinal study.

The semen quality of the mobile phone users.

The specific features of the development of metabolic and regenerative processes under the action of low-intensity electromagnetic radiation in radiation exposure conditions (an experimental study)].

The therapeutic effect of a pulsed electromagnetic field on the reproductive patterns of male Wistar rats exposed to a 2.45-GHz microwave field.

The use of FDTD in establishing in vitro experimentation conditions representative of lifelike cell phone radiation on the spermatozoa.

Therapeutic approaches of melatonin in microwave radiations-induced oxidative stress-mediated toxicity on male fertility pattern of Wistar rats.

Whole-body microwave exposure emitted by cellular phones and testicular function of rats.

Wi-Fi (2.45 GHz)- and mobile phone (900 and 1800 MHz)-induced risks on oxidative stress and elements in kidney and testis of rats during pregnancy and the development of offspring.

FACTOR 5

Theme – Brain neoplasms

Key MeSH Headings - Meningioma, Glioma, Meningeal Neoplasms, Neuroma, Acoustic, Brain Neoplasms, Glioblastoma, Neoplasms, Radiation-Induced, Neuroma, Cranial Nerve Neoplasms, Parotid Neoplasms, Central Nervous System Neoplasms

Titles

50-Hz electromagnetic environment and the incidence of childhood tumors in Stockholm County.

A Bayesian approach to hazard identification. The case of electromagnetic fields and cancer.

A case-case study of mobile phone use and acoustic neuroma risk in Japan.

A cerebral primitive neuroectodermal tumor in a squirrel monkey (Saimiri sciureus).

A literature review of medical side effects from radio-frequency energy in the human environment: involving cancer, tumors, and problems of the central nervous system.

A pooled analysis of extremely low-frequency magnetic fields and childhood brain tumors.

A population-based case-control study of radiofrequency exposure in relation to childhood neoplasm.

A review of in vitro studies: low-frequency electromagnetic fields.

A three-dimensional point process model for the spatial distribution of disease occurrence in relation to an exposure source.

Acoustic neuroma risk in relation to mobile telephone use: results of the INTERPHONE international case-control study.

Adult glioma in relation to residential power frequency electromagnetic field exposures in the San Francisco Bay area.

Adult mortality from leukemia, brain cancer, amyotrophic lateral sclerosis and magnetic fields from power lines: a case-control study in Brazil.

Alternative functional relationships between ELF field exposure and possible health effects: report on an expert workshop.

An epidemiological review of mobile telephones and cancer.

An international prospective cohort study of mobile phone users and health (Cosmos): design considerations and enrolment.

Analyses of temporal and spatial patterns of glioblastoma multiforme and other brain cancer subtypes in relation to mobile phones using synthetic counterfactuals.

Analysis of ear side of mobile phone use in the general population of Japan.

Analysis of gene expression in two human-derived cell lines exposed in vitro to a 1.9 GHz pulse-modulated radiofrequency field.

Analysis of mobile phone use among young patients with brain tumors in Japan.

Anthropogenic Radio-Frequency Electromagnetic Fields Elicit Neuropathic Pain in an Amputation Model.

Application criteria of the precautionary principle].

Assessing the potential carcinogenic activity of magnetic fields using animal models.

Assessment of cellular telephone and other radio frequency exposure for epidemiologic research.

Association between number of cell phone contracts and brain tumor incidence in nineteen U.S. States.

Association between radiation from mobile phones and tumour risk in adults].

Association between vestibular schwannomas and mobile phone use.

Association of childhood cancer with residential traffic density.

Berkson error adjustment and other exposure surrogates in occupational case-control studies, with application to the Canadian INTEROCC study.

Bioeffects of electromagnetic fields--safety limits of each frequency band, especially less than radio one].

Biological effects from electromagnetic field exposure and public exposure standards.

Biological effects of amplitude-modulated radiofrequency radiation.

Biological effects of electromagnetic fields and radiation.

Biological effects of extremely low-frequency electromagnetic fields: in vivo studies.

Biological effects on human health due to radiofrequency/microwave exposure: a synopsis of cohort studies.

Biological indicators in response to radiofrequency/microwave exposure.

Biological interactions and potential health effects of extremely-low-frequency magnetic fields from power lines and other common sources.

Biological responses to electromagnetic fields.

Biomarkers of induced electromagnetic field and cancer.

Biophysical estimation of the environmental importance of electromagnetic fields.

Biophysical mechanisms of electromagnetic fields interaction and health effects].

Brain cancer and occupational exposure to magnetic fields among men: results from a Canadian population-based case-control study.

Brain cancer incidence trends in relation to cellular telephone use in the United States.

Brain cancer risk and electromagnetic fields (EMFs): assessing the geomagnetic component.

Brain tumor risk in children in relation to use of electric blankets and water bed heaters. Results from the United States West Coast Childhood Brain Tumor Study.

Brain tumor risk in offspring of men occupationally exposed to electric and magnetic fields.

Calcium protects differentiating neuroblastoma cells during 50 Hz electromagnetic radiation.

Cancer in radar technicians exposed to radiofrequency/microwave radiation: sentinel episodes.

Cancer incidence among welders: possible effects of exposure to extremely low frequency electromagnetic radiation (ELF) and to welding fumes.

Cancer incidence and magnetic field exposure in industries using resistance welding in Sweden.

Cancer incidence and mortality and proximity to TV towers.

Cancer incidence vs. FM radio transmitter density.

Cancer morbidity in subjects occupationally exposed to high frequency (radiofrequency and microwave) electromagnetic radiation.

Cancer risks related to low-level RF/MW exposures, including cell phones.

Carcinogenic risk of extremely-low-frequency electromagnetic fields: state of the art].

Carcinogenicity study of 217 Hz pulsed 900 MHz electromagnetic fields in Pim1 transgenic mice.

Carcinogenicity study of GSM and DCS wireless communication signals in B6C3F1 mice.

Carcinogenicity test of 50 Hz sinusoidal magnetic fields in rats.

Case-control study of childhood cancer and exposure to 60-Hz magnetic fields.

Case-control study of the association between malignant brain tumours diagnosed between 2007 and 2009 and mobile and cordless phone use.

Case-control study on occupational exposure to extremely low-frequency electromagnetic fields and glioma risk.

Case-Control Study on Occupational Exposure to Extremely Low-Frequency Electromagnetic Fields and the Association with Meningioma.

Case-control study on the use of cellular and cordless phones and the risk for malignant brain tumours.

Case-control study on uveal melanoma (RIFA): rational and design.

Cell phone radiation exposure on brain and associated biological systems.

Cell phone use and acoustic neuroma: the need for standardized questionnaires and access to industry data.

Cell phone use and risk of thyroid cancer: a population-based case-control study in Connecticut.

Cell phones and brain tumors: a review including the long-term epidemiologic data.

Cell phones and cancer: what is the evidence for a connection?

Cell phones and children: follow the precautionary road.

Cell Phones and Risk of brain and acoustic nerve tumours: the French INTERPHONE case-control study].

Cell phones: health risks and prevention].

Cellular and cordless telephone use and the association with brain tumors in different age groups.

Cellular and cordless telephones and the risk for brain tumours.

Cellular phone use and brain tumor: a meta-analysis.

Cellular phone use and risk of benign and malignant parotid gland tumors--a nationwide case-control study.

Cellular phones and risk of brain tumors.

Cellular phones and their hazards: the current evidence.

Cellular phones, cordless phones, and the risks of glioma and meningioma (Interphone Study Group, Germany).

Cellular telephone use and risk of intratemporal facial nerve tumor.

Cellular telephone use and time trends for brain, head and neck tumours.

Cellular telephones and risk for brain tumors: a population-based, incident case-control study.

Cellular-telephone use and brain tumors.

Changes in brain glioma incidence and laterality correlates with use of mobile phones--a nationwide population based study in Israel.

Childhood brain tumors and residential electromagnetic fields (EMF).

Childhood brain tumour risk and its association with wireless phones: a commentary.

Childhood brain tumours and use of mobile phones: comparison of a case-control study with incidence data.

Childhood cancer and magnetic fields from high-voltage power lines in England and Wales: a case-control study.

Childhood cancer and residential proximity to power lines. UK Childhood Cancer Study Investigators.

Childhood cancer in relation to a modified residential wire code.

Childhood cancer in relation to distance from high voltage power lines in England and Wales: a case-control study.

Childhood cancer in relation to indicators of magnetic fields from ground current sources.

Childhood cancer occurrence in relation to power line configurations: a study of potential selection bias in case-control studies.

Childhood leukaemia and distance from power lines in California: a population-based case-control study.

Children's health and RF EMF exposure. Views from a risk assessment and risk communication perspective.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in F344/N rats.

Chronic, low-level (1.0 W/kg) exposure of mice prone to mammary cancer to 2450 MHz microwaves.

Cochlear implants in the etiopathogenesis of glioblastoma--an interesting observation or independent finding?

Cohort and nested case-control studies of hematopoietic cancers and brain cancer among electric utility workers.

Comparative analyses of the studies of magnetic fields and cancer in electric utility workers: studies from France, Canada, and the United States.

Comparative health risk assessment of electromagnetic fields.

Computer screens and brain cancer.

Concern that "EMF" magnetic fields from power lines cause cancer.

Correlation between cellular phone use and epithelial parotid gland malignancies.

Current state of our knowledge on brain tumor epidemiology.

Cytotoxicity of temozolomide on human glioblastoma cells is enhanced by the concomitant exposure to an extremely low-frequency electromagnetic field (100Hz, 100G).

Danger of cellular telephones and their relay stations].

Decreased survival of glioma patients with astrocytoma grade IV (glioblastoma multiforme) associated with long-term use of mobile and cordless phones.

Do people understand IARC's 2B categorization of RF fields from cell phones?

Does cell phone use increase the chances of parotid gland tumor development? A systematic review and meta-analysis.

Ecological study on residences in the vicinity of AM radio broadcasting towers and cancer death: preliminary observations in Korea.

Effect of magnetic field exposure on anchorage-independent growth of a promoter-sensitive mouse epidermal cell line (JB6).

Effect of Mobile Phone-Induced Electromagnetic Field on Brain Hemodynamics and Human Stem Cell Functioning: Possible Mechanistic Link to Cancer Risk and Early Diagnostic Value of Electronphotonic Imaging.

Effect of radiofrequency radiation exposure on mouse skin tumorigenesis initiated by 7,12-dimethybenz[alpha]anthracene.

Effects of 2.45-GHz microwave radiation and phorbol ester 12-O-tetradecanoylphorbol-13-acetate on dimethylhydrazine-induced colon cancer in mice.

Effects of 2450 MHz electromagnetic fields with a wide range of SARs on methylcholanthrene-induced transformation in C3H10T1/2 cells.

Effects of 900 MHz GSM wireless communication signals on DMBA-induced mammary tumors in rats.

Effects of a 2450 MHz high-frequency electromagnetic field with a wide range of SARs on the induction of heat-shock proteins in A172 cells.

Effects of electromagnetic fields on health].

Effects of electromagnetic radiation of mobile phones on the central nervous system.

Effects of exposure to a 1950 MHz radio frequency field on expression of Hsp70 and Hsp27 in human glioma cells.

Effects of GSM-900 microwaves on DMBA-induced mammary gland tumors in female Sprague-Dawley rats.

Effects of low level microwave radiation on carcinogenesis in Swiss Albino mice.

Effects of mobile phone radiation on UV-induced skin tumourigenesis in ornithine decarboxylase transgenic and non-transgenic mice.

Electric and magnetic field exposure and brain cancer: a review.

Electric blanket or mattress cover use and breast cancer incidence in women 50-79 years of age.

Electric Blanket Use and Risk of Thyroid Cancer in the Women's Health Initiative Observational Cohort.

Electrical field exposure and human health. Risk assessment and problems relative to bureaucratic procedures and to the role of instituitional organizations in control and prevention].

Electromagnetic field exposures and childhood cancers in New Zealand.

Electromagnetic fields and brain tumours: a commentary.

Electromagnetic fields and cancer risks.

Electromagnetic fields and cancer: the cost of doing nothing.

Electromagnetic fields and cells.

Electromagnetic fields and female breast cancer.

Electromagnetic fields and health effects--epidemiologic studies of cancer, diseases of the central nervous system and arrhythmia-related heart disease.

Electromagnetic fields and public health.

Electromagnetic fields from high-voltage installations and cancer in childhood].

Electromagnetic fields of mobile telephone systems--thresholds, effects and risks for cochlear implant patients and healthy people].

Electromagnetic fields--effects on health].

Electromagnetic fields: a cancer promoter?

Electromagnetic radiations and cancer. Cause and prevention.

Electromagnetic-field exposure and cancer.

Electrosmog as a health risk factor: sources of artificial electromagnetic fields, evaluation of health risk, prevention methods].

EMF and health.

Environmental risk factors for brain tumors.

Environmental risk factors for sporadic acoustic neuroma (Interphone Study Group, Germany).

Epidemiologic evidence on mobile phones and tumor risk: a review.

Epidemiologic evidence relevant to radar (microwave) effects.

Epidemiologic study of residential proximity to transmission lines and childhood cancer in California: description of design, epidemiologic methods and study population.

Epidemiological appraisal of studies of residential exposure to power frequency magnetic fields and adult cancers.

Epidemiological studies of human exposures to radiofrequency radiation. A critical review.

Epidemiological studies of radio frequency exposures and human cancer.

Epidemiological study of power lines and childhood cancer in the UK: further analyses.

Epidemiology and etiology of gliomas.

Epidemiology of brain tumors.

Epidemiology of health effects of radiofrequency exposure.

Epidemiology of Intracranial Gliomas.

Estimates of Environmental Exposure to Radiofrequency Electromagnetic Fields and Risk of Lymphoma Subtypes.

Estimating associations of mobile phone use and brain tumours taking into account laterality: a comparison and theoretical evaluation of applied methods.

Estimating exposure in studies of residential magnetic fields and cancer: importance of short-term variability, time interval between diagnosis and measurement, and distance to power line.

Evaluation of carcinogenic effects of electromagnetic fields (EMF).

Evaluation of Mobile Phone and Cordless Phone Use and Glioma Risk Using the Bradford Hill Viewpoints from 1965 on Association or Causation.

Evaluation of potential confounders in planning a study of occupational magnetic field exposure and female breast cancer.

Evaluation of residential exposure to intermediate frequency magnetic fields.

Evaluation of the effects of electric and magnetic fields in humans].

Evaluation of the potential carcinogenicity of 60 Hz linear sinusoidal continuous-wave magnetic fields in Fischer F344 rats.

Evaluation of the potential of mobile phone specific electromagnetic fields (UMTS) to produce micronuclei in human glioblastoma cell lines.

Experimental data on radiofrequency].

Exposure to 2.45 GHz electromagnetic fields induces hsp70 at a high SAR of more than 20 W/kg but not at 5W/kg in human glioma MO54 cells.

Exposure to 50-Hz electric field and incidence of leukemia, brain tumors, and other cancers among French electric utility workers.

Exposure to 60-Hz magnetic fields and proliferation of human astrocytoma cells in vitro.

Exposure to low electromagnetic fields and the carcinogenesis process].

Exposure to power frequency electric fields and the risk of childhood cancer in the UK.

Exposure to power-frequency magnetic fields and the risk of childhood cancer. UK Childhood Cancer Study Investigators.

Exposure to radio-frequency electromagnetic fields from broadcast transmitters and risk of childhood cancer: a census-based cohort study.

Extremely low frequency electromagnetic fields (EMF) and brain cancer in adults and children: review and comment.

Extremely low frequency electromagnetic fields and cancer: the epidemiologic evidence.

Extremely low-frequency electromagnetic fields exposure and female breast cancer risk: a meta-analysis based on 24,338 cases and 60,628 controls.

Fifty Hertz electromagnetic field exposure stimulates secretion of beta-amyloid peptide in cultured human neuroglioma.

Follow-up of radio and telegraph operators with exposure to electromagnetic fields and risk of breast cancer.

Further aspects on cellular and cordless telephones and brain tumours.

Future needs of occupational epidemiology of extremely low frequency electric and magnetic fields: review and recommendations.

Genetic, carcinogenic and teratogenic effects of radiofrequency fields.

GSM and DCS wireless communication signals: combined chronic toxicity/carcinogenicity study in the Wistar rat.

Has the incidence of brain cancer risen in Australia since the introduction of mobile phones 29 years ago?

Mobile phone use and brain tumors in children and adolescents: a multicenter case-control study.

Mobile phone use and brain tumours in the CERENAT case-control study.

Mobile phone use and glioma risk: A systematic review and meta-analysis.

Mobile phone use and glioma risk: comparison of epidemiological study results with incidence trends in the United States.

Mobile phone use and incidence of brain tumour histological types, grading or anatomical location: a population-based ecological study.

Mobile phone use and incidence of glioma in the Nordic countries 1979-2008: consistency check.

Mobile phone use and location of glioma: a case-case analysis.

Mobile phone use and risk for intracranial tumors and salivary gland tumors - A meta-analysis.

Mobile phone use and risk for intracranial tumors.

Mobile phone use and risk of acoustic neuroma: results of the Interphone case-control study in five North European countries.

Mobile phone use and risk of brain neoplasms and other cancers: prospective study.

Mobile phone use and risk of brain tumours: a systematic review of association between study quality, source of funding, and research outcomes.

Mobile phone use and risk of glioma in 5 North European countries.

Mobile phone use and risk of glioma in adults: case-control study.

Mobile phone use and risk of intracranial tumors: a consistency analysis.

Mobile phone use and risk of parotid gland tumor.

Mobile phone use and risk of tumors: a meta-analysis.

Mobile phone use and the risk for malignant brain tumors: a case-control study on deceased cases and controls.

Mobile phone use and the risk of acoustic neuroma.

Mobile Phone Use and the Risk of Parotid Gland Tumors: A Retrospective Case-Control Study.

Mobile phone use and the risk of skin cancer: a nationwide cohort study in Denmark.

Mobile phone use, exposure to radiofrequency electromagnetic field, and brain tumour: a case-control study.

Mobile phones and brain tumours: a review of epidemiological research.

Mobile phones and head tumours. The discrepancies in cause-effect relationships in the epidemiological studies - how do they arise?

Mobile phones and head tumours: it is time to read and highlight data in a proper way].

Mobile phones, brain tumors, and the interphone study: where are we now?

Mobile phones, cordless phones and rates of brain tumors in different age groups in the Swedish National Inpatient Register and the Swedish Cancer Register during 1998-2015.

Mobile phones, cordless phones and the risk for brain tumours.

Mobile phones, mobile phone base stations and cancer: a review.

Mobile phones: influence on auditory and vestibular systems.

Mortality from brain cancer and leukaemia among electrical workers.

Mortality in workers exposed to electromagnetic fields.

Mortality indices for hemoblastoses in Rivno Province before and after the accident at the Chernobyl Atomic Electric Power Station].

Motivation and significance of IARC classification for mobile phone].

Need for a European approach to the effects of extremely low-frequency electromagnetic fields on cancer. ELF-EMF European Feasibility Study Group.

New Zealand adolescents' cellphone and cordless phone user-habits: are they at increased risk of brain tumours already? A cross-sectional study.

Non dietetic environmental risk factors in prostate cancer].

Non-ionizing electromagnetic radiation and cancer--is there a relationship?

Non-ionizing electromagnetic radiation: a study of carcinogenic and cancer treatment potential.

Non-thermal bioeffects of static and extremely low frequency electromagnetic fields].

Nonionizing electromagnetic fields and cancer: a review.

Normal doses of visible light can cause mutations in skin].

Occupational and residential exposure to electromagnetic fields and risk of brain tumors in adults: a case-control study in Gironde, France.

Occupational and residential magnetic field exposure and leukemia and central nervous system tumors.

Occupational electric and magnetic field exposure and brain cancer: a meta-analysis.

Occupational exposure to electromagnetic fields and its health effects in electric energy workers].

Occupational exposure to electromagnetic fields and sex-differential risk of uveal melanoma.

Occupational exposure to electromagnetic fields and the occurrence of brain tumors. An analysis of possible associations.

Occupational exposure to high-frequency electromagnetic fields and brain tumor risk in the INTEROCC study: An individualized assessment approach.

Occupational exposure to ionizing and non-ionizing radiation and risk of non-Hodgkin lymphoma.

Occupational exposure to ionizing radiation and electromagnetic fields in relation to the risk of thyroid cancer in Sweden.

Occupational exposure to low frequency magnetic fields and the risk of low grade and high grade glioma.

Occupational exposure to magnetic fields and brain tumours in central Sweden.

Occupational exposure to magnetic fields and the risk of brain tumors.

Occupational exposure to non-ionizing radiation and an association with heart disease: an exploratory study.

Occupational exposure to power frequency magnetic fields and risk of non-Hodgkin lymphoma.

Occupational exposure to radio frequency/microwave radiation and the risk of brain tumors: Interphone Study Group, Germany.

Occupational exposures and brain cancer mortality: a preliminary study of east Texas residents.

Occupational magnetic field exposure and the risk of acoustic neuroma.

Occupational risk factors for cancer of the central nervous system: a case-control study on death certificates from 24 U.S. states.

Overview of epidemiologic research on electric and magnetic fields and cancer.

p53 immunoreactivity in cutaneous PUVA tumors is similar to that in other non-melanoma skin neoplasms.

Panel exploring pro and con arguments as to whether EMFs cause childhood brain cancer.

Parental occupational exposure to magnetic fields and childhood cancer (Sweden).

Pathophysiology of cell phone radiation: oxidative stress and carcinogenesis with focus on male reproductive system.

Physical basis of adverse and therapeutic effects of low intensity microwave radiation.

Pooled analysis of case-control studies on acoustic neuroma diagnosed 1997-2003 and 2007-2009 and use of mobile and cordless phones.

Pooled analysis of case-control studies on malignant brain tumours and the use of mobile and cordless phones including living and deceased subjects.

Pooled analysis of Swedish case-control studies during 1997-2003 and 2007-2009 on meningioma risk associated with the use of mobile and cordless phones.

Possible cocarcinogenic effects of ELF electromagnetic fields may require repeated long-term interaction with known carcinogenic factors.

Possible effects of radiofrequency electromagnetic fields on in vivo C6 brain tumors in Wistar rats.

Possible health hazards from exposure to power-frequency electric and magnetic fields--a COMAR Technical Information Statement.

Power-frequency magnetic fields and childhood brain tumors: a case-control study in Japan.

Primary brain cancer in adults and the use of common household appliances: a case-control study.

Probabilistic Multiple-Bias Modeling Applied to the Canadian Data From the Interphone Study of Mobile Phone Use and Risk of Glioma, Meningioma, Acoustic Neuroma, and Parotid Gland Tumors.

Public health and the radio frequency radiation emitted by cellphone technology, smart meters and WiFi.

Quantifying the impact of selection bias caused by nonparticipation in a case-control study of mobile phone use.

Radiation exposure, socioeconomic status, and brain tumor risk in the US Air Force: a nested case-control study.

Radio and microwave frequency radiation and health--an analysis of the literature].

Radio frequency electromagnetic fields: cancer, mutagenesis, and genotoxicity.

Radio-frequency radiation exposure from AM radio transmitters and childhood leukemia and brain cancer.

Radiofrequency and microwave radiation in the microelectronics industry.

Radiofrequency electromagnetic fields emitted from base stations of DECT cordless phones and the risk of glioma and meningioma (Interphone Study Group, Germany).

Radiofrequency exposure and mammalian cell toxicity, genotoxicity, and transformation.

Radiofrequency exposure and mortality from cancer of the brain and lymphatic/hematopoietic systems.

Radiofrequency field exposure and cancer: what do the laboratory studies suggest?

Radiofrequency-induced carcinogenesis: cellular calcium homeostasis changes as a triggering factor.

Rate of occurrence of transient magnetic field events in U.S. residences.

Reanalysis of risks of childhood leukaemia with distance from overhead power lines in the UK.

Recent advances in research on radiofrequency fields and health: 2001-2003.

Recent advances in research on radiofrequency fields and health: 2004-2007.

Recent data from the literature on the biological and pathologic effects of electromagnetic radiation, radio waves and stray currents].

Refinements in magnetic field exposure assignment for a case-cohort study of electrical utility workers.

Repeated exposure of C3H/HeJ mice to ultra-wideband electromagnetic pulses: lack of effects on mammary tumors.

Report of final results regarding brain and heart tumors in Sprague-Dawley rats exposed from prenatal life until natural death to mobile phone radiofrequency field representative of a 1.8GHz GSM base station environmental emission.

Residential electric consumption and childhood cancer in Canada (1971-1986)

Residential exposure to 60-Hertz magnetic fields and adult cancers in Taiwan.

Residential magnetic field exposure and childhood brain cancer: a meta-analysis.

Residential mobility of populations near UK power lines and implications for childhood leukaemia.

Review of four publications on the Danish cohort study on mobile phone subscribers and risk of brain tumors.

Review of possible modulation-dependent biological effects of radiofrequency fields.

Review of the epidemiologic literature on EMF and Health.

Review on health effects related to mobile phones. Part II: results and conclusions.

Risk for leukaemia and brain and breast cancer among Danish utility workers: a second follow-up.

Risk of brain tumors from wireless phone use.

Risk of brain tumours in relation to estimated RF dose from mobile phones: results from five Interphone countries.

Risk of cancer among Danish electricity workers. A cohort study].

Risk of neoplastic diseases in conditions of exposure to power magnetic fields--epidemiologic investigations].

Risk of neoplastic diseases in conditions of exposure to radio- and microwave fields--epidemiologic investigations].

Selection bias due to differential participation in a case-control study of mobile phone use and brain tumors.

Selection bias from differential residential mobility as an explanation for associations of wire codes with childhood cancer.

Self-reported electrical appliance use and risk of adult brain tumors.

Setting prudent public health policy for electromagnetic field exposures.

Should the threshold limit value for power frequency (60 Hz) magnetic fields be changed? Perceptions among scientists and other risk experts.

Significant differences in the effects of magnetic field exposure on 7,12-dimethylbenz(a)anthracene-induced mammary carcinogenesis in two substrains of Sprague-Dawley rats.

Simulation of the incidence of malignant brain tumors in birth cohorts that started using mobile phones when they first became popular in Japan.

Spontaneous and nitrosourea-induced primary tumors of the central nervous system in Fischer 344 rats chronically exposed to 836 MHz modulated microwaves.

Spontaneous and nitrosourea-induced primary tumors of the central nervous system in Fischer 344 rats exposed to frequency-modulated microwave fields.

Studies of childhood brain tumors using immunohistochemistry and microwave technology: methodological considerations.

Studying the effects of mobile phone use on the auditory system and the central nervous system: a review of the literature and future directions.

Survival and cancer in laboratory mammals exposed to radiofrequency energy.

Survival of glioma patients in relation to mobile phone use in Denmark, Finland and Sweden.

Symptomatic complex partial status epilepticus manifesting as utilization behavior of a mobile phone.

Systematic review of wireless phone use and brain cancer and other head tumors.

The anatomical distribution of cerebral gliomas in mobile phone users.

The controversy about a possible relationship between mobile phone use and cancer.

The controversy about a possible relationship between mobile phone use and cancer.

The design, construction and calibration of a carefully controlled source for exposure of mammalian cells to extremely low-frequency electromagnetic fields.

The effect of 60-Hz magnetic fields on co-promotion of chemically induced skin tumors on SENCAR mice: a discussion of three studies.

The effect of chronic exposure to 835.62 MHz FDMA or 847.74 MHz CDMA radiofrequency radiation on the incidence of spontaneous tumors in rats.

The effect of embryonic and fetal exposure to x-ray, microwaves, and ultrasound: counseling the pregnant and nonpregnant patient about these risks.

The effects of 860 MHz radiofrequency radiation on the induction or promotion of brain tumors and other neoplasms in rats.

The effects of embryonic and fetal exposure to x-ray, microwaves, and ultrasound.

The effects of ionizing radiation, microwaves, and ultrasound on the developing embryo: clinical interpretations and applications of the data.

The effects of pulsed 860 MHz radiofrequency radiation on the promotion of neurogenic tumors in rats.

The epidemiology of electric and magnetic field exposures in the power frequency range and reproductive outcomes.

The estimation of 3D SAR distributions in the human head from mobile phone compliance testing data for epidemiological studies.

The IARC carcinogenicity evaluation of radio-frequency electromagnetic field: with special reference to epidemiology of mobile phone use and brain tumor risk].

The incidence rate and mortality of malignant brain tumors after 10 years of intensive cell phone use in Taiwan.

The Intracranial Distribution of Gliomas in Relation to Exposure From Mobile Phones: Analyses From the INTERPHONE Study.

The possible role of contact current in cancer risk associated with residential magnetic fields.

The possible role of radiofrequency radiation in the development of uveal melanoma.

The potential carcinogenic hazards of electromagnetic radiation: a review.

The precautionary principle and electric and magnetic fields.

The probability of developing brain tumours among users of cellular telephones (scientific information to the decision of the International Agency for Research on Cancer (IARC) announced on May 31, 2011)].

The problem of hygienic standardization of commercial electric and magnetic fields in Russia and other countries].

The question of health effects from exposure to electromagnetic fields.

The role of chemical and physical factors in cancer development].

The sensitivity of children to electromagnetic fields.

Thermal and non-thermal health effects of low intensity non-ionizing radiation: An international perspective.

Time trend in incidence of malignant neoplasms of the central nervous system in relation to mobile phone use among young people in Japan.

Time trends (1998-2007) in brain cancer incidence rates in relation to mobile phone use in England.

Trends in incidence of primary brain cancer in New Zealand, 1995 to 2010.

Uncertainty in the relation between exposure to magnetic fields and brain cancer due to assessment and assignment of exposure and analytical methods in dose-response modeling.

Use of cellular and cordless telephones and risk of testicular cancer.

Use of cellular telephones and brain tumour risk in urban and rural areas.

Use of cellular telephones and risk of cancer. A Danish cohort study].

Use of cellular telephones and the risk for brain tumours: A case-control study.

Use of mobile and cordless phones and survival of patients with glioma.

Use of mobile phones and cancer risk.

Use of mobile phones and risk of brain tumours: update of Danish cohort study.

Use of mobile phones in Norway and risk of intracranial tumours.

Use of wireless phones and the risk of salivary gland tumours: a case-control study.

Using the Hill viewpoints from 1965 for evaluating strengths of evidence of the risk for brain tumors associated with use of mobile and cordless phones.

Validation of self-reported start year of mobile phone use in a Swedish case-control study on radiofrequency fields and acoustic neuroma risk.

Variation in cancer risk estimates for exposure to powerline frequency electromagnetic fields: a meta-analysis comparing EMF measurement methods.

Vestibular schwannoma and cell-phones. Results, limits and perspectives of clinical studies.

Wire codes, magnetic fields, and childhood cancer.

Wireless Phone Use and Risk of Adult Glioma: Evidence from a Meta-Analysis.

World Health Organization, radiofrequency radiation and health - a hard nut to crack (Review).

FACTOR 6

Theme – Sensory disorders

Key MeSH Headings - Burning Mouth Syndrome, Taste Disorders, Skin Diseases, Mouth Diseases, Dizziness, Vision Disorders, Hypersensitivity, Delayed, Fatigue

Titles

A method for in vivo detection of abnormal subepidermal tissues based on dielectric properties.

A survey study on some neurological symptoms and sensations experienced by long term users of mobile phones.

Adverse cutaneous effects of ionizing and non-ionizing electromagnetic radiation.

Association between exposure to radiofrequency electromagnetic fields assessed by dosimetry and acute symptoms in children and adolescents: a population based cross-sectional study.

Association of mobile phone radiation with fatigue, headache, dizziness, tension and sleep disturbance in Saudi population.

Bedtime mobile phone use and sleep in adults.

Can exposure to a terrestrial trunked radio (TETRA)-like signal cause symptoms? A randomised double-blind provocation study.

Cardiac devices and electromagnetic interference revisited: new radiofrequency technologies and implications for dermatologic surgery.

Description of persons with symptoms presumed to be caused by electricity or visual display units--oral aspects.

Effect of millimeter waves on cyclophosphamide induced suppression of the immune system.

Effect of stress and intesity of mobile phone using on the health and subjective symptoms in GSM workers].

Electromagnetic hypersensitivity (EHS) and subjective health complaints associated with electromagnetic fields of mobile phone communication--a literature review published between 2000 and 2004.

Environmental illness: fatigue and cholinesterase activity in patients reporting hypersensitivity to electricity.

Health response of two communities to military antennae in Cyprus.

Health status of the workers exposed to strong, constant magnetic fields].

Human exposure to 4.0-Tesla magnetic fields in a whole-body scanner.

Immune function and host defense in rodents exposed to 60-Hz magnetic fields.

Immunomorphologic changes in the testes upon exposure to a microwave electromagnetic field].

Interference with cardiac pacemakers by cellular telephones.

Microwave sickness: a reappraisal.

Mobile communication: radiobiology problems and evaluation of danger].

Mobile phone use and subjective symptoms. Comparison of symptoms experienced by users of analogue and digital mobile phones.

Mobile phone use, school electromagnetic field levels and related symptoms: a cross-sectional survey among 2150 high school students in Izmir.

Neurobehavioral effects among inhabitants around mobile phone base stations.

Non-specific physical symptoms and electromagnetic field exposure in the general population: can we get more specific? A systematic review.

Odontologic survey of referred patients with symptoms allegedly caused by electricity or visual display units.

Provocation with stress and electricity of patients with "sensitivity to electricity".

Psychologic aspects of patients with symptoms presumed to be caused by electricity or visual display units.

Some ocular symptoms and sensations experienced by long term users of mobile phones.

Some ocular symptoms experienced by users of mobile phones.

Specific patterns of weak (1 microTesla) transcerebral complex magnetic fields differentially affect depression, fatigue, and confusion in normal volunteers.

Study of human neurovegetative and hematologic effects of environmental low-frequency (50-Hz) electromagnetic fields produced by transformers.

Subjective symptoms related to mobile phone use--a pilot study].

Symptoms experienced by people in vicinity of base stations: II/ Incidences of age, duration of exposure, location of subjects in relation to the antennas and other electromagnetic factors].

Symptoms of ill health ascribed to electromagnetic field exposure--a questionnaire survey.

Symptoms, personality traits, and stress in people with mobile phone-related symptoms and electromagnetic hypersensitivity.

The effects of cell phone use on peripheral vision.

The effects of multivitamin supplementation on mood and general well-being in healthy young adults. A laboratory and at-home mobile phone assessment.

The risk of subjective symptoms in mobile phone users in Poland--an epidemiological study.

Video display terminals: risk of electromagnetic radiation.

FACTOR 7

Theme – Breast neoplasms

Key MeSH Headings - Carcinoma, Lobular, Carcinoma, Ductal, Breast, Breast Neoplasms, Male, Adenoma

Titles

A cluster of male breast cancer in office workers.

A meta-analysis of epidemiologic studies of electric and magnetic fields and breast cancer in women and men.

Breast cancer, occupation, and exposure to electromagnetic fields among Swedish men.

Carcinogenic risk of extremely-low-frequency electromagnetic fields: state of the art].

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in F344/N rats.

Effect of 13 week magnetic field exposures on DMBA-initiated mammary gland carcinomas in female Sprague-Dawley rats.

Electromagnetic field exposure and male breast cancer risk: a meta-analysis of 18 studies.

Epidemiology and aetiological factors of male breast cancer: a ten years retrospective study in eastern Turkey.

Evaluation of health risks caused by radio frequency accelerated carcinogenesis: the importance of processes driven by the calcium ion signal.

Magnetic fields and breast cancer in Swedish adults residing near high-voltage power lines.

Magnetic fields and mammary cancer in rodents: a critical review and evaluation of published literature.

Male breast tumors in railway engine drivers: investigation of 5 cases].

Occupational exposure to magnetic fields in relation to male breast cancer and testicular cancer: a Swedish case-control study.

Risk for leukaemia and brain and breast cancer among Danish utility workers: a second follow-up.

The relationship between electromagnetic field and light exposures to melatonin and breast cancer risk: a review of the relevant literature.

FACTOR 8

Theme – Oxidative stress

Key MeSH Headings - Oxidative Stress, Malondialdehyde, Glutathione Peroxidase, Lipid Peroxidation, Reactive Oxygen Species, Apoptosis, DNA Damage, Nitric Oxide, Protein Carbonylation

Titles

14.6 mT ELF magnetic field exposure yields no DNA breaks in model system Salmonella, but provides evidence of heat stress protection.

1800 MHz mobile phone irradiation induced oxidative and nitrosative stress leads to p53 dependent Bax mediated testicular apoptosis in mice, Mus musculus.

1950MHz Radio Frequency Electromagnetic Radiation Inhibits Testosterone Secretion of Mouse Leydig Cells.

2.1 GHz electromagnetic field does not change contractility and intracellular Ca2+ transients but decreases beta-adrenergic responsiveness through nitric oxide signaling in rat ventricular myocytes.

2.45 GHz microwave irradiation-induced oxidative stress affects implantation or pregnancy in mice, Mus musculus.

2.45 GHz Microwave Radiation Impairs Learning and Spatial Memory via Oxidative/Nitrosative Stress Induced p53-Dependent/Independent Hippocampal Apoptosis: Molecular Basis and Underlying Mechanism.

2.45 GHz microwave radiation induced oxidative and nitrosative stress mediated testicular apoptosis: Involvement of a p53 dependent bax-caspase-3 mediated pathway.

2.45-GHz microwave irradiation adversely affects reproductive function in male mouse, Mus musculus by inducing oxidative and nitrosative stress.

2.45-Gz wireless devices induce oxidative stress and proliferation through cytosolic Ca(2)(+) influx in human leukemia cancer cells.

50 Hz extremely low frequency electromagnetic fields enhance protein carbonyl groups content in cancer cells: effects on proteasomal systems.

50-Hertz electromagnetic fields induce gammaH2AX foci formation in mouse preimplantation embryos in vitro.

8-Oxo-7, 8-dihydro-2'-deoxyguanosine as a biomarker of DNA damage by mobile phone radiation.

8-oxoG DNA glycosylase-1 inhibition sensitizes Neuro-2a cells to oxidative DNA base damage induced by 900 MHz radiofrequency electromagnetic radiation.

900 MHz pulse-modulated radiofrequency radiation induces oxidative stress on heart, lung, testis and liver tissues.

900 MHz radiofrequency-induced histopathologic changes and oxidative stress in rat endometrium: protection by vitamins E and C.

900-MHz microwave radiation enhances gamma-ray adverse effects on SHG44 cells.

900-MHz microwave radiation promotes oxidation in rat brain.

915 MHz microwaves and 50 Hz magnetic field affect chromatin conformation and 53BP1 foci in human lymphocytes from hypersensitive and healthy persons.

A 700 MHz 1H-NMR study reveals apoptosis-like behavior in human K562 erythroleukemic cells exposed to a 50 Hz sinusoidal magnetic field.

A comparative analysis of the biological action of microwaves and laser radiation].

A critical review of the genotoxic potential of electric and magnetic fields.

A cross-sectional case control study on genetic damage in individuals residing in the vicinity of a mobile phone base station.

A cross-sectional study on oxidative stress in workers exposed to extremely low frequency electromagnetic fields.

A histopathological and biochemical evaluation of oxidative injury in the sciatic nerves of male rats exposed to a continuous 900-megahertz electromagnetic field throughout all periods of adolescence.

Acute exposure to 930 MHz CW electromagnetic radiation in vitro affects reactive oxygen species level in rat lymphocytes treated by iron ions.

Acute exposure to a 60 Hz magnetic field increases DNA strand breaks in rat brain cells.

Acute low-intensity microwave exposure increases DNA single-strand breaks in rat brain cells.

Adaptive response in mice exposed to 900 MHZ radiofrequency fields: bleomycin-induced DNA and oxidative damage/repair.

Adaptive response in mice exposed to 900 MHz radiofrequency fields: primary DNA damage.

Adaptive response in mouse bone-marrow stromal cells exposed to 900-MHz radiofrequency fields: Gamma-radiation-induced DNA strand breaks and repair.

Adverse and beneficial effects in Chinese hamster lung fibroblast cells following radiofrequency exposure.

Age diseases depending on geomagnetic field activity inside the womb period].

Age-related effects on induction of DNA strand breaks by intermittent exposure to electromagnetic fields.

An evaluation of genotoxicity in human neuronal-type cells subjected to oxidative stress under an extremely low frequency pulsed magnetic field.

An in vitro study of the effects of exposure to a GSM signal in two human cell lines: monocytic U937 and neuroblastoma SK-N-SH.

Analysis of proto-oncogene and heat-shock protein gene expression in human derived cell-lines exposed in vitro to an intermittent 1.9 GHz pulse-modulated radiofrequency field.

Antioxidants alleviate electric field-induced effects on lung tissue based on assays of heme oxygenase-1, protein carbonyl content, malondialdehyde, nitric oxide, and hydroxyproline.

Anxiety-like behavioural effects of extremely low-frequency electromagnetic field in rats.

Apoptosis in haemopoietic progenitor cells exposed to extremely low-frequency magnetic fields.

Apoptosis induced by microwave radiation in pancreatic cancer JF305 cells.

Apoptosis induced by ultraviolet radiation is enhanced by amplitude modulated radiofrequency radiation in mutant yeast cells.

Apoptosis is induced by radiofrequency fields through the caspase-independent mitochondrial pathway in cortical neurons.

Apoptosis of Lewis Lung Carcinoma Cells Induced by Microwave via p53 and Proapoptotic Proteins In vivo.

Apoptotic cell death during Drosophila oogenesis is differentially increased by electromagnetic radiation depending on modulation, intensity and duration of exposure.

Assessment of biological changes of continuous whole body exposure to static magnetic field and extremely low frequency electromagnetic fields in mice.

Assessment of cytogenetic damage and oxidative stress in personnel occupationally exposed to the pulsed microwave radiation of marine radar equipment.

Assessment of DNA sensitivity in peripheral blood leukocytes after occupational exposure to microwave radiation: the alkaline comet assay and chromatid breakage assay.

Assessment of genetic damage in peripheral blood of human volunteers exposed (whole-body) to a 200 muT, 60 Hz magnetic field.

Assessment of genotoxicity and genomic instability in rat primary astrocytes exposed to 872 MHz radiofrequency radiation and chemicals.

Assessment of nuclear abnormalities in exfoliated cells from the oral epithelium of mobile phone users.

Assessment of oxidant/antioxidant status in saliva of cell phone users.

Association of microwaves and ionizing radiation: potentiation of teratogenic effects in the rat.

Autoimmune processes after long-term low-level exposure to electromagnetic fields (the results of an experiment). Part 4. Manifestation of oxidative intracellular stress-reaction after long-term non-thermal EMF exposure of rats].

Biochemical and histological studies on adverse effects of mobile phone radiation on rat's brain.

Biochemical and pathological changes in the male rat kidney and bladder following exposure to continuous 900-MHz electromagnetic field on postnatal days 22-59<sup/>.

Biochemical modifications and neuronal damage in brain of young and adult rats after long-term exposure to mobile phone radiations.

Bioeffects of microwave--a brief review.

Bioelectromagnetic field effects on cancer cells and mice tumors.

Biological effects of non-ionizing electromagnetic fields: Two sides of a coin.

Biological responses of mobile phone frequency exposure.

Biological stress responses to radio frequency electromagnetic radiation: are mobile phones really so (heat) shocking?

Biophysical evaluation of radiofrequency electromagnetic field effects on male reproductive pattern.

Blocking 1800 MHz mobile phone radiation-induced reactive oxygen species production and DNA damage in lens epithelial cells by noise magnetic fields].

Calreticulin protects rat microvascular endothelial cells against microwave radiation-induced injury by attenuating endoplasmic reticulum stress.

Cell oxidation-reduction imbalance after modulated radiofrequency radiation.

Cell phone electromagnetic field radiations affect rhizogenesis through impairment of biochemical processes.

Cell phone radiation exposure on brain and associated biological systems.

Cell phones and cancer: what is the evidence for a connection?

Cell type-specific genotoxic effects of intermittent extremely low-frequency electromagnetic fields.

Cellphone electromagnetic radiation damages the testicular ultrastructure of male rats].

Cellular effects of electromagnetic fields.

Changes in antioxidant capacity of blood due to mutual action of electromagnetic field (1800 MHz) and opioid drug (tramadol) in animal model of persistent inflammatory state.

Changes of apoptosis, mitochondrion membrane potential and Ca2+ of hypothalamic neurons induced by high power microwave].

Changes of rat testicular germ cell apoptosis after high power microwave radiation].

Chromosomal damage in human diploid fibroblasts by intermittent exposure to extremely low-frequency electromagnetic fields.

Chronic exposure to 50Hz magnetic fields causes a significant weakening of antioxidant defence systems in aged rat brain.

Cognitive impairment and neurogenotoxic effects in rats exposed to low-intensity microwave radiation.

Combinative exposure effect of radio frequency signals from CDMA mobile phones and aphidicolin on DNA integrity.

Combined effects of 872 MHz radiofrequency radiation and ferrous chloride on reactive oxygen species production and DNA damage in human SH-SY5Y neuroblastoma cells.

Combined exposure of ELF magnetic fields and x-rays increased mutant yields compared with x-rays alone in pTN89 plasmids.

Comments on "Radiofrequency electromagnetic fields (UMTS, 1,950 MHz) induce genotoxic effects in vitro in human fibroblasts but not in lymphocytes" by Schwarz et al. (Int Arch Occup Environ Health 2008: doi: 10.1007/s00420-008-0305-5).

Comparative study of cell cycle kinetics and induction of apoptosis or necrosis after exposure of human Mono Mac 6 cells to radiofrequency radiation.

Comparison of biological effects between continuous and intermittent exposure to GSM-900-MHz mobile phone radiation: Detection of apoptotic cell-death features.

Comparison of cytotoxic and genotoxic effects of plutonium-239 alpha particles and mobile phone GSM 900 radiation in the Allium cepa test.

Correction of microcirculatory disturbances with terahertz electromagnetic radiation at nitric oxide frequencies in albino rats under conditions of acute stress.

Corrective effects of electromagnetic radiation in a millimeter wavelength range on the parameters of oxidative stress after standard anti-helicobacterial therapy in patients with ulcer disease].

Critical comments on DNA breakage by mobile-phone electromagnetic fields [Diem et al., Mutat. Res. 583 (2005) 178-183].

Cytogenetic effects of 18.0 and 16.5 GHz microwave radiation on human lymphocytes in vitro.

Cytogenetic effects of 935.2-MHz (GSM) microwaves alone and in combination with mitomycin C.

Cytogenetic studies in human blood lymphocytes exposed in vitro to 2.45 GHz or 8.2 GHz radiofrequency radiation.

Cytogenetic studies in human cells exposed in vitro to GSM-900 MHz radiofrequency radiation using R-banded karyotyping.

Cytokines produced by microwave-radiated Sertoli cells interfere with spermatogenesis in rat testis.

Cytotoxic and genotoxic effect in RTG-2 cell line exposed to selected biocides used in the disinfection of cooling towers.

Cytotoxic and genotoxic effects of high-frequency electromagnetic fields (GSM 1800 MHz) on immature and mature rats.

Decreased DNA repair rates and protection from heat induced apoptosis mediated by electromagnetic field exposure.

Dependence of microwave effect on the secondary structure of DNA on molecular weight of polynucleotide].

Developmental effects of perinatal exposure to extremely weak 7 Hz magnetic fields and nitric oxide modulation in the Wistar albino rat.

Different methods for evaluating the effects of microwave radiation exposure on the nervous system.

Disordered redox metabolism of brain cells in rats exposed to low doses of ionizing radiation or UHF electromagnetic radiation.

DNA and chromosomal damage in response to intermittent extremely low-frequency magnetic fields.

DNA damage and repair induced by acute exposure of microwave from mobile phone on cultured human lens epithelial cells].

DNA damage in rat brain cells after in vivo exposure to 2450 MHz electromagnetic radiation and various methods of euthanasia.

DNA damage induced in brain cells of CBA mice exposed to magnetic fields.

DNA damage, cell kinetics and ODC activities studied in CBA mice exposed to electromagnetic fields generated by transmission lines.

Do extremely low frequency magnetic fields enhance the effects of environmental carcinogens? A meta-analysis of experimental studies.

Do naturally occurring magnetic nanoparticles in the human body mediate increased risk of childhood leukaemia with EMF exposure?

Does MW Radiation Affect Gene Expression, Apoptotic Level, and Cell Cycle Progression of Human SH-SY5Y Neuroblastoma Cells?

Does prolonged radiofrequency radiation emitted from Wi-Fi devices induce DNA damage in various tissues of rats?

Drosophila oogenesis as a bio-marker responding to EMF sources.

Effect of 0.2 T static magnetic field on human neurons: remodeling and inhibition of signal transduction without genome instability.

Effect of 2.45 GHz microwave radiation on the fertility pattern in male mice.

Effect of 3G cell phone exposure with computer controlled 2-D stepper motor on non-thermal activation of the hsp27/p38MAPK stress pathway in rat brain.

Effect of 7 mT static magnetic field and iron ions on rat lymphocytes: apoptosis, necrosis and free radical processes.

Effect of 900 MHz radio frequency radiation on beta amyloid protein, protein carbonyl, and malondialdehyde in the brain.

Effect of 900 MHz radiofrequency radiation on oxidative stress in rat brain and serum.

Effect of 900-, 1800-, and 2100-MHz radiofrequency radiation on DNA and oxidative stress in brain.

Effect of 950 MHz UHF electromagnetic radiation on biomarkers of oxidative damage, metabolism of UFA and antioxidants in the livers of young rats of different ages.

Effect of acute exposure to microwave from mobile phone on DNA damage and repair of cultured human lens epithelial cells in vitro].

Effect of American Ginseng Capsule on the liver oxidative injury and the Nrf2 protein expression in rats exposed by electromagnetic radiation of frequency of cell phone].

Effect of coexposure to 50 Hz magnetic fields and an aneugen on human lymphocytes, determined by the cytokinesis block micronucleus assay.

Effect of continuous irradiation with terahertz electromagnetic waves of the NO frequency range on behavioral reactions of male albino rats under stress conditions.

Effect of electromagnetic field produced by mobile phones on the activity of superoxide dismutase (SOD-1) and the level of malonyldialdehyde (MDA)--in vitro study].

Effect of electromagnetic field produced by mobile phones on the activity of superoxide dismutase (SOD-1)--in vitro researches].

Effect of electromagnetic microwave radiation on the growth of Ehrlich ascites carcinoma.

Effect of exposure and withdrawal of 900-MHz-electromagnetic waves on brain, kidney and liver oxidative stress and some biochemical parameters in male rats.

Effect of exposure to the edge signal on oxidative stress in brain cell models.

Effect of extremely low frequency magnetic field on antioxidant activity in plasma and red blood cells in spot welders.

Effect of extremely low-frequency electromagnetic fields on antioxidant activity in the human keratinocyte cell line NCTC 2544.

Effect of GSTM1 and GSTT1 Polymorphisms on Genetic Damage in Humans Populations Exposed to Radiation From Mobile Towers.

Effect of handportable mobiletelephone microwave radiation on rat central neuron apoptosis].

Effect of intermittent and continuous exposure to electromagnetic fields on cultured hippocampal cells.

Effect of long-term power frequency electromagnetic field exposure on proliferation and apoptosis of SRA01/04 cells].

Effect of low level microwave radiation exposure on cognitive function and oxidative stress in rats.

Effect of Low Level Subchronic Microwave Radiation on Rat Brain.

Effect of microwave radiation on primary cultured Sertoli cells].

Effect of mobile phone exposure on apoptotic glial cells and status of oxidative stress in rat brain.

Effect of Mobile Phone Radiation on Cardiovascular Development of Chick Embryo.

Effect of mobile phones on micronucleus frequency in human exfoliated oral mucosal cells.

Effect of Modified Wuzi Yanzong Pill () on Tip60-Mediated Apoptosis in Testis of Male Rats after Microwave Radiation.

Effect of pulsed electromagnetic field with different frequencies on the proliferation, apoptosis and migration of human ovarian cancer cells].

Effect of Radiofrequency Radiation on Human Hematopoietic Stem Cells.

Effect of radiofrequency radiation on reproductive health.

Effect of rosmarinic acid on sertoli cells apoptosis and serum antioxidant levels in rats after exposure to electromagnetic fields.

Effect of selenium pre-treatment on plasma antioxidant vitamins A (retinol) and E (alpha-tocopherol) in static magnetic field-exposed rats.

Effect of static magnetic field on development toxicity of rat embryonic midbrain neurons cells].

Effect of superposed electromagnetic noise on DNA damage of lens epithelial cells induced by microwave radiation.

Effects of 10-GHz microwaves on hematological parameters in Swiss albino mice and their modulation by Prunus avium.

Effects of 1800 MHz RF-EMF exposure on DNA damage and cellular functions in primary cultured neurogenic cells.

Effects of 2,450 MHz microwave on DNA damage induced by three chemical mutagens in vitro].

Effects of 2.45 GHz electromagnetic fields with a wide range of SARs on bacterial and HPRT gene mutations.

Effects of 2.45 GHz microwave exposures on the peroxidation status in Wistar rats.

Effects of 50 Hz electromagnetic fields on the histology, apoptosis, and expression of c-Fos and beta-catenin on the livers of preincubated white Leghorn chicken embryos.

Effects of 50-Hz magnetic field exposure on hormone secretion and apoptosis-related gene expression in human first trimester villous trophoblasts in vitro.

Effects of 60 Hz electromagnetic field exposure on testicular germ cell apoptosis in mice.

Effects of 60-Hz fields, estradiol and xenoestrogens on human breast cancer cells.

Effects of 837 and 1950 MHz radiofrequency radiation exposure alone or combined on oxidative stress in MCF10A cells.

Effects of 900-MHz electromagnetic field emitted from cellular phone on brain oxidative stress and some vitamin levels of guinea pigs.

Effects of 900-MHz electromagnetic fields exposure throughout middle/late adolescence on the kidney morphology and biochemistry of the female rat.

Effects of acute electromagnetic field exposure and movement restraint on antioxidant system in liver, heart, kidney and plasma of Wistar rats: a preliminary report.

Effects of acute exposure to the radiofrequency fields of cellular phones on plasma lipid peroxide and antioxidase activities in human erythrocytes.

Effects of aluminum and extremely low frequency electromagnetic radiation on oxidative stress and memory in brain of mice.

Effects of broad band electromagnetic fields on HSP70 expression and ischemia-reperfusion in rat hearts.

Effects of cell phone radiation on lipid peroxidation, glutathione and nitric oxide levels in mouse brain during epileptic seizure.

Effects of centimeter waves on the immune system of mice in endotoxic shock].

Effects of chronic exposure to 950 MHz ultra-high-frequency electromagnetic radiation on reactive oxygen species metabolism in the right and left cerebral cortex of young rats of different ages.

Effects of co-exposure to extremely low frequency (ELF) magnetic fields and benzene or benzene metabolites determined in vitro by the alkaline comet assay.

Effects of dietary green tea polyphenol supplementation on the health of workers exposed to high-voltage power lines.

Effects of electromagnetic field produced by mobile phones on the oxidant and antioxidant status of rats.

Effects of electromagnetic pulses on apoptosis and TGF-beta3 expression of mouse testis tissue].

Effects of electromagnetic radiation from a cellular telephone on the oxidant and antioxidant levels in rabbits.

Effects of electromagnetic radiation on morphology and TGF-beta3 expression in mouse testicular tissue.

Effects of electromagnetic radiation on RAF/MEK/ERK signaling pathway in rats hippocampus].

Effects of electromagnetic radiation produced by 3G mobile phones on rat brains: magnetic resonance spectroscopy, biochemical, and histopathological evaluation.

Effects of exposure to 2100MHz GSM-like radiofrequency electromagnetic field on auditory system of rats.

Effects of exposure to 50 Hz electric field at different strengths on oxidative stress and antioxidant enzyme activities in the brain tissue of guinea pigs.

Effects of extremely low frequency electromagnetic field and its combination with lead on the antioxidant system in mouse].

Effects of extremely low-frequency pulsed electromagnetic fields on morphological and biochemical properties of human breast carcinoma cells (T47D).

Effects of GSM 1800 MHz radiofrequency electromagnetic fields on DNA damage in Chinese hamster lung cells].

Effects of high power microwave on the expressions of Bcl-2 and C-myc proteins in the rat testis].

Effects of in vitro exposure to power frequency magnetic fields on UV-induced DNA damage of rat lymphocytes.

Effects of long-term 50Hz power-line frequency electromagnetic field on cell behavior in Balb/c 3T3 cells.

Effects of Long-Term Exposure to 60 GHz Millimeter-Wavelength Radiation on the Genotoxicity and Heat Shock Protein (Hsp) Expression of Cells Derived from Human Eye.

Effects of Low-Frequency Electromagnetic Field on Oxidative Stress in Selected Structures of the Central Nervous System.

Effects of low-intensity ultrahigh frequency electromagnetic radiation on inflammatory processes.

Effects of melatonin on Wi-Fi-induced oxidative stress in lens of rats.

Effects of microwave radiation on lipid peroxidation and the content of neurotransmitters in mice].

Effects of microwave radiation on thymocytes in mice at different power densities].

Effects of microwaves (950 MHZ mobile phone) on morphometric and apoptotic changes of rabbit epididymis.

Effects of mobile phone exposure on metabolomics in the male and female reproductive systems.

Effects of mobile phone radiation (900 MHz radiofrequency) on structure and functions of rat brain.

Effects of mobile phone use on brain tissue from the rat and a possible protective role of vitamin C - a preliminary study.

Effects of mobile phones on oxidant/antioxidant balance in cornea and lens of rats.

Effects of prenatal and postnatal exposure of Wi-Fi on development of teeth and changes in teeth element concentration in rats. [corrected].

Effects of prenatal and postnatal exposure to GSM-like radiofrequency on blood chemistry and oxidative stress in infant rabbits, an experimental study.

Effects of prenatal exposure to WIFI signal (2.45GHz) on postnatal development and behavior in rat: Influence of maternal restraint.

Effects of pulsed 2.856 GHz microwave exposure on BM-MSCs isolated from C57BL/6 mice.

Effects of pulsed electric fields on DNA of human lymphocytes.

Effects of pulsed electromagnetic fields on cartilage apoptosis signalling pathways in ovariectomised rats.

Effects of pulsed magnetic field treatment of soybean seeds on calli growth, cell damage, and biochemical changes under salt stress.

Effects of radiofrequency electromagnetic wave exposure from cellular phones on the reproductive pattern in male Wistar rats.

Effects of radiofrequency electromagnetic waves (RF-EMW) from cellular phones on human ejaculated semen: an in vitro pilot study.

Effects of sinusoidal electromagnetic fields on histopathology and structures of brains of preincubated white Leghorn chicken embryos.

Effects of static magnetic field and cadmium on oxidative stress and DNA damage in rat cortex brain and hippocampus.

Effects of the ELF-MFs on the development of spleens of preincubated chicken embryos.

Effects of the exposure to mobile phones on male reproduction: a review of the literature.

Effects of third generation mobile phone-emitted electromagnetic radiation on oxidative stress parameters in eye tissue and blood of rats.

Effects on protein kinase C and gene expression in a human mast cell line, HMC-1, following microwave exposure.

Electric and/or magnetic field effects on DNA structure and function in cultured human cells.

Electromagnetic fields and health: DNA-based dosimetry.

Electromagnetic fields at a mobile phone frequency (900 MHz) trigger the onset of general stress response along with DNA modifications in Eisenia fetida earthworms.

Electromagnetic fields at mobile phone frequency induce apoptosis and inactivation of the multi-chaperone complex in human epidermoid cancer cells.

Electromagnetic fields may act directly on DNA.

Electromagnetic fields may act via calcineurin inhibition to suppress immunity, thereby increasing risk for opportunistic infection: Conceivable mechanisms of action.

Electromagnetic noise inhibits radiofrequency radiation-induced DNA damage and reactive oxygen species increase in human lens epithelial cells.

Electromagnetic pulse activated brain microglia via the p38 MAPK pathway.

Electromagnetic pulse exposure induces overexpression of beta amyloid protein in rats.

Electromagnetic radiation (Wi-Fi) and epilepsy induce calcium entry and apoptosis through activation of TRPV1 channel in hippocampus and dorsal root ganglion of rats.

Electromagnetic radiation 2450 MHz exposure causes cognition deficit with mitochondrial dysfunction and activation of intrinsic pathway of apoptosis in rats.

Electromagnetic radiation at 900 MHz induces sperm apoptosis through bcl-2, bax and caspase-3 signaling pathways in rats.

Electromagnetic wave emitting products and "Kikoh" potentiate human leukocyte functions.

Electromagnetic wave irradiation promotes osteoblastic cell proliferation and up-regulates growth factors via activation of the ERK1/2 and p38 MAPK pathways.

Enhanced cytotoxic and genotoxic effects of gadolinium following ELF-EMF irradiation in human lymphocytes.

Epinephrine, DNA integrity and oxidative stress in workers exposed to extremely low-frequency electromagnetic fields (ELF-EMFs) at 132 kV substations.

EUROPAEM EMF Guideline 2016 for the prevention, diagnosis and treatment of EMF-related health problems and illnesses.

Evaluating the combinative effects on human lymphocyte DNA damage induced by ultraviolet ray C plus 1.8 GHz microwaves using comet assay in vitro.

Evaluation of basal DNA damage and oxidative stress in Wistar rat leukocytes after exposure to microwave radiation.

Evaluation of DNA damage in spinal cord and mutagenic effect of a Phalpha1beta recombinant toxin with analgesic properties from the Phoneutria nigriventer spider.

Evaluation of genotoxic and/or co-genotoxic effects in cells exposed in vitro to extremely-low frequency electromagnetic fields].

Evaluation of genotoxic effects in human fibroblasts after intermittent exposure to 50 Hz electromagnetic fields: a confirmatory study.

Evaluation of genotoxic effects in human leukocytes after in vitro exposure to 1950 MHz UMTS radiofrequency field.

Evaluation of genotoxic effects in human peripheral blood leukocytes following an acute in vitro exposure to 900 MHz radiofrequency fields.

Evaluation of genotoxic effects in male Wistar rats following microwave exposure.

Evaluation of hormonal change, biochemical parameters, and histopathological status of uterus in rats exposed to 50-Hz electromagnetic field.

Evaluation of HSP70 expression and DNA damage in cells of a human trophoblast cell line exposed to 1.8 GHz amplitude-modulated radiofrequency fields.

Evaluation of Mobile Phone and Cordless Phone Use and Glioma Risk Using the Bradford Hill Viewpoints from 1965 on Association or Causation.

Evaluation of selected biochemical parameters in the saliva of young males using mobile phones.

Evaluation of the cytogenotoxic damage in immature and mature rats exposed to 900 MHz radiofrequency electromagnetic fields.

Evaluation of the effects of mobile phones on the neural tube development of chick embryos.

Evaluation of the potential of mobile phone specific electromagnetic fields (UMTS) to produce micronuclei in human glioblastoma cell lines.

Evidence for mobile phone radiation exposure effects on reproductive pattern of male rats: role of ROS.

Evidence of oxidative stress in American kestrels exposed to electromagnetic fields.

Examination of electric field effects on tissues by using back propagation neural network.

Exposure of magnetic bacteria to simulated mobile phone-type RF radiation has no impact on mortality.

Exposure of mammalian cells to 60-Hz magnetic or electric fields: analysis for DNA single-strand breaks.

Exposure of rat brain to 915 MHz GSM microwaves induces changes in gene expression but not double stranded DNA breaks or effects on chromatin conformation.

Exposure to 1.8 GHz electromagnetic fields affects morphology, DNA-related Raman spectra and mitochondrial functions in human lympho-monocytes.

Exposure to 1800 MHz radiofrequency electromagnetic radiation induces oxidative DNA base damage in a mouse spermatocyte-derived cell line.

Exposure to 1800 MHz radiofrequency radiation induces oxidative damage to mitochondrial DNA in primary cultured neurons.

Exposure to 1950-MHz TD-SCDMA electromagnetic fields affects the apoptosis of astrocytes via caspase-3-dependent pathway.

Exposure to 900 MHz electromagnetic field induces an unbalance between pro-apoptotic and pro-survival signals in T-lymphoblastoid leukemia CCRF-CEM cells.

Exposure to 900 MHz radiofrequency radiation induces caspase 3 activation in proliferating human lymphocytes.

Exposure to acute electromagnetic radiation of mobile phone exposure range alters transiently skin homeostasis of a model of pigmented reconstructed epidermis.

Exposure to cell phone radiation up-regulates apoptosis genes in primary cultures of neurons and astrocytes.

Exposure to GSM 900-MHz mobile radiation impaired inhibitory avoidance memory consolidation in rat: Involvements of opioidergic and nitrergic systems.

Exposure to mobile phone (900-1800 MHz) during pregnancy: tissue oxidative stress after childbirth.

Exposure to mobile phone electromagnetic field radiation, ringtone and vibration affects anxiety-like behaviour and oxidative stress biomarkers in albino wistar rats.

Exposure to non-ionizing electromagnetic fields emitted from mobile phones induced DNA damage in human ear canal hair follicle cells.

Exposure to radiation from single or combined radio frequencies provokes macrophage dysfunction in the RAW 264.7 cell line.

Exposure to radiofrequency radiation induces oxidative stress in duckweed Lemna minor L.

Exposure to static magnetic field of pregnant rats induces hepatic GSH elevation but not oxidative DNA damage in liver and kidney.

Extremely low frequency (ELF) magnetic fields and apoptosis: a review.

Extremely low frequency (ELF) magnetic fields enhance chemically induced formation of apurinic/apyrimidinic (AP) sites in A172 cells.

Extremely low frequency electromagnetic field reduces oxidative stress during the rehabilitation of post-acute stroke patients.

Extremely low frequency electromagnetic radiation enhanced energy metabolism and induced oxidative stress in Caenorhabditis elegans].

Extremely low frequency magnetic field induces hyperalgesia in mice modulated by nitric oxide synthesis.

Extremely low-frequency magnetic fields modulate nitric oxide signaling in rat brain.

From the Cover: 2.45-GHz Microwave Radiation Impairs Hippocampal Learning and Spatial Memory: Involvement of Local Stress Mechanism-Induced Suppression of iGluR/ERK/CREB Signaling.

Gene expression and reproductive abilities of male Drosophila melanogaster subjected to ELF-EMF exposure.

Gene expression changes in the skin of rats induced by prolonged 35 GHz millimeter-wave exposure.

Genetic damage in human cells exposed to non-ionizing radiofrequency fields: a meta-analysis of the data from 88 publications (1990-2011).

Genetic damage in humans exposed to extremely low-frequency electromagnetic fields.

Genetic damage in mammalian somatic cells exposed to extremely low frequency electro-magnetic fields: a meta-analysis of data from 87 publications (1990-2007).

Genetic damage in mammalian somatic cells exposed to radiofrequency radiation: a meta-analysis of data from 63 publications (1990-2005).

Genetic damage in subjects exposed to radiofrequency radiation.

Genotoxic and carcinogenic effects of non-ionizing electromagnetic fields.

Genotoxic Effects in Human Fibroblasts Exposed to Microwave Radiation.

Genotoxicity evaluation of electromagnetic fields generated by 835-MHz mobile phone frequency band.

Genotoxicity of radiofrequency signals. I. Investigation of DNA damage and micronuclei induction in cultured human blood cells.

Ginkgo biloba prevents mobile phone-induced oxidative stress in rat brain.

GSM base station electromagnetic radiation and oxidative stress in rats.

GSM-like radiofrequency exposure induces apoptosis via caspase-dependent pathway in infant rabbits.

Hematological and toxicogenomic effects of ferromagnetic screening of natural electromagnetic fields.

Histological and histochemical study of the protective role of rosemary extract against harmful effect of cell phone electromagnetic radiation on the parotid glands.

Human fibroblasts and 900 MHz radiofrequency radiation: evaluation of DNA damage after exposure and co-exposure to 3-chloro-4-(dichloromethyl)-5-hydroxy-2(5h)-furanone (MX).

Human health consequences of environmentally-modulated gene expression: potential roles of ELF-EMF induced epigenetic versus mutagenic mechanisms of disease.

Human mesenchymal stem cells are sensitive to abnormal gravity and exhibit classic apoptotic features.

Human skin cell stress response to GSM-900 mobile phone signals. In vitro study on isolated primary cells and reconstructed epidermis.

Immunohistopathologic demonstration of deleterious effects on growing rat testes of radiofrequency waves emitted from conventional Wi-Fi devices.

Immunomodulating action of low intensity millimeter waves on primed neutrophils.

Impact of 2.45 GHz microwave radiation on the testicular inflammatory pathway biomarkers in young rats: The role of gallic acid.

Impact of cell phone radiation on male reproduction].

Impact of electromagnetic radiation emitted by monitors on changes in the cellular membrane structure and protective antioxidant effect of vitamin A - In vitro study.

Impact of microwave at X-band in the aetiology of male infertility.

Impact of radio frequency electromagnetic radiation on DNA integrity in the male germline.

Impact of radiofrequency radiation on DNA damage and antioxidants in peripheral blood lymphocytes of humans residing in the vicinity of mobile phone base stations.

Impacts of exposure to 900 MHz mobile phone radiation on liver function in rats.

Importance of DNA fragmentation in apoptosis with regard to TUNEL specificity.

In vitro free radical scavenging activities and effect of synthetic oligosaccharides on antioxidant enzymes and lipid peroxidation in aged mice.

In vitro non-thermal oxidative stress response after 1800 MHz radiofrequency radiation.

Increased apoptosis, changes in intracellular Ca2+, and functional alterations in lymphocytes and macrophages after in vitro exposure to static magnetic field.

Induction of adaptive response in mice exposed to 900MHz radiofrequency fields: application of micronucleus assay.

Induction of apoptotic cell death in human leukemic cell line, HL-60, by extremely low frequency electric magnetic fields: analysis of the possible mechanisms in vitro.

Induction of DNA strand breaks by intermittent exposure to extremely-low-frequency electromagnetic fields in human diploid fibroblasts.

Influence of 1.8 GHz microwave on DNA damage induced by 4 chemical mutagens].

Influence of 1.8 GHz microwave on DNA damage induced by ultraviolet C ray].

Influence of 1.8-GHz (GSM) radiofrequency radiation (RFR) on DNA damage and repair induced by X-rays in human leukocytes in vitro.

Influence of 900 MHz frequency electromagnetic radiation on some blood indices].

Influence of a static magnetic field (250 mT) on the antioxidant response and DNA integrity in THP1 cells.

Influence of electromagnetic field (1800 MHz) on lipid peroxidation in brain, blood, liver and kidney in rats.

Influence of extremely-low-frequency magnetic field on antioxidative melatonin properties in AT478 murine squamous cell carcinoma culture.

Influence of high-frequency electromagnetic fields on different modes of cell death and gene expression.

Influence of low magnetic field on lipid peroxidation].

Influence of microwave exposure on fertility of male rats.

Influence of microwaves on different types of receptors and the role of peroxidation of lipids on receptor-protein shedding.

Inhibition by Egb761 of the effect of cellphone radiation on the male reproductive system.

Inhibitory effect of microwave radiation on proliferation of human pancreatic cancer JF305 cells and its mechanism].

Intermittent extremely low frequency electromagnetic fields cause DNA damage in a dose-dependent way.

Investigation of co-genotoxic effects of radiofrequency electromagnetic fields in vivo.

Investigation of potential genotoxic effects of low frequency electromagnetic fields on Escherichia coli.

Investigation of the effects of 2.1 GHz microwave radiation on mitochondrial membrane potential (DeltaPsim), apoptotic activity and cell viability in human breast fibroblast cells.

Investigation of the effects of distance from sources on apoptosis, oxidative stress and cytosolic calcium accumulation via TRPV1 channels induced by mobile phones and Wi-Fi in breast cancer cells.

Is human saliva an indicator of the adverse health effects of using mobile phones?

Lasting hepatotoxic effects of prenatal mobile phone exposure.

Lipid peroxide damage in retinal ganglion cells induced by microwave].

Liver antioxidant stores protect the brain from electromagnetic radiation (900 and 1800 MHz)-induced oxidative stress in rats during pregnancy and the development of offspring.

Local vasodilator response to mobile phones.

Long term exposure to cell phone frequencies (900 and 1800 MHz) induces apoptosis, mitochondrial oxidative stress and TRPV1 channel activation in the hippocampus and dorsal root ganglion of rats.

Long-term exposure to electromagnetic radiation from mobile phones and Wi-Fi devices decreases plasma prolactin, progesterone, and estrogen levels but increases uterine oxidative stress in pregnant rats and their offspring.

Loss of transforming activity of plasmid DNA (pBR322) in E. coli caused by singlet molecular oxygen.

Low intensity and frequency pulsed electromagnetic fields selectively impair breast cancer cell viability.

Low intensity microwave radiation induced oxidative stress, inflammatory response and DNA damage in rat brain.

Low power density microwave radiation induced early changes in rabbit lens epithelial cells.

Low-Frequency Electromagnetic Field Exposure Enhances Extracellular Trap Formation by Human Neutrophils through the NADPH Pathway.

Low-intensity electromagnetic fields induce human cryptochrome to modulate intracellular reactive oxygen species.

Magnetic-field-induced DNA strand breaks in brain cells of the rat.

Measurement of DNA damage after acute exposure to pulsed-wave 2450 MHz microwaves in rat brain cells by two alkaline comet assay methods.

Measurement of DNA damage after exposure to 2450 MHz electromagnetic radiation.

Measurement of DNA damage after exposure to electromagnetic radiation in the cellular phone communication frequency band (835.62 and 847.74 MHz).

Measurement of DNA damage and apoptosis in Molt-4 cells after in vitro exposure to radiofrequency radiation.

Measurement of the 100MHz EMF radiation in vivo effects on zebrafish D. rerio embryonic development: A multidisciplinary study.

Measurements of alkali-labile DNA damage and protein-DNA crosslinks after 2450 MHz microwave and low-dose gamma irradiation in vitro.

Mechanism of short-term ERK activation by electromagnetic fields at mobile phone frequencies.

Mechanisms of electromagnetic radiation damaging male reproduction].

Melatonin and a spin-trap compound block radiofrequency electromagnetic radiation-induced DNA strand breaks in rat brain cells.

Melatonin attenuates radiofrequency radiation (900 MHz)-induced oxidative stress, DNA damage and cell cycle arrest in germ cells of male Swiss albino mice.

Melatonin modulates 900 Mhz microwave-induced lipid peroxidation changes in rat brain.

Melatonin protects rat thymus against oxidative stress caused by exposure to microwaves and modulates proliferation/apoptosis of thymocytes.

Melatonin reduces oxidative stress induced by chronic exposure of microwave radiation from mobile phones in rat brain.

Metabolic changes in cells under electromagnetic radiation of mobile communication systems].

Microwave absorption by magnetite: a possible mechanism for coupling nonthermal levels of radiation to biological systems.

Microwave effects on plasmid DNA.

Microwave electromagnetic field regulates gene expression in T-lymphoblastoid leukemia CCRF-CEM cell line exposed to 900 MHz.

Microwave exposure affecting reproductive system in male rats.

Microwave exposure of neuronal cells in vitro: Study of apoptosis.

Microwave induces apoptosis in A549 human lung carcinoma cell line.

Microwave radiation (2.45 GHz)-induced oxidative stress: Whole-body exposure effect on histopathology of Wistar rats.

Microwave radiation induced oxidative stress, cognitive impairment and inflammation in brain of Fischer rats.

Microwave radiation induces injury to GC-2spd cells].

Microwave-induced Apoptosis and Cytotoxicity of NK Cells through ERK1/2 Signaling.

Mitochondrial DNA damage and oxidative damage in HL-60 cells exposed to 900MHz radiofrequency fields.

Mitochondrial hyperpolarization and cytochrome-c release in microwave-exposed MCF-7 cells.

Mobile phone (1800MHz) radiation impairs female reproduction in mice, Mus musculus, through stress induced inhibition of ovarian and uterine activity.

Mobile phone radiation induces mode-dependent DNA damage in a mouse spermatocyte-derived cell line: a protective role of melatonin.

Mobile phone radiation induces reactive oxygen species production and DNA damage in human spermatozoa in vitro.

Mobile phone radiation-induced free radical damage in the liver is inhibited by the antioxidants N-acetyl cysteine and epigallocatechin-gallate.

Mobile phone signal exposure triggers a hormesis-like effect in Atm(+/+) and Atm(-/-) mouse embryonic fibroblasts.

Mobile phone specific electromagnetic fields induce transient DNA damage and nucleotide excision repair in serum-deprived human glioblastoma cells.

Mobile phone usage and male infertility in Wistar rats.

Mobile phones, heat shock proteins and cancer.

Mobile-phone radiation-induced perturbation of gene-expression profiling, redox equilibrium and sporadic-apoptosis control in the ovary of Drosophila melanogaster.

Modulation of cell death in the rat thymus. Light and electron microscopic investigations.

Modulation of wireless (2.45 GHz)-induced oxidative toxicity in laryngotracheal mucosa of rat by melatonin.

Morphological and antioxidant impairments in the spinal cord of male offspring rats following exposure to a continuous 900MHz electromagnetic field during early and mid-adolescence.

Mutagenic response of 2.45 GHz radiation exposure on rat brain.

Neural cell apoptosis induced by microwave exposure through mitochondria-dependent caspase-3 pathway.

Neurodegenerative changes and apoptosis induced by intrauterine and extrauterine exposure of radiofrequency radiation.

Neuroprotective effects of lotus seedpod procyanidins on extremely low frequency electromagnetic field-induced neurotoxicity in primary cultured hippocampal neurons.

Non-thermal bioeffects of static and extremely low frequency electromagnetic fields].

Non-thermal cellular effects of lowpower microwave radiation on the lens and lens epithelial cells.

Non-thermal DNA breakage by mobile-phone radiation (1800 MHz) in human fibroblasts and in transformed GFSH-R17 rat granulosa cells in vitro.

Non-thermal effects of 2.45 GHz microwaves on spindle assembly, mitotic cells and viability of Chinese hamster V-79 cells.

Non-thermal effects of continuous 2.45 GHz microwaves on Fas-induced apoptosis in human Jurkat T-cell line.

Normal doses of visible light can cause mutations in skin].

Overproduction of free radical species in embryonal cells exposed to low intensity radiofrequency radiation.

Oxidative and mutagenic effects of low intensity GSM 1800 MHz microwave radiation.

Oxidative changes and apoptosis induced by 1800-MHz electromagnetic radiation in NIH/3T3 cells.

Oxidative DNA damage in rats exposed to extremely low frequency electro magnetic fields.

Oxidative effects of extremely low frequency magnetic field and radio frequency radiation on testes tissues of diabetic and healthy rats.

Oxidative mechanisms of biological activity of low-intensity radiofrequency radiation.

Oxidative stress and prevention of the adaptive response to chronic iron overload in the brain of young adult rats exposed to a 150 kilohertz electromagnetic field.

Oxidative stress effects on the central nervous system of rats after acute exposure to ultra high frequency electromagnetic fields.

Oxidative stress-mediated alterations on sperm parameters in male Wistar rats exposed to 3G mobile phone radiation.

Oxidative stress-mediated skin damage in an experimental mobile phone model can be prevented by melatonin.

p25/CDK5 is partially involved in neuronal injury induced by radiofrequency electromagnetic field exposure.

PARAMETERS OF SPERMATOGENESIS IN MEN EXPOSED TO DIFFICULT ENVIRONMENTS].

Pathological effects of prenatal exposure to a 900 MHz electromagnetic field on the 21-day-old male rat kidney.

Pathological Findings Observed in the Kidneys of Postnatal Male Rats Exposed to the 2100 MHz Electromagnetic Field.

Pathophysiology of cell phone radiation: oxidative stress and carcinogenesis with focus on male reproductive system.

Pernicious effects of long-term, continuous 900-MHz electromagnetic field throughout adolescence on hippocampus morphology, biochemistry and pyramidal neuron numbers in 60-day-old Sprague Dawley male rats.

Post-continuous whole body exposure of rabbits to 650 MHz electromagnetic fields: effects on liver, spleen, and brain.

Postnatal development and behavior effects of in-utero exposure of rats to radiofrequency waves emitted from conventional WiFi devices.

Preliminary evaluation of nanoscale biogenic magnetite-based ferromagnetic transduction mechanisms for mobile phone bioeffects.

Prevalence of nuclear cataract in Swiss veal calves and its possible association with mobile telephone antenna base stations.

Pro- and antioxidant effect of electromagnetic fields of extremely high frequency (460 MHz) on brain tissues in experiment].

Proliferation and apoptosis in a neuroblastoma cell line exposed to 900 MHz modulated radiofrequency field.

Propagation of electromagnetic radiation in mitochondria?

Protective effect of Liuweidihuang Pills against cellphone electromagnetic radiation-induced histomorphological abnormality, oxidative injury, and cell apoptosis in rat testes].

Protective effect of melatonin and vitamin E against prooxidative action of iron ions and static magnetic field].

Protective effects of beta-glucan against oxidative injury induced by 2.45-GHz electromagnetic radiation in the skin tissue of rats.

Protective effects of Genistein on human renal tubular epithelial cells damage of microwave radiation].

Protective effects of luteolin on rat testis following exposure to 900 MHz electromagnetic field.

Protein oxidation under extremely low frequency electric field in guinea pigs. Effect of N-acetyl-L-cysteine treatment.

Pulse modulated 900 MHz radiation induces hypothyroidism and apoptosis in thyroid cells: a light, electron microscopy and immunohistochemical study.

Pulse-modulated Electromagnetic Radiation of Extremely High Frequencies Protects Cellular DNA against Damaging Effect of Physico-Chemical Factors in vitro].

Pulsed Electromagnetic Field Stimulation Promotes Anti-cell Proliferative Activity in Doxorubicin-treated Mouse Osteosarcoma Cells.

Pulsed electromagnetic fields accelerate apoptotic rate in osteoclasts.

Pulsed or continuous electromagnetic field induce p53/p21-mediated apoptotic signaling pathway in mouse spermatogenic cells in vitro and thus may affect male fertility.

Purkinje cell number decreases in the adult female rat cerebellum following exposure to 900 MHz electromagnetic field.

Quality Matters: Systematic Analysis of Endpoints Related to "Cellular Life" in Vitro Data of Radiofrequency Electromagnetic Field Exposure.

Radiation protection and possible mechanisms for low intensity microwave].

Radiations and male fertility.

Radio frequency electromagnetic radiation (RF-EMR) from GSM (0.9/1.8GHz) mobile phones induces oxidative stress and reduces sperm motility in rats.

Radiofrequency (microwave) radiation exposure of mammalian cells during UV-induced DNA repair synthesis.

Radiofrequency electromagnetic fields (UMTS, 1,950 MHz) induce genotoxic effects in vitro in human fibroblasts but not in lymphocytes.

Radiofrequency electromagnetic radiation exposure effects on amygdala morphology, place preference behavior and brain caspase-3 activity in rats.

Radiofrequency electromagnetic radiation from cell phone causes defective testicular function in male Wistar rats.

Radiofrequency exposure and mammalian cell toxicity, genotoxicity, and transformation.

Radiofrequency radiation (900 MHz) induces Egr-1 gene expression and affects cell-cycle control in human neuroblastoma cells.

Radiofrequency radiation (900 MHz)-induced DNA damage and cell cycle arrest in testicular germ cells in swiss albino mice.

Radiofrequency radiation emitted from Wi-Fi (2.4 GHz) causes impaired insulin secretion and increased oxidative stress in rat pancreatic islets.

Radioprotective effects of honeybee venom (Apis mellifera) against 915-MHz microwave radiation-induced DNA damage in wistar rat lymphocytes: in vitro study.

RAPD Profiling, DNA Fragmentation, and Histomorphometric Examination in Brains of Wistar Rats Exposed to Indoor 2.5 Ghz Wi-Fi Devices Radiation.

Reactive oxygen species elevation and recovery in Drosophila bodies and ovaries following short-term and long-term exposure to DECT base EMF.

Reactive oxygen species formation and apoptosis in human peripheral blood mononuclear cell induced by 900 MHz mobile phone radiation.

Reactive oxygen species levels and DNA fragmentation on astrocytes in primary culture after acute exposure to low intensity microwave electromagnetic field.

Recent advances in research on radiofrequency fields and health.

Recent advances in the effects of microwave radiation on brains.

The effect of microwave radiation on the levels of MDA and the activity of SOD of nasopharyngeal carcinoma cells].

The effect of microwaves on lipid peroxidation and on lipid and mineral metabolism in warm-blooded animals (experimental research)].

The effect of prenatal exposure to 1800 MHz electromagnetic field on calcineurin and bone development in rats.

The effect of prenatal exposure to 900-MHz electromagnetic field on the 21-old-day rat testicle.

The effect of radiofrequency radiation on DNA and lipid damage in female and male infant rabbits.

The effect of radiofrequency radiation on DNA and lipid damage in non-pregnant and pregnant rabbits and their newborns.

The effects of electromagnetic fields from power lines on avian reproductive biology and physiology: a review.

The effects of electromagnetic radiation (2450 MHz wireless devices) on the heart and blood tissue: role of melatonin.

The effects of exposure to electromagnetic field on rat myocardium.

The effects of long-term exposure to a 2450 MHz electromagnetic field on growth and pubertal development in female Wistar rats.

The Effects of Melatonin on Oxidative Stress Parameters and DNA Fragmentation in Testicular Tissue of Rats Exposed to Microwave Radiation.

The effects of mobile phones on apoptosis in cerebral tissue: an experimental study on rats.

The effects of N-acetylcysteine and epigallocatechin-3-gallate on liver tissue protein oxidation and antioxidant enzyme levels after the exposure to radiofrequency radiation.

The effects of prenatal exposure to a 900-MHz electromagnetic field on the 21-day-old male rat heart.

The effects of prenatal long-duration exposure to 900-MHz electromagnetic field on the 21-day-old newborn male rat liver.

The effects of radiofrequency electromagnetic radiation on sperm function.

The effects of simultaneous combined exposure to CDMA and WCDMA electromagnetic fields on rat testicular function.

The genotoxic effect of radiofrequency waves on mouse brain.

The impact of electromagnetic radiation (2.45 GHz, Wi-Fi) on the female reproductive system: The role of vitamin C.

The impact of electromagnetic radiation of different parameters on platelet oxygen metabolism - in vitro studies.

The influence of 1800 MHz GSM-like signals on blood chemistry and oxidative stress in non-pregnant and pregnant rabbits.

The influence of 1800 MHz GSM-like signals on hepatic oxidative DNA and lipid damage in nonpregnant, pregnant, and newly born rabbits.

The influence of microwave radiation from cellular phone on fetal rat brain.

The injury effects of microwave exposure on visual performance and retinal ganglion cells (RGCs) in rats].

The link between radiofrequencies emitted from wireless technologies and oxidative stress.

The pathogenesis of central nervous system functional disordersafter exposure to microwave radiation].

The physiopathological effects of quercetin on oxidative stress in radiation of 4.5 g mobile phone exposed liver tissue of rat.

The preventive effect of lotus seedpod procyanidins on cognitive impairment and oxidative damage induced by extremely low frequency electromagnetic field exposure.

The prophylactic effect of vitamin C on oxidative stress indexes in rat eyes following exposure to radiofrequency wave generated by a BTS antenna model.

The protective effect of autophagy on mouse spermatocyte derived cells exposure to 1800MHz radiofrequency electromagnetic radiation.

The protective effect of caffeic acid phenethyl ester (CAPE) on oxidative stress in rat liver exposed to the 900 MHz electromagnetic field.

The protective effects of N-acetyl-L-cysteine and epigallocatechin-3-gallate on electric field-induced hepatic oxidative stress.

The repair of gamma-ray-induced chromosomal damage in human lymphocytes after exposure to extremely low frequency electromagnetic fields.

The role of chemical and physical factors in cancer development].

The role of electromagnetic fields in neurological disorders.

The role of heat shock proteins HSP90 in the response of immune cells to centimeter microwaves].

The role of zinc supplementation in the inhibition of tissue damage caused by exposure to electromagnetic field in rat lung and liver tissues.

The study of retinal ganglion cell apoptosis induced by different intensities of microwave irradiation.

The therapeutic effect of a pulsed electromagnetic field on the reproductive patterns of male Wistar rats exposed to a 2.45-GHz microwave field.

The use of millimeter wavelength electromagnetic waves in cardiology.

Therapeutic approaches of melatonin in microwave radiations-induced oxidative stress-mediated toxicity on male fertility pattern of Wistar rats.

Thermal and non-thermal health effects of low intensity non-ionizing radiation: An international perspective.

Ultra-wideband pulses increase nitric oxide production by RAW 264.7 macrophages incubated in nitrate.

Upregulation of HIF-1alpha via activation of ERK and PI3K pathway mediated protective response to microwave-induced mitochondrial injury in neuron-like cells.

Use of terahertz electromagnetic radiation at nitric oxide frequencies for the correction of thyroid functional state during stress].

Vitamin C protects rat cerebellum and encephalon from oxidative stress following exposure to radiofrequency wave generated by a BTS antenna model.

Wi-Fi (2.45 GHz)- and mobile phone (900 and 1800 MHz)-induced risks on oxidative stress and elements in kidney and testis of rats during pregnancy and the development of offspring.

Wi-Fi is an important threat to human health.

Zinc protective effects on pig retinal pigment epithelial cell damage of lipid peroxide induced by 2450 MHz microwave].

Zinc supplementation ameliorates electromagnetic field-induced lipid peroxidation in the rat brain.

FACTOR 9

Theme – Neurodegenerative diseases

Key MeSH Headings - Parkinson Disease, Neurodegenerative Diseases, Alzheimer Disease, Amyotrophic Lateral Sclerosis, Motor Neuron Disease, Occupational Diseases, Dementia, Brain Diseases, Dementia, Vascular

Titles

5-HT contents change in peripheral blood of workers exposed to microwave and high frequency radiation].

60 Hertz magnetic field exposure assessment for an investigation of leukemia in telephone lineworkers.

A case-control study on the risk factors of Alzheimer's disease in military elderly men].

A cluster of male breast cancer in office workers.

A cognitive-behavioral treatment of patients suffering from "electric hypersensitivity". Subjective effects and reactions in a double-blind provocation study.

A literature review: the cardiovascular effects of exposure to extremely low frequency electromagnetic fields.

A methodological approach to studying the values of 50-Hz electromagnetic fields that influence the workers of power enterprises].

A mortality study of electrical utility workers in Quebec.

A population-based cohort study of occupational exposure to magnetic fields and cardiovascular disease mortality.

A study on the biological effects of exposure mobile-phone frequency EMF].

Absenteeism and mortality of workers exposed to electromagnetic fields in the French Electricity Company.

Acute effects of ELF electromagnetic fields: a field study of linesmen working with 400 kV power lines.

Acute effects of pulsed microwaves and 3-nitropropionic acid on neuronal ultrastructure in the rat caudate-putamen.

Acute leukaemia in workers exposed to electromagnetic fields.

Acute leukemia in electrical workers: a New Zealand case-control study.

Adult mortality from leukemia, brain cancer, amyotrophic lateral sclerosis and magnetic fields from power lines: a case-control study in Brazil.

Amyotrophic lateral sclerosis (ALS) and extremely-low frequency (ELF) magnetic fields: a study in the SOD-1 transgenic mouse model.

Amyotrophic lateral sclerosis and environmental factors.

Amyotrophic lateral sclerosis and exposure to metals and other occupational/environmental hazardous materials: state of the art].

Amyotrophic lateral sclerosis and occupational exposure to electromagnetic fields.

Amyotrophic Lateral Sclerosis and Occupational Exposures: A Systematic Literature Review and Meta-Analyses.

An apparently incongruous exposure-response relationship resulting from the use of job description to assess magnetic field exposure.

Annals of conflicting results: looking back on electromagnetic field research.

Are occupational, hobby, or lifestyle exposures associated with Philadelphia chromosome positive chronic myeloid leukaemia?

Are thyroid dysfunctions related to stress or microwave exposure (900 MHz)?

Assessment of cellular telephone and other radio frequency exposure for epidemiologic research.

Assessment of magnetic field exposures for a mortality study at a uranium enrichment plant.

ASSESSMENT OF OCCUPATIONAL EXPOSURE TO RADIO FREQUENCY ELECTROMAGNETIC FIELDS].

Association between exposure to pulsed electromagnetic fields and cancer in electric utility workers in Quebec, Canada, and France.

Association between extremely low-frequency electromagnetic fields occupations and amyotrophic lateral sclerosis: a meta-analysis.

Association between occupational exposure to power frequency electromagnetic fields and amyotrophic lateral sclerosis: a review.

Berkson error adjustment and other exposure surrogates in occupational case-control studies, with application to the Canadian INTEROCC study.

Biologic effects and health consequences of low and high (radio) frequency electromagnetic fields.

Biological effects on human health due to radiofrequency/microwave exposure: a synopsis of cohort studies.

Biological indicators in response to radiofrequency/microwave exposure.

Biophysical mechanisms of electromagnetic fields interaction and health effects].

Brain cancer and occupational exposure to magnetic fields among men: results from a Canadian population-based case-control study.

Breast cancer and electromagnetic fields--a review.

Can exposure to a terrestrial trunked radio (TETRA)-like signal cause symptoms? A randomised double-blind provocation study.

Cancer in the electric power industry.

Cancer incidence among Norwegian airline pilots.

Cancer incidence among welders: possible effects of exposure to extremely low frequency electromagnetic radiation (ELF) and to welding fumes.

Cancer incidence and magnetic field exposure in industries using resistance welding in Sweden.

Carcinogenic risk of extremely-low-frequency electromagnetic fields: state of the art].

Cardiovascular diseases and the work environment. A critical review of the epidemiologic literature on nonchemical factors.

Causes of death among Belgian professional military radar operators: a 37-year retrospective cohort study.

Chromosome studies of personnel exposed to electromagnetic radiation at radar centers].

Clinical monitoring in areas of exposure to radiofrequency electromagnetic fields].

Clinical variants of the disease caused by exposure to radio-frequency electromagnetic fields].

Cohort and nested case-control studies of hematopoietic cancers and brain cancer among electric utility workers.

Computer screens and brain cancer.

Contemporary state of hygienic regulation of electromagnetic fields and prospective harmonizing with foreign standards].

Criterial parameter of hygienic regulation for exposure to rarely repeated ultrashort electromagnetic impulses].

Current problems of nonionizing radiation.

Dementia and occupational exposure to magnetic fields.

Depression in high voltage power line workers.

Description of persons with symptoms presumed to be caused by electricity or visual display units--oral aspects.

Development and evaluation of a tool for retrospective exposure assessment of selected endocrine disrupting chemicals and EMF in the car manufacturing industry.

Difficulties of expert testimony in microwave disease].

Ecological and hygienic studies of electromagnetic irradiation of navigation safety system in Eastern area of the Finnish Gulf].

Effect of electromagnetic radiation on T-lymphocyte subpopulations and immunoglobulin level in human blood serum after occupational exposure].

Effect of radiofrequency electromagnetic field exposure on in vitro models of neurodegenerative disease.

Effect of ultra high frequency electromagnetic waves and lead on the workers' health; phytotherapy of the disorders].

Effect of wide-band modulated electromagnetic fields on the workers of high-frequency telephone exchanges].

Effects of 60 Hz electromagnetic field exposure on APP695 transcription levels in differentiating human neuroblastoma cells.

Effects of exposure to microwaves: problems and perspectives.

Effects of exposure to very high frequency radiofrequency radiation on six antenna engineers in two separate incidents.

Electric and magnetic fields and health outcomes--an overview.

Electric and magnetic fields at power frequencies.

Electrical occupations and neurodegenerative disease: analysis of U.S. mortality data.

Electromagnetic field exposure and cancer: a review of epidemiologic evidence.

Electromagnetic interference of GSM mobile phones with the implantable deep brain stimulator, ITREL-III.

Electromagnetic pulse exposure induces overexpression of beta amyloid protein in rats.

Elevated risk of Alzheimer's disease among workers with likely electromagnetic field exposure.

EMF and health.

Environmental risk factors for non-Hodgkin's lymphoma: a population-based case-control study in Languedoc-Roussillon, France.

Epidemiologic studies of electric and magnetic fields and cancer: a case study of distortions by the media.

Epidemiologic studies of the effect of microwaves (neurophysiologic, hematologic and ophthalmologic aspects)].

Epidemiological risk assessment of pathology development in occupational exposure to radiofrequency electromagnetic fields].

Evaluation of occupational risk caused by exposure to electromagnetic rays].

Evaluation of various psychologic parameters in a group of workers occupationally exposed to radiofrequency].

Evaluation of vital activity of workers with obliterating diseases of lower extremities servicing electric transmission lines].

Exposure from occupational versus other sources.

Exposure to electromagnetic fields and risk of central nervous system diseases among employees at Danish electric companies].

Exposure to extremely-low-frequency electromagnetic fields and radiofrequency radiation: cardiovascular effects in humans.

Exposure to low-frequency electromagnetic fields--a health hazard?

Exposure to magnetic fields among electrical workers in relation to leukemia risk in Los Angeles County.

Exposure to VHF and UHF electromagnetic fields among workers employed in radio and TV broadcast centers. I. Assessment of exposure].

Exposure, health complaints and cognitive performance among employees of an MRI scanners manufacturing department.

Fifty Hertz electromagnetic field exposure stimulates secretion of beta-amyloid peptide in cultured human neuroglioma.

Follow-up of radio and telegraph operators with exposure to electromagnetic fields and risk of breast cancer.

Future needs of occupational epidemiology of extremely low frequency electric and magnetic fields: review and recommendations.

Health Effects of Electromagnetic Fields on Reproductive-Age Female Operators of Plastic Welding Machines in Fuzhou, China.

Health effects of electromagnetic fields].

Health effects relevant to the setting of EMF exposure limits.

Health of workers exposed to electric fields.

Health problems among operators of plastic welding machines and exposure to radiofrequency electromagnetic fields.

Health state and performance of operators in electric discharge facilities--sources of electromagnetic impulses].

HEALTH STATUS OF ELECTROTECHNICAL PERSONNEL EXPOSED TO THE COMBINED IMPACT OF ELECTROMAGNETIC FIELDS OF 50 HZ AND CHEMICALS].

Health status of railway workers using magnetic powder flaw detectors].

Health status of the workers exposed to strong, constant magnetic fields].

Hygienic assessment of working conditions and functional resistance in electric power station workers].

HYGIENIC ASSESSMENT OF WORKING CONDITIONS OF EMPLOYEES OF BROADCASTING CENTER].

Hygienic evaluation of work conditions for shielded compartments staff].

Hygienic optimization of the use of chemical protective means on railway transport].

Idiopathic environmental intolerance: 2 disabling entities to recognize].

Impact of electromagnetic fields on a computer user].

Incidence of breast cancer in a Norwegian cohort of women with potential workplace exposure to 50 Hz magnetic fields.

Incidence of cancer among workers in Norwegian hydroelectric power companies.

Incidence of cancer in Norwegian workers potentially exposed to electromagnetic fields.

Incidence of cancer in persons with occupational exposure to electromagnetic fields in Denmark.

Incidence of leukaemia and brain tumours in some "electrical occupations".

Increased incidence of cancer in a cohort of office workers exposed to strong magnetic fields.

Influence of power frequency electric and magnetic fields on human health.

Interactions between occupational exposure to extremely low frequency magnetic fields and chemicals for brain tumour risk in the INTEROCC study.

Interactive effect of chemical substances and occupational electromagnetic field exposure on the risk of gliomas and meningiomas in Swedish men.

Leukaemia, brain tumours and exposure to extremely low frequency magnetic fields: cohort study of Swiss railway employees.

Leukemia and occupational exposure to electromagnetic fields: review of epidemiologic surveys.

Leukemia following occupational exposure to 60-Hz electric and magnetic fields among Ontario electric utility workers.

Leukemia in electric utility workers: the evaluation of alternative indices of exposure to 60 Hz electric and magnetic fields.

Leukemia in telephone linemen.

Long term and excessive use of 900 MHz radiofrequency radiation alter microRNA expression in brain.

Low frequency electromagnetic fields in the working environment--exposure and health effects. Elevated risk of cancer, reproductive hazards or other unwanted health effects?].

Low-back pain among electric power supply workers and their attitude toward its prevention and the treatment.

Magnetic field exposure and neurodegenerative disease mortality among electric utility workers.

Magnetic field exposure and neurodegenerative diseases--recent epidemiological studies.

Magnetic field exposure in relation to leukemia and brain cancer mortality among electric utility workers.

Magnetic field exposure related to cancer subtypes.

Magnetic field on the deranged accommodation of visual detector terminal operators].

Magnetic fields and brain tumour risks in UK electricity supply workers.

Magnetic fields and leukaemia risks in UK electricity supply workers.

Magnetic fields exposure from high-voltage power lines and risk of amyotrophic lateral sclerosis in two Italian populations.

Male breast tumors in railway engine drivers: investigation of 5 cases].

Microwave antigen retrieval of beta-amyloid precursor protein immunoreactivity.

Microwave sickness: a reappraisal.

Mobile phone use and brain tumours in the CERENAT case-control study.

Modern concepts and methodology of means, methods of protection, and safety measures for servicemen affected by nonionizing radiation].

Mortality among workers in the geothermal power plants at Larderello, Italy.

Mortality from amyotrophic lateral sclerosis, other chronic disorders, and electric shocks among utility workers.

Mortality from brain cancer and leukaemia among electrical workers.

Mortality from neurodegenerative disease and exposure to extremely low-frequency magnetic fields: 31 years of observations on Swiss railway employees.

Mortality of personnel operating electric power objects with 500 kV voltage].

Myeloid leukemias and myelodysplastic syndromes: chemical exposure, histologic subtype and cytogenetics in a case-control study.

Neurodegenerative disease and magnetic field exposure in UK electricity supply workers.

Neurodegenerative diseases in welders and other workers exposed to high levels of magnetic fields.

Neurodegenerative diseases, suicide and depressive symptoms in relation to EMF.

Neurological effects of microwave exposure related to mobile communication.

Neurological effects of radiofrequency radiation.

News in occupational cancers].

Non-Hodgkin's lymphoma among electric utility workers in Ontario: the evaluation of alternate indices of exposure to 60 Hz electric and magnetic fields.

Non-ionizing radiation exposure causing ill-health and alopecia areata.

Novelties in hygienic evaluation of electromagnetic conditions on computerized workplaces].

Occupation and malignant lymphoma: a population based case control study in Germany.

Occupational assessment of computer placement in school areas].

Occupational electromagnetic field exposures associated with sleep quality: a cross-sectional study.

Occupational exposure and amyotrophic lateral sclerosis in a prospective cohort.

Occupational exposure of healthcare and research staff to static magnetic stray fields from 1.5-7 Tesla MRI scanners is associated with reporting of transient symptoms.

Occupational exposure to electromagnetic field and breast cancer risk in a large, population-based, case-control study in the United States.

Occupational exposure to electromagnetic fields and Alzheimer disease.

Occupational exposure to electromagnetic fields and its health effects in electric energy workers].

Occupational exposure to electromagnetic fields and sex-differential risk of uveal melanoma.

Occupational exposure to electromagnetic fields and the occurrence of brain tumors. An analysis of possible associations.

Occupational exposure to electromagnetic fields of extremely low frequency (with particular regard to power plants) and the health status of workers, based on a literature review].

Occupational exposure to extremely low frequency electric and magnetic fields and Alzheimer disease: a meta-analysis.

Occupational exposure to extremely low frequency magnetic fields and risk of Alzheimer disease: A systematic review and meta-analysis.

Occupational exposure to ionizing radiation and electromagnetic fields in relation to the risk of thyroid cancer in Sweden.

Occupational exposure to low frequency magnetic fields and dementia: a case-control study.

Occupational exposure to low frequency magnetic fields and the risk of low grade and high grade glioma.

Occupational exposure to magnetic fields in case-referent studies of neurodegenerative diseases.

Occupational exposure to non-ionizing radiation and an association with heart disease: an exploratory study.

Occupational exposure to physical agents: the new Italian database for risk assessment and control.

Occupational exposure to power frequency magnetic fields and risk of non-Hodgkin lymphoma.

Occupational exposures and brain cancer mortality: a preliminary study of east Texas residents.

Occupational Exposures and Neurodegenerative Diseases-A Systematic Literature Review and Meta-Analyses.

Occupational exposures and the risk of amyotrophic lateral sclerosis.

Occupational exposures obtained by questionnaire in clinical practice and their association with semen quality.

Occupational exposures to extremely low frequency magnetic fields and postmenopausal breast cancer.

Occupational factors of anxiety and depressive disorders in the French National Electricity and Gas Company. The Anxiety-Depression Group.

Occupational hazards for the male reproductive system.

Occupational health evaluation of electromagnetic fields in electric trains and subway technologic areas].

Occupational magnetic field exposure and neurodegenerative disease.

Occupational magnetic field exposure and site-specific cancer incidence: a Swedish cohort study.

Occupational risk and its prophylaxis for female workers engaged in radio-electronic instrument industry].

Occupational risk factors for acute leukaemia: a case-control study.

Occupational risk factors for cancer of the central nervous system: a case-control study on death certificates from 24 U.S. states.

Occupational risk factors in Alzheimer's disease: a review assessing the quality of published epidemiological studies.

Occupational risks in grocery stores].

Occupations with exposure to electromagnetic fields: a possible risk factor for Alzheimer's disease.

Ocular medical surveillance on microwave and laser workers.

On prevention of a combined impact of electromagnetic radiation and climatic/weather factors on worker's organism].

On prevention of electromagnetic rays effects in workers exposed to extreme climate conditions].

On the microwave exposure.

Optimization of methods for measurement and assessment of occupational exposure to electromagnetic fields in physiotherapy (SW diathermy)].

Overview of epidemiologic research on electric and magnetic fields and cancer.

Perspectives on health effects of electric and magnetic fields.

Physical factors and stress].

Physicians appeals on the dangers of mobile communication--what is the evidence? Assessment of public health data.

Prevalence of depression among electrical workers.

Prevalence of musculoskeletal disorders and related occupational causative factors among electricity linemen: A narrative review.

Problem of studying influence of electric and magnetic fields on human health. Results and prospects].

Provocation of the electromagnetic distress syndrome.

Radiofrequency (RF) sickness in the Lilienfeld Study: an effect of modulated microwaves?

Radiofrequency electromagnetic fields; male infertility and sex ratio of offspring.

Radiofrequency fields, transthyretin, and Alzheimer's disease.

Relationship between amyloid beta protein and melatonin metabolite in a study of electric utility workers.

Relationships between occupational history and serum concentrations of organochlorine compounds in exocrine pancreatic cancer.

Remote effects of occupational and non-occupational exposure to electromagnetic fields of power-line frequency. Epidemiological studies].

Reports on electromagnetic field strength measurements issued for occupational health and safety needs in the opinion of radio communication station users].

Residence near power lines and mortality from neurodegenerative diseases: longitudinal study of the Swiss population.

Residential and occupational exposures to 50-Hz magnetic fields and breast cancer in women: a population-based study.

Residential distance to high-voltage power lines and risk of neurodegenerative diseases: a Danish population-based case-control study.

Review of the epidemiologic literature on EMF and Health.

Risk agents related to work and amyotrophic lateral sclerosis: An occupational medicine focus.

Risk factors for Alzheimer disease: a population-based case-control study in Istanbul, Turkey.

Risk factors, health risks, and risk management for aircraft personnel and frequent flyers.

Risk for leukaemia and brain and breast cancer among Danish utility workers: a second follow-up.

Risk of severe cardiac arrhythmia in male utility workers: a nationwide danish cohort study.

Searching for the perfect wave: the effect of radiofrequency electromagnetic fields on cells.

Setting prudent public health policy for electromagnetic field exposures.

Socioeconomic status, social mobility and cancer occurrence during working life: a case-control study among French electricity and gas workers.

State of peripheral blood of technical personnel exposed to constant magnetic fields].

Symptoms of the musculoskeletal system and exposure to magnetic fields in an aluminium plant.

Systematic analysis of the state of man exposed to radio wave irradiation for a long time].

The effect of various occupational exposures to microwave radiation on the concentrations of immunoglobulins and T lymphocyte subsets].

The evaluation of the consequences of electromagnetic irradiation of hands in operators of high-frequency welding devices].

The evaluation of the exposure of seamstresses to electromagnetic fields, emitted by sewing machines].

The health problems of computer operators].

The possible role of radiofrequency radiation in the development of uveal melanoma.

The potential hazard for the development of leukemia from exposure to electromagnetic radiation (a review of the literature)].

The psychosocial work environment and skin symptoms among visual display terminal workers: a case referent study.

The strategy of targetted health surveillance. II. Genetically determined susceptibility to chemical substances and other issues related to health surveillance.

Trends in nonionizing electomagnetic radiation bioeffects research and related occupational health aspects.

Various psychological parameters in subjects occupationally exposed to radiofrequencies].

Work environment and cardiovascular diseases. A short review of the literature.

Work related etiology of amyotrophic lateral sclerosis (ALS): a meta-analysis.

FACTOR 10

Theme - Cerebrovascular disorders

Key MeSH Headings - Cerebrovascular Disorders, Dementia, Migraine Disorders, Tinnitus, Headache, Sleep Wake Disorders, Carotid Artery Diseases, Alzheimer Disease, Dementia, Vascular

Titles

A 50-Hz electromagnetic field impairs sleep.

A case-control study on the risk factors of Alzheimer's disease in military elderly men].

A literature review of medical side effects from radio-frequency energy in the human environment: involving cancer, tumors, and problems of the central nervous system.

A study on the biological effects of exposure mobile-phone frequency EMF].

A survey study on some neurological symptoms and sensations experienced by long term users of mobile phones.

Association between exposure to radiofrequency electromagnetic fields assessed by dosimetry and acute symptoms in children and adolescents: a population based cross-sectional study.

Association between overuse of mobile phones on quality of sleep and general health among occupational health and safety students.

Association of mobile phone radiation with fatigue, headache, dizziness, tension and sleep disturbance in Saudi population.

Association of tinnitus and electromagnetic hypersensitivity: hints for a shared pathophysiology?

Cell phones: modern man's nemesis?

Clinical features of headache associated with mobile phone use: a cross-sectional study in university students.

Cohort study on the effects of everyday life radio frequency electromagnetic field exposure on non-specific symptoms and tinnitus.

Dementia and occupational exposure to magnetic fields.

Do mobile phone base stations affect sleep of residents? Results from an experimental double-blind sham-controlled field study.

Effect of stress and intesity of mobile phone using on the health and subjective symptoms in GSM workers].

Effects of 60 Hz electromagnetic field exposure on APP695 transcription levels in differentiating human neuroblastoma cells.

Effects of Millimeter-Wave Electromagnetic Radiation on the Experimental Model of Migraine.

Effects of Sleep Quality on the Association between Problematic Mobile Phone Use and Mental Health Symptoms in Chinese College Students.

Electrical occupations and neurodegenerative disease: analysis of U.S. mortality data.

Electromagnetic hypersensitivity (EHS) and subjective health complaints associated with electromagnetic fields of mobile phone communication--a literature review published between 2000 and 2004.

Electromagnetic pulse exposure induces overexpression of beta amyloid protein in rats.

Elevated risk of Alzheimer's disease among workers with likely electromagnetic field exposure.

Exposure to electromagnetic fields and risk of central nervous system diseases among employees at Danish electric companies].

Fifty Hertz electromagnetic field exposure stimulates secretion of beta-amyloid peptide in cultured human neuroglioma.

Headache and sferics.

Health of workers exposed to electric fields.

Individual variation in temporal relationships between exposure to radiofrequency electromagnetic fields and non-specific physical symptoms: A new approach in studying 'electrosensitivity'.

Investigation of sleep disorders in the vicinity of high frequency transmitters].

Long term and excessive use of 900 MHz radiofrequency radiation alter microRNA expression in brain.

Long-term and frequent cellular phone use and risk of acoustic neuroma.

Magnetic field exposure and neurodegenerative disease mortality among electric utility workers.

Magnetic field exposure and neurodegenerative diseases--recent epidemiological studies.

Microwave antigen retrieval of beta-amyloid precursor protein immunoreactivity.

Microwave sickness: a reappraisal.

Mobile communication: radiobiology problems and evaluation of danger].

Mobile phone headache: a double blind, sham-controlled provocation study.

Mobile phone use and health symptoms in children.

Mobile phone use and stress, sleep disturbances, and symptoms of depression among young adults--a prospective cohort study.

Mobile phone use and subjective symptoms. Comparison of symptoms experienced by users of analogue and digital mobile phones.

Mobile Phone Use and The Risk of Headache: A Systematic Review and Meta-analysis of Cross-sectional Studies.

Mobile phone use, school electromagnetic field levels and related symptoms: a cross-sectional survey among 2150 high school students in Izmir.

Natural very-low-frequency sferics and headache.

Neurobehavioral effects among inhabitants around mobile phone base stations.

Neurodegenerative diseases in welders and other workers exposed to high levels of magnetic fields.

Neurodegenerative diseases, suicide and depressive symptoms in relation to EMF.

Neurological changes induced by a mobile phone.

Non-specific physical symptoms and electromagnetic field exposure in the general population: can we get more specific? A systematic review.

Occupational electromagnetic field exposures associated with sleep quality: a cross-sectional study.

Occupational exposure to electromagnetic fields and Alzheimer disease.

Occupational exposure to extremely low frequency electric and magnetic fields and Alzheimer disease: a meta-analysis.

Occupational exposure to extremely low frequency magnetic fields and risk of Alzheimer disease: A systematic review and meta-analysis.

Occupational exposure to low frequency magnetic fields and dementia: a case-control study.

Occupational exposure to magnetic fields in case-referent studies of neurodegenerative diseases.

Occupational Exposures and Neurodegenerative Diseases-A Systematic Literature Review and Meta-Analyses.

Occupational magnetic field exposure and neurodegenerative disease.

Occupational risk factors in Alzheimer's disease: a review assessing the quality of published epidemiological studies.

Occupations with exposure to electromagnetic fields: a possible risk factor for Alzheimer's disease.

Physicians appeals on the dangers of mobile communication--what is the evidence? Assessment of public health data.

Preliminary report: symptoms associated with mobile phone use.

Prevalence of headache among handheld cellular telephone users in Singapore: a community study.

Psychological symptoms and intermittent hypertension following acute microwave exposure.

Radio and microwave frequency radiation and health--an analysis of the literature].

Radiofrequency fields, transthyretin, and Alzheimer's disease.

Relationship between amyloid beta protein and melatonin metabolite in a study of electric utility workers.

Residence near power lines and mortality from neurodegenerative diseases: longitudinal study of the Swiss population.

Residential distance to high-voltage power lines and risk of neurodegenerative diseases: a Danish population-based case-control study.

Risk factors for Alzheimer disease: a population-based case-control study in Istanbul, Turkey.

Role of ultrasonic dopplerography in monitoring the effectiveness of treatment of patients who have sustained a stroke with decimeter-range electromagnetic waves].

Subjective symptoms related to mobile phone use--a pilot study].

Subjective symptoms, sleeping problems, and cognitive performance in subjects living near mobile phone base stations.

Survey of mobile phone use and their chronic effects on the hearing of a student population.

Symptom prevalence and worry about high voltage transmission lines.

Symptoms experienced by people in vicinity of base stations: II/ Incidences of age, duration of exposure, location of subjects in relation to the antennas and other electromagnetic factors].

Symptoms of ill health ascribed to electromagnetic field exposure--a questionnaire survey.

Symptoms reported by mobile cellular telephone users].

The association between use of mobile phones after lights out and sleep disturbances among Japanese adolescents: a nationwide cross-sectional survey.

The effects of 884 MHz GSM wireless communication signals on headache and other symptoms: an experimental provocation study.

The prevalence of symptoms attributed to electromagnetic field exposure: a cross-sectional representative survey in Switzerland.

The relationship between adolescents' well-being and their wireless phone use: a cross-sectional study.

The risk of subjective symptoms in mobile phone users in Poland--an epidemiological study.

The role of microwave radiometry in carotid artery disease. Diagnostic and clinical prospective.

Time-dependent hematological changes in workers exposed to electromagnetic fields.

Tinnitus and cell phones: the role of electromagnetic radiofrequency radiation.

Tinnitus and mobile phone use.

FACTOR 11

Theme - Congenital abnormalities and glandular-based tumors

Key MeSH Headings - Cleft Lip, Cleft Palate, Fibroadenoma, Adenoma, Calcification, Physiologic, Mammary Neoplasms, Animal, Mammary Neoplasms, Experimental, Adenocarcinoma

Titles

A histopathological study on alterations in DMBA-induced mammary carcinogenesis in rats with 50 Hz, 100 muT magnetic field exposure.

Acceleration of mammary tumorigenesis by exposure of 7,12-dimethylbenz[a]anthracene-treated female rats in a 50-Hz, 100-microT magnetic field: replication study.

Are microwaves a co-teratogen? Experimental model concept and its verification].

Bioelectromagnetic field effects on cancer cells and mice tumors.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in F344/N rats.

Chronic, low-level (1.0 W/kg) exposure of mice prone to mammary cancer to 2450 MHz microwaves.

Do cocarcinogenic effects of ELF electromagnetic fields require repeated long-term interaction with carcinogens? Characteristics of positive studies using the DMBA breast cancer model in rats.

Effect of 13 week magnetic field exposures on DMBA-initiated mammary gland carcinomas in female Sprague-Dawley rats.

Effect of 26 week magnetic field exposures in a DMBA initiation-promotion mammary gland model in Sprague-Dawley rats.

Effect of a 9 mT pulsed magnetic field on C3H/Bi female mice with mammary carcinoma. A comparison between the 12 Hz and the 460 Hz frequencies.

Effects of 50- or 60-hertz, 100 microT magnetic field exposure in the DMBA mammary cancer model in Sprague-Dawley rats: possible explanations for different results from two laboratories.

Effects of 900 MHz GSM wireless communication signals on DMBA-induced mammary tumors in rats.

Effects of GSM-900 microwaves on DMBA-induced mammary gland tumors in female Sprague-Dawley rats.

Effects of magnetic fields on mammary tumor development induced by 7,12-dimethylbenz(a)anthracene in rats.

Effects of mobile-phone microwave on dimethylbenz (a) anthracene induced mammary carcinoma development in rats].

Effects of weak alternating magnetic fields on nocturnal melatonin production and mammary carcinogenesis in rats.

Evaluation of health risks caused by radio frequency accelerated carcinogenesis: the importance of processes driven by the calcium ion signal.

Evaluation of the potential carcinogenicity of 60 Hz linear sinusoidal continuous-wave magnetic fields in Fischer F344 rats.

Low-frequency electromagnetic radiation enhances the induction of rat mammary tumors by nitrosomethyl urea.

Magnetic fields and mammary cancer in rodents: a critical review and evaluation of published literature.

Male breast tumors in railway engine drivers: investigation of 5 cases].

Microwave absorption by normal and tumor cells.

Modifying effect of light and electromagnetic field on development of mammary tumors induced by N-nitrosomethyl urea in female rats].

Non dietetic environmental risk factors in prostate cancer].

Occupational exposure to magnetic fields in relation to male breast cancer and testicular cancer: a Swedish case-control study.

On the role of the interactions of ions with external magnetic fields in physiologic processes and their importance in chronobiology.

Pulsed magnetic field from video display terminals enhances teratogenic effects of cytosine arabinoside in mice.

Repeated exposure of C3H/HeJ mice to ultra-wideband electromagnetic pulses: lack of effects on mammary tumors.

Search for teratogenic risks with the aid of malformation registries.

Significant differences in the effects of magnetic field exposure on 7,12-dimethylbenz(a)anthracene-induced mammary carcinogenesis in two substrains of Sprague-Dawley rats.

Study on potential effects of "902-MHz GSM-type Wireless Communication Signals" on DMBA-induced mammary tumours in Sprague-Dawley rats.

The effect of low-frequency electromagnetic fields on the development of experimental mammary tumors].

The influence of electromagnetic radiation generated by a mobile phone on the skeletal system of rats.

Transferrin receptors and natural killer cell lysis. A study using Colo 205 cells exposed to 60 Hz electromagnetic fields.

VDT pulse magnetic field enhances teratogenic effect of ara-c in mice].

FACTOR 12

Theme – Skin neoplasms

Key MeSH Headings - Carcinoma, Basal Cell, Carcinoma, Squamous Cell, Skin Neoplasms, Cocarcinogenesis, Neoplasms, Experimental, Neoplasms, Radiation-Induced, Colonic Neoplasms

Titles

50-Hz electromagnetic environment and the incidence of childhood tumors in Stockholm County.

A case-case study of mobile phone use and acoustic neuroma risk in Japan.

A histopathological study on alterations in DMBA-induced mammary carcinogenesis in rats with 50 Hz, 100 muT magnetic field exposure.

A literature review of medical side effects from radio-frequency energy in the human environment: involving cancer, tumors, and problems of the central nervous system.

A pooled analysis of extremely low-frequency magnetic fields and childhood brain tumors.

A population-based case-control study of radiofrequency exposure in relation to childhood neoplasm.

A review of in vitro studies: low-frequency electromagnetic fields.

A study on skin tumour formation in mice with 50 Hz magnetic field exposure.

A three-dimensional point process model for the spatial distribution of disease occurrence in relation to an exposure source.

Acceleration of the development of benzopyrene-induced skin cancer in mice by microwave radiation.

Acoustic neuroma risk in relation to mobile telephone use: results of the INTERPHONE international case-control study.

Adverse cutaneous effects of ionizing and non-ionizing electromagnetic radiation.

Alternative functional relationships between ELF field exposure and possible health effects: report on an expert workshop.

An epidemiological review of mobile telephones and cancer.

Animal carcinogenicity studies on radiofrequency fields related to mobile phones and base stations.

Application criteria of the precautionary principle].

Assessing the potential carcinogenic activity of magnetic fields using animal models.

Assessment of cellular telephone and other radio frequency exposure for epidemiologic research.

Association between radiation from mobile phones and tumour risk in adults].

Bcl-2 and p53 immunoprofile in Kaposi's sarcoma.

Bioeffects of electromagnetic fields--safety limits of each frequency band, especially less than radio one].

Biological effects from electromagnetic field exposure and public exposure standards.

Biological effects of amplitude-modulated radiofrequency radiation.

Biological effects of electromagnetic fields and radiation.

Biological effects of extremely low-frequency electromagnetic fields: in vivo studies.

Biological effects on human health due to radiofrequency/microwave exposure: a synopsis of cohort studies.

Biological indicators in response to radiofrequency/microwave exposure.

Biological interactions and potential health effects of extremely-low-frequency magnetic fields from power lines and other common sources.

Biological responses to electromagnetic fields.

Biomarkers of induced electromagnetic field and cancer.

Biophysical estimation of the environmental importance of electromagnetic fields.

Biophysical mechanisms of electromagnetic fields interaction and health effects].

Brain tumor risk in offspring of men occupationally exposed to electric and magnetic fields.

Cancer in radar technicians exposed to radiofrequency/microwave radiation: sentinel episodes.

Cancer incidence among welders: possible effects of exposure to extremely low frequency electromagnetic radiation (ELF) and to welding fumes.

Cancer incidence and magnetic field exposure in industries using resistance welding in Sweden.

Cancer incidence in California flight attendants (United States).

Cancer incidence vs. FM radio transmitter density.

Cancer morbidity in subjects occupationally exposed to high frequency (radiofrequency and microwave) electromagnetic radiation.

Cancer promotion in a mouse-skin model by a 60-Hz magnetic field: I. Experimental design and exposure system.

Cancer promotion in a mouse-skin model by a 60-Hz magnetic field: II. Tumor development and immune response.

Cancer risks related to low-level RF/MW exposures, including cell phones.

Cancer versus FM radio polarization types.

Carcinogenic risk of extremely-low-frequency electromagnetic fields: state of the art].

Carcinogenicity study of 217 Hz pulsed 900 MHz electromagnetic fields in Pim1 transgenic mice.

Carcinogenicity study of GSM and DCS wireless communication signals in B6C3F1 mice.

Carcinogenicity test in B6C3F1 mice after parental and prenatal exposure to 50 Hz magnetic fields.

Carcinogenicity test of 50 Hz sinusoidal magnetic fields in rats.

Case-control study on uveal melanoma (RIFA): rational and design.

Cell phone radiation exposure on brain and associated biological systems.

Cell phones and cancer: what is the evidence for a connection?

Cellular and cordless telephone use and the association with brain tumors in different age groups.

Childhood cancer and magnetic fields from high-voltage power lines in England and Wales: a case-control study.

Childhood cancer in relation to distance from high voltage power lines in England and Wales: a case-control study.

Childhood cancer in relation to indicators of magnetic fields from ground current sources.

Childhood cancer occurrence in relation to power line configurations: a study of potential selection bias in case-control studies.

Children's health and RF EMF exposure. Views from a risk assessment and risk communication perspective.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in F344/N rats.

Chronic, low-level (1.0 W/kg) exposure of mice prone to mammary cancer to 2450 MHz microwaves.

Comparative health risk assessment of electromagnetic fields.

Concern that "EMF" magnetic fields from power lines cause cancer.

Danger of cellular telephones and their relay stations].

Delayed biological effect of electromagnetic fields action].

Do cocarcinogenic effects of ELF electromagnetic fields require repeated long-term interaction with carcinogens? Characteristics of positive studies using the DMBA breast cancer model in rats.

Do people understand IARC's 2B categorization of RF fields from cell phones?

Ecological study on residences in the vicinity of AM radio broadcasting towers and cancer death: preliminary observations in Korea.

Effect of 13 week magnetic field exposures on DMBA-initiated mammary gland carcinomas in female Sprague-Dawley rats.

Effect of 26 week magnetic field exposures in a DMBA initiation-promotion mammary gland model in Sprague-Dawley rats.

Effect of magnetic field exposure on anchorage-independent growth of a promoter-sensitive mouse epidermal cell line (JB6).

Effect of radiofrequency radiation exposure on mouse skin tumorigenesis initiated by 7,12-dimethybenz[alpha]anthracene.

Effects of 2.45-GHz microwave radiation and phorbol ester 12-O-tetradecanoylphorbol-13-acetate on dimethylhydrazine-induced colon cancer in mice.

Effects of 2450 MHz electromagnetic fields with a wide range of SARs on methylcholanthrene-induced transformation in C3H10T1/2 cells.

Effects of 900 MHz GSM wireless communication signals on DMBA-induced mammary tumors in rats.

Effects of GSM-900 microwaves on DMBA-induced mammary gland tumors in female Sprague-Dawley rats.

Effects of low level microwave radiation on carcinogenesis in Swiss Albino mice.

Effects of mobile phone radiation on UV-induced skin tumourigenesis in ornithine decarboxylase transgenic and non-transgenic mice.

Electric blanket or mattress cover use and breast cancer incidence in women 50-79 years of age.

Electric Blanket Use and Risk of Thyroid Cancer in the Women's Health Initiative Observational Cohort.

Electrical field exposure and human health. Risk assessment and problems relative to bureaucratic procedures and to the role of instituitional organizations in control and prevention].

Electromagnetic fields and cancer risks.

Electromagnetic fields and cancer: the cost of doing nothing.

Electromagnetic fields and cells.

Electromagnetic fields and female breast cancer.

Electromagnetic fields and health effects--epidemiologic studies of cancer, diseases of the central nervous system and arrhythmia-related heart disease.

Electromagnetic fields and public health.

Electromagnetic fields at mobile phone frequency induce apoptosis and inactivation of the multi-chaperone complex in human epidermoid cancer cells.

Electromagnetic fields of mobile telephone systems--thresholds, effects and risks for cochlear implant patients and healthy people].

Electromagnetic fields--effects on health].

Electromagnetic fields: a cancer promoter?

Electromagnetic radiations and cancer. Cause and prevention.

Electromagnetic-field exposure and cancer.

EMF and current cancer concepts.

EMF and health.

Epidemiologic evidence on mobile phones and tumor risk: a review.

Epidemiological studies of human exposures to radiofrequency radiation. A critical review.

Epidemiological studies of radio frequency exposures and human cancer.

Epidemiological study of power lines and childhood cancer in the UK: further analyses.

Estimates of Environmental Exposure to Radiofrequency Electromagnetic Fields and Risk of Lymphoma Subtypes.

Estimating exposure in studies of residential magnetic fields and cancer: importance of short-term variability, time interval between diagnosis and measurement, and distance to power line.

Evaluation of carcinogenic effects of electromagnetic fields (EMF).

Evaluation of potential confounders in planning a study of occupational magnetic field exposure and female breast cancer.

Evaluation of residential exposure to intermediate frequency magnetic fields.

Evaluation of the effects of electric and magnetic fields in humans].

Evaluation of the potential carcinogenicity of 60 Hz linear sinusoidal continuous-wave magnetic fields in Fischer F344 rats.

Evaluation of the potential in vitro antiproliferative effects of millimeter waves at some therapeutic frequencies on RPMI 7932 human skin malignant melanoma cells.

Evidence for microwave carcinogenesis in vitro.

Experimental data on radiofrequency].

Exposure to low electromagnetic fields and the carcinogenesis process].

Exposure to low-intensive superhigh frequency electromagnetic field as a factor of carcinogenesis in experimental animals.

Exposure to power-frequency magnetic fields and the risk of childhood cancer. UK Childhood Cancer Study Investigators.

Exposure to radio-frequency electromagnetic fields from broadcast transmitters and risk of childhood cancer: a census-based cohort study.

Extremely low frequency electromagnetic fields (EMF) and brain cancer in adults and children: review and comment.

Extremely low-frequency electromagnetic fields exposure and female breast cancer risk: a meta-analysis based on 24,338 cases and 60,628 controls.

Follow-up of radio and telegraph operators with exposure to electromagnetic fields and risk of breast cancer.

Further aspects on cellular and cordless telephones and brain tumours.

Future needs of occupational epidemiology of extremely low frequency electric and magnetic fields: review and recommendations.

Genetic, carcinogenic and teratogenic effects of radiofrequency fields.

GSM and DCS wireless communication signals: combined chronic toxicity/carcinogenicity study in the Wistar rat.

Health effects of microwave exposures: a review of the recent (1995-1998) literature.

Health risks from the use of mobile phones.

Health risks of electric and magnetic fields caused by high-voltage systems in Finland.

Health risks of electromagnetic fields. Part I: Evaluation and assessment of electric and magnetic fields.

Health risks of exposure to non-ionizing radiation--myths or science-based evidence.

Health risks of mobile phones].

Hematopoietic neoplasia in C57BL/6 mice exposed to split-dose ionizing radiation and circularly polarized 60 Hz magnetic fields.

High-voltage overhead power lines in epidemiology: patterns of time variations in current load and magnetic fields.

How dangerous are mobile phones, transmission masts, and electricity pylons?

Human disease resulting from exposure to electromagnetic fields.

Immunotropic effects of electromagnetic fields in the range of radio- and microwave frequencies].

Improved classification of evidence for EMF health risks.

In vivo exposure of rats to a weak alternating magnetic field increases ornithine decarboxylase activity in the mammary gland by a similar extent as the carcinogen DMBA.

Incidence of breast cancer in a Norwegian cohort of women with potential workplace exposure to 50 Hz magnetic fields.

Incorporation of epidemiological findings into radiation protection standards.

Increased mortality in amateur radio operators due to lymphatic and hematopoietic malignancies.

Indication of cocarcinogenic potential of chronic UMTS-modulated radiofrequency exposure in an ethylnitrosourea mouse model.

Influence of extremely-low-frequency magnetic field on antioxidative melatonin properties in AT478 murine squamous cell carcinoma culture.

Invited commentary: electromagnetic fields and cancer in railway workers.

Joint actions of environmental nonionizing electromagnetic fields and chemical pollution in cancer promotion.

Leukemia, brain tumors, and exposure to extremely low frequency electromagnetic fields in Swiss railway employees.

Long-term use of cellular phones and brain tumours: increased risk associated with use for > or =10 years.

Long-term, low-level microwave irradiation of rats.

Lost in laterality: interpreting "preferred side of the head during mobile phone use and risk of brain tumour" associations.

Low frequency electromagnetic fields in the working environment--exposure and health effects. Elevated risk of cancer, reproductive hazards or other unwanted health effects?].

Low-frequency electromagnetic radiation enhances the induction of rat mammary tumors by nitrosomethyl urea.

Low-level exposure to radiofrequency electromagnetic fields: health effects and research needs.

Magnetic fields and breast cancer in Swedish adults residing near high-voltage power lines.

Magnetic fields and childhood cancer--a pooled analysis of two Scandinavian studies.

Magnetic fields and childhood cancer: an epidemiological investigation of the effects of high-voltage underground cables.

Magnetic fields of high voltage power lines and risk of cancer in Finnish adults: nationwide cohort study.

Malignant melanoma of the skin - not a sunshine story!

Medical aspects of radiofrequency radiation overexposure.

Medical exposure to ionising radiation and the risk of brain tumours: Interphone study group, Germany.

Melanoma incidence and frequency modulation (FM) broadcasting.

Melatonin suppression by static and extremely low frequency electromagnetic fields: relationship to the reported increased incidence of cancer.

Meta-analysis of long-term mobile phone use and the association with brain tumours.

Methods used to calculate exposures in two epidemiological studies of power lines in the UK.

Microwave absorption by normal and tumor cells.

Mobile phone base stations and early childhood cancers: case-control study.

Mobile phone radiation and the risk of cancer; a review.

Mobile phone use and acoustic neuroma risk in Japan.

Mobile phone use and brain tumours in the CERENAT case-control study.

Mobile phone use and risk of parotid gland tumor.

Mobile phone use and the risk of skin cancer: a nationwide cohort study in Denmark.

Mobile phone use, exposure to radiofrequency electromagnetic field, and brain tumour: a case-control study.

Mobile phones and brain tumours: a review of epidemiological research.

Mobile phones and head tumours. The discrepancies in cause-effect relationships in the epidemiological studies - how do they arise?

Mobile phones, cordless phones and the risk for brain tumours.

Mobile phones, mobile phone base stations and cancer: a review.

Mortality in workers exposed to electromagnetic fields.

Mortality indices for hemoblastoses in Rivno Province before and after the accident at the Chernobyl Atomic Electric Power Station].

Motivation and significance of IARC classification for mobile phone].

Need for a European approach to the effects of extremely low-frequency electromagnetic fields on cancer. ELF-EMF European Feasibility Study Group.

Non dietetic environmental risk factors in prostate cancer].

Non-ionizing electromagnetic radiation and cancer--is there a relationship?

Non-ionizing electromagnetic radiation: a study of carcinogenic and cancer treatment potential.

Non-ionizing electromagnetic radiations, emitted by a cellular phone, modify cutaneous blood flow.

Non-thermal bioeffects of static and extremely low frequency electromagnetic fields].

Nonionizing electromagnetic fields and cancer: a review.

Normal doses of visible light can cause mutations in skin].

Occupational exposure to electromagnetic fields and sex-differential risk of uveal melanoma.

Occupational exposure to electromagnetic fields and the occurrence of brain tumors. An analysis of possible associations.

Occupational exposure to ionizing and non-ionizing radiation and risk of non-Hodgkin lymphoma.

Occupational exposure to ionizing radiation and electromagnetic fields in relation to the risk of thyroid cancer in Sweden.

Occupational exposure to non-ionizing radiation and an association with heart disease: an exploratory study.

Occupational exposure to power frequency magnetic fields and risk of non-Hodgkin lymphoma.

Overview of epidemiologic research on electric and magnetic fields and cancer.

p53 immunoreactivity in cutaneous PUVA tumors is similar to that in other non-melanoma skin neoplasms.

Pathophysiology of cell phone radiation: oxidative stress and carcinogenesis with focus on male reproductive system.

Physical basis of adverse and therapeutic effects of low intensity microwave radiation.

Possible cocarcinogenic effects of ELF electromagnetic fields may require repeated long-term interaction with known carcinogenic factors.

Possible health hazards from exposure to power-frequency electric and magnetic fields--a COMAR Technical Information Statement.

Primary brain cancer in adults and the use of common household appliances: a case-control study.

Public health and the radio frequency radiation emitted by cellphone technology, smart meters and WiFi.

Radiation exposure, socioeconomic status, and brain tumor risk in the US Air Force: a nested case-control study.

Radio and microwave frequency radiation and health--an analysis of the literature].

Radio frequency electromagnetic fields: cancer, mutagenesis, and genotoxicity.

Radio-frequency radiation exposure from AM radio transmitters and childhood leukemia and brain cancer.

Radiofrequency and microwave radiation in the microelectronics industry.

Radiofrequency electromagnetic fields emitted from base stations of DECT cordless phones and the risk of glioma and meningioma (Interphone Study Group, Germany).

Radiofrequency exposure and mammalian cell toxicity, genotoxicity, and transformation.

Radiofrequency field exposure and cancer: what do the laboratory studies suggest?

Radiofrequency-induced carcinogenesis: cellular calcium homeostasis changes as a triggering factor.

Rate of occurrence of transient magnetic field events in U.S. residences.

Reanalysis of risks of childhood leukaemia with distance from overhead power lines in the UK.

Recent advances in research on radiofrequency fields and health: 2001-2003.

Recent advances in research on radiofrequency fields and health: 2004-2007.

Recent data from the literature on the biological and pathologic effects of electromagnetic radiation, radio waves and stray currents].

Recent experimental data on Extremely Low Frequency (ELF) magnetic field carcinogenic risk: open questions.

Repeated exposure of C3H/HeJ mice to ultra-wideband electromagnetic pulses: lack of effects on mammary tumors.

Report of final results regarding brain and heart tumors in Sprague-Dawley rats exposed from prenatal life until natural death to mobile phone radiofrequency field representative of a 1.8GHz GSM base station environmental emission.

Residential and occupational exposure to 50 Hz magnetic fields and malignant melanoma: a population based study.

Residential mobility of populations near UK power lines and implications for childhood leukaemia.

Review of possible modulation-dependent biological effects of radiofrequency fields.

Risk of brain tumors from wireless phone use.

Risk of brain tumours in relation to estimated RF dose from mobile phones: results from five Interphone countries.

Risk of cancer among Danish electricity workers. A cohort study].

Risk of neoplastic diseases in conditions of exposure to radio- and microwave fields--epidemiologic investigations].

Selection bias from differential residential mobility as an explanation for associations of wire codes with childhood cancer.

Self-reported electrical appliance use and risk of adult brain tumors.

Short-term exposure to 50 Hz ELF-EMF alters the cisplatin-induced oxidative response in AT478 murine squamous cell carcinoma cells.

Should the threshold limit value for power frequency (60 Hz) magnetic fields be changed? Perceptions among scientists and other risk experts.

Significant differences in the effects of magnetic field exposure on 7,12-dimethylbenz(a)anthracene-induced mammary carcinogenesis in two substrains of Sprague-Dawley rats.

Socioeconomic status, social mobility and cancer occurrence during working life: a case-control study among French electricity and gas workers.

Spontaneous and nitrosourea-induced primary tumors of the central nervous system in Fischer 344 rats chronically exposed to 836 MHz modulated microwaves.

Spontaneous and nitrosourea-induced primary tumors of the central nervous system in Fischer 344 rats exposed to frequency-modulated microwave fields.

Studying the effects of mobile phone use on the auditory system and the central nervous system: a review of the literature and future directions.

Survival and cancer in laboratory mammals exposed to radiofrequency energy.

Systematic review of wireless phone use and brain cancer and other head tumors.

Testing electromagnetic fields for potential carcinogenic activity: a critical review of animal models.

The design, construction and calibration of a carefully controlled source for exposure of mammalian cells to extremely low-frequency electromagnetic fields.

The effect of 60-Hz magnetic fields on co-promotion of chemically induced skin tumors on SENCAR mice: a discussion of three studies.

The effect of chronic exposure to 835.62 MHz FDMA or 847.74 MHz CDMA radiofrequency radiation on the incidence of spontaneous tumors in rats.

The effect of embryonic and fetal exposure to x-ray, microwaves, and ultrasound: counseling the pregnant and nonpregnant patient about these risks.

The effects of 860 MHz radiofrequency radiation on the induction or promotion of brain tumors and other neoplasms in rats.

The effects of embryonic and fetal exposure to x-ray, microwaves, and ultrasound.

The effects of ionizing radiation, microwaves, and ultrasound on the developing embryo: clinical interpretations and applications of the data.

The effects of pulsed 860 MHz radiofrequency radiation on the promotion of neurogenic tumors in rats.

The epidemiology of electric and magnetic field exposures in the power frequency range and reproductive outcomes.

The Intracranial Distribution of Gliomas in Relation to Exposure From Mobile Phones: Analyses From the INTERPHONE Study.

The possible role of contact current in cancer risk associated with residential magnetic fields.

The possible role of radiofrequency radiation in the development of uveal melanoma.

The potential carcinogenic hazards of electromagnetic radiation: a review.

The precautionary principle and electric and magnetic fields.

The probability of developing brain tumours among users of cellular telephones (scientific information to the decision of the International Agency for Research on Cancer (IARC) announced on May 31, 2011)].

The problem of hygienic standardization of commercial electric and magnetic fields in Russia and other countries].

The question of health effects from exposure to electromagnetic fields.

The role of chemical and physical factors in cancer development].

The sensitivity of children to electromagnetic fields.

Time trend in incidence of malignant neoplasms of the central nervous system in relation to mobile phone use among young people in Japan.

Use of cellular and cordless telephones and risk of testicular cancer.

Use of cellular telephones and brain tumour risk in urban and rural areas.

Use of cellular telephones and risk of cancer. A Danish cohort study].

Use of cellular telephones and the risk for brain tumours: A case-control study.

Use of mobile phones and cancer risk.

Use of wireless phones and the risk of salivary gland tumours: a case-control study.

Variable E-cadherin expression in a MNU-induced colon tumor model in rats which exposed with 50 Hz frequency sinusoidal magnetic field.

Variation in cancer risk estimates for exposure to powerline frequency electromagnetic fields: a meta-analysis comparing EMF measurement methods.

Wire codes, magnetic fields, and childhood cancer.

World Health Organization, radiofrequency radiation and health - a hard nut to crack (Review).

FACTOR 13

Theme - Leukemia

Key MeSH Headings - Leukemia, Myeloid, Acute, Leukemia, Lymphocytic, Chronic, B-Cell, Leukemia, Myelogenous, Chronic, BCR-ABL Positive, Leukemia, Myeloid, Leukemia, Multiple Myeloma, Lymphoma, Leukemia, Radiation-Induced, Acute Disease, Liver Neoplasms, Experimental, Central Nervous System Neoplasms

Titles

60 Hertz magnetic field exposure assessment for an investigation of leukemia in telephone lineworkers.

A Bayesian approach to hazard identification. The case of electromagnetic fields and cancer.

A case-control pilot study of traffic exposures and early childhood leukemia using a geographic information system.

A case-control study of childhood leukemia in southern Ontario, Canada, and exposure to magnetic fields in residences.

A case-control study of risk of leukaemia in relation to mobile phone use.

A literature review of medical side effects from radio-frequency energy in the human environment: involving cancer, tumors, and problems of the central nervous system.

A pooled analysis of magnetic fields and childhood leukaemia.

A pooled analysis of magnetic fields, wire codes, and childhood leukemia. Childhood Leukemia-EMF Study Group.

A population-based case-control study of radiofrequency exposure in relation to childhood neoplasm.

A precautionary public health protection strategy for the possible risk of childhood leukaemia from exposure to power frequency magnetic fields.

Acute childhood leukemias and exposure to magnetic fields generated by high voltage overhead power lines - a risk factor in Iran.

Acute effects of pulsed microwaves and 3-nitropropionic acid on neuronal ultrastructure in the rat caudate-putamen.

Acute leukaemia in workers exposed to electromagnetic fields.

Acute leukemia in electrical workers: a New Zealand case-control study.

Acute nonlymphocytic leukemia and residential exposure to power frequency magnetic fields.

Acute ocular injuries caused by 60-Ghz millimeter-wave exposure.

Adult and childhood leukemia near a high-power radio station in Rome, Italy.

Adult mortality from leukemia, brain cancer, amyotrophic lateral sclerosis and magnetic fields from power lines: a case-control study in Brazil.

Aetiology of childhood leukemia.

Aluminum, calcium ion and radiofrequency synergism in acceleration of lymphomagenesis.

An evaluation of exposure metrics in an epidemiologic study on radio and television broadcast transmitters and the risk of childhood leukemia.

An examination of underlying physical principles. The interaction of power-line electromagnetic fields with the human body.

Animal carcinogenicity studies on radiofrequency fields related to mobile phones and base stations.

Are occupational, hobby, or lifestyle exposures associated with Philadelphia chromosome positive chronic myeloid leukaemia?

Are the stray 60-Hz electromagnetic fields associated with the distribution and use of electric power a significant cause of cancer?

Assessment of cellular telephone and other radio frequency exposure for epidemiologic research.

Assessment of selection bias in the Canadian case-control study of residential magnetic field exposure and childhood leukemia.

Association of childhood cancer with residential traffic density.

Biological effects of environmental electromagnetic fields: molecular mechanisms.

Biophysical mechanisms of electromagnetic fields interaction and health effects].

Can disturbances in the atmospheric electric field created by powerline corona ions disrupt melatonin production in the pineal gland?

Cancer incidence among welders: possible effects of exposure to extremely low frequency electromagnetic radiation (ELF) and to welding fumes.

Cancer incidence and magnetic field exposure in industries using resistance welding in Sweden.

Cancer incidence and mortality and proximity to TV towers.

Cancer incidence near radio and television transmitters in Great Britain. I. Sutton Coldfield transmitter.

Cancer incidence near radio and television transmitters in Great Britain. II. All high power transmitters.

Carcinogenic risk of extremely-low-frequency electromagnetic fields: state of the art].

Carcinogenicity test of 50 Hz sinusoidal magnetic fields in rats.

Case-control study of childhood cancer and exposure to 60-Hz magnetic fields.

Case-only study of interactions between DNA repair genes (hMLH1, APEX1, MGMT, XRCC1 and XPD) and low-frequency electromagnetic fields in childhood acute leukemia.

Cell Phones and Risk of brain and acoustic nerve tumours: the French INTERPHONE case-control study].

Characterization of Children's Exposure to Extremely Low Frequency Magnetic Fields by Stochastic Modeling.

Childhood cancer and exposure to corona ions from power lines: an epidemiological test.

Childhood cancer and magnetic fields from high-voltage power lines in England and Wales: a case-control study.

Childhood cancer and residential proximity to power lines. UK Childhood Cancer Study Investigators.

Childhood cancer in relation to a modified residential wire code.

Childhood cancer in relation to indicators of magnetic fields from ground current sources.

Childhood incidence of acute lymphoblastic leukaemia and exposure to broadcast radiation in Sydney--a second look.

Childhood leukaemia and distance from power lines in California: a population-based case-control study.

Childhood leukaemia close to high-voltage power lines--the Geocap study, 2002-2007.

Childhood leukaemia in a residential area with a high-voltage power line: approach according to the Dutch Community Health Services' guideline 'Cancer Clusters'].

Childhood leukemia and electromagnetic fields: results of a population-based case-control study in Germany.

Childhood leukemia and magnetic fields in infant incubators.

Childhood leukemia and magnetic fields in Japan: a case-control study of childhood leukemia and residential power-frequency magnetic fields in Japan.

Childhood leukemia and personal monitoring of residential exposures to electric and magnetic fields in Ontario, Canada.

Childhood leukemia, electric and magnetic fields, and temporal trends.

Childhood leukemia: electric and magnetic fields as possible risk factors.

Children's exposure to magnetic fields produced by U.S. television sets used for viewing programs and playing video games.

Children's health and RF EMF exposure. Views from a risk assessment and risk communication perspective.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in F344/N rats.

Cohort and nested case-control studies of hematopoietic cancers and brain cancer among electric utility workers.

Combined risk estimates for two German population-based case-control studies on residential magnetic fields and childhood acute leukemia.

Comparative analyses of the studies of magnetic fields and cancer in electric utility workers: studies from France, Canada, and the United States.

Comparative health risk assessment of electromagnetic fields.

Contact voltage measured in residences: implications to the association between magnetic fields and childhood leukemia.

Decreased survival for childhood leukemia in proximity to television towers.

Description of a new computer wire coding method and its application to evaluate potential control selection bias in the Savitz et al. childhood cancer study.

Designs and analyses for exploring the relationship of magnetic fields to childhood leukaemia: a pilot project for the Danish National Birth Cohort.

Determinants of power-frequency magnetic fields in residences located away from overhead power lines.

Developing policy in the face of scientific uncertainty: interpreting 0.3 microT or 0.4 microT cutpoints from EMF epidemiologic studies.

Distance from residence to power line and risk of childhood leukemia: a population-based case-control study in Denmark.

Distance to high-voltage power lines and risk of childhood leukemia--an analysis of confounding by and interaction with other potential risk factors.

Do magnetic fields cause increased risk of childhood leukemia via melatonin disruption?

Do naturally occurring magnetic nanoparticles in the human body mediate increased risk of childhood leukaemia with EMF exposure?

Do power frequency magnetic fields cause leukemia in children?

Do studies of wire code and childhood leukemia point towards or away from magnetic fields as the causal agent?

Effect of pulsed magnetic fields on leukemia-prone AKR mice. No-effect on mortality through five generations.

Effects of centimeter waves on the immune system of mice in endotoxic shock].

Effects of electromagnetic fields on health].

Effects of extremely low-frequency electromagnetic fields (ELF-EMF) exposure on B6C3F1 mice.

Effects of mobile phone type signals on calcium levels within human leukaemic T-cells (Jurkat cells).

Electric and magnetic fields (EMF): what do we know about the health effects?

Electric and magnetic fields and health outcomes--an overview.

Electric and magnetic fields at power frequencies.

Electrical field exposure and human health. Risk assessment and problems relative to bureaucratic procedures and to the role of instituitional organizations in control and prevention].

Electrical power lines and childhood leukemia: a study from Greece.

Electromagnetic field exposures and childhood cancers in New Zealand.

Electromagnetic field exposures and childhood leukaemia in New Zealand.

Electromagnetic fields (EMF): do they play a role in children's environmental health (CEH)?

Electromagnetic fields and cancer risks.

Electromagnetic fields from high-voltage installations and cancer in childhood].

Electromagnetic fields--effects on health].

Electromagnetic pollution (electrosmog)--potential hazards of our electromagnetic future].

Electrosmog as a health risk factor: sources of artificial electromagnetic fields, evaluation of health risk, prevention methods].

EMF and health.

EMFs: cutting through the controversy.

Environmental factors and childhood acute leukemias and lymphomas.

Epidemiologic evidence relevant to radar (microwave) effects.

Epidemiologic study of residential proximity to transmission lines and childhood cancer in California: description of design, epidemiologic methods and study population.

Epidemiological appraisal of studies of residential exposure to power frequency magnetic fields and adult cancers.

Epidemiological study of power lines and childhood cancer in the UK: further analyses.

Epidemiology of health effects of radiofrequency exposure.

Estimates of Environmental Exposure to Radiofrequency Electromagnetic Fields and Risk of Lymphoma Subtypes.

Estimating exposure in studies of residential magnetic fields and cancer: importance of short-term variability, time interval between diagnosis and measurement, and distance to power line.

Estimation of population attributable fractions from fitted incidence ratios and exposure survey data, with an application to electromagnetic fields and childhood leukemia.

Ethical values in the regulation of the exposure to electromagnetic fields].

Evaluation of health risks caused by radio frequency accelerated carcinogenesis: the importance of processes driven by the calcium ion signal.

Experimental estimation of thermogenic levels of acute microwave exposure for different animal species].

Exposure of high resolution fetuses in advanced pregnant woman models at different stages of pregnancy to uniform magnetic fields at the frequency of 50 Hz.

Exposure to 50-Hz electric field and incidence of leukemia, brain tumors, and other cancers among French electric utility workers.

Exposure to electromagnetic fields and risk of leukemia.

Exposure to electromagnetic fields and the risk of leukemia.

Exposure to low frequency pulsed electromagnetic fields increases interleukin-1 and interleukin-6 production by human peripheral blood mononuclear cells.

Exposure to low-frequency electromagnetic fields--a health hazard?

Exposure to magnetic fields among electrical workers in relation to leukemia risk in Los Angeles County.

Exposure to magnetic fields and survival after diagnosis of childhood leukemia: a German cohort study.

Exposure to power frequency electric fields and the risk of childhood cancer in the UK.

Exposure to power-frequency magnetic fields and the risk of childhood cancer. UK Childhood Cancer Study Investigators.

Exposure to radio-frequency electromagnetic fields from broadcast transmitters and risk of childhood cancer: a census-based cohort study.

Exposure to residential electric and magnetic fields and risk of childhood leukemia.

Extra low frequency electric and magnetic fields in the bedplace of children diagnosed with leukaemia: a case-control study.

Extremely low frequency electromagnetic fields and cancer: the epidemiologic evidence.

Factors that explain the power line configuration wiring code-childhood leukemia association: what would they look like?

Geomagnetic field variation in early ontogenesis as a risk factor for oncopathology].

Health effects of electromagnetic fields].

Health effects of low-level electromagnetic fields: phantom or not-so-phantom risk?

Hematopoietic neoplasia in C57BL/6 mice exposed to split-dose ionizing radiation and circularly polarized 60 Hz magnetic fields.

High incidence of acute leukemia in the proximity of some industrial facilities in El Bierzo, northwestern Spain.

Hypothesis: the risk of childhood leukemia is related to combinations of power-frequency and static magnetic fields.

In vitro microwave effects on human neutrophil precursor cells (CFU-C).

Incidence of cancer in the vicinity of Korean AM radio transmitters.

Incidence of leukaemia and brain tumours in some "electrical occupations".

Incorporation of epidemiological findings into radiation protection standards.

Increased mortality in amateur radio operators due to lymphatic and hematopoietic malignancies.

Increased ornithine decarboxylase activity in cultured cells exposed to low energy modulated microwave fields and phorbol ester tumor promoters.

Increased risk of childhood acute lymphoblastic leukemia (ALL) by prenatal and postnatal exposure to high voltage power lines: a case control study in Isfahan, Iran.

Induction of macrophage migration inhibitory factor precedes the onset of acute tonsillitis.

Infantile leukemia and exposure to 50/60 Hz magnetic fields: review of epidemiologic evidence in 2000].

Influence of 60-Hertz magnetic fields on leukemia.

Investigation of increased incidence in childhood leukemia near radio towers in Hawaii: preliminary observations.

Investigation of the sources of residential power frequency magnetic field exposure in the UK Childhood Cancer Study.

Knowledge and perceptions of the health effects of environmental hazards in the general population in Italy.

Leukaemia and residence near electricity transmission equipment: a case-control study.

Leukaemia, brain tumours and exposure to extremely low frequency magnetic fields: cohort study of Swiss railway employees.

Leukemia and lymphoma incidence in rodents exposed to low-frequency magnetic fields.

Leukemia and occupational exposure to electromagnetic fields: review of epidemiologic surveys.

Leukemia following occupational exposure to 60-Hz electric and magnetic fields among Ontario electric utility workers.

Leukemia in electric utility workers: the evaluation of alternative indices of exposure to 60 Hz electric and magnetic fields.

Leukemia in telephone linemen.

Leukemia mortality and incidence of infantile leukemia near the Vatican Radio Station of Rome].

Leukemia risk and occupational electric field exposure in Los Angeles County, California.

Leukemia, brain tumors, and exposure to extremely low frequency electromagnetic fields in Swiss railway employees.

Living near overhead high voltage transmission power lines as a risk factor for childhood acute lymphoblastic leukemia: a case-control study.

Lymphoma development in mice chronically exposed to UMTS-modulated radiofrequency electromagnetic fields.

Lymphoma development of simultaneously combined exposure to two radiofrequency signals in AKR/J mice.

Lymphoma induced in mice chronically exposed to very strong low-frequency electromagnetic field.

Magnetic field exposure in relation to leukemia and brain cancer mortality among electric utility workers.

Magnetic fields and acute leukemia in children with Down syndrome.

Magnetic fields and acute lymphoblastic leukemia in children: a systematic review of case-control studies.

Magnetic fields and childhood cancer--a pooled analysis of two Scandinavian studies.

Magnetic fields and leukaemia risks in UK electricity supply workers.

Magnetic fields and leukemia--risk for adults living close to power lines.

Magnetic fields, leukemia, and central nervous system tumors in Swedish adults residing near high-voltage power lines.

Maternal occupational exposure to electromagnetic fields before, during, and after pregnancy in relation to risks of childhood cancers: findings from the Oxford Survey of Childhood Cancers, 1953-1981 deaths.

Meta-analysis and its application in epidemiology].

Mortality among workers in the geothermal power plants at Larderello, Italy.

Mortality from brain cancer and leukaemia among electrical workers.

Mortality in workers exposed to electromagnetic fields.

Mortality indices for hemoblastoses in Rivno Province before and after the accident at the Chernobyl Atomic Electric Power Station].

Mortality of people residing near electric power supply line with voltage of 500 kV].

Mortality of persons resident in the vicinity of electricity transmission facilities.

Myelogenous leukemia and electric blanket use.

Myeloid leukemias and myelodysplastic syndromes: chemical exposure, histologic subtype and cytogenetics in a case-control study.

Nighttime exposure to electromagnetic fields and childhood leukemia: an extended pooled analysis.

Occupation and malignant lymphoma: a population based case control study in Germany.

Occupational and residential exposure to electric and magnetic field and its relationship on acute myeloid leukemia in adults - A Meta-analysis].

Occupational and residential magnetic field exposure and leukemia and central nervous system tumors.

Occupational electric and magnetic field exposure and brain cancer: a meta-analysis.

Occupational electric and magnetic field exposure and leukemia. A meta-analysis.

Occupational exposure to electromagnetic fields and acute leukaemia: analysis of a case-control study.

Occupational exposure to electromagnetic fields and its health effects in electric energy workers].

Occupational exposure to electromagnetic fields of extremely low frequency (with particular regard to power plants) and the health status of workers, based on a literature review].

Occupational magnetic field exposure and myocardial infarction incidence.

Occupational risk factors for acute leukaemia: a case-control study.

Occupational risk factors for cancer of the central nervous system: a case-control study on death certificates from 24 U.S. states.

Overhead electricity power lines and childhood leukemia: a registry-based, case-control study.

Parental occupational exposure to magnetic fields and childhood cancer (Sweden).

Pharmacological correction of the acute effects of microwave irradiation in an experiment].

Pooled analysis of recent studies on magnetic fields and childhood leukaemia.

Potential motion related bias in the worn dosimeter measurements of two childhood leukemia studies.

Power lines and the geomagnetic field.

Power-frequency electric and magnetic fields and risk of childhood leukemia in Canada.

Probing lymphoma infiltration in spleen of AKR/J mice chronically exposed to electromagnetic fields for risk assessment--toward noninvasive modeling.

Proximity to overhead power lines and childhood leukaemia: an international pooled analysis.

Radio and microwave frequency radiation and health--an analysis of the literature].

Radio-frequency radiation exposure from AM radio transmitters and childhood leukemia and brain cancer.

Radiofrequency exposure and mortality from cancer of the brain and lymphatic/hematopoietic systems.

Reanalysis of risks of childhood leukaemia with distance from overhead power lines in the UK.

Recent data from the literature on the biological and pathologic effects of electromagnetic radiation, radio waves and stray currents].

Refinements in magnetic field exposure assignment for a case-cohort study of electrical utility workers.

Remote effects of occupational and non-occupational exposure to electromagnetic fields of power-line frequency. Epidemiological studies].

Residence close to high-tension electric power lines and its association with leukemia in children].

Residential electric consumption and childhood cancer in Canada (1971-1986)

Residential EMF exposure and childhood leukemia: meta-analysis and population attributable risk.

Residential exposure to 60-Hertz magnetic fields and adult cancers in Taiwan.

Residential exposure to electromagnetic fields and childhood leukaemia: a meta-analysis.

Residential exposure to magnetic fields and risk of canine lymphoma.

Residential magnetic fields and childhood leukemia: a meta-analysis.

Residential magnetic fields as a risk factor for childhood acute leukaemia: results from a German population-based case-control study.

Residential magnetic fields predicted from wiring configurations: I. Exposure model.

Residential magnetic fields predicted from wiring configurations: II. Relationships To childhood leukemia.

Residential magnetic fields, contact voltage and their relationship: the effects of distribution unbalance and residential proximity to a transmission line.

Residential mobility and childhood leukemia.

Residential mobility of populations near UK power lines and implications for childhood leukaemia.

Residential proximity to electricity transmission and distribution equipment and risk of childhood leukemia, childhood lymphoma, and childhood nervous system tumors: systematic review, evaluation, and meta-analysis.

Residential wire codes: reproducibility and relation with measured magnetic fields.

Review of the epidemiologic literature on EMF and Health.

Risk factors for leukemia in Thailand.

Risk for leukaemia and brain and breast cancer among Danish utility workers: a second follow-up.

Risk of childhood leukemia and environmental exposure to ELF electromagnetic fields].

Risk of childhood leukemia in areas passed by high power lines.

Risk of leukemia in children living near high-voltage transmission lines.

Risk of major lymphoma subtypes and use of mobile phones].

Risk of neoplastic diseases in conditions of exposure to power magnetic fields--epidemiologic investigations].

Risk of neoplastic diseases in conditions of exposure to radio- and microwave fields--epidemiologic investigations].

Risks of leukaemia among residents close to high voltage transmission electric lines.

Selection bias and its implications for case-control studies: a case study of magnetic field exposure and childhood leukaemia.

Setting prudent public health policy for electromagnetic field exposures.

Should the threshold limit value for power frequency (60 Hz) magnetic fields be changed? Perceptions among scientists and other risk experts.

Spontaneous and nitrosourea-induced primary tumors of the central nervous system in Fischer 344 rats chronically exposed to 836 MHz modulated microwaves.

Study of extremely low frequency electromagnetic fields in infant incubators.

Suggestion of concomitant changes of electric power consumption and childhood leukemia in Greece.

Synthesis of the epidemiological evidence concerning childhood leukemia in relation to exposure to 50 Hz. electric and magnetic fields].

Teratogenic effect of broad-band electromagnetic field on neonatal mice (Mus musculus).

The Bernal Lecture 2004 Are low-frequency electromagnetic fields a health hazard?

The determinants of Canadian children's personal exposures to magnetic fields.

The effect of chronic exposure to 835.62 MHz FDMA or 847.74 MHz CDMA radiofrequency radiation on the incidence of spontaneous tumors in rats.

The effects of low-energy 60-Hz environmental electromagnetic fields upon the growth-related enzyme ornithine decarboxylase.

The epidemiology of exposure to electromagnetic fields: an overview of the recent literature.

The possible role of contact current in cancer risk associated with residential magnetic fields.

The potential hazard for the development of leukemia from exposure to electromagnetic radiation (a review of the literature)].

The potential impact of bias in studies of residential exposure to magnetic fields and childhood leukemia.

The precautionary principle and electric and magnetic fields.

The sensitivity of children to electromagnetic fields.

Time trend in incidence of malignant neoplasms of the central nervous system in relation to mobile phone use among young people in Japan.

Variation in cancer risk estimates for exposure to powerline frequency electromagnetic fields: a meta-analysis comparing EMF measurement methods.

Viral contacts confound studies of childhood leukemia and high-voltage transmission lines.

Wire codes, magnetic fields, and childhood cancer.

FACTOR 14

Theme – Precancerous conditions

Key MeSH Headings - Atrophy, Precancerous Conditions, Hyperplasia, Hypersensitivity, Delayed, Thymus Gland, Capillary Permeability, Lymphoma

Titles

A histopathological study on alterations in DMBA-induced mammary carcinogenesis in rats with 50 Hz, 100 muT magnetic field exposure.

A study on skin tumour formation in mice with 50 Hz magnetic field exposure.

Aluminum, calcium ion and radiofrequency synergism in acceleration of lymphomagenesis.

Animal carcinogenicity studies on radiofrequency fields related to mobile phones and base stations.

Calreticulin protects rat microvascular endothelial cells against microwave radiation-induced injury by attenuating endoplasmic reticulum stress.

Case-control study of childhood cancer and exposure to 60-Hz magnetic fields.

Cerebrovascular permeability to 86Rb in the rat after exposure to pulsed microwaves.

Childhood cancer in relation to a modified residential wire code.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Cohort and nested case-control studies of hematopoietic cancers and brain cancer among electric utility workers.

Dependence of microwave effect on the secondary structure of DNA on molecular weight of polynucleotide].

Detrimental effect of electromagnetic pulse exposure on permeability of in vitro blood-brain-barrier model.

Differential response of the permeability of the rat liver canalicular membrane to sucrose and mannitol following in vivo acute single and multiple exposures to microwave radiation (2.45 GHz) and radiant-energy thermal stress.

Effect of electromagnetic pulse exposure on brain micro vascular permeability in rats.

Effect of electromagnetic radiation of millimetric wave band on genome of somatic cells].

Effect of extremely high frequency electromagnetic radiation of low intensity on parameters of humoral immunity in healthy mice].

Effect of extremely low frequency electromagnetic radiation and ultra-violet radiation on aggregation of thymocytes and erythrocytes].

Effect of global system for mobile communication (GSM) microwave exposure on blood-brain barrier permeability in rat.

Effect of global system for mobile communication (gsm)-like radiofrequency fields on vascular permeability in mouse brain.

Effect of long-term mobile communication microwave exposure on vascular permeability in mouse brain.

Effect of microwaves on the expression by thymocytes of various surface membrane markers].

Effect of millimeter waves on cyclophosphamide induced suppression of the immune system.

Effect of pulsed magnetic fields on leukemia-prone AKR mice. No-effect on mortality through five generations.

Effects of electromagnetic pulse on blood-brain barrier permeability and tight junction proteins in rats].

Effects of extremely high-frequency electromagnetic radiation on the immune system and systemic regulation of homeostasis].

Effects of GSM-modulated 900 MHz radiofrequency electromagnetic fields on the hematopoietic potential of mouse bone marrow cells.

Effects of low level microwave radiation on carcinogenesis in Swiss Albino mice.

Effects of low-intensity extremely high frequency electromagnetic radiation on chromatin structure of lymphoid cells in vivo and in vitro].

Effects of microwave radiation on thymocytes in mice at different power densities].

Electromagnetic fields from high-voltage installations and cancer in childhood].

Environmental factors and childhood acute leukemias and lymphomas.

Estimates of Environmental Exposure to Radiofrequency Electromagnetic Fields and Risk of Lymphoma Subtypes.

Evaluation of health risks caused by radio frequency accelerated carcinogenesis: the importance of processes driven by the calcium ion signal.

Geomagnetic field variation in early ontogenesis as a risk factor for oncopathology].

Hematopoietic neoplasia in C57BL/6 mice exposed to split-dose ionizing radiation and circularly polarized 60 Hz magnetic fields.

Immune function and host defense in rodents exposed to 60-Hz magnetic fields.

Immunomorphologic changes in the testes upon exposure to a microwave electromagnetic field].

Increased mortality in amateur radio operators due to lymphatic and hematopoietic malignancies.

Increased sensitivity of the non-human primate eye to microwave radiation following ophthalmic drug pretreatment.

Inhibitory effects of low doses of melatonin on induction of preneoplastic liver lesions in a medium-term liver bioassay in F344 rats: relation to the influence of electromagnetic near field exposure.

Japanese encephalitis virus (JEV): potentiation of lethality in mice by microwave radiation.

Leukemia and lymphoma incidence in rodents exposed to low-frequency magnetic fields.

Lymphoma development in mice chronically exposed to UMTS-modulated radiofrequency electromagnetic fields.

Lymphoma development of simultaneously combined exposure to two radiofrequency signals in AKR/J mice.

Lymphoma induced in mice chronically exposed to very strong low-frequency electromagnetic field.

Magnetic fields and childhood cancer--a pooled analysis of two Scandinavian studies.

Melatonin protects rat thymus against oxidative stress caused by exposure to microwaves and modulates proliferation/apoptosis of thymocytes.

Metabolic and ultrastructural adaptation mechanisms during the primary prophylactic action of low-intensity electromagnetic radiation under normal and radiation conditions].

Microwave alteration of the blood-brain barrier system of rats.

Microwave irradiation of rats at 2.45 GHz activates pinocytotic-like uptake of tracer by capillary endothelial cells of cerebral cortex.

Modulation of cell death in the rat thymus. Light and electron microscopic investigations.

Modulation of natural killer cell function after exposure to 60 Hz magnetic fields: confirmation of the effect in mature B6C3F1 mice.

Mortality in workers exposed to electromagnetic fields.

Mortality indices for hemoblastoses in Rivno Province before and after the accident at the Chernobyl Atomic Electric Power Station].

Nonlinear determinism in the immune system. In vivo influence of electromagnetic fields on different functions of murine lymphocyte subpopulations.

Nonlinear dynamical law governs magnetic field induced changes in lymphoid phenotype.

Occupation and malignant lymphoma: a population based case control study in Germany.

Odontologic survey of referred patients with symptoms allegedly caused by electricity or visual display units.

Permeability of the blood-brain barrier induced by 915 MHz electromagnetic radiation, continuous wave and modulated at 8, 16, 50, and 200 Hz.

Prenatal exposure to radiofrequencies: effects of WiFi signals on thymocyte development and peripheral T cell compartment in an animal model.

Probing lymphoma infiltration in spleen of AKR/J mice chronically exposed to electromagnetic fields for risk assessment--toward noninvasive modeling.

Radiofrequency exposure and mammalian cell toxicity, genotoxicity, and transformation.

Radiofrequency exposure and mortality from cancer of the brain and lymphatic/hematopoietic systems.

Residential electric consumption and childhood cancer in Canada (1971-1986)

Residential exposure to magnetic fields and risk of canine lymphoma.

Residential proximity to electricity transmission and distribution equipment and risk of childhood leukemia, childhood lymphoma, and childhood nervous system tumors: systematic review, evaluation, and meta-analysis.

Retinal damage experimentally induced by microwave radiation at 55 mW/cm2.

Reversible microwave effects on the blood-brain barrier.

Risk of major lymphoma subtypes and use of mobile phones].

Risk of neoplastic diseases in conditions of exposure to power magnetic fields--epidemiologic investigations].

Risk of neoplastic diseases in conditions of exposure to radio- and microwave fields--epidemiologic investigations].

Teratogenic effect of broad-band electromagnetic field on neonatal mice (Mus musculus).

The effect of chronic exposure to 835.62 MHz FDMA or 847.74 MHz CDMA radiofrequency radiation on the incidence of spontaneous tumors in rats.

The effect of ultrahigh-frequency radiation on adaptation thresholds and the damages to blood system cells].

The effect on rat thymocytes of the simultaneous in vivo exposure to 50-Hz electric and magnetic field and to continuous light.

The effects of low-energy 60-Hz environmental electromagnetic fields upon the growth-related enzyme ornithine decarboxylase.

The efficiency and direction of thymus changes after whole-body exposure of mice to the weak electromagnetic field are determined by the initial status of the thymus].

The functional state of thymus cells following microwave exposure of endocrine glands.

The immunological and hormonal effects of combined exposure to a bitemporal ultrahigh-frequency electrical field and to decimeter waves at different sites].

The immunological mechanism of the modulation of IgE antibody formation during microwave irradiation of the thymus].

The role of fatty acids in anti-inflammatory effects of low-intensity extremely high-frequency electromagnetic radiation.

FACTOR 15

Theme - Circadian Rhythm

Key MeSH Headings - Melatonin, Circadian Rhythm, Pineal Gland

Titles

900-MHz microwave radiation promotes oxidation in rat brain.

A 0.5 G, 60 Hz magnetic field suppresses melatonin production in pinealocytes.

A 50-Hz electromagnetic field impairs sleep.

Acceleration of mammary tumorigenesis by exposure of 7,12-dimethylbenz[a]anthracene-treated female rats in a 50-Hz, 100-microT magnetic field: replication study.

Acute exposure to 50 Hz magnetic fields with harmonics and transient components: lack of effects on nighttime hormonal secretion in men.

Age-dependent association of exposure to television screen with children's urinary melatonin excretion?

Anatomical localization of human detection of weak electromagnetic radiation: experiments with dowsers.

Anxiogenic effect of chronic exposure to extremely low frequency magnetic field in adult rats.

Biological effects of continuous exposure of embryos and young chickens to electromagnetic fields emitted by video display units.

Biological effects of extremely low-frequency electromagnetic fields: in vivo studies.

Biological effects of non-ionizing electromagnetic radiation].

Biological effects produced by the influence of low frequency electromagnetic fields on hormone secretion].

Biological influences of electromagnetic fields].

Biologically based epidemiological studies of electric power and cancer.

Breast cancer and electric power.

Can disturbances in the atmospheric electric field created by powerline corona ions disrupt melatonin production in the pineal gland?

Cardiac autonomic control mechanisms in power-frequency magnetic fields: a multistudy analysis.

Cardiovascular diseases and the work environment. A critical review of the epidemiologic literature on nonchemical factors.

Chronic exposure to 2.9 mT, 40 Hz magnetic field reduces melatonin concentrations in humans.

Chronic exposure to ELF fields may induce depression.

Chronic exposure to ELF magnetic fields during night sleep with electric sheet: effects on diurnal melatonin rhythms in men.

Chronotoxicity of 1800 MHz microwave radiation on sex hormones and spermatogenesis in male mice].

Circadian locomotor activity of Musca flies: recording method and effects of 10 Hz square-wave electric fields.

Circadian rhythmicity of antioxidant markers in rats exposed to 1.8 GHz radiofrequency fields.

Designing EMF experiments: what is required to characterize "exposure"?

Direct suppressive effects of weak magnetic fields (50 Hz and 16 2/3 Hz) on melatonin synthesis in the pineal gland of Djungarian hamsters (Phodopus sungorus).

Do magnetic fields cause increased risk of childhood leukemia via melatonin disruption?

Does evening exposure to mobile phone radiation affect subsequent melatonin production?

Earthing: health implications of reconnecting the human body to the Earth's surface electrons.

Effect of occupational EMF exposure from radar at two different frequency bands on plasma melatonin and serotonin levels.

Effects of 1800-MHz radiofrequency fields on circadian rhythm of plasma melatonin and testosterone in male rats.

Effects of 60-Hz magnetic field exposure on nocturnal 6-sulfatoxymelatonin, estrogens, luteinizing hormone, and follicle-stimulating hormone in healthy reproductive-age women: results of a crossover trial.

Effects of electric and magnetic fields from high-power lines on female urinary excretion of 6-sulfatoxymelatonin.

Effects of electric and magnetic fields on nocturnal melatonin concentrations in dairy cows.

Effects of electromagnetic fields exposure on plasma hormonal and inflammatory pathway biomarkers in male workers of a power plant.

Effects of electromagnetic fields on photophasic circulating melatonin levels in American kestrels.

Effects of electromagnetic radiation from 3G mobile phone on heart rate, blood pressure and ECG parameters in rats.

Effects of exposure to 16.7 Hz magnetic fields on urinary 6-hydroxymelatonin sulfate excretion of Swiss railway workers.

Effects of melatonin on Wi-Fi-induced oxidative stress in lens of rats.

Effects of mobile phone electromagnetic fields at nonthermal SAR values on melatonin and body weight of Djungarian hamsters (Phodopus sungorus).

Effects of mobile phone radiation on UV-induced skin tumourigenesis in ornithine decarboxylase transgenic and non-transgenic mice.

Effects of static electromagnetic fields on chick embryo pineal gland development.

Effects of weak alternating magnetic fields on nocturnal melatonin production and mammary carcinogenesis in rats.

Electric blanket or mattress cover use and breast cancer incidence in women 50-79 years of age.

Electric power, pineal function, and the risk of breast cancer.

Endocrine functions in young men exposed for one night to a 50-Hz magnetic field. A circadian study of pituitary, thyroid and adrenocortical hormones.

Evaluation in humans of the effects of radiocellular telephones on the circadian patterns of melatonin secretion, a chronobiological rhythm marker.

Evaluation of the nocturnal levels of urinary biogenic amines in men exposed overnight to 50-Hz magnetic field.

Evidence of oxidative stress in American kestrels exposed to electromagnetic fields.

Exacerbation of hypertension and disturbances of the geomagnetic field].

Examination of the melatonin hypothesis in women exposed at night to EMF or bright light.

Exposure to 1800 MHz radiofrequency radiation induces oxidative damage to mitochondrial DNA in primary cultured neurons.

Exposure to electromagnetic fields and suicide among electric utility workers: a nested case-control study.

Extremely low frequency electromagnetic fields (EMF) and brain cancer in adults and children: review and comment.

Geomagnetic activity and human melatonin metabolite excretion.

Geomagnetic disturbances are associated with reduced nocturnal excretion of a melatonin metabolite in humans.

Human melatonin during continuous magnetic field exposure.

Immune markers and ornithine decarboxylase activity among electric utility workers.

Impact of microwave at X-band in the aetiology of male infertility.

Incidence of micronuclei in human peripheral blood lymphocytes exposed to modulated and unmodulated 2450 MHz radiofrequency fields.

Increases in geomagnetic activity are associated with increases in thyroxine levels in a single patient: implications for melatonin levels.

Influence of electromagnetic fields emitted by GSM-900 cellular telephones on the circadian patterns of gonadal, adrenal and pituitary hormones in men.

Influence of extremely-low-frequency magnetic field on antioxidative melatonin properties in AT478 murine squamous cell carcinoma culture.

Influence of light and electromagnetic radiation of Sun on circadian rhythms of the total antioxidant capacity of human saliva in the North].

Inhibitory effects of low doses of melatonin on induction of preneoplastic liver lesions in a medium-term liver bioassay in F344 rats: relation to the influence of electromagnetic near field exposure.

Interaction of static and extremely low frequency electric and magnetic fields with living systems: health effects and research needs.

Is melatonin the hormonal missing link between magnetic field effects and human diseases?

Is newborn melatonin production influenced by magnetic fields produced by incubators?

Is problematic mobile phone use explained by chronotype and personality?

Magnetic fields and pineal function in humans: evaluation of nocturnal acute exposure to extremely low frequency magnetic fields on serum melatonin and urinary 6-sulfatoxymelatonin circadian rhythms.

Magnetic storm effect on the circulation of rabbits.

Melatonin and a spin-trap compound block radiofrequency electromagnetic radiation-induced DNA strand breaks in rat brain cells.

Melatonin and magnetic fields.

Melatonin attenuates radiofrequency radiation (900 MHz)-induced oxidative stress, DNA damage and cell cycle arrest in germ cells of male Swiss albino mice.

Melatonin metabolite levels in workers exposed to 60-Hz magnetic fields: work in substations and with 3-phase conductors.

Melatonin modulates 900 Mhz microwave-induced lipid peroxidation changes in rat brain.

Melatonin protects rat cerebellar granule cells against electromagnetic field-induced increases in Na(+) currents through intracellular Ca(2+) release.

Melatonin protects rat thymus against oxidative stress caused by exposure to microwaves and modulates proliferation/apoptosis of thymocytes.

Melatonin reduces oxidative stress induced by chronic exposure of microwave radiation from mobile phones in rat brain.

Melatonin suppression by static and extremely low frequency electromagnetic fields: relationship to the reported increased incidence of cancer.

Mobile phone radiation induces mode-dependent DNA damage in a mouse spermatocyte-derived cell line: a protective role of melatonin.

Mobile phones and health: a literature overview.

Modifying effect of light and electromagnetic field on development of mammary tumors induced by N-nitrosomethyl urea in female rats].

Modulation of wireless (2.45 GHz)-induced oxidative toxicity in laryngotracheal mucosa of rat by melatonin.

Morphometric and structural study of the pineal gland of the Wistar rat subjected to the pulse action of a 52 Gauss, (50 Hz) magnetic field. Evolutive analysis over 21 days.

Multi-night exposure to 60 Hz magnetic fields: effects on melatonin and its enzymatic metabolite.

Neuroprotective effects of melatonin and omega-3 on hippocampal cells prenatally exposed to 900 MHz electromagnetic fields.

Nighttime exposure to electromagnetic fields and childhood leukemia: an extended pooled analysis.

Nocturnal 6-hydroxymelatonin sulfate excretion in female workers exposed to magnetic fields.

Nocturnal excretion of a urinary melatonin metabolite among electric utility workers.

Nocturnal exposure to intermittent 60 Hz magnetic fields alters human cardiac rhythm.

Non-thermal biomarkers of exposure to radiofrequency/microwave radiation.

Nonionizing electromagnetic fields and cancer: a review.

Oxidative stress-mediated skin damage in an experimental mobile phone model can be prevented by melatonin.

Pathophysiology of microwave radiation: effect on rat brain.

Prevention of mobile phone induced skin tissue changes by melatonin in rat: an experimental study.

Protective effect of melatonin and vitamin E against prooxidative action of iron ions and static magnetic field].

Rapid-onset/offset, variably scheduled 60 Hz electric and magnetic field exposure reduces nocturnal serum melatonin concentration in nonhuman primates.

Rate of occurrence of transient magnetic field events in U.S. residences.

Reduced excretion of a melatonin metabolite in workers exposed to 60 Hz magnetic fields.

Relationship between amyloid beta protein and melatonin metabolite in a study of electric utility workers.

Residential magnetic fields and the risk of breast cancer.

Risk factors, health risks, and risk management for aircraft personnel and frequent flyers.

Role of melatonin on electromagnetic radiation-induced oxidative stress and Ca2+ signaling molecular pathways in breast cancer.

Serum-thyroxine levels in microwave-exposed rats.

Shift work, light at night, and breast cancer on Long Island, New York.

Temporal trends and misclassification in residential 60 Hz magnetic field measurements.

The effect of melatonin on body mass and behaviour of rats during an exposure to microwave radiation from mobile phone.

The effect of melatonin on the liver of rats exposed to microwave radiation.

The Effects of Electromagnetic Field on the Endocrine System in Children and Adolescents.

The effects of electromagnetic radiation (2450 MHz wireless devices) on the heart and blood tissue: role of melatonin.

The effects of extremely low-frequency magnetic fields on melatonin and cortisol, two marker rhythms of the circadian system.

The Effects of Melatonin on Oxidative Stress Parameters and DNA Fragmentation in Testicular Tissue of Rats Exposed to Microwave Radiation.

The excretion of 6-hydroxymelatonin sulfate in healthy young men exposed to electromagnetic fields emitted by cellular phone -- an experimental study.

The impact of electromagnetic field at a frequency of 50 Hz and a magnetic induction of 2.5 mT on viability of pineal cells in vitro.

The influence of long-term exposure of mice to randomly varied power frequency magnetic fields on their nocturnal melatonin secretion patterns.

The melatonin hypothesis: electric power and breast cancer.

The relationship between electromagnetic field and light exposures to melatonin and breast cancer risk: a review of the relevant literature.

The therapeutic effect of a pulsed electromagnetic field on the reproductive patterns of male Wistar rats exposed to a 2.45-GHz microwave field.

Therapeutic approaches of melatonin in microwave radiations-induced oxidative stress-mediated toxicity on male fertility pattern of Wistar rats.

Understanding the effects of electromagnetic field emissions from Marine Renewable Energy Devices (MREDs) on the commercially important edible crab, Cancer pagurus (L.).

Urinary 6-sulphatoxymelatonin excretion is increased in rats after 24 hours of exposure to vertical 50 Hz, 100 microT magnetic field.

Variations of melatonin and stress hormones under extended shifts and radiofrequency electromagnetic radiation.

FACTOR 16

Theme - Eye diseases

Key MeSH Headings - Eye Diseases, Cataract, Vision Disorders, Sensation Disorders, Neurotic Disorders, Lens, Crystalline, Corneal Diseases, Edema, Hematologic Diseases

Titles

A quantitative study on early changes in rabbit lens capsule epithelium induced by low power density microwave radiation].

Acute microwave irradiation and cataract formation in rabbits and monkeys.

Acute ocular lesions after exposure to electromagnetic radiation of ultrahigh frequency (an experimental study)].

Age-Related Modulations of AQP4 and Caveolin-1 in the Hippocampus Predispose the Toxic Effect of Phoneutria nigriventer Spider Venom.

Ascorbic acid changes in cultured rabbit lenses after microwave irradiation.

Biologic effects and hygienic regulation of electromagnetic fields caused by mobile communication devices].

Blocking 1800 MHz mobile phone radiation-induced reactive oxygen species production and DNA damage in lens epithelial cells by noise magnetic fields].

Cataracts induced by microwave and ionizing radiation.

Changes in gap junctional intercellular communication in rabbits lens epithelial cells induced by low power density microwave radiation.

Combined microwave energy and fixative agent for cataract induction in pig eyes.

Comments on Frey's "Data analysis reveals significant microwave-induced eye damage in humans".

Data analysis reveals significant microwave-induced eye damage in humans.

Dependence of anti-inflammatory effects of high peak-power pulsed electromagnetic radiation of extremely high frequency on exposure parameters].

DNA damage and repair induced by acute exposure of microwave from mobile phone on cultured human lens epithelial cells].

Dosimetric study of microwave cataractogenesis.

Effect of acute exposure to microwave from mobile phone on DNA damage and repair of cultured human lens epithelial cells in vitro].

Effect of high-power density microwave irradiation on the soluble proteins of the rabbit lens.

Effect of long-term power frequency electromagnetic field exposure on proliferation and apoptosis of SRA01/04 cells].

Effect of low-intensity microwave radiation on proliferation of cultured epithelial cells of rabbit lens].

Effect of superposed electromagnetic noise on DNA damage of lens epithelial cells induced by microwave radiation.

Effects of different dose microwave radiation on protein components of cultured rabbit lens].

Effects of exposure to microwaves: problems and perspectives.

Effects of Long-Term Exposure to 60 GHz Millimeter-Wavelength Radiation on the Genotoxicity and Heat Shock Protein (Hsp) Expression of Cells Derived from Human Eye.

Effects of melatonin on Wi-Fi-induced oxidative stress in lens of rats.

Effects of microwave radiation on the eye: the occupational health perspective.

Effects of microwave radiation on the lens epithelium in the rabbit eye.

Effects of mobile phones and radar radiofrequencies on the eye].

Effects of mobile phones on oxidant/antioxidant balance in cornea and lens of rats.

Effects of repeated microwave irradiations to the albino rabbit eye.

Electrical properties of lens material at microwave frequencies.

Electromagnetic noise inhibits radiofrequency radiation-induced DNA damage and reactive oxygen species increase in human lens epithelial cells.

Epidemiologic studies of the effect of microwaves (neurophysiologic, hematologic and ophthalmologic aspects)].

Epidemiological studies of human exposures to radiofrequency radiation. A critical review.

Evaluation of lens transparency in persons exposed to electromagnetic radiation of 27--30 MHz frequency].

Evaluation of possible microwave-induced lens changes in the United States Air Force.

Experimental studies on the influence of millimeter radiation on light transmission through the lens].

Features of anti-inflammatory effects of modulated extremely high-frequency electromagnetic radiation.

Glutathione concentration and peptidase activity in the lens after exposure to microwaves.

Hazards of radio frequency magnetic field and their prevention and control].

Health problems among workers of iron welding machines: an effect of electromagnetic fields.

In vitro studies of microwave-induced cataract. II. Comparison of damage observed for continuous wave and pulsed microwaves.

In vitro studies of microwave-induced cataract: reciprocity between exposure duration and dose rate for pulsed microwaves.

Increased occurrence of nuclear cataract in the calf after erection of a mobile phone base station].

Inducing cataract in postmortem pig eyes for cataract surgery training purposes.

Localized effects of microwave radiation on the intact eye lens in culture conditions.

Low power density microwave radiation induced early changes in rabbit lens epithelial cells.

Low power microwave radiation inhibits the proliferation of rabbit lens epithelial cells by upregulating P27Kip1 expression.

Low-intensity microwave blockes cell cycle and regulate cell cycle related gene expression in rabbit lens epithelial cells].

Microwave cataract and litigation: a case study.

Microwave cyclodestruction: evaluation on human eyes.

Microwave lens effects in humans. II. Results of five-year survey.

Microwave radiation-induced chromosomal aberrations in corneal epithelium of Chinese hamsters.

Microwaves and the visual analyzer].

Millimeter wave absorption in the nonhuman primate eye at 35 GHz and 94 GHz.

Mobile Phone Radiation: Physiological & Pathophysiologcal Considerations.

Neurotic disturbances, depression and anxiety disorders in the population living in the vicinity of overhead high-voltage transmission line 400 kV. Epidemiological pilot study].

Non-thermal cellular effects of lowpower microwave radiation on the lens and lens epithelial cells.

Observation of microwave-induced eye lens surface motion in vitro.

Ocular effects of radiofrequency energy.

Odontologic survey of referred patients with symptoms allegedly caused by electricity or visual display units.

On the microwave exposure.

Phantom vibration and phantom ringing among mobile phone users: A systematic review of literature.

Post-mortem histologic evaluation of microwave lesions after epicardial pulmonary vein isolation for atrial fibrillation.

Prevalence of nuclear cataract in Swiss veal calves and its possible association with mobile telephone antenna base stations.

Proteomic analysis of human lens epithelial cells exposed to microwaves.

Radiofrequency and microwave radiation in the microelectronics industry.

Some ocular symptoms and sensations experienced by long term users of mobile phones.

Some ocular symptoms experienced by users of mobile phones.

State of peripheral blood of technical personnel exposed to constant magnetic fields].

The effect of extremely low frequency magnetic field on the conjunctiva and goblet cells.

The effects of cell phone use on peripheral vision.

The effects of ionizing radiation, microwaves, and ultrasound on the developing embryo: clinical interpretations and applications of the data.

The ocular effects of microwaves on hypothermic rabbits: a study of microwave cataractogenic mechanisms.

Thermal cataract formation in rabbits.

Thresholds for lenticular damage in the rabbit eye due to single exposure to CW microwave radiation: an analysis of the experimental information at a frequency of 2.45 GHz.

Ultrastructural change of rabbit lens epithelial cells induced by low power level microwave radiation].

Ultrastructural changes in the rabbit lens induced by microwave radiation.

Video display terminals: risk of electromagnetic radiation.

FACTOR 17

Theme - Electromagnetic interference in implanted electronic devices

Key MeSH Headings - Tachycardia, Ventricular, Ventricular Fibrillation, Death, Sudden, Cardiac, Arrhythmias, Cardiac

Titles

AANA Journal Course: update for nurse anesthetists. Arrhythmia management devices and electromagnetic interference.

Accidental deaths caused by electricity in Sweden, 1975-2000.

Are patients with cardiac implants protected against electromagnetic interference in daily life and occupational environment?

Avoidance behaviors in patients with implantable cardioverter defibrillators.

Cardiac autonomic control mechanisms in power-frequency magnetic fields: a multistudy analysis.

Deaths associated with implantable cardioverter defibrillator failure and deactivation reported in the United States Food and Drug Administration Manufacturer and User Facility Device Experience Database.

Detection of refrigerator-associated 60 Hz alternating current as ventricular fibrillation by an implantable defibrillator.

Disturbances in the function of cardiac pacemaker caused by short wave and microwave diathermies and pulsed high frequency current.

Do airport metal detectors interfere with implantable pacemakers or cardioverter-defibrillators?

Do media players cause interference with pacemakers?

Do mobile telephones have adverse effects on the functions of implantable cardioverter defibrillators?].

ECG changes caused by the effect of static magnetic fields of nuclear magnetic resonance tomography using magnets with a field power of 0.5 to 4.0 Telsa].

Effects of 900 MHz electromagnetic field emitted by cellular phones on electrocardiograms of guinea pigs.

Electromagnetic fields and health effects--epidemiologic studies of cancer, diseases of the central nervous system and arrhythmia-related heart disease.

Electromagnetic Interference (EMI) and arrhythmic events in ICD patients undergoing gastrointestinal procedures.

Electromagnetic interference in cardiac rhythm management devices.

Electromagnetic interference in implantable cardioverter defibrillators: present but rare.

Electromagnetic interference of cardiac rhythmic monitoring devices to radio frequency identification: analytical analysis and mitigation methodology.

Electromagnetic interference with cardiac pacemakers and implantable cardioverter-defibrillators from low-frequency electromagnetic fields in vivo.

Electromagnetic interference with implantable cardioverter-defibrillators at power frequency: an in vivo study.

Fine structural alterations in radiofrequency energy-induced lesions in dog hearts: possible basis for reduced arrhythmic complications.

Implantable cardioverter defibrillators and cellular telephones: is there any interference?

Implanted devices and electromagnetic interference: case presentations and review.

Induction ovens and electromagnetic interference: what is the risk for patients with implantable cardioverter defibrillators?

Induction ovens and electromagnetic interference: what is the risk for patients with implanted pacemakers?

Influence of 50 Hz electric and magnetic fields on the human heart.

Influence of digital and analogue cellular telephones on implanted pacemakers.

Interference of electrical dental equipment with implantable cardioverter-defibrillators.

Interference with cardiac pacemakers by cellular telephones.

Interference with cardiac pacing.

Is there any risk interaction between electromagnetic field generated by mobile phones and artificial pacemakers].

Magnetic field exposure and arrythmic risk: evaluation in railway drivers.

Magnetism and cardiac arrhythmias.

Microwave effects on isolated chick embryo hearts.

Modifications in ventricular fibrillation and capture capacity induced by a linear radiofrequency lesion.

Risk of severe cardiac arrhythmia in male utility workers: a nationwide danish cohort study.

Selective interference with pacemaker activity by electrical dental devices.

Studies on microwaves in medicine and biology: from snails to humans.

The effect of power frequency high intensity electric fields on implanted cardiac pacemakers.

Ventricular fibrillation induced by radiofrequency energy delivery for premature ventricular contractions arising from the right ventricular outflow tract: is implantablecardioverterdefibrillator indicated?

FACTOR 18

Theme – Liver Neoplasms

Key MeSH Headings - Liver Neoplasms, Carcinoma, Hepatocellular, Neoplasm Recurrence, Local, Lymphatic Metastasis

Titles

40 GHz RF biosensor based on microwave coplanar waveguide transmission line for cancer cells (HepG2) dielectric characterization.

A case of hepatocellular carcinoma rupturing after angiography.

A case of recurring hepatocellular carcinoma with a solitary Virchow's lymph node metastasis.

A case report of primary hepatic carcinoid with lymph node metastasis--treatment of hepatic arterial infusion to post-reoperative liver and radiation to metastasis of para-aortic lymph nodes].

Construction and clinical significance of a predictive system for prognosis of hepatocellular carcinoma.

Effects of extremely low-frequency electromagnetic fields (ELF-EMF) exposure on B6C3F1 mice.

Geomagnetic field variation in early ontogenesis as a risk factor for oncopathology].

Inhibitory effects of low doses of melatonin on induction of preneoplastic liver lesions in a medium-term liver bioassay in F344 rats: relation to the influence of electromagnetic near field exposure.

Lymphoma development of simultaneously combined exposure to two radiofrequency signals in AKR/J mice.

Mobile phone radiation alters proliferation of hepatocarcinoma cells.

MoS2 nanosheets encapsulated in sodium alginate microcapsules as microwave embolization agents for large orthotopic transplantation tumor therapy.

Multimodal treatment of hepatocellular carcinoma.

Non-resection approaches for colorectal liver metastases.

Rat liver foci study on coexposure with 50 Hz magnetic fields and known carcinogens.

FACTOR 19

Theme – Symptoms of discomfort

Key MeSH Headings - Headache, Dizziness, Fatigue, Depression, Anxiety, Tremor, Sleep Wake Disorders, Neurotic Disorders, Stress, Psychological, Anxiety Disorders, Nervous System Diseases

Titles

A 50-Hz electromagnetic field impairs sleep.

A literature review of medical side effects from radio-frequency energy in the human environment: involving cancer, tumors, and problems of the central nervous system.

A study on the biological effects of exposure mobile-phone frequency EMF].

A survey study on some neurological symptoms and sensations experienced by long term users of mobile phones.

Altered cortical excitability in subjectively electrosensitive patients: results of a pilot study.

An analysis of the impact of cell phone use on depressive symptoms among Japanese elders.

Anxiety-like behavioural effects of extremely low-frequency electromagnetic field in rats.

Anxiogenic effect of chronic exposure to extremely low frequency magnetic field in adult rats.

Are media reports able to cause somatic symptoms attributed to WiFi radiation? An experimental test of the negative expectation hypothesis.

Association between Excessive Use of Mobile Phone and Insomnia and Depression among Japanese Adolescents.

Association between exposure to radiofrequency electromagnetic fields assessed by dosimetry and acute symptoms in children and adolescents: a population based cross-sectional study.

Association between mobile phone use and depressed mood in Japanese adolescents: a cross-sectional study.

Association between overuse of mobile phones on quality of sleep and general health among occupational health and safety students.

Association between problematic cellular phone use and suicide: the moderating effect of family function and depression.

Association of low job control with a decrease in memory (CD4+ CD45RO+) T lymphocytes in Japanese middle-aged male workers in an electric power plant.

Association of mobile phone radiation with fatigue, headache, dizziness, tension and sleep disturbance in Saudi population.

Association of tinnitus and electromagnetic hypersensitivity: hints for a shared pathophysiology?

Associations between problematic mobile phone use and psychological parameters in young adults.

Avoidance behaviors in patients with implantable cardioverter defibrillators.

Bedtime mobile phone use and sleep in adults.

Behavior and memory evaluation of Wistar rats exposed to 1.8 GHz radiofrequency electromagnetic radiation.

Can exposure to a terrestrial trunked radio (TETRA)-like signal cause symptoms? A randomised double-blind provocation study.

Cancer incidence and magnetic field exposure in industries using resistance welding in Sweden.

Cell phones: modern man's nemesis?

Cellular phones for reducing battlefield stress: rationale and a preliminary research.

Cerebral radiofrequency exposures during adolescence: Impact on astrocytes and brain functions in healthy and pathologic rat models.

Chronic exposure to an extremely low-frequency magnetic field induces depression-like behavior and corticosterone secretion without enhancement of the hypothalamic-pituitary-adrenal axis in mice.

Chronic exposure to ELF fields may induce depression.

Clinical features of headache associated with mobile phone use: a cross-sectional study in university students.

Cohort study on the effects of everyday life radio frequency electromagnetic field exposure on non-specific symptoms and tinnitus.

Contribution of physical factors to the complex anthropogenic load in an industrial town].

Coping and self-image in patients with visual display terminal-related skin symptoms and perceived hypersensitivity to electricity.

Correction of microcirculatory disturbances with terahertz electromagnetic radiation at nitric oxide frequencies in albino rats under conditions of acute stress.

Delayed biological effect of electromagnetic fields action].

Depression in high voltage power line workers.

Determinants and stability over time of perception of health risks related to mobile phone base stations.

Development of a problematic mobile phone use scale for Turkish adolescents.

Do mobile phone base stations affect sleep of residents? Results from an experimental double-blind sham-controlled field study.

Does short-term exposure to mobile phone base station signals increase symptoms in individuals who report sensitivity to electromagnetic fields? A double-blind randomized provocation study.

Effect of hypokinetic stress and low intensity electromagnetic field of extremely high frequency on changes of cytokine concentration in rat blood].

Effect of short-term 50 Hz electromagnetic field exposure on the behavior of rats.

Effect of stress and intesity of mobile phone using on the health and subjective symptoms in GSM workers].

Effective methods of protection from technogenic electromagnetic irradiation and information-wave diagnostic means].

Effects of acute exposure to ultrahigh radiofrequency radiation on three antenna engineers.

Effects of chronic exposure of power frequency magnetic field on neurobehavior in rats].

Effects of electromagnetic fields from mobile phones on depression and anxiety after titanium mesh cranioplasty among patients with traumatic brain injury.

Effects of exposure to microwaves: problems and perspectives.

Effects of extremely low frequency electromagnetic fields (100muT) on behaviors in rats.

Effects of GSM-900 microwaves on the experimental allergic encephalomyelitis (EAE) rat model of multiple sclerosis.

Effects of GSM-Frequency Electromagnetic Radiation on Some Physiological and Biochemical Parameters in Rats.

Effects of information and 50 Hz magnetic fields on cognitive performance and reported symptoms.

Effects of mobile phone radiation (900 MHz radiofrequency) on structure and functions of rat brain.

Effects of Sleep Quality on the Association between Problematic Mobile Phone Use and Mental Health Symptoms in Chinese College Students.

Electromagnetic field effect or simply stress? Effects of UMTS exposure on hippocampal longterm plasticity in the context of procedure related hormone release.

Electromagnetic fields and health outcomes.

Electromagnetic fields at a mobile phone frequency (900 MHz) trigger the onset of general stress response along with DNA modifications in Eisenia fetida earthworms.

Electromagnetic fields hypersensitivity].

Electromagnetic fields: damage to health due to the nocebo effect].

Electromagnetic hypersensitivity (EHS) and subjective health complaints associated with electromagnetic fields of mobile phone communication--a literature review published between 2000 and 2004.

Electromagnetic hypersensitivity: evidence for a novel neurological syndrome.

Endocrine mechanism of placental circulatory disturbances induced by microwave in pregnant rats].

Enhancement of allergic skin wheal responses in patients with atopic eczema/dermatitis syndrome by playing video games or by a frequently ringing mobile phone.

Environmental illness: fatigue and cholinesterase activity in patients reporting hypersensitivity to electricity.

Enzymatic activity of some tissues and blood serum from animals and humans exposed to microwaves and hypothesis on the possible role of free radical processes in the nonlinear effects and modification of emotional behavior of animals].

Epidemiologic studies of the effect of microwaves (neurophysiologic, hematologic and ophthalmologic aspects)].

Epidemiological risk assessment of pathology development in occupational exposure to radiofrequency electromagnetic fields].

EUROPAEM EMF Guideline 2016 for the prevention, diagnosis and treatment of EMF-related health problems and illnesses.

Exposure to electromagnetic fields and suicide among electric utility workers: a nested case-control study.

Exposure to mobile phone electromagnetic field radiation, ringtone and vibration affects anxiety-like behaviour and oxidative stress biomarkers in albino wistar rats.

Exposure to radio-frequency radiation from an aircraft radar unit.

Expression of the immediate early gene, c-fos, in mouse brain after acute global system for mobile communication microwave exposure.

Follow up study on the immune response to low frequency electromagnetic fields in men and women working in a museum.

Frequent cellular phone use modifies hypothalamic-pituitary-adrenal axis response to a cellular phone call after mental stress in healthy children and adolescents: A pilot study.

Functional changes in human peripheral neutrophils in workers with different exposure to noxious agents.

Health Effects of Electromagnetic Fields on Reproductive-Age Female Operators of Plastic Welding Machines in Fuzhou, China.

Health effects of living near mobile phone base transceiver station (BTS) antennae: a report from Isfahan, Iran.

Health of workers exposed to electric fields.

Health response of two communities to military antennae in Cyprus.

Health status of the workers exposed to strong, constant magnetic fields].

Hypersensitivity to electricity: working definition and additional characterization of the syndrome.

Individual subject sensitivity to extremely low frequency magnetic field.

Individual variation in temporal relationships between exposure to radiofrequency electromagnetic fields and non-specific physical symptoms: A new approach in studying 'electrosensitivity'.

Influence of electromagnetic fields on the emotional behaviour of rats].

Influence of microwave exposure on chlordiazepoxide effects in the mouse staircase test.

Interference with cardiac pacemakers by cellular telephones.

Investigation of sleep disorders in the vicinity of high frequency transmitters].

Is There a Connection Between Electrosensitivity and Electrosensibility? A Replication Study.

Life styles, anxiety, expertise: the perception of risk from electromagnetic fields.

Low-frequency pulsed electromagnetic field therapy in fibromyalgia: a randomized, double-blind, sham-controlled clinical study.

Low-level microwave irradiation and central cholinergic systems.

Magnetic fields of transmission lines and depression.

Magnetic fields of video display terminals and spontaneous abortion.

MEMO--a mobile phone depression prevention intervention for adolescents: development process and postprogram findings on acceptability from a randomized controlled trial.

Microwave frequency electromagnetic fields (EMFs) produce widespread neuropsychiatric effects including depression.

Microwave sickness: a reappraisal.

Mobile communication and health of population: estimation of danger, social and ethical problems].

Mobile communication: radiobiology problems and evaluation of danger].

Mobile phone base stations and adverse health effects: phase 1 of a population-based, cross-sectional study in Germany.

Mobile phone base stations and adverse health effects: phase 2 of a cross-sectional study with measured radio frequency electromagnetic fields.

Mobile phone headache: a double blind, sham-controlled provocation study.

Mobile phone use and stress, sleep disturbances, and symptoms of depression among young adults--a prospective cohort study.

Mobile phone use and subjective symptoms. Comparison of symptoms experienced by users of analogue and digital mobile phones.

Mobile Phone Use and The Risk of Headache: A Systematic Review and Meta-analysis of Cross-sectional Studies.

Mobile phone use, school electromagnetic field levels and related symptoms: a cross-sectional survey among 2150 high school students in Izmir.

Motor activity of rabbits in conditions of chronic low-intensity pulse microwave irradiation].

Natural very-low-frequency sferics and headache.

Neurobehavioral effects among inhabitants around mobile phone base stations.

Neurodegenerative diseases, suicide and depressive symptoms in relation to EMF.

Neurological changes induced by a mobile phone.

Neurophysiological effects of flickering light in patients with perceived electrical hypersensitivity.

Neurotic disturbances, depression and anxiety disorders in the population living in the vicinity of overhead high-voltage transmission line 400 kV. Epidemiological pilot study].

Non-contact determination of parasympathetic activation induced by a full stomach using microwave radar.

Non-specific physical symptoms and electromagnetic field exposure in the general population: can we get more specific? A systematic review.

Occupational electromagnetic field exposures associated with sleep quality: a cross-sectional study.

Occupational factors of anxiety and depressive disorders in the French National Electricity and Gas Company. The Anxiety-Depression Group.

Odontologic survey of referred patients with symptoms allegedly caused by electricity or visual display units.

Phantom vibration and phantom ringing among mobile phone users: A systematic review of literature.

Physical factors and stress].

Physicians appeals on the dangers of mobile communication--what is the evidence? Assessment of public health data.

Polluted places or polluted minds? An experimental sham-exposure study on background psychological factors of symptom formation in 'Idiophatic Environmental Intolerance attributed to electromagnetic fields'.

Preliminary report: symptoms associated with mobile phone use.

Prevalence of annoyance attributed to electrical equipment and smells in a Swedish population, and relationship with subjective health and daily functioning.

Prevalence of depression among electrical workers.

Prevalence of headache among handheld cellular telephone users in Singapore: a community study.

Provocation with stress and electricity of patients with "sensitivity to electricity".

Psychologic aspects of patients with symptoms presumed to be caused by electricity or visual display units.

Psychological factors associated with self-reported sensitivity to mobile phones.

Psychological symptoms and intermittent hypertension following acute microwave exposure.

Quantitative analysis of lesion parameters in radiofrequency trigeminal rhizotomy.

Radio and microwave frequency radiation and health--an analysis of the literature].

Recent data from the literature on the biological and pathologic effects of electromagnetic radiation, radio waves and stray currents].

Review of the epidemiologic literature on EMF and Health.

Risk factors, health risks, and risk management for aircraft personnel and frequent flyers.

Self-reported depression and anxiety symptoms and usage of computers and mobile phones among working-age Finns.

Self-reporting of symptom development from exposure to radiofrequency fields of wireless smart meters in victoria, australia: a case series.

Specific patterns of weak (1 microTesla) transcerebral complex magnetic fields differentially affect depression, fatigue, and confusion in normal volunteers.

Speculations on the influence of electromagnetism on genomic and associated structures.

Stress-related endocrinological and psychopathological effects of short- and long-term 50Hz electromagnetic field exposure in rats.

Study of human neurovegetative and hematologic effects of environmental low-frequency (50-Hz) electromagnetic fields produced by transformers.

Subjective symptoms related to mobile phone use--a pilot study].

Subjective symptoms, sleeping problems, and cognitive performance in subjects living near mobile phone base stations.

Sympathetic Resonance Technology: scientific foundation and summary of biologic and clinical studies.

Symptom prevalence and worry about high voltage transmission lines.

Symptoms experienced by people in vicinity of base stations: II/ Incidences of age, duration of exposure, location of subjects in relation to the antennas and other electromagnetic factors].

Symptoms of ill health ascribed to electromagnetic field exposure--a questionnaire survey.

Symptoms of problematic cellular phone use, functional impairment and its association with depression among adolescents in Southern Taiwan.

Symptoms reported by mobile cellular telephone users].

Symptoms, personality traits, and stress in people with mobile phone-related symptoms and electromagnetic hypersensitivity.

The association between use of mobile phones after lights out and sleep disturbances among Japanese adolescents: a nationwide cross-sectional survey.

The effect of chronic exposure to extremely low-frequency electromagnetic fields on sleep quality, stress, depression and anxiety.

The effect of electromagnetic radiation in the mobile phone range on the behaviour of the rat.

The effects of 884 MHz GSM wireless communication signals on headache and other symptoms: an experimental provocation study.

The effects of multivitamin supplementation on mood and general well-being in healthy young adults. A laboratory and at-home mobile phone assessment.

The immune response of women with prolonged exposure to electromagnetic fields produced by radiotelevision broadcasting stations.

The influence of occupational environment and professional factors on the risk of cardiovascular disease].

The prevalence of symptoms attributed to electromagnetic field exposure: a cross-sectional representative survey in Switzerland.

The relationship between adolescents' well-being and their wireless phone use: a cross-sectional study.

The risk of subjective symptoms in mobile phone users in Poland--an epidemiological study.

The role of anxiety in the perception of technological hazards - a cross-sectional study on cell phones and masts.

The role of electromagnetic fields in neurological disorders.

Time-dependent hematological changes in workers exposed to electromagnetic fields.

Use of terahertz electromagnetic radiation at nitric oxide frequencies for the correction of thyroid functional state during stress].

Work environment and cardiovascular diseases. A short review of the literature.

FACTOR 20

Theme - Neoplasms

Key MeSH Headings - Lung Neoplasms, Ovarian Neoplasms, Pituitary Neoplasms, Lymphoma, Prostatic Neoplasms, Colonic Neoplasms, Carcinoma, Breast Neoplasms, Hematologic Neoplasms, Neoplasms, Liver Neoplasms, Cell Transformation, Neoplastic, Nervous System Neoplasms

Titles

2-GHz band CW and W-CDMA modulated radiofrequency fields have no significant effect on cell proliferation and gene expression profile in human cells.

40 GHz RF biosensor based on microwave coplanar waveguide transmission line for cancer cells (HepG2) dielectric characterization.

50 Hz extremely low frequency electromagnetic fields enhance protein carbonyl groups content in cancer cells: effects on proteasomal systems.

50-Hz electromagnetic environment and the incidence of childhood tumors in Stockholm County.

A case of hepatocellular carcinoma rupturing after angiography.

A case of recurring hepatocellular carcinoma with a solitary Virchow's lymph node metastasis.

A case report of primary hepatic carcinoid with lymph node metastasis--treatment of hepatic arterial infusion to post-reoperative liver and radiation to metastasis of para-aortic lymph nodes].

A large-scale study of the ultrawideband microwave dielectric properties of normal, benign and malignant breast tissues obtained from cancer surgeries.

A meta-analysis of epidemiologic studies of electric and magnetic fields and breast cancer in women and men.

A microwave radiometric method for the study of the semiconductor properties of living tissue: its potential application to tumour location.

A mortality study of electrical utility workers in Quebec.

A new electromagnetic exposure metric: high frequency voltage transients associated with increased cancer incidence in teachers in a California school.

A review of cancer induction by extremely low frequency electromagnetic fields. Is there a plausible mechanism?

A review of epidemiological studies on the relationship of residential electromagnetic exposure to cancer].

A unified approach to the analysis of case-distribution (case-only) studies.

Activation of Signaling Cascades by Weak Extremely Low Frequency Electromagnetic Fields.

Adult cancers near high-voltage overhead power lines.

Age diseases depending on geomagnetic field activity inside the womb period].

Alternate indices of electric and magnetic field exposures among Ontario electrical utility workers.

Aluminum, calcium ion and radiofrequency synergism in acceleration of lymphomagenesis.

An alternate hypothesis for the association between electrical wiring configurations and cancer.

An apparently incongruous exposure-response relationship resulting from the use of job description to assess magnetic field exposure.

An epidemiological study of cancer morbidity and mortality among the population living in areas close to thermal and atomic electric power stations].

An evaluation of the existing evidence on the carcinogenic potential of extremely low frequency magnetic fields.

An evaluation of the mutagenic, carcinogenic and teratogenic potential of microwaves.

Animal carcinogenicity studies on radiofrequency fields related to mobile phones and base stations.

Annals of conflicting results: looking back on electromagnetic field research.

Are mobile phones harmful?

Are the stray 60-Hz electromagnetic fields associated with the distribution and use of electric power a significant cause of cancer?

Assessment of occupational exposure patterns by frequency-domain analysis of time series data.

Association between exposure to pulsed electromagnetic fields and cancer in electric utility workers in Quebec, Canada, and France.

Association of childhood cancer with residential traffic density.

Bioelectromagnetic field effects on cancer cells and mice tumors.

Biologic effects and health consequences of low and high (radio) frequency electromagnetic fields.

Biological and health effects on electric and magnetic fields at extremely low frequencies].

Biological effects and mechanisms of shortwave radiation: a review.

Biological effects of electromagnetic fields and recently updated safety guidelines for strong static magnetic fields.

Biological effects of electromagnetic fields].

Biological effects of low frequency electromagnetic fields.

Biological effects of non-ionizing electromagnetic fields: Two sides of a coin.

Biological effects of power-frequency fields as they relate to carcinogenesis.

Biological influences of electromagnetic fields].

Biological mechanisms and health effects of emf in view of requirements of reports on the impact of various installations on the environment].

Biologically based epidemiological studies of electric power and cancer.

Biophysical cancer transformation pathway.

Breast cancer and electric power.

Breast cancer and electromagnetic fields--a review.

Cancer cluster among young Indian adults living near power transmission lines in Bom Jesus do Tocantins, Para, brazil.

Cancer from exposure to 50/60 Hz electric and magnetic fields--a major scientific debate.

Cancer in Korean war navy technicians: mortality survey after 40 years.

Cancer in the electric power industry.

Cancer incidence among Norwegian airline pilots.

Cancer incidence among welders: possible effects of exposure to extremely low frequency electromagnetic radiation (ELF) and to welding fumes.

Cancer incidence and mortality and proximity to TV towers.

Cancer incidence in California flight attendants (United States).

Cancer incidence near radio and television transmitters in Great Britain. I. Sutton Coldfield transmitter.

Cancer incidence near radio and television transmitters in Great Britain. II. All high power transmitters.

Cancer mortality among electricity utility workers in a the state of Sao Paulo, Brazil].

Cancer mortality and residence near electricity transmission equipment: a retrospective cohort study.

Carcinogenesis and initiation of cell cycling by charge-induced membrane clusters may be due to mitogen receptors and Na+/H+ antiports.

Carcinogenic risk of extremely-low-frequency electromagnetic fields: state of the art].

Case-control study of childhood cancer and exposure to 60-Hz magnetic fields.

Cell phones and tumor: still in no man's land.

Cell phones: modern man's nemesis?

Cellular neoplastic transformation induced by 916 MHz microwave radiation.

Cellular phones and public health].

Chicken embryo fibroblasts exposed to weak, time-varying magnetic fields share cell proliferation, adenosine deaminase activity, and membrane characteristics of transformed cells.

Childhood cancer and magnetic fields from high-voltage power lines in England and Wales: a case-control study.

Childhood cancer and residential proximity to power lines. UK Childhood Cancer Study Investigators.

Childhood cancer in relation to a modified residential wire code.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Cohort and nested case-control studies of hematopoietic cancers and brain cancer among electric utility workers.

Combined biological effect of electromagnetic fields and chemical substances (toxic)].

Construction and clinical significance of a predictive system for prognosis of hepatocellular carcinoma.

Current Understanding of the Health Effects of Electromagnetic Fields.

Delayed biological effect of electromagnetic fields action].

Description of a new computer wire coding method and its application to evaluate potential control selection bias in the Savitz et al. childhood cancer study.

Determining health policy for sensible mobile phone use--current world status].

Developing policy in the face of scientific uncertainty: interpreting 0.3 microT or 0.4 microT cutpoints from EMF epidemiologic studies.

Dielectric Properties for Differentiating Normal and Malignant Thyroid Tissues.

Dielectric properties for non-invasive detection of normal, benign, and malignant breast tissues using microwave theories.

Dirty electricity": what, where, and should we care?

Do extremely low frequency magnetic fields enhance the effects of environmental carcinogens? A meta-analysis of experimental studies.

Does our electricity distribution system pose a serious risk to public health?

Effect of electromagnetic field exposure on chemically induced differentiation of friend erythroleukemia cells.

Effect of lesion morphology on microwave signature in 2-D ultra-wideband breast imaging.

Effect of magnetic field exposure on anchorage-independent growth of a promoter-sensitive mouse epidermal cell line (JB6).

Effect of millimeter waves on cyclophosphamide induced NF-kappaB.

Effect of pulsed electromagnetic field with different frequencies on the proliferation, apoptosis and migration of human ovarian cancer cells].

Effects of 2.45-GHz microwave radiation and phorbol ester 12-O-tetradecanoylphorbol-13-acetate on dimethylhydrazine-induced colon cancer in mice.

Effects of 2450 MHz electromagnetic fields with a wide range of SARs on methylcholanthrene-induced transformation in C3H10T1/2 cells.

Effects of 60-Hz fields, estradiol and xenoestrogens on human breast cancer cells.

Effects of ELF magnetic fields on protein expression profile of human breast cancer cell MCF7.

Effects of extremely low-frequency electromagnetic fields (ELF-EMF) exposure on B6C3F1 mice.

Effects of extremely low-frequency pulsed electromagnetic fields on morphological and biochemical properties of human breast carcinoma cells (T47D).

Effects of Mobile Phones on Children's and Adolescents' Health: A Commentary.

Electric and magnetic fields (EMF): what do we know about the health effects?

Electric and magnetic fields and health outcomes--an overview.

Electric blanket or mattress cover use and breast cancer incidence in women 50-79 years of age.

Electric blanket use and breast cancer in the Nurses' Health Study.

Electric blanket use and breast cancer on Long Island.

Electric blanket use and breast cancer risk among younger women.

Electric power, pineal function, and the risk of breast cancer.

Electromagnetic field exposure and cancer: a review of epidemiologic evidence.

Electromagnetic field exposures and childhood cancers in New Zealand.

Electromagnetic fields and breast cancer on Long Island: a case-control study.

Electromagnetic fields and cancer in children residing near Norwegian high-voltage power lines.

Electromagnetic fields and cancer risks.

Electromagnetic fields and female breast cancer.

Electromagnetic fields and health outcomes.

Electromagnetic fields and male breast cancer.

Electromagnetic fields and people's health].

Electromagnetic fields from high-voltage installations and cancer in childhood].

Electromagnetic fields, polychlorinated biphenyls, and prostate cancer mortality in electric utility workers.

Electromagnetic fields: is there any probability of the risk of cancer?].

Electromagnetic fields: low dose exposure, current update.

Electromagnetic residential fields and childhood cancers: state of epidemiological research].

ELF magnetic fields in a city environment.

EMF and current cancer concepts.

EMF-cancer link: the ferritin hypothesis.

Enhancement of efficacy of neoadjuvant polychemotherapy in combined treatment of lung cancer].

Environment and cancer risk].

Environmental exposure to electromagnetic fields and the risk of cancer].

Environmental factors and breast cancer.

Environmental factors and childhood acute leukemias and lymphomas.

Environmental risk factors and female breast cancer.

Epidemiologic studies of electric and magnetic fields and cancer: a case study of distortions by the media.

Epidemiologic studies of electric and magnetic fields and cancer: strategies for extending knowledge.

Epidemiologic study of residential proximity to transmission lines and childhood cancer in California: description of design, epidemiologic methods and study population.

Epidemiological appraisal of studies of residential exposure to power frequency magnetic fields and adult cancers.

Epidemiological risk assessment of mobile phones and cancer: where can we improve?

Estimates of Environmental Exposure to Radiofrequency Electromagnetic Fields and Risk of Lymphoma Subtypes.

EUROPAEM EMF Guideline 2016 for the prevention, diagnosis and treatment of EMF-related health problems and illnesses.

Evaluation of health risks caused by radio frequency accelerated carcinogenesis: the importance of processes driven by the calcium ion signal.

Evaluation of potential confounders in planning a study of occupational magnetic field exposure and female breast cancer.

Evidence for microwave carcinogenesis in vitro.

Examination of the melatonin hypothesis in women exposed at night to EMF or bright light.

Exposure assessment for power frequency electric and magnetic fields (EMF) and its application to epidemiologic studies.

Exposure from occupational versus other sources.

Exposure to 50-Hz electric field and incidence of leukemia, brain tumors, and other cancers among French electric utility workers.

Exposure to electromagnetic fields and the risk of leukemia.

Exposure to electromagnetic fields from use of electric blankets and other in-home electrical appliances and breast cancer risk.

Exposure to extremely low frequency electromagnetic fields and the risk of malignant diseases--an evaluation of epidemiological and experimental findings.

Exposure to low-frequency electromagnetic fields--a health hazard?

Exposure to power frequency electric fields and the risk of childhood cancer in the UK.

Extremely low frequency electromagnetic fields (EMF) and brain cancer in adults and children: review and comment.

Extremely low frequency electromagnetic fields and cancer: the epidemiologic evidence.

Extremely low-frequency electromagnetic fields exposure and female breast cancer risk: a meta-analysis based on 24,338 cases and 60,628 controls.

Fields and currents in the organs of the human body when exposed to power lines and VLF transmitters.

Follow-up of radio and telegraph operators with exposure to electromagnetic fields and risk of breast cancer.

Genetic damage in human cells exposed to non-ionizing radiofrequency fields: a meta-analysis of the data from 88 publications (1990-2011).

Genetic damage in mammalian somatic cells exposed to extremely low frequency electromagnetic fields: a meta-analysis of data from 87 publications (1990-2007).

Genetic damage in mammalian somatic cells exposed to radiofrequency radiation: a meta-analysis of data from 63 publications (1990-2005).

Genotoxicity of radiofrequency radiation. DNA/Genetox Expert Panel.

Geomagnetic field variation in early ontogenesis as a risk factor for oncopathology].

Health disorders caused by radiation].

Hematopoietic neoplasia in C57BL/6 mice exposed to split-dose ionizing radiation and circularly polarized 60 Hz magnetic fields.

How to approach complex mixtures: lessons from the epidemiology of electromagnetic fields.

Human cancer from environmental pollutants: the epidemiological evidence.

Human health consequences of environmentally-modulated gene expression: potential roles of ELF-EMF induced epigenetic versus mutagenic mechanisms of disease.

Hypothesis on a casual link between EMF and an evolutionary class of cancer and spontaneous abortion.

Incidence of breast cancer in a Norwegian cohort of women with potential workplace exposure to 50 Hz magnetic fields.

Incidence of cancer among workers in Norwegian hydroelectric power companies.

Incidence of cancer in Norwegian workers potentially exposed to electromagnetic fields.

Incidence of cancer in persons with occupational exposure to electromagnetic fields in Denmark.

Increased incidence of cancer in a cohort of office workers exposed to strong magnetic fields.

Increased mortality in amateur radio operators due to lymphatic and hematopoietic malignancies.

Induction of neoplastic transformation in C3H/10T1/2 cells by 2.45-GHz microwaves and phorbol ester.

Induction of tamoxifen resistance in breast cancer cells by ELF electromagnetic fields.

Influence of power frequency electric and magnetic fields on human health.

Inhibitory effects of low doses of melatonin on induction of preneoplastic liver lesions in a medium-term liver bioassay in F344 rats: relation to the influence of electromagnetic near field exposure.

Interaction of static and extremely low frequency electric and magnetic fields with living systems: health effects and research needs.

Joint actions of environmental nonionizing electromagnetic fields and chemical pollution in cancer promotion.

Knowledge and perceptions of the health effects of environmental hazards in the general population in Italy.

Leukemia and lymphoma incidence in rodents exposed to low-frequency magnetic fields.

Limitations of interview-based risk assessment of RF exposure from appliances.

Long-term exposure to microwave radiation provokes cancer growth: evidences from radars and mobile communication systems.

Low intensity and frequency pulsed electromagnetic fields selectively impair breast cancer cell viability.

Low-frequency magnetic fields and cancer. What you should know and what to tell your patients.

Lymphoma development in mice chronically exposed to UMTS-modulated radiofrequency electromagnetic fields.

Lymphoma development of simultaneously combined exposure to two radiofrequency signals in AKR/J mice.

Lymphoma induced in mice chronically exposed to very strong low-frequency electromagnetic field.

Magnetic field exposure related to cancer subtypes.

Magnetic fields and breast cancer in Swedish adults residing near high-voltage power lines.

Magnetic fields and cancer in children residing near Swedish high-voltage power lines.

Magnetic fields and childhood cancer--a pooled analysis of two Scandinavian studies.

Magnetic fields and mammary cancer in rodents: a critical review and evaluation of published literature.

Magnetic fields of high voltage power lines and risk of cancer in Finnish adults: nationwide cohort study.

Magnetic resonance imaging of the chest. Where we stand.

Maternal occupational exposure to electromagnetic fields before, during, and after pregnancy in relation to risks of childhood cancers: findings from the Oxford Survey of Childhood Cancers, 1953-1981 deaths.

Measurement of DNA damage and apoptosis in Molt-4 cells after in vitro exposure to radiofrequency radiation.

Melatonin and magnetic fields.

Meta-analysis of extremely low frequency electromagnetic fields and cancer risk: a pooled analysis of epidemiologic studies.

Micronucleus induction in Syrian hamster embryo cells following exposure to 50 Hz magnetic fields, benzo(a)pyrene, and TPA in vitro.

Microwave absorption by normal and tumor cells.

Microwave antigen retrieval blocks endogenous peroxidase activity in immunohistochemistry.

Microwave induces apoptosis in A549 human lung carcinoma cell line.

Mobile phone radiation alters proliferation of hepatocarcinoma cells.

Mobile phone use and risk of brain neoplasms and other cancers: prospective study.

Mobile phone use and risk of tumors: a meta-analysis.

Mobile phones, heat shock proteins and cancer.

Mobile telecommunications and health: report of an investigation into an alleged cancer cluster in Sandwell, West Midlands.

Mobile telephones and cancer--a review of epidemiological evidence.

Modeling of noninvasive microwave characterization of breast tumors.

Modification of the 1979 "Denver wire code" for different wire or plumbing types.

Morbidity experience in populations residentially exposed to 50 hz magnetic fields: methodology and preliminary findings of a cohort study.

Mortality among workers in the geothermal power plants at Larderello, Italy.

Mortality by neoplasia and cellular telephone base stations in the Belo Horizonte municipality, Minas Gerais state, Brazil.

Mortality in workers exposed to electromagnetic fields.

Mortality indices for hemoblastoses in Rivno Province before and after the accident at the Chernobyl Atomic Electric Power Station].

Mortality of persons resident in the vicinity of electricity transmission facilities.

Mortality of plastic-ware workers exposed to radiofrequencies.

MoS2 nanosheets encapsulated in sodium alginate microcapsules as microwave embolization agents for large orthotopic transplantation tumor therapy.

Multi-physics modeling to study the influence of tissue compression and cold stress on enhancing breast tumor detection using microwave radiometry.

Multimodal treatment of hepatocellular carcinoma.

Mutagenic, carcinogenic and teratogenic effects induced by radiofrequency electromagnetic field of mobile phone].

Neoplastic transformation in C3H 10T(1/2) cells after exposure to 835.62 MHz FDMA and 847.74 MHz CDMA radiations.

Neoplastic transformation of C3H/10T1/2 cells following exposure to 120-Hz modulated 2.45-GHz microwaves and phorbol ester tumor promoter.

News in occupational cancers].

Non dietetic environmental risk factors in prostate cancer].

Non-ionizing electromagnetic radiation: a study of carcinogenic and cancer treatment potential.

Non-resection approaches for colorectal liver metastases.

Occupation and malignant lymphoma: a population based case control study in Germany.

Occupational and residential magnetic field exposure and breast cancer in females.

Occupational exposure to electromagnetic field and breast cancer risk in a large, population-based, case-control study in the United States.

Occupational exposures associated with male breast cancer.

Occupational exposures to extremely low frequency magnetic fields and postmenopausal breast cancer.

Occupational magnetic field exposure and site-specific cancer incidence: a Swedish cohort study.

Occupational magnetic fields and female breast cancer: a case-control study using Swedish population registers and new exposure data.

Occupational risk factors for lung cancer in the French electricity and gas industry: a case-control survey nested in a cohort of active employees.

Parental occupational exposure to extremely low frequency magnetic fields and childhood cancer: a German case-control study.

Parental occupational exposure to magnetic fields and childhood cancer (Sweden).

Paternal occupational exposure to electro-magnetic fields as a risk factor for cancer in children and young adults: a case-control study from the North of England.

Paternal work in the power industry: effects on children at delivery.

Pathophysiology of cell phone radiation: oxidative stress and carcinogenesis with focus on male reproductive system.

Perspectives on health effects of electric and magnetic fields.

Pituitary tumor risk in relation to mobile phone use: A case-control study.

Population-based case-control study of occupational exposure to electromagnetic fields and breast cancer.

Power frequency electromagnetic fields and health. Where's the evidence?

Preliminary study of cause-specific mortality of a population exposed to 50 Hz magnetic fields, in a district of Rome municipality].

Probing lymphoma infiltration in spleen of AKR/J mice chronically exposed to electromagnetic fields for risk assessment--toward noninvasive modeling.

Prostate cancer in relation to the use of electric blanket or heated water bed.

Radiation from mobile phone and the health].

Radio and microwave frequency radiation and health--an analysis of the literature].

Radio frequency radiation-related cancer: assessing causation in the occupational/military setting.

Radiofrequency exposure and mammalian cell toxicity, genotoxicity, and transformation.

Radiofrequency exposure and mortality from cancer of the brain and lymphatic/hematopoietic systems.

Rat liver foci study on coexposure with 50 Hz magnetic fields and known carcinogens.

Rate of occurrence of transient magnetic field events in U.S. residences.

Recent advances in research on radiofrequency fields and health.

Recent data from the literature on the biological and pathologic effects of electromagnetic radiation, radio waves and stray currents].

Relationship between exposure to extremely low-frequency electromagnetic fields and breast cancer risk: a meta-analysis.

Remote effects of occupational and non-occupational exposure to electromagnetic fields of power-line frequency. Epidemiological studies].

Residence near high voltage facilities and risk of cancer in children.

Residential and occupational exposure to 50 Hz magnetic fields and hematological cancers in Norway.

Residential and occupational exposures to 50-Hz magnetic fields and breast cancer in women: a population-based study.

Residential electric consumption and childhood cancer in Canada (1971-1986)

Residential exposure to 60-Hertz magnetic fields and adult cancers in Taiwan.

Residential exposure to magnetic fields and risk of canine lymphoma.

Residential exposure to magnetic fields generated by 110-400 kV power lines in Finland.

Residential magnetic field exposure and breast cancer risk: a nested case-control study from a multiethnic cohort in Los Angeles County, California.

Residential magnetic fields and the risk of breast cancer.

Residential proximity to electricity transmission and distribution equipment and risk of childhood leukemia, childhood lymphoma, and childhood nervous system tumors: systematic review, evaluation, and meta-analysis.

Residential proximity to high-voltage power lines and risk of childhood hematological malignancies.

Results of lifespan exposure to continuous and intermittent extremely low frequency electromagnetic fields (ELFEMF) administered alone to Sprague Dawley rats.

Review of the epidemiologic literature on EMF and Health.

Risk for leukaemia and brain and breast cancer among Danish utility workers: a second follow-up.

Risk of cancer among Danish electricity workers. A cohort study].

Risk of cancer among Danish utility workers--a nationwide cohort study.

Risk of cancer in Finnish children living close to power lines.

Risk of hematological malignancies associated with magnetic fields exposure from power lines: a case-control study in two municipalities of northern Italy.

Risk of major lymphoma subtypes and use of mobile phones].

Risk of neoplastic diseases in conditions of exposure to power magnetic fields--epidemiologic investigations].

Risk of neoplastic diseases in conditions of exposure to radio- and microwave fields--epidemiologic investigations].

Risk of pituitary tumors in cellular phone users: a case-control study.

Risk of premenopausal breast cancer and use of electric blankets.

Risk perception of the general public of cell phone towers and cancer: trend and associated factors, 2005-2010].

Risks of carcinogenesis from electromagnetic radiation of mobile telephony devices.

Rodent cell transformation and immediate early gene expression following 60-Hz magnetic field exposure.

Role of melatonin on electromagnetic radiation-induced oxidative stress and Ca2+ signaling molecular pathways in breast cancer.

Role of radical pairs and feedback in weak radio frequency field effects on biological systems.

Scaling Relationship of In Vivo Muscle Contraction Strength of Rabbits Exposed to High-Frequency Nanosecond Pulse Bursts.

Searching for the perfect wave: the effect of radiofrequency electromagnetic fields on cells.

Selenium reduces mobile phone (900 MHz)-induced oxidative stress, mitochondrial function, and apoptosis in breast cancer cells.

Shift work, light at night, and breast cancer on Long Island, New York.

Socioeconomic status, social mobility and cancer occurrence during working life: a case-control study among French electricity and gas workers.

Speculations on the influence of electromagnetism on genomic and associated structures.

Studies on microwaves in medicine and biology: from snails to humans.

Studying the protein expression in human B lymphoblastoid cells exposed to 1.8-GHz (GSM) radiofrequency radiation (RFR) with protein microarray.

Teratogenic effect of broad-band electromagnetic field on neonatal mice (Mus musculus).

Testing electromagnetic fields for potential carcinogenic activity: a critical review of animal models.

The effects of 860 MHz radiofrequency radiation on the induction or promotion of brain tumors and other neoplasms in rats.

The effects of ionizing radiation, microwaves, and ultrasound on the developing embryo: clinical interpretations and applications of the data.

The effects of low-energy 60-Hz environmental electromagnetic fields upon the growth-related enzyme ornithine decarboxylase.

The effects of recall errors and of selection bias in epidemiologic studies of mobile phone use and cancer risk.

The electromagnetic spectrum: current and future applications in oncology.

The enhanced lethality of cells in suspension during simultaneous exposure to pulsed electrical and shock-wave acoustic fields].

The epidemiology of exposure to electromagnetic fields: an overview of the recent literature.

The INTERPHONE study: design, epidemiological methods, and description of the study population.

The measured electrical properties of normal and malignant human tissues from 50 to 900 MHz.

The melatonin hypothesis: electric power and breast cancer.

The relationship between electromagnetic field and light exposures to melatonin and breast cancer risk: a review of the relevant literature.

The relative merits of contemporary measurements and historical calculated fields in the Swedish childhood cancer study.

The residential case-specular method to study wire codes, magnetic fields, and disease.

The role of chemical and physical factors in cancer development].

The role of household electromagnetic fields in the development of mammary tumors in women: clinical case-record observations.

The use of cell phone and insight into its potential human health impacts.

Towards 5G communication systems: Are there health implications?

Transmission electron microscopy study of the effects produced by wide-band low-power millimeter waves on MCF-7 human breast cancer cells in culture.

Use of cellular telephones and risk of cancer. A Danish cohort study].

Use of electric bedding devices and risk of breast cancer in African-American women.

Use of electric blankets and risk of postmenopausal breast cancer.

Validation of self-reported cellular phone use.

Variable E-cadherin expression in a MNU-induced colon tumor model in rats which exposed with 50 Hz frequency sinusoidal magnetic field.

Appendix 4 – Hierarchical Text Clustering Taxonomy of Adverse EMF Effects Database

A4-A. Cluster Themes

A query to retrieve Medline records showing adverse health effects of wireless radiation was generated. The query was entered into the Medline search engine, and ~15,000 records were retrieved. Filtering was applied to the retrieval to remove records not associated with adverse health effects of wireless radiation, and 5311 records remained. Further filtering was not done, and more records showing no adverse effects, examining ELF frequencies, and exceeding the FCC exposure limits, were included compared to the filtered database in Appendix 2. The partially filtered records were imported into the CLUTO software, and a 48-cluster hierarchical text clustering of titles/abstracts was performed.

The following tables (A4-1, A4-2) show the categories in the taxonomy. The first table shows hierarchical Levels 2 and 4, and the second table shows Level 4 and its associated leaf (lowest level) clusters. For each cluster in both tables, the number of associated records is shown in parentheses, followed by the cluster theme. Following the tables, each leaf cluster is shown, including numbers of records, theme, and associated record titles. The Level 4 clusters in the second table are hyperlinked to their positions in the list of titles. Because of the filtering process limitations, most, but not all, records are associated with adverse effects of wireless radiation. To access the full record, insert the titles of interest into Pubmed or other Medline search engine.

Main adverse effects identified at the cluster theme level include cancer, brain tumors, mammary cancer, childhood cancer, childhood leukemia, breast cancer, acoustic neuromas, neurodegenerative diseases, cognitive function, neural function, oxidative stress, genotoxic, DNA damage, chromosome damage, gene expression alterations, implanted electronic device malfunction, sleep, melatonin secretion, embryos, cataracts, hearing, electrohypersensitivity.

Table A4-1 - CLUTO-Based Text Clustering Taxonomy – Top Levels

SECOND LEVEL	FOURTH LEVEL
Cluster 92 (2561) – Adverse effects of wireless radiation at cellular level, including radiation absorption at different frequencies	Cluster 78 (912) – Adverse impacts of wireless radiation, especially on cataracts, cells, and cognitive functions
	Cluster 79 (428) – Microwave radiation absorption at different frequencies
	Cluster 82 (529) – Adverse effects of mobile phone radiation, especially oxidative stress
	Cluster 84 (692) – Genotoxic effects of radiofrequency radiation
Cluster 93 (2750) – Adverse health effects of EMF on humans, especially cancer and neurodegenerative diseases, and on implanted electronic devices	Cluster 81 (673) – Adverse impacts of power-line EMF
	Cluster 85 (540) – Adverse impacts of low-frequency EMF, emphasizing cancer and neurodegenerative diseases
	Cluster 83 (668) – Adverse effects of mobile phone use, especially brain tumors, and brain and neural function
	Cluster 89 (869) – Human health risks from electromagnetic radiation, including adverse effects on implanted electronic devices, and possible protections

Table A4-2. CLUTO-Based Text Clustering Taxonomy - Bottom Levels

FOURTH LEVEL	LEAF (LOWEST) LEVEL
Cluster 78 (912) – Adverse impacts of wireless radiation, especially on cataracts, cells, and cognitive functions	Cluster 46 (331) – Adverse effects of microwave radiation, mainly on rats
	Cluster 3 (39) – Adverse impact of wireless radiation on eye lens
	Cluster 35 (107) – Adverse impacts of microwave radiation on cells and cognitive functions
	Cluster 39 (211) – Adverse effects from microwave radiation
	Cluster 29 (94) – Adverse effects of microwave radiation, especially pulsed microwave
	Cluster 31 (130) – Adverse effects of microwave exposures on rats, especially at WiFi frequencies
Cluster 79 (428) – Microwave radiation absorption at different frequencies	Cluster 10 (75) – Dielectric properties of tissue at different microwave frequencies
	Cluster 23 (88) – Specific absorption rate in human body models
	Cluster 21 (63) – Adverse effects of millimeter-wave exposures on biological systems
	Cluster 44 (95) – Adverse effects of microwave resonances in biological systems
	Cluster 47 (107) – Adverse biological effects of decimeter waves
Cluster 82 (529) – Adverse effects of mobile phone radiation, especially oxidative stress	Cluster 22 (127) – Effects of radiofrequency radiation, especially from mobile phones, on rats
	Cluster 26 (129) - Oxidative stress effects from mobile phone radiofrequency radiation
	Cluster 37 (140) – Effect of radiofrequency exposure, especially prenatal exposure, on rats
	Cluster 38 (133) – Effect of radiofrequency radiation on rat brain
Cluster 84 (692) – Genotoxic effects of radiofrequency radiation	Cluster 20 (126) – DNA damage after microwave radiation
	Cluster 28 (100) – Chromosome damage in lymphocytes exposed to radiofrequency radiation
	Cluster 45 (179) – Adverse effects of low-frequency EMF on cells
	Cluster 24 (111) – Gene expression alterations following radiofrequency exposure
	Cluster 11 (51) – Adverse impacts of radiofrequency fields on sleep
	Cluster 41 (125) – Adverse effects of radiofrequency fields on cells
Cluster 81 (673) – Adverse impacts of power-line EMF	Cluster 9 (43) – Adverse effects of ELF magnetic field exposures
	Cluster 17 (55) – Adverse impacts of EMF on mammary cancer development
	Cluster 6 (67) – Adverse health effects of magnetic fields associated with magnetic resonance imaging
	Cluster 32 (139) – Health risks of power-line electromagnetic fields on humans
	Cluster 34 (188) – Adverse effects of low-frequency electromagnetic fields on humans

	Cluster 40 (116) – Adverse effects of low-frequency magnetic fields on rodents
	Cluster 2 (27) – Effects of electromagnetic fields on chicken embryos
	Cluster 12 (38) – Impact of static and low-frequency magnetic fields on melatonin secretion
Cluster 85 (540) – Adverse impacts of low-frequency EMF, emphasizing cancer and neurodegenerative diseases	Cluster 4 (97) – Exposure to power lines and risk of childhood cancer
	Cluster 15 (131) – Residential magnetic fields and childhood leukemia
	Cluster 13 (113) – Electromagnetic fields and cancer, especially breast cancer
	Cluster 18 (62) – Mortality studies of electrical utility workers, focusing on electromagnetic field exposures
	Cluster 27 (137) – Occupational exposure to electromagnetic fields, emphasizing neurodegenerative disease and cancer
Cluster 83 (668) – Adverse effects of mobile phone use, especially brain tumors, and brain and neural function	Cluster 30 (321) – Adverse health symptoms from mobile phone use
	Cluster 1 (36) – Effects of mobile phones on brain and neural function
	Cluster 25 (68) – Effects of cell phone radiation on cognitive function and hearing
	Cluster 14 (93) – Myriad adverse health effects from cellphones
	Cluster 7 (44) – Risks from cell phone use, especially brain tumors
	Cluster 8 (106) – Risk of brain tumors/acoustic neuromas from mobile phone use
Cluster 89 (869) – Human health risks from electromagnetic radiation, including adverse effects on implanted electronic devices, and possible protections	Cluster 0 (63) – Electromagnetic interference with cardiac pacemakers
	Cluster 16 (103) – Electromagnetic interference on implanted cardiac devices
	Cluster 5 (120) – Health risks from mobile phone base stations
	Cluster 19 (84) – Electromagnetic hypersensitivity
	Cluster 43 (202) – Health risks from low-frequency electromagnetic fields
	Cluster 33 (91) – Health risks to workers in different occupations
	Cluster 36 (84) – Precautionary measures to reduce potential EMF health risks
	Cluster 42 (122) - Regulatory protections against electromagnetic fields

A4-B. Cluster Record Titles

Fourth Level Cluster 78 (912)
Theme - Adverse impacts of wireless radiation, especially on cataracts, cells, and cognitive functions

--Leaf Cluster 46 (331)

Theme - Adverse effects of microwave radiation, mainly on rats

Titles

Recent advances in the effects of microwave radiation on brains.

Microwave radiation absorption: behavioral effects.

Behavioral thermoregulation with microwave radiation of albino rats.

[Effect of microwave irradiation on biological systems].

[Microwave radiation sources requiring periodic or sporadic hygienic control].

Microwave radiation (2.45 GHz)-induced oxidative stress: Whole-body exposure effect on histopathology of Wistar rats.

Low intensity microwave radiation induced oxidative stress, inflammatory response and DNA damage in rat brain.

Mechanism of low-level microwave radiation effect on nervous system.

Apoptosis of Lewis Lung Carcinoma Cells Induced by Microwave via p53 and Proapoptotic Proteins In vivo.

Studies on the interaction of microwave radiation with cholinesterase.

A system for studying effects of microwaves on cells in culture.

Enzymatic alterations in developing rat brain cells exposed to a low-intensity 16.5 GHz microwave radiation.

Bioeffects of microwave--a brief review.

Behavioral effects of chlorpromazine and diazepam combined with low-level microwaves.

Microwave radiation induced oxidative stress, cognitive impairment and inflammation in brain of Fischer rats.

Interaction of microwave radiation with turkey sperm.

Effect of Low Level Subchronic Microwave Radiation on Rat Brain.

Acceleration of the development of benzopyrene-induced skin cancer in mice by microwave radiation.

Effect of 2.45 GHz microwave radiation on the fertility pattern in male mice.

Alterations in activity at auditory nuclei of the rat induced by exposure to microwave radiation: autoradiographic evidence using [14C]2-deoxy-D-glucose.

[Effect of microwave radiation on the rat hematopoietic system].

The effect of exposure of acetylcholinesterase to 2,450-MHz microwave radiation.

[The impact of electromagnetic radiation at microwave frequency (9.8 HhZ)on the embryonic and postembryonic development of the tick Hyalomma asiaticum (Acarina, Ixodidae)].

[Structural and metabolic analysis of the reaction of the central nervous system to the combined action of microwave and ionizing radiations].

[Mechanism of the effect of nonionizing radiation on animals at the level of sensory systems].

Effects of microwaves on membranes of hematopoietic cells in their structural and functional organization.

Microwave radiation and chlordiazepoxide: synergistic effects on fixed-interval behavior.

Behavioral effects of microwaves.

[Long-term exposure to low intensity microwave radiation affects male reproductivity].

[Effect of microwave radiation on cellular immunity indices in conditions of chronic exposure].

[Long-term microwave radiation affects male reproduction in rats].

Results of our 15-year study into the biological effects of microwave exposure.

Effect of whole-body 1800MHz GSM-like microwave exposure on testicular steroidogenesis and histology in mice.

Genotoxic Effects in Human Fibroblasts Exposed to Microwave Radiation.

[The effect of microwave radiation on the levels of MDA and the activity of SOD of nasopharyngeal carcinoma cells].

The effects of low-level radiofrequency and microwave radiation on brain tissue and animal behaviour.

Physiological changes in rats after exposure to low levels of microwaves.

The influence of prenatal 10 GHz microwave radiation exposure on a developing mice brain.

[The phenomenon of adaptive immunity in exposure to nonionizing microwave radiation].

Non-thermal effects of 500MHz - 900MHz microwave radiation on enzyme kinetics.

Activation of TLR signalling regulates microwave radiation-mediated impairment of spermatogenesis in rat testis.

Effect of 2.45 GHz microwave radiation on permeability of unilamellar liposomes to 5(6)-carboxyfluorescein. Evidence of non-thermal leakage.

Spatial memory and learning performance and its relationship to protein synthesis of Swiss albino mice exposed to 10 GHz microwaves.

[Effects of the microwave radiation from the cellular phones on humans and animals].

Cognitive impairment and neurogenotoxic effects in rats exposed to low-intensity microwave radiation.

Microwave hearing: evidence for thermoacoustic auditory stimulation by pulsed microwaves.

Effects of 2.45 GHz microwave radiation and heat on mouse spermatogenic epithelium.

Studies of the induction of dominant lethals and translocations in male mice after chronic exposure to microwave radiation.

Effect of Low-Intensity Microwave Radiation on Monoamine Neurotransmitters and Their Key Regulating Enzymes in Rat Brain.

Fluorescence depolarization studies of red cell membrane fluidity. The effect of exposure to 1.0-GHz microwave radiation.

[Effects of microwave radiation on the content of five elements in mice bone tissue].

Research on the neurological effects of nonionizing radiation at the University of Washington.

Cellular neoplastic transformation induced by 916 MHz microwave radiation.

Radiofrequency and microwave radiation in the microelectronics industry.

Reduced exposure to microwave radiation by rats: frequency specific effects.

[Reaction of the brain receptor system to the effect of low intensity microwaves].

Ten gigahertz microwave radiation impairs spatial memory, enzymes activity, and histopathology of developing mice brain.

Cytogenetic effects of 18.0 and 16.5 GHz microwave radiation on human lymphocytes in vitro.

Influence of microwave exposure on fertility of male rats.

Health aspects of radio and microwave radiation.

Japanese encephalitis virus (JEV): potentiation of lethality in mice by microwave radiation.

Microwave exposure induces Hsp70 and confers protection against hypoxia in chick embryos.

Potentially hazardous microwave radiation source--a review.

Behavioral effects of microwave reinforcement schedules and variations in microwave intensity on albino rats.

[Metabolic changes in cells under electromagnetic radiation of mobile communication systems].

Effect of microwave radiation on inactivation of Clostridium sporogenes (PA 3679) spores.

A circular dichroism study of human erythrocyte ghost proteins during exposure to 2450 MHz microwave radiation.

[Evaluation of bone density in rats after hydrocortisone and microwave radiation].

[Chronotoxicity of 1800 MHz microwave radiation on sex hormones and spermatogenesis in male mice].

Radiation hazard assessment of pulsed microwave radars.

Results of a United States and Soviet Union joint project on nervous system effects of microwave radiation.

Non-thermal microwave effects on protein dynamics? An X-ray diffraction study on tetragonal lysozyme crystals.

Effect of microwave radiation on permeability of liposomes. Evidence against non-thermal leakage.

Assessment of cytogenetic damage and oxidative stress in personnel occupationally exposed to the pulsed microwave radiation of marine radar equipment.

[Modification of the effects of microwave irradiation on biochemical processes by using foreign protein].

Some behavioral effects of short-term exposure of rats to 2.45 GHz microwave radiation.

[5-HT contents change in peripheral blood of workers exposed to microwave and high frequency radiation].

Microwave radiation effects on the thermally driven oxidase of erythrocytes.

Effects of microwave radiation (340 and 900 MHz) on different structural levels of erythrocyte membranes.

Environmental radiation hazards.

[Radiation protection and possible mechanisms for low intensity microwave].

Effects of low level microwave radiation on carcinogenesis in Swiss Albino mice.

Effects of pulsed 2.856 GHz microwave exposure on BM-MSCs isolated from C57BL/6 mice.

[Effect of pulse electromagnetic radiation on erythrocyte ghosts].

[Experimental modeling of autoimmune reactions as affected by nonionizing microwave radiation].

Biologic effects of microwave exposure. II. Studies on the mechanisms controlling susceptibility to microwave-induced increases in complement receptor-positive spleen cells.

Hearing of microwave pulses by humans and animals: effects, mechanism, and thresholds.

Individual responsiveness to induction of micronuclei in human lymphocytes after exposure in vitro to 1800-MHz microwave radiation.

Immunologic and hematopoietic alterations by 2,450-MHz electromagnetic radiation.

Exposure of cultured astroglial and microglial brain cells to 900 MHz microwave radiation.

Influence of microwave exposure on chlordiazepoxide effects in the mouse staircase test.

Activation of endoplasmic reticulum stress in rat brain following low-intensity microwave exposure.

Non-thermal effects of microwaves on proteins: thermophilic enzymes as model system.

[Morinda officialis how extract improves microwave-induced reproductive impairment in male rats].

Reception of microwaves by the brain.

Interaction of radiofrequency and microwave radiation with living systems. A review of mechanisms.

Effect on the immune system of mice exposed chronically to 50 Hz amplitude-modulated 2.45 GHz microwaves.

Selective changes in locomotor activity in mice due to low-intensity microwaves amplitude modulated in the EEG spectral domain.

Physical basis of adverse and therapeutic effects of low intensity microwave radiation.

Resonance effect of microwaves on the genome conformational state of E. coli cells.

Induction of micronuclei in human lymphocytes exposed in vitro to microwave radiation.

Biological effects of electromagnetic fields--mechanisms for the effects of pulsed microwave radiation on protein conformation.

The influence of microwave radiation on transdermal delivery systems.

Parametric mechanism of excitation of the electroencephalographic rhythms by modulated microwave radiation.

[Cytogenetic changes induced by low-intensity microwaves in the species Triticum aestivum].

High-frequency electromagnetic radiation injury to the upper extremity: local and systemic effects.

Effect of chronic microwave radiation on T cell-mediated immunity in the rabbit.

Prenatal microwave exposure and behavior.

[The state of receptor-dependent signal pathways in the agranulocytes from the peripheral blood of the reconvalescent patients following community-acquired pneumonia under the influence of microwave radiation].

Effects of 2.45 GHz microwaves on meiotic chromosomes of male CBA/CAY mice.

Inhibitory Effects of Microwave Radiation on LPS-Induced NFkappaB Expression in THP-1 Monocytes.

The relation of dose rate of microwave radiation to the time of death and total absorbed dose in the mouse.

Differential damage in bacterial cells by microwave radiation on the basis of cell wall structure.

Effect of 7, 14 and 21 Hz modulated 450 MHz microwave radiation on human electroencephalographic rhythms.

Immunotropic influence of 900 MHz microwave GSM signal on human blood immune cells activated in vitro.

[Are microwaves a co-teratogen? Experimental model concept and its verification].

Studies on microwaves in medicine and biology: from snails to humans.

Changes in human EEG caused by low level modulated microwave stimulation.

Electromagnetic radiations and cancer. Cause and prevention.

Microwave elution of red cell antibodies.

Influence of low intensity 2,450 MHz microwave radiation upon the growth of various micro-organisms and their sensitivity towards chemical inactivation.

Low power microwave interaction with phospholipase C and D signal transduction pathways in myogenic cells.

[Antagonistic effect of microwave on hematopoietic damage of mice induced by gamma-ray irradiation].

Acid resistance and verocytotoxin productivity of enterohemorrhagic Escherichia coli O157:H7 exposed to microwave.

The relationship between colony-forming ability, chromosome aberrations and incidence of micronuclei in V79 Chinese hamster cells exposed to microwave radiation.

Effects of differently polarized microwave radiation on the microscopic structure of the nuclei in human fibroblasts.

The correlation between the frequency of micronuclei and specific chromosome aberrations in human lymphocytes exposed to microwave radiation in vitro.

A search for nonthermal effects of 434 MHz microwave radiation on whole human blood.

Review of the specific effects of microwave radiation on bacterial cells.

Microwave dissociation of antigen-antibody complexes: a new elution technique to permit phenotyping of antibody-coated red cells.

[Nature of the changes in the morphofunctional and cytochemical indices of blood leukocytes as affected by low-intensity microwaves].

Effects of 2.45-GHz microwave radiation and phorbol ester 12-O-tetradecanoylphorbol-13-acetate on dimethylhydrazine-induced colon cancer in mice.

Effects of X-band microwave exposure on rabbit erythrocytes.

Transgenic nematodes as biomonitors of microwave-induced stress.

The effects of microwave radiation on avian dominance behavior.

Dominant lethal studies in male mice after exposure to 2.45 GHz microwave radiation.

[Action of UHF microwaves on the germ and somatic cells of mammals].

Sperm count and sperm abnormality in male mice after exposure to 2.45 GHz microwave radiation.

Effect of microwaves (2450-MHz) on the immune system in mice: studies of nucleic acid and protein synthesis.

The influence of differently polarised microwave radiation on chromatin in human cells.

Effects of 10-GHz microwaves on hematological parameters in Swiss albino mice and their modulation by Prunus avium.

Effects of fetal microwave radiation exposure on offspring behavior in mice.

Ibuprofen effects on behavioral thermoregulation with microwave radiation in albino rats.

Microwave and man: the direct and indirect hazards, and the precautions.

Biomarkers in volunteers exposed to mobile phone radiation.

Effects of 900-MHz microwave radiation on gamma-ray-induced damage to mouse hematopoietic system.

Detection of probable effects of microwave exposure of blood parameters of RBC, PCV and Hb in rat.

Effects of microwaves on the colony-forming capacity of haemopoietic stem cells in mice.

2.45-GHz microwave irradiation adversely affects reproductive function in male mouse, Mus musculus by inducing oxidative and nitrosative stress.

Adaptation of human brain bioelectrical activity to low-level microwave.

Biochemical changes in rat brain exposed to low intensity 9.9 GHz microwave radiation.

Effect of microwave radiation on the permeability of carbonic anhydrase loaded unilamellar liposomes.

Effects on the nervous system by exposure to electromagnetic fields: experimental and clinical studies.

Microwave effect on diffusion: a possible mechanism for non-thermal effect.

Teratology, survival, and reversal learning after fetal irradiation of mice by 2450-MHz microwave energy.

[Changes in drug pharmacokinetics and pharmacodynamics under the influence of microwaves of different ranges].

Increase in the frequency of Fc receptor (FcR) bearing cells in the mouse spleen following a single exposure of mice to 2450 MHz microwaves.

Modification of membrane fluidity in melanin-containing cells by low-level microwave radiation.

Effects of low level microwave radiation on the digestive transit of the rat.

Microwave-stimulated drug release from liposomes.

[Changes in immunobiological reactivity under the combined action of microwave, infrasonic and gamma irradiation].

Behavioral and cognitive effects of microwave exposure.

The effect of microwave radiation on the cell genome.

Neurological effects of microwave exposure related to mobile communication.

Microwave effects on plasmid DNA.

Differential response of the permeability of the rat liver canalicular membrane to sucrose and mannitol following in vivo acute single and multiple exposures to microwave radiation (2.45 GHz) and radiant-energy thermal stress.

Effects of microwave radiation and strychnine on cerebral biopotentials in narcotized rats.

[Some biochemical indexes in white rabbit's blood affected by acute high intensity microwave].

Long-term exposure to microwave radiation provokes cancer growth: evidences from radars and mobile communication systems.

Effect of low power microwave on the mouse genome: a direct DNA analysis.

Fluorescence depolarization studies of the phase transition in multilamellar phospholipid vesicles exposed to 1.0-GHz microwave radiation.

Effect of low frequency modulated microwave exposure on human EEG: individual sensitivity.

A negative test for mutagenic action of microwave radiation in Drosophila melanogaster.

[Non-thermal microwave effect on nerve fiber function].

Influence of microwaves on different types of receptors and the role of peroxidation of lipids on receptor-protein shedding.

[Effect of nonionizing microwave radiation on autoimmune reactions and antigenic structure of serum proteins].

Effects of 9.4 GHz microwave exposure on meiosis in mice.

[Two-step exposure of biological objects to infrared laser and microwave radiation].

Influence of in vitro microwave radiation on the fertilizing capacity of turkey sperm.

Measure of enzymatic activity coincident with 2450 MHz microwave exposure.

Effect of microwave radiation on redissolving precipitated matter in fluorouracil injection.

[Germ reduction by microwaves--microwave specific effects].

Effects of microwave (2.45 GHz) irradiation on some biological characters of Salmonella typhimurium.

The relation of sex, age, and weight of mice to microwave radiation sensitivity.

The origins of U.S. safety standards for microwave radiation.

Pathophysiology of microwave radiation: effect on rat brain.

Influence of CW microwave radiation on in vitro release of enzymes from retinol- treated hepatic lysosomes.

Cytological effects of microwave radiation in Chinese hamster cells in vitro.

Ouabain inhibition of kidney ATPase is altered by 9.14 GHz radiation.

Cytogenetic investigations on microwaves emitted by a 455.7 MHz car phone.

[The reaction of the tick Hyalomma asiaticum (Acarina, Ixodidae) to 1- to 4-GHz microwaves].

The effects of low level microwaves on the fluidity of photoreceptor cell membrane.

Insensitivity of cardiovascular function to low power cm-/mm-microwaves.

[Ultracytochemical changes in the brain and liver in exposure to low-intensity nonionizing microwave radiation].

Microwave effect on camphor binding to rat olfactory epithelium.

In vitro effects of microwave radiation on rat liver mitochondria.

Induction of neoplastic transformation in C3H/10T1/2 cells by 2.45-GHz microwaves and phorbol ester.

Evidence for microwave carcinogenesis in vitro.

Microwave radiation injury.

Effect of microwave radiation on human EEG at two different levels of exposure.

Effects of noinionizing radiation on the central nervous system, behavior, and blood: a progress report.

Brain enzyme histochemistry following stabilization by microwave irradiation.

Poly ADP ribosylation as a possible mechanism of microwave--biointeraction.

Investigation of an acute microwave-oven hand injury.

Rat lymphocytes in cell culture exposed to 2450 MHz (CW) microwave radiation.

Effect of electromagnetic microwave radiation on the growth of Ehrlich ascites carcinoma.

Effects of 36.6 GHz and static magnetic field on degree of endoreduplication in Drosophila melanogaster polytene chromosomes.

Extremely low-level microwaves attenuate immune imbalance induced by inhalation exposure to low-level toluene in mice.

[The effect of microwaves on the neuronal activity of the hyperstriatum in chick embryos at the critical developmental period].

Psychological symptoms and intermittent hypertension following acute microwave exposure.

Very new waves in very old meridians: quantum medical physics of the living.

[The effect of various occupational exposures to microwave radiation on the concentrations of immunoglobulins and T lymphocyte subsets].

Microwave effect upon chlorpromazine-inhibited kidney ATPase.

Evidence for genetic control of microwave-induced augmentation of complement receptor-bearing B lymphocytes.

[The combined action of microwave radiation and hydrogen peroxide on the viability and ultrastructure of Pseudomonas aeruginosa cells].

A demonstration of athermal effects of continuous microwave irradiation on the growth and antibiotic sensitivity of Pseudomonas aeruginosa PAO1.

Influence of low power cm-/mm-microwaves on cardiovascular function.

Local cerebral blood flow after microwave exposure.

The properties of bird feathers as converse piezoelectric transducers and as receptors of microwave radiation. II. Bird feathers as dielectric receptors of microwave radiation.

Different methods for evaluating the effects of microwave radiation exposure on the nervous system.

Microwave cell death: Immunohistochemical and enzyme histochemical evaluation.

Study of nonionizing microwave radiation effects upon the central nervous system and behavior reactions.

[Cellular effects of microwaves of thermal intensity].

Microwave induced stimulation of 32Pi incorporation into phosphoinositides of rat brain synaptosomes.

Laser doppler flowmetry as a method for evaluating the microwave radiation effect on cutaneous microcirculation.

Microwave effects on acetylcholine-induced channels in cultured chick myotubes.

[The participation of thyroid hormones in modifying the mutagenic effect of microwaves].

Investigation of the effects of continuous-wave, pulse- and amplitude-modulated microwaves on single excitable cells of Chara corallina.

Microwave frequency electromagnetic fields (EMFs) produce widespread neuropsychiatric effects including depression.

[Effect of centimeter microwaves on the antibody production in mice].

[Effect of electromagnetic SHF-radiation on the morphofunctional status of early mouse embryos].

The effect of acute far field exposure at 2.45 GHz on the mouse testis.

[Pharmacological correction of the acute effects of microwave irradiation in an experiment].

Effects of exposure to microwaves: problems and perspectives.

Semen analysis of military personnel associated with military duty assignments.

Setting exposure limits for radiofrequency radiation and microwaves in China.

Effect of exposure to operant-controlled microwaves on certain blood and immunological parameters in the young chick.

In vitro cytogenetic effects of 2450 MHz waves on human peripheral blood lymphocytes.

[Microwaves and blood-brain barrier].

Microwave radiation: an epidemiologic assessment.

[The dynamics of the immunobiological effects in transcerebral microwave exposures].

Microwave absorption by normal and tumor cells.

Microwaves induce an increase in the frequency of complement receptor-bearing lymphoid spleen cells in mice.

Microwave radiation-induced calcium ion efflux from human neuroblastoma cells in culture.

Studies on possible genetic effects of microwaves in procaryotic and eucaryotic cells.

Middle-ear structures contribute little to auditory perception of microwaves.

[Effect of long wave pre-illumination on the kinetic characteristics of microwave photoconductivity signals in Chlorella cells and the Emerson effect].

Non-thermal effects of 2.45 GHz microwaves on spindle assembly, mitotic cells and viability of Chinese hamster V-79 cells.

Microwave diathermy: the invisible healer.

[Biological effects of microwave radiation of low nonthermal intensity (regarding the maximal admissible values)].

[Effect of electromagnetic radiation of radio frequency (340 and 800 MHz) on liposomes from dimyristoyl lecithin].

[Studies on the microwave leakage of the interphone].

Effect of microwave radiation on the stability of frozen cefoxitin sodium solution in plastic bags.

[The role of TLR4 receptor in the stress response of lymphocytes].

Febrile convulsions induced by microwaves and the alteration in behavior of albino mouse OF1.

[Immunobiological effect of bitemporal exposure of rabbits to microwaves].

Thermal effects of 2450 MHz microwave exposure near a titanium alloy plate implanted in rabbit limbs.

[The role of protein kinase SAPK/JNK in cell responses to low-intensity nonionizing radiation].

[Activity of cytochromes P-450p and P-450h in liver microsomes and blood corticosteroid levels in experimental animals under the action of physical factors].

The effect of high intensity microwave exposure on enucleation of murine erythroid cells in vitro.

Microwave-evoked brainstem potentials in cats.

Tight junctional changes upon microwave and x-ray irradiation.

The analysis of animal bioelectric brain activity influenced by microwaves or by the introduction of strychnine.

[The characteristics of the effect of centimeter-range microwaves on drug pharmacokinetics in the body of experimental animals].

[Effect of centimeter microwaves and the combined magnetic field on the tumor necrosis factor production in cells of mice with experimental tumors].

[Enzymatic activity of some tissues and blood serum from animals and humans exposed to microwaves and hypothesis on the possible role of free radical processes in the nonlinear effects and modification of emotional behavior of animals].

Non-thermal effects in the microwave induced unfolding of proteins observed by chaperone binding.

[Study of bioeffects of ship-borne microwave navigation radar in chronic experiments].

[Combined effect of microwaves and gamma-rays on the imprinting of chickens, irradiated in early embryogenesis].

Effects of nonionizing radiation on birds.

[The effect of electromagnetic radiation on the membranes of the sarcoplasmic reticulum].

[The combined action of microwave irradiation and hypoxia on the biogenic amine content of the blood in guinea pigs in anaphylactic shock].

Possible humoral mechanism of 2450-MHz microwave-induced increase in complement receptor positive cells.

[Synaptic transmission in the frog spinal cord exposed to intensive microwave radiation].

Microwave-enhanced folding and denaturation of globular proteins.

[Hematologic changes in workers exposed to radio wave radiation].

[The reaction of glia in visual centers during the whole body effect of combined microwaves and x-rays].

Elimination of microwave effects on the vitality of nerves after blockage of active transport.

Low frequency amplitude modulated microwave fields change calcium efflux rates from synaptosomes.

Study of effects of low level microwave field by method of face masking.

Association of microwaves and ionizing radiation: potentiation of teratogenic effects in the rat.

[The use of microwave for immunohistochemical technology in forensic pathology].

[The effect of microwaves on the bioelectric brain activity].

MoS2 nanosheets encapsulated in sodium alginate microcapsules as microwave embolization agents for large orthotopic transplantation tumor therapy.

Microwave drying of microorganisms: I. Influence of the microwave energy and of the sample thickness on the drying of yeast.

Effect of non-ionising radiation on body weight and growth of the gastro-intestinal tract in broilers.

[The role of the thyroid hormones in regulating chromosomal resistance to microwave exposure].

[Analysis of ECG on the staffs exposed to microwave in the radio calling signal station].

Cochlear microphonics generated by microwave pulses.

Holographic assessment of a hypothesized microwave hearing mechanism.

Enhancement of allergic skin wheal responses by microwave radiation from mobile phones in patients with atopic eczema/dermatitis syndrome.

Microwave antigen retrieval blocks endogenous peroxidase activity in immunohistochemistry.

[Increase in the immunogenicity of cancer cells exposed to microwaves].

Aspirin (acetylsalicylic acid) effects on behavioral thermoregulation with microwave radiation.

[The effect of microwaves on lipid peroxidation and on lipid and mineral metabolism in warm-blooded animals (experimental research)].

Effects of microwave radiation on house dust mites, Dermatophagoides pteronyssinus and Dermatophagoides farinae (Astigmata: Pyroglyphidae).

The effect of non ionising electromagnetic radiation on RAAF personnel during World War II.

[Action of millimeter-range electromagnetic radiation on the Ca pump of sarcoplasmic reticulum].

After-effect induced by microwave radiation in human electroencephalographic signal: a feasibility study.

Superconductivity--a possible mechanism for non-thermal biological effects of microwaves.

Microwaving for double indirect immunofluorescence with primary antibodies from the same species and for staining of mouse tissues with mouse monoclonal antibodies.

[Accelerated decalcification using microwaves].

Influence of chopper and mixer speeds and microwave power level during the high-shear granulation process on the final granule characteristics.

[Effects of prolonged low-intensity radiofrequency radiation in cm-range on the development of subcutaneously grafted Ehrlich's adenocarcinoma].

The effects of irradiation intensity on the microwave-enhanced advanced oxidation process.

The role of coherence time in the effect of microwaves on ornithine decarboxylase activity.

[Effect of microwaves over Staphylococcus aureus and Salmonella spp. inoculated into frozen minced meat].

Microwave decalcification of human temporal bones.

An EM radiation safety controller.

Electrosmog and autoimmune disease.

Capability of Thai Mission grass (Pennisetum polystachyon) as a new weedy lignocellulosic feedstock for production of monomeric sugar.

A novel autonomic activation measurement method for stress monitoring: non-contact measurement of heart rate variability using a compact microwave radar.

Late heat damage in normal swine rectum: a comparison of thermosensitivity of rectum and oesophagus.

[Effect of UHF and ionizing radiation on the Na-K-ATPase activity of Ehrlich ascitic carcinoma cells].

Acute multiple mononeuropathy after accidental exposure to oven microwaves.

Microwave enhanced ion exchange of cationic and anionic clays.

[New mechanisms of biological effects of electromagnetic fields].

Non-contact determination of parasympathetic activation induced by a full stomach using microwave radar.

Immunohistochemistry and microwave decalcification of human temporal bones.

Monitoring of lung edema by microwave reflectometry during lung ischemia-reperfusion injury in vivo.

Joint effects of microwave and chromium trioxide on root tip cells of Vicia faba.

An alternative approach to the treatment of mammary duct fistulas: a combination of microwave and ultrasound.

[Body's reaction to weakened geomagnetic field (the effect of magnetic deprivation)].

Influence of radar radiation on breeding biology of tits (Parus sp.).

[Effect of short-term exposure to ash from electric power plants on histochemical reactions of succinate dehydrogenase and lactate dehydrogenase in the lungs of experimental animals].

Theme - Adverse impacts of microwave radiation on cells and cognitive functions

Titles

[A aquaporin 4 expression and effects in rat hippocampus after microwave radiation].

Impairment of long-term potentiation induction is essential for the disruption of spatial memory after microwave exposure.

[Changes of apoptosis, mitochondrion membrane potential and Ca2+ of hypothalamic neurons induced by high power microwave].

Upregulation of HIF-1alpha via activation of ERK and PI3K pathway mediated protective response to microwave-induced mitochondrial injury in neuron-like cells.

[Microwave radiation induces injury to GC-2spd cells].

The relationship between NMDA receptors and microwave-induced learning and memory impairment: a long-term observation on Wistar rats.

Apoptosis induced by microwave radiation in pancreatic cancer JF305 cells.

[The cardiac injury effect of microwave radiation on rabbit and its mechanism].

[The injury effects of microwave exposure on visual performance and retinal ganglion cells (RGCs) in rats].

[Inhibitory effect of microwave radiation on proliferation of human pancreatic cancer JF305 cells and its mechanism].

Study on dose-dependent, frequency-dependent, and accumulative effects of 1.5 GHz and 2.856 GHz microwave on cognitive functions in Wistar rats.

Microwave induces apoptosis in A549 human lung carcinoma cell line.

Acute effects of pulsed microwaves and 3-nitropropionic acid on neuronal ultrastructure in the rat caudate-putamen.

[Influence of microwave radiation on synaptic structure and function of hippocampus in Wistar rats].

Microwave-induced Apoptosis and Cytotoxicity of NK Cells through ERK1/2 Signaling.

Identification of a Novel Rat NR2B Subunit Gene Promoter Region Variant and Its Association with Microwave-Induced Neuron Impairment.

Microwave exposure impairs synaptic plasticity in the rat hippocampus and PC12 cells through over-activation of the NMDA receptor signaling pathway.

iTRAQ quantitatively proteomic analysis of the hippocampus in a rat model of accumulative microwave-induced cognitive impairment.

The apoptotic effect and the plausible mechanism of microwave radiation on rat myocardial cells.

Neural cell apoptosis induced by microwave exposure through mitochondria-dependent caspase-3 pathway.

The effect of 2450 MHz microwave radiation on the ultrastructure of snail neurons.

Relationship between cognition function and hippocampus structure after long-term microwave exposure.

2.45 GHz Microwave Radiation Impairs Learning and Spatial Memory via Oxidative/Nitrosative Stress Induced p53-Dependent/Independent Hippocampal Apoptosis: Molecular Basis and Underlying Mechanism.

Real-time Microwave Exposure Induces Calcium Efflux in Primary Hippocampal Neurons and Primary Cardiomyocytes.

AduoLa Fuzhenglin down-regulates microwave-induced expression of beta1-adrenergic receptor and muscarinic type 2 acetylcholine receptor in myocardial cells of rats.

Alterations of cognitive function and 5-HT system in rats after long term microwave exposure.

Extracellular calcium and microwave enhancement of membrane conductance in snail neurons.

[Effect of handportable mobiletelephone microwave radiation on rat central neuron apoptosis].

[Effect of electromagnetic radiation in a decimeter wave-length range on the calcium current of molluscan neurons].

[Effects of microwave radiation on thymocytes in mice at different power densities].

Long term impairment of cognitive functions and alterations of NMDAR subunits after continuous microwave exposure.

Reduction of phosphorylated synapsin I (ser-553) leads to spatial memory impairment by attenuating GABA release after microwave exposure in Wistar rats.

Retinal damage experimentally induced by microwave radiation at 55 mW/cm2.

[Microwave radiation decreases the expressions of occludin and JAM-1 in rats].

[Changes of the expression of beta1-adrenergic receptor and M2-muscarinic acetylcholine receptor in rat hearts after high power microwave radiation].

[Effect of qindan fuzheng capsule on ultrastructure of microwave radiation injured cardiomyocytes and hepatocytes in rats].

From the Cover: 2.45-GHz Microwave Radiation Impairs Hippocampal Learning and Spatial Memory: Involvement of Local Stress Mechanism-Induced Suppression of iGluR/ERK/CREB Signaling.

[Influence of microwave radiation on synapsin I expression in PC12 cells and its mechanism].

[Effect of vitamin E on morphological variation of retinal ganglion cells after microwave radiation].

[Effect of microwave radiation on primary cultured Sertoli cells].

Chronic exposure to GSM 1800-MHz microwaves reduces excitatory synaptic activity in cultured hippocampal neurons.

Microwave radiation leading to shrinkage of dendritic spines in hippocampal neurons mediated by SNK-SPAR pathway.

Activation of VEGF/Flk-1-ERK Pathway Induced Blood-Brain Barrier Injury After Microwave Exposure.

The study of retinal ganglion cell apoptosis induced by different intensities of microwave irradiation.

The effects of high-power microwaves on the ultrastructure of Bacillus subtilis.

The effect of microwave radiation on passive membrane properties of snail neurons.

[Effect of 900MHz electromagnetic fields on energy metabolism of cerebral cortical neurons in postnatal rat].

Effects of GSM 1800 MHz on dendritic development of cultured hippocampal neurons.

Low intensity microwave radiation effects on the ultrastructure of Chang liver cells.

[Effect of 900Mhz electromagnetic fields on energy metabolism in postnatal rat cerebral cortical neurons].

Real-time Assessment of Cytosolic, Mitochondrial, and Nuclear Calcium Levels Change in Rat Pheochromocytoma Cells during Pulsed Microwave Exposure Using a Genetically Encoded Calcium Indicator.

Protective Role of NMDAR for Microwave-Induced Synaptic Plasticity Injuries in Primary Hippocampal Neurons.

Abnormality of synaptic vesicular associated proteins in cerebral cortex and hippocampus after microwave exposure.

RKIP Regulates Neural Cell Apoptosis Induced by Exposure to Microwave Radiation Partly Through the MEK/ERK/CREB Pathway.

[The protective effects of Aduola Fuzhenglin on the heart injury induced by microwave exposure in rats].

Differentiation of murine erythroleukemic cells during exposure to microwave radiation.

Cytokines produced by microwave-radiated Sertoli cells interfere with spermatogenesis in rat testis.

[Effect of 900 MHz electromagnetic fields on the expression of GABA receptor of cerebral cortical neurons in postnatal rats].

[Effects of high power microwave exposure on cholinergic neurotrophic factors protein in rabbit retina].

[Neuroeffects of prolonged exposure to microwaves: systemic, neuronal and electron microscope study].

Microwave enhancement of membrane conductance: calmodulin hypothesis.

[Influence of electromagnetic radiation on raf kinase inhibitor protein and its related proteins of hippocampus].

2.45 GHz microwave radiation induced oxidative and nitrosative stress mediated testicular apoptosis: Involvement of a p53 dependent bax-caspase-3 mediated pathway.

Microwave effects on input resistance and action potential firing of snail neurons.

MicroRNAs: Novel Mechanism Involved in the Pathogenesis of Microwave Exposure on Rats' Hippocampus.

The Screening of Genes Sensitive to Long-Term, Low-Level Microwave Exposure and Bioinformatic Analysis of Potential Correlations to Learning and Memory.

[Pathological study of testicular injury induced by high power microwave radiation in rats].

Noise-modulated-microwave-induced response in snail neurons.

[Early ultrastructural reactions in various parts of the visual analyzer in guinea pigs after thermogenic microwave irradiation].

[Changes of rat testicular germ cell apoptosis after high power microwave radiation].

The transmission of reflexes in the spinal cord of cats during direct irradiation with microwaves.

[Lipid peroxide damage in retinal ganglion cells induced by microwave].

Calreticulin attenuated microwave radiation-induced human microvascular endothelial cell injury through promoting actin acetylation and polymerization.

[Reaction of the ultrastructure of the rat spinal ganglion to exposure to a pulsed electromagnetic field].

Specific electromagnetic effects of microwave radiation on Escherichia coli.

Microwave enhancement of membrane conductance: effects of EDTA, caffeine and tetracaine.

[Effect of Qidan Granule on PMC Derived Peptide Content and Structure of Hippocampal CA1 Region in Microwave Radiated Rats].

[The microarray study on the stress gene transcription profile in human retina pigment epithelial cells exposed to microwave radiation].

[The electroporation effects of high power pulse microwave and electromagnetic pulse irradiation on the membranes of cardiomyocyte cells and the mechanism therein involved].

Non-thermal effects of continuous 2.45 GHz microwaves on Fas-induced apoptosis in human Jurkat T-cell line.

[Zinc protective effects on pig retinal pigment epithelial cell damage of lipid peroxide induced by 2450 MHz microwave].

Pathological changes in the sinoatrial node tissues of rats caused by pulsed microwave exposure.

[High power microwave radiation damages blood-testis barrier in rats].

[Experimental analysis of biological effects of microwaves: their systemic, ultrastructural and neuronal mechanisms].

[Relationship between activation of microglia and Jaks phosphorylation induced by microwave irradiation].

Ultrastructural changes following treatment with a microwave pulse in the oocyst of Eimeria magna Perard, 1925.

The functional state of thymus cells following microwave exposure of endocrine glands.

Non-thermal effects of electromagnetic fields at mobile phone frequency on the refolding of an intracellular protein: myoglobin.

[Effect of microwaves on the expression by thymocytes of various surface membrane markers].

[Dynamics of morphological changes in the spinal cord following exposure to non-ionizing microwave radiation].

Immunoreactivity of normal rabbit serum with epinephrine (E) cells of the rat adrenal medulla after microwave antigen retrieval.

[Changes in response of neurons in visual area of cerebral cortex of rabbits to flashes of light under the influence of low-intensity physical factors of non-ionizing nature].

Ultrastructural studies of alterations induced by microwaves in Toxocara canis eggs: prophylactic interest.

Morphological changes in the liver after microwave destruction.

Studies of childhood brain tumors using immunohistochemistry and microwave technology: methodological considerations.

Cell attachment and viability on micro-arc-oxidation (MAO) microwave/hydrothermal treated titanium surface.

The role of the NF-kappaB, SAPK/JNK, and TLR4 signalling pathways in the responses of RAW 264.7 cells to extremely low-intensity microwaves.

Calreticulin stabilizes F-actin by acetylating actin and protects microvascular endothelial cells against microwave radiation.

Dual effects of microwaves on single Ca(2+)-activated K+ channels in cultured kidney cells Vero.

Microwave antigen retrieval of beta-amyloid precursor protein immunoreactivity.

Nerve agent exposure elicits site-specific changes in protein phosphorylation in mouse brain.

Cyclic AMP-dependent signaling system is a primary metabolic target for non-thermal effect of microwaves on heart muscle hydration.

[Microwaves and the visual analyzer].

Evaluation of immunohistochemical staining of human duodenal endocrine cells after microwave antigen retrieval.

[Quantitative histologic changes of the glioneuronal complex in the central and intermediate parts of the visual analyzer exposed to microwaves of thermogenic intensity].

Study of interlaboratory reliability and reproducibility of estrogen and progesterone receptor assays in Europe. Documentation of poor reliability and identification of insufficient microwave antigen retrieval time as a major contributory element of unreliable assays.

Structural changes in abdominal aorta and vena cava inferior after experimental microwave destruction.

Theme - Adverse effects of microwave radiation, especially pulsed microwave

Titles

Physiological effects of 2.8 GHz radio-frequency radiation: a comparison of pulsed and continuous-wave radiation.

Abnormal cardiovascular responses induced by localized high power microwave exposure.

Thermoregulatory responses of rats exposed to 9.3-GHz radiofrequency radiation.

Microwave alteration of the blood-brain barrier system of rats.

Blood-brain barrier permeation in the rat during exposure to low-power 1.7-GHz microwave radiation.

Low-level microwave irradiations affect central cholinergic activity in the rat.

Cerebrovascular permeability to 86Rb in the rat after exposure to pulsed microwaves.

Effects of pulsed microwave radiation on the contractile rate of isolated frog hearts.

High-peak-power microwave pulses: effects on heart rate and blood pressure in unanesthetized rats.

Microwave-induced lethal heat stress: effects of phentolamine, prazosin and metoprolol.

Low-level microwave irradiation and central cholinergic activity: a dose-response study.

Cardiorespiratory changes during microwave-induced lethal heat stress and beta-adrenergic blockade.

Tolazoline decreases survival time during microwave-induced lethal heat stress in anesthetized rats.

Studies on blood-brain barrier permeability after microwave-radiation.

Low-level microwave irradiation and central cholinergic systems.

Heart rate changes due to 5.6-GHz radiofrequency radiation: relation to average power density.

Effects of 2.8-GHz microwaves on restrained and ketamine-anesthetized rats.

Effect of 2450 MHz microwave energy on the blood-brain barrier to hydrophilic molecules. C. Effect on the permeability to [14C]sucrose.

Increased sensitivity of the non-human primate eye to microwave radiation following ophthalmic drug pretreatment.

Circulating antibody response of mice exposed to 9-GHz pulsed microwave radiation.

Immediate post-exposure effects of high-peak-power microwave pulses on operant behavior of Wistar rats.

Permeability of the blood-brain barrier to mannitol in the rat following 2450 MHz microwave irradiation.

Effects of esmolol on 35 GHz microwave-induced lethal heat stress.

Studies on microwave and blood-brain barrier interaction.

Effects of 2.45-GHz microwaves on primate corneal endothelium.

Corticotropin-releasing factor antagonist blocks microwave-induced decreases in high-affinity choline uptake in the rat brain.

Cardiovascular and thermal effects of microwave irradiation at 1 and/or 10 GHz in anesthetized rats.

Effect of 2450 MHz microwave energy on the blood-brain barrier to hydrophilic molecules. B. Effect on the permeability to HRP.

Microwave influence on the isolated heart function: II. Combined effect of radiation and some drugs.

Acute low-level microwave exposure and central cholinergic activity: studies on irradiation parameters.

Microwave irradiation of rats at 2.45 GHz activates pinocytotic-like uptake of tracer by capillary endothelial cells of cerebral cortex.

Microwave influence on the isolated heart function: I. Effect of modulation.

Permeability of the blood-brain barrier induced by 915 MHz electromagnetic radiation, continuous wave and modulated at 8, 16, 50, and 200 Hz.

Rhesus monkey behavior during exposure to high-peak-power 5.62-GHz microwave pulses.

The insensitivity of frog heart rate to pulse modulated microwave energy.

Effects of low-level microwave irradiation on hippocampal and frontal cortical choline uptake are classically conditionable.

[Comparative estimation of the effects of continuous and intermittent cyclical microwave radiation on the behavior of rats in the extraordinary situation].

In vitro studies of microwave-induced cataract: reciprocity between exposure duration and dose rate for pulsed microwaves.

Effect of 2450 MHz microwave energy on the blood-brain barrier to hydrophilic molecules. A. Effect on the permeability to sodium fluorescein.

Absorption of microwave radiation by the anesthetized rat: electromagnetic and thermal hotspots in body and tail.

Opioid receptor subtypes that mediate a microwave-induced decrease in central cholinergic activity in the rat.

Cardiovascular changes in unanesthetized and ketamine-anesthetized Sprague-Dawley rats exposed to 2.8-GHz radiofrequency radiation.

Auditory unit responses to single-pulse and twin-pulse microwave stimuli.

Naltrexone pretreatment blocks microwave-induced changes in central cholinergic receptors.

Microwave effects on isolated chick embryo hearts.

Comparative effects of extremely high power microwave pulses and a brief CW irradiation on pacemaker function in isolated frog heart slices.

Temporal bisection in rats: the effects of high-peak-power pulsed microwave irradiation.

[Effects of 2375 MHz pulse-modulated microwave radiation on ATPase activity of the rat muscle actomyosin].

Influence of microwaves on the beating rate of isolated rat hearts.

Microwave radiation and heart-beat rate of rabbits.

Effects of continuous-wave, pulsed, and sinusoidal-amplitude-modulated microwaves on brain energy metabolism.

In vitro studies of microwave-induced cataract. II. Comparison of damage observed for continuous wave and pulsed microwaves.

Antibody responses of mice exposed to low-power microwaves under combined, pulse-and-amplitude modulation.

[Proposed exposure levels of pulse-modulated electromagnetic fields].

Characteristics of microwave evoked body movements in mice.

The effect of pulsed microwaves on passive electrical properties and interspike intervals of snail neurons.

[Effect of low-intensity pulse-modulated microwave on human blood aspartate aminotransferase activity].

Effect of global system for mobile communication (GSM) microwave exposure on blood-brain barrier permeability in rat.

Slow and rapid responses to CW and pulsed microwave radiation by individual Aplysia pacemakers.

Effects of continuous and pulsed 2450-MHz radiation on spontaneous lymphoblastoid transformation of human lymphocytes in vitro.

Effects of high power microwave pulses on synaptic transmission and long term potentiation in hippocampus.

Bursting responses of Lymnea neurons to microwave radiation.

Influence of acute microwave radiation on cardiac function in normal and myocardial ischemic cats.

NF-kappaB DNA-binding activity after high peak power pulsed microwave (8.2 GHz) exposure of normal human monocytes.

Measurement of blood-brain barrier permeation in rats during exposure to 2450-MHz microwaves.

Single vs. repeated microwave exposure: effects on benzodiazepine receptors in the brain of the rat.

In vitro study of microwave effects on calcium efflux in rat brain tissue.

Thermoregulatory responses of rats exposed to 9.3-GHz microwaves: a comparison of E and H orientation.

Modification of acoustic startle by microwave pulses in the rat: a preliminary report.

Effects of high peak power microwaves on the retina of the rhesus monkey.

Alteration of circulating antibody response of mice exposed to 9-GHz pulsed microwaves.

Effect of 9.6-GHz pulsed microwaves on the orb web spinning ability of the cross spider (Araneus diadematus).

Environmental-health aspects of pulse-modulated microwaves.

[The effect of pulsed cyclical microware radiation on the conditioned behavior of rats].

[Effects of electromagnetic radiation of various modes on heart activity (in experiments)].

Modification of acoustic and tactile startle by single microwave pulses.

Effect of short electromagnetic pulses on brain acetylcholine content and spontaneous motor activity of mice.

Microwave auditory effect- a comparison of some possible transduction mechanisms.

Increased susceptibility to radiofrequency radiation due to pharmacological agents.

Microwave irradiation affects radial-arm maze performance in the rat.

[Changes in serum alkaline phosphatase activity during in vitro exposure to amplitude-modulated electromagnetic field of ultrahigh frequency (2375 MHz) in guinea pigs].

Reversible microwave effects on the blood-brain barrier.

Effect of microwave radiation on the beating rate of isolated frog hearts.

Amino acid concentrations in hypothalamic and caudate nuclei during microwave-induced thermal stress: analysis by microdialysis.

Character of the effect of microwave on conduction velocity of frog ventricular muscle.

Inter-beat intervals of cardiac-cell aggregates during exposure to 2.45 GHz CW, pulsed, and square-wave-modulated microwaves.

[The efficiency and direction of thymus changes after whole-body exposure of mice to the weak electromagnetic field are determined by the initial status of the thymus].

Alterations in alpha-adrenergic and muscarinic cholinergic receptor binding in rat brain following nonionizing radiation.

[Dependence of microwave effect on the secondary structure of DNA on molecular weight of polynucleotide].

Effects of weak amplitude-modulated microwave fields on calcium efflux from awake cat cerebral cortex.

In vivo exposure of rats to GSM-modulated microwaves: flow cytometry analysis of lymphocyte subpopulations and of mitogen stimulation.

[Microwave method of determining cerebral blood flow].

[Effects of unmodulated electromagnetic radiation of decimetric diapason on the morphogenesis of Drosophila].

Pulsed magnetic field induced "analgesia" in the land snail, Cepaea nemoralis, and the effects of mu, delta, and kappa opioid receptor agonists/antagonists.

Titles

Behavioral effects of chronic exposure to 0.5 mW/cm2 of 2,450-MHz microwaves.

Effects of 2.45 GHz CW microwave radiation on embryofetal development in mice.

Decreased body weight in fetal rats after irradiation with 2450-MHz (CW) microwaves.

Observations of rat fetuses after irradiation with 2450-MHz (CW) microwaves.

Teratogenic, biochemical, and histological studies with mice prenatally exposed to 2.45-GHz microwave radiation.

Intermittent exposure of rats to 2450 MHz microwaves at 2.5 mW cm2: behavioral and physiological effects.

Behavioral and physiological effects of chronic 2,450-MHz microwave irradiation of the rat at 0.5 mW/cm2.

Effect of nonionizing radiation on the Purkinje cells of the rat cerebellum.

Physiological and behavioral effects of prolonged exposure to 915 MHz microwaves.

Physiological and behavioral effects of chronic exposure to 2450-MHz microwaves.

Behavioral thermoregulation in the squirrel monkey: adaptation processes during prolonged microwave exposure.

Microwave radiation (2450 MHz) alters the endotoxin-induced hypothermic response of rats.

Cardiovascular, hematologic, and biochemical effects of acute ventral exposure of conscious rats to 2450-MHz (CW) microwave radiation.

Tests of mutagenesis and reproduction in male rats exposed to 2,450-MHz (CW) microwaves.

Observations of Syrian hamster fetuses after exposure to 2450-MHz microwaves.

Nonthermal effects of mobile-phone frequency microwaves on uteroplacental functions in pregnant rats.

Serum-thyroxine levels in microwave-exposed rats.

Blood-forming system in rats after whole-body microwave exposure; reference to the lymphocytes.

The in vivo effects of 2.45 GHz microwave radiation of rabbit serum components and sleeping times.

Hematologic and immunologic effects of pulsed microwaves in mice.

Microwave-induced increase of water and conductivity in submaxillary salivary gland of rats.

Effects of whole body microwave exposure on the rat brain contents of biogenic amines.

Effects of microwave exposure in utero on embryonal, fetal and postnatal development of mice.

Effect of continuous-wave and amplitude-modulated 2.45 GHz microwave radiation on the liver and brain aminoacyl-transfer RNA synthetases of in utero exposed mice.

Influence of 2.45-GHz CW microwave radiation on spontaneously beating rat atria.

Alteration of life span of mice chronically exposed to 2.45 GHz CW microwaves.

Studies on the hematologic effects of long-term, low-dose microwave exposure.

[Development of murine embryos and fetuses after irradiation with 2450 MHz microwaves].

Thermoregulatory adjustments in squirrel monkeys exposed to microwaves at high power densities.

[Effects of microwave radiation on lipid peroxidation and the content of neurotransmitters in mice].

An evaluation of the teratogenic potential of protracted exposure of pregnant rats to 2450-MHz microwave radiation: I. Morphologic analysis at term.

[Effects of microwave radiation on conditioned behavior of rats].

Increased serum enzyme activity in microwave-exposed rats.

Long-term, low-level microwave irradiation of rats.

Microwaves modify thermoregulatory behavior in squirrel monkey.

Testicular function of rats following exposure to microwave radiation.

Uteroplacental circulatory disturbance mediated by prostaglandin f2alpha in rats exposed to microwaves. hiro-n@po.incl.ne.jp.

Effects of microwaves on three different strains of rats.

The effect of melatonin on body mass and behaviour of rats during an exposure to microwave radiation from mobile phone.

Thermoregulatory, metabolic, and cardiovascular response of rats to microwaves.

Modification of the repeated acquisition of response sequences in rats by low-level microwave exposure.

Preliminary investigations of the effects of low-level microwave radiation on spontaneous motor activity in rats.

Delineating acute neuroendocrine responses in microwave-exposed rats.

Acute exposure to pulsed 2450-MHz microwaves affects water-maze performance of rats.

Quantitative changes in potassium, sodium, and calcium in the submaxillary salivary gland and blood serum of rats exposed to 2880-MHz microwave radiation.

Effects of hypophysectomy and dexamethasone on rat adrenal response to microwaves.

Simultaneous response of brain electrical activity (EEG) and cerebral circulation (REG) to microwave exposure in rats.

[Effects of whole-body microwave exposure on the plasma adrenocorticotropic hormone, thyroid-stimulating hormone and thyroid hormones in rats].

An evaluation of the teratogenic potential of protracted exposure of pregnant rats to 2450-MHz microwave radiation. II. Postnatal psychophysiologic analysis.

Effects of 2.45-GHz microwave radiation on embryonic quail hearts.

Chronic exposure of rabbits to 0.5 and 5 mW/cm2 2450-MHz CW microwave radiation.

Effect of 2,450 MHz microwave radiation on the development of the rat brain.

In utero exposure to microwave radiation and rat brain development.

Thermoregulatory responses of the immature rat following repeated postnatal exposures to 2,450-MHz microwaves.

Studies of the teratogenic potential of exposure of rats to 6000-MHz microwave radiation. I. Morphologic analysis at term.

Effects of acute low-level microwaves on pentobarbital-induced hypothermia depend on exposure orientation.

Adjustments in metabolic heat production by squirrel monkeys exposed to microwaves.

Effect of 2450 MHz microwave radiation on hematopoiesis of pregnant mice.

Natural killer cell activity reduced by microwave exposure during pregnancy is mediated by opioid systems.

Interaction of microwaves and a temporally incoherent magnetic field on spatial learning in the rat.

Effects of exposure to microwaves on cellular immunity and placental steroids in pregnant rats.

Acute, whole-body microwave exposure and testicular function of rats.

Reproduction in male Japanese quail exposed to microwave radiation during embryogeny.

Repeated exposure to low-level extremely low frequency-modulated microwaves affects baseline and scopolamine-modified electroencephalograms in freely moving rats.

Microwaves: effect on thermoregulatory behavior in rats.

Effects of microwaves on the adrenal cortex.

[Effects of whole-body microwave exposure on the plasma corticosterone, glucose, uric acid and allantoin levels in rats].

Effects of microwave exposure on the hamster immune system. IV. Spleen cell IgM hemolytic plaque formation.

Microwave irradiation and instrumental behavior in rats: unitized irradiation and behavioral evaluation facility.

Cytogenetic effects of microwave irradiation on male germ cells of the mouse.

Effect of microwave irradiation (2.45 GHz, CW) on egg weight loss, egg hatchability, and hatchling growth of the Coturnix quail.

Microwave effects on energy metabolism of rat brain.

[Experimental estimation of thermogenic levels of acute microwave exposure for different animal species].

Lethality in mice and rats exposed to 2450 MHz circularly polarized microwaves as a function of exposure duration and environmental factors.

Heat-dissipation rate of mice after microwave irradiation.

Studies of the teratogenic potential of exposure of rats to 6000-MHz microwave radiation. II. Postnatal psychophysiologic evaluations.

Effects of 2450 MHz microwave radiation during the gestational period on the postnatal hematology of rats.

Effects of 2.45 GHz microwave radiation on the development of Japanese quail cerebellum.

Repeated exposure to low-level extremely low frequency-modulated microwaves affects cortex-hypothalamus interplay in freely moving rats: EEG study.

Comparative effects of pulsed and continuous-wave 2.8-GHz microwaves on temporally defined behavior.

[Endocrine mechanism of placental circulatory disturbances induced by microwave in pregnant rats].

Response of Japanese quail to hemorrhagic stress after exposure to microwave radiation during embryogeny.

Exposure of fertile chicken eggs to microwave radiation (2.45 GHz, CW) during incubation: technique and evaluation.

B16 melanoma development in black mice exposed to low-level microwave radiation.

Complement receptor positive spleen cells in microwave (2450-MHz)-irradiated mice.

Prolonged microwave irradiation of rats: effects on concurrent operant behavior.

Effects of microwave exposure on the hamster immune system. II. Peritoneal macrophage function.

Space efficient system for small animal, whole body microwave exposure at 1.6 GHz.

[Animal death after exposure to ultra-high frequency waves in the dependence of power flux density and specific absorption rate].

Effects of microwave exposure on the hamster immune system. I. Natural killer cell activity.

Influence of pre- and postnatal exposure of rats to 2.45-GHz microwave radiation on neurobehavioral function.

Morphological changes in cerebellum of neonatal rats exposed to 2.45 GHz microwaves.

Effect of nonionizing radiation on the Purkinje cells of the uvula in squirrel monkey cerebellum.

Pulse modulated and continuous wave microwave radiation yield equivalent changes in operant behavior of rodents.

Effects of postnatal microwave exposure on thyrotropin level in the adult male rat.

The effects of single and repeated exposure to 2.45 GHz radiofrequency fields on c-Fos protein expression in the paraventricular nucleus of rat hypothalamus.

Miniature anechoic chamber for chronic exposure of small animals to plane-wave microwave fields.

Microwaves induce peripheral vasodilation squirrel monkeys.

Some effects of exposure of the Japanese quail embryo to 2.45-GHz microwave radiation.

Protein kinase C activity in developing rat brain cells exposed to 2.45 GHz radiation.

Longevity and food consumption of microwave-treated (2.45 GHz CW) honeybees in the laboratory.

Age-dependent effect of long-term microwave radiation on postnatal neurogenesis in rats: morphological and behavioral study.

Radial arm maze performance of rats following repeated low level microwave radiation exposure.

Microwave radiation enhances teratogenic effect of cytosine arabinoside in mice.

Effects of microwaves (900 MHz) on the cochlear receptor: exposure systems and preliminary results.

Effects of GSM-900 microwaves on the experimental allergic encephalomyelitis (EAE) rat model of multiple sclerosis.

Transbilayer movement of 24Na in sonicated phosphatidylcholine vesicles exposed to frequency-modulated microwave radiation.

Antipruritic effect of millimeter waves in mice: evidence for opioid involvement.

Effects on energy absorption of orientation and size of animals exposed to 2.45-GHz microwave radiation.

Biological studies with continuous-wave radiofrequency (28 MHz) radiation.

Flight, orientation, and homing abilities of honeybees following exposure to 2.45-GHz CW microwaves.

Age-related changes in the noradrenergic pattern and receptor responses of the rat cardiovascular system after repeated microwave exposure.

Failure of rats to escape from a potentially lethal microwave field.

Humoral and cell-mediated immune function in adult Japanese Quail following exposure to 2.45-GHz microwave radiation during embryogeny.

[Which neurophysiologic effects at low level 2.45 GHz RF exposure?].

[Effects of 2450 MHz microwave on long-term potentiation of hippocampus and lipofuscin contents in rat brain].

The effect of microwave radiation on the primary IgM response to sheep red blood cells in mice.

[Effects of electromagnetic field of thermal intensity on the hypophysis-thyroid unit of the neuroendocrine system].

[Action of a UHF field on GABA-ergic and acetylcholinergic systems in synaptic transmission].

Noradrenergic innervation and receptor responses of cardiovascular tissues from young and aged rats after acute microwave exposure.

Effects of weak microwave fields amplitude modulated at ELF on EEG of symmetric brain areas in rats.

Erythropoietic dynamic equilibrium in rats maintained after microwave irradiation.

Glucose administration attenuates spatial memory deficits induced by chronic low-power-density microwave exposure.

Behavioral Abnormality along with NMDAR-related CREB Suppression in Rat Hippocampus after Shortwave Exposure.

Effects of microwave exposure on the hamster immune system. III. Macrophage resistance to vesicular stomatitis virus infection.

Retrograde amnesia: effects of handling and microwave radiation.

[Effect of high frequency electromagnetic fields on the processes of transamination in the liver and small intestine tissues of rats].

Influence of postnatal exposition to microwaves on brain and hypothalamo-pituitary monoamines in the adult male rat.

Electric power induction through an isolated intestinal pouch.

Theme - Dielectric properties of tissue at different microwave frequencies

Titles

The UHF and microwave dielectric properties of normal and tumour tissues: variation in dielectric properties with tissue water content.

Changes in the dielectric properties of rat tissue as a function of age at microwave frequencies.

Dielectric properties of muscle and liver from 500 MHz-40 GHz.

Dielectric properties of tissues; variation with age and their relevance in exposure of children to electromagnetic fields; state of knowledge.

A large-scale study of the ultrawideband microwave dielectric properties of normal, benign and malignant breast tissues obtained from cancer surgeries.

A quick accurate method for measuring the microwave dielectric properties of small tissue samples.

A method for in vivo detection of abnormal subepidermal tissues based on dielectric properties.

Microwave method for determing dielectric parameters of living biological objects I.

Microwave dielectric studies on proteins, tissues, and heterogeneous suspensions.

Dielectric properties of porcine brain tissue in the transition from life to death at frequencies from 800 to 1900 MHz.

A large-scale study of the ultrawideband microwave dielectric properties of normal breast tissue obtained from reduction surgeries.

Dielectric property measurement of ocular tissues up to 110 GHz using 1 mm coaxial sensor.

Radio-frequency and microwave dielectric properties of insects.

Dielectric properties of Co-gamma-irradiated and microwave-heated rat tumour and skin measured in vivo between 0.2 and 2.4 GHz.

Microwave dielectric relaxation in muscle. A second look.

Dielectric properties of animal tissues in vivo at radio and microwave frequencies: comparison between species.

Dielectric properties of rat embryo and foetus as a function of gestation.

Dielectric properties of porcine cerebrospinal tissues at microwave frequencies: in vivo, in vitro and systematic variation with age.

Dielectric properties of insect tissues.

Development of anatomically realistic numerical breast phantoms with accurate dielectric properties for modeling microwave interactions with the human breast.

Dielectric properties at microwave frequencies studied in partially filled cylindrical TE011 cavities.

Dielectric properties of human brain tissue measured less than 10 h postmortem at frequencies from 800 to 2450 MHz.

[Dielectric properties of human sweat fluid in the microwave range].

Dielectric behavior of DNA solution at radio and microwave frequencies (at 20 degrees C).

A heterogeneous breast phantom for microwave breast imaging.

Dielectric properties of supersaturated alpha-D-glucose aqueous solutions at 2450 MHz.

Variation of the dielectric properties of tissues with age: the effect on the values of SAR in children when exposed to walkie-talkie devices.

Microwave dielectric properties of tissue. Some comments on the rotational mobility of tissue water.

Monitoring water content of rat lung tissue in vivo using microwave reflectometry.

Microwave dielectric properties and thermochemical characteristics of the mixtures of walnut shell and manganese ore.

Microwave-induced thermal imaging of tissue dielectric properties.

Dielectrical model of cellular structures in radio frequency and microwave spectrum. Electrically interacting versus noninteracting cells.

Average dielectric property analysis of complex breast tissue with microwave transmission measurements.

Modeling of the dielectric properties of trabecular bone samples at microwave frequency.

Dielectric properties for non-invasive detection of normal, benign, and malignant breast tissues using microwave theories.

Microwave dielectric measurements (0.8-70 GHz) on Artemia cysts at variable water content.

An evaluation of the mutagenic, carcinogenic and teratogenic potential of microwaves.

Microwave dielectric analysis of human stratum corneum in vivo.

Dielectric properties of human ovary follicular fluid at 9.2 GHz.

A macroscopic model of lungs and a material simulating their properties at radio and microwave frequencies.

Microwave dielectric measurements and tissue characteristics of the human brain: potential in localizing intracranial tissues.

Theoretical evaluation of dielectric absorption of microwave energy at the scale of nucleic acids.

40 GHz RF biosensor based on microwave coplanar waveguide transmission line for cancer cells (HepG2) dielectric characterization.

Modeling of noninvasive microwave characterization of breast tumors.

Cole-Cole parameters for the dielectric properties of porcine tissues as a function of age at microwave frequencies.

The dielectric properties of normal and tumour mouse tissue between 50 MHz and 10 GHz.

Dielectric Properties for Differentiating Normal and Malignant Thyroid Tissues.

The dielectric properties of the cerebellum, cerebrum and brain stem of mouse brain at radiowave and microwave frequencies.

Effect of ultraviolet light on the dielectric behavior of bone at microwave frequencies.

Microwave dielectric measurements of erythrocyte suspensions.

Electrical properties of lens material at microwave frequencies.

A semi-automatic method for developing an anthropomorphic numerical model of dielectric anatomy by MRI.

Microwave absorption in aqueous solutions of DNA.

The measured electrical properties of normal and malignant human tissues from 50 to 900 MHz.

Numerical assessment of the reduction of specific absorption rate by adding high dielectric materials for fetus MRI at 3 T.

Non-invasive and continuous monitoring of the sol-gel phase transition of supramolecular gels using a fast (open-ended coaxial) microwave sensor.

Carbon-coated CoFe-CoFe2O4 composite particles with high and dual-band electromagnetic wave absorbing properties.

A microwave radiometric method for the study of the semiconductor properties of living tissue: its potential application to tumour location.

Theoretical evaluation of the distributed power dissipation in biological cells exposed to electric fields.

[Mechanism of microwave radiation absorption by biological membranes].

A generalized model for the interaction of microwave radiation with bound water in biological material.

Understanding physical mechanism of low-level microwave radiation effect.

Analytical approximations in multiple scattering of electromagnetic waves by aligned dielectric spheroids.

A novel discrete particle swarm optimization algorithm for estimating dielectric constants of tissue.

Multi-physics modeling to study the influence of tissue compression and cold stress on enhancing breast tumor detection using microwave radiometry.

Microwave facilities for welding thermoplastic composites and preliminary results.

Biological effects of low-level environmental agents.

Multifunctional composites: optimizing microstructures for simultaneous transport of heat and electricity.

The properties of bird feathers as converse piezoelectric transducers and as receptors of microwave radiation. I. Bird feathers as converse piezoelectric transducers.

Brain banks and non nervous tissues.

Characterization of three iron ferredoxins by microwave power saturation.

[Possible mechanisms of aftereffects of GSM electromagnetic radiation on air-dry seeds].

Microwave grafted, composite and coprocessed materials: drug delivery applications.

Production of a Novel Mineral-based Sun Lotion for Protecting the Skin from Biohazards of Electromagnetic Radiation in the UV Region.

Microwave drying remediation of petroleum-contaminated drill cuttings.

Theme - Specific absorption rate in human body models

Titles

Body effects on SAR distributions for microwave exposures in a realistic model of the human head.

Analysis of SAR distribution in human head of antenna used in wireless power transform based on magnetic resonance.

FDTD chiral brain tissue model for specific absorption rate determination under radiation from mobile phones at 900 and 1800 MHz.

FDTD calculations of specific energy absorption rate in a seated voxel model of the human body from 10 MHz to 3 GHz.

Development of a rat head exposure system for simulating human exposure to RF fields from handheld wireless telephones.

Radio frequency electromagnetic exposure: tutorial review on experimental dosimetry.

SAR calculations in an anatomically realistic model of the head for mobile communication transceivers at 900 MHz and 1.8 GHz.

Specific absorption rate (SAR) in models of the human head exposed to hand-held UHF portable radios.

Initial analysis of SAR from a cell phone inside a vehicle by numerical computation.

Dosimetry associated with exposure to non-ionizing radiation: very low frequency to microwaves.

SAR versus S(inc): What is the appropriate RF exposure metric in the range 1-10 GHz? Part I: Using planar body models.

Whole-body and local dosimetry in rats exposed to 2.45-GHz microwave radiation.

Specific absorption rate in rats exposed to 2,450-MHz microwaves under seven exposure conditions.

Electromagnetic fields: human safety issues.

Microwave radiation absorption in the rat: frequency-dependent SAR distribution in body and tail.

Observing-responses of rats exposed to 1.28- and 5.62-GHz microwaves.

Multibody effects on microwave power absorption by multilayered cylindrical models of man.

Numerical compliance testing of human exposure to electromagnetic radiation from smart-watches.

A simulation for effects of RF electromagnetic radiation from a mobile handset on eyes model using the finite-difference time-domain method.

Outdoor measurement of SAR in a full-sized human model exposed to 29.9 MHz in the near field.

Effects of frequency, irradiation geometry and polarisation on computation of SAR in human brain.

SAR in a child voxel phantom from exposure to wireless computer networks (Wi-Fi).

Preliminary studies: far-field microwave dosimetric measurements of a full-scale model of man.

Numerical simulation of pressure waves in the cochlea induced by a microwave pulse.

The effects of RF absorbers on exposure levels at 100 MHz.

Comparison of numerical and experimental methods for determination of SAR and radiation patterns of handheld wireless telephones.

Dominant factors influencing whole-body average SAR due to far-field exposure in whole-body resonance frequency and GHz regions.

Numerical evaluation of human exposure to WiMax patch antenna in tablet or laptop.

Far-field microwave dosimetry in a rhesus monkey model.

A method for safety testing of radiofrequency/microwave-emitting devices using MRI.

Local exposure system for rats head using a figure-8 loop antenna in 1500-MHz band.

Analytic SAR computation in a multilayer elliptic cylinder for bioelectromagnetic applications.

Computation of high-resolution SAR distributions in a head due to a radiating dipole antenna representing a hand-held mobile phone.

Thermal mapping on male genital and skin tissues of laptop thermal sources and electromagnetic interaction.

Acute dosimetry and estimation of threshold-inducing behavioral signs of thermal stress in rabbits at 2.45-GHz microwave exposure.

Comparison of Thermal Response for RF Exposure in Human and Rat Models.

Systems for exposing mice to 2,450-MHz electromagnetic fields.

A suggested limit for population exposure to radiofrequency radiation.

SAR distribution in a bio-medium in close proximity with dual segment cylindrical dielectric resonator antenna.

A comparative study of the PIFA and printed monopole antenna EM absorption.

Compact shielded exposure system for the simultaneous long-term UHF irradiation of forty small mammals. II. Dosimetry.

Thermal effects of radiation from cellular telephones.

SAR in rats exposed in 2,450-MHz circularly polarized waveguides.

A formula for human average whole-body SARwb under diffuse fields exposure in the GHz region.

Scaling the physiological effects of exposure to radiofrequency electromagnetic radiation: consequences of body size.

Radiofrequency dosimetry in subjects implanted with metallic straight wires: a numerical study.

Further studies of human whole-body radiofrequency absorption rates.

Estimation of whole-body SAR from electromagnetic fields using personal exposure meters.

Numerical modelling of thermal effects in rats due to high-field magnetic resonance imaging (0.5-1 GHZ).

Dosimetry for a study of effects of 2.45-GHz microwaves on mouse testis.

SAR exposure from UHF RFID reader in adult, child, pregnant woman, and fetus anatomical models.

Head and neck resonance in a rhesus monkey--a comparison with results from a human model.

On the averaging area for incident power density for human exposure limits at frequencies over 6 GHz.

Dosimetric study on eye's exposure to wide band radio frequency electromagnetic fields: variability by the ocular axial length.

Absorption of microwave energy by muscle models and by birds of differing mass and geometry.

Influence of electromagnetic polarization on the whole-body averaged SAR in children for plane-wave exposures.

Thermal effects of MR imaging: worst-case studies on sheep.

Comparison of dose dependences for bioeffects of continuous-wave and high-peak power microwave emissions using gel-suspended cell cultures.

An attempt at quantitative specification of SAR distribution homogeneity.

A new method of SAR determination in animals exposed to microwave/radiofrequency radiation (MW/RFR).

Metabolic and vasomotor responses of rhesus monkeys exposed to 225-MHz radiofrequency energy.

Exposure assessment of one-year-old child to 3G tablet in uplink mode and to 3G femtocell in downlink mode using polynomial chaos decomposition.

Harmful effects of 41 and 202 MHz radiations on some body parts and tissues.

Whole-body new-born and young rats' exposure assessment in a reverberating chamber operating at 2.4 GHz.

A 3-D hp finite/infinite element method to calculate power deposition in the human head.

Ocular effects of radiofrequency energy.

The development of biomedical approaches and concepts in radiofrequency radiation protection.

Absorbed energy distribution from radiofrequency electromagnetic radiation in a mammalian cell model: effect of membrane-bound water.

Statistical analysis of whole-body absorption depending on anatomical human characteristics at a frequency of 2.1 GHz.

Computational human model VHP-FEMALE derived from datasets of the national library of medicine.

Modeling the detectability of vesicoureteral reflux using microwave radiometry.

Radio-wave exposure of the human head: analytical study based on a versatile eccentric spheres model including a brain core and a pair of eyeballs.

Millimeter-wave absorption by cutaneous blood vessels: a computational study.

Simple method to measure power density entering a plane biological sample at millimeter wavelengths.

Exposure of Insects to Radio-Frequency Electromagnetic Fields from 2 to 120 GHz.

[Use of dose parameters of UHF irradiation in the interpretation of lethal effects in laboratory animals].

Noninvasive measurement of current in the human body for electromagnetic dosimetry.

Exposure to non-ionizing radiation provokes changes in rat thyroid morphology and expression of HSP-90.

Induced EM fields inside human bodies irradiated by EM waves of up to 500 MHz.

A dual vial waveguide exposure facility for examining microwave effects in vitro.

[Estimation of the restricted area related to the limitation of exposure of the general public to electromagnetic fields in the vicinity of microwave relay antenna systems].

FDTD simulation of electromagnetic wave scattering from retina cells.

Effect of metal-framed spectacles on microwave radiation hazards to the eye of humans.

Effect of insertion depth on helical antenna performance in a muscle-equivalent phantom.

A survey of the urban radiofrequency (RF) environment.

[The evaluation of the consequences of electromagnetic irradiation of hands in operators of high-frequency welding devices].

Dosimetry considerations in far field microwave exposure of mammalian cells.

[Changes of neurocytes in CNS under general exposure to UHF field with local protection applied].

Titles

[Effects of millimeter wave irradiation with different frequency and power density on their offsprings in mice].

[Relationship between millimeter wave irradiation in pregnant mice and c-Fos protein expression in hippocampus and learning and memory functions in their offsprings].

Gene expression changes in the skin of rats induced by prolonged 35 GHz millimeter-wave exposure.

[Effect of low intensity of electromagnetic radiation in the centimeter and millimeter range on proliferative and cytotoxic activity of murine spleen lymphocytes].

[Effects of millimeter wave on gene expression in human keratinocytes].

Current state and implications of research on biological effects of millimeter waves: a review of the literature.

Acute ocular injuries caused by 60-Ghz millimeter-wave exposure.

A non-thermal effect of millimeter wave radiation on the puffing of giant chromosomes.

Effects of millimeter waves on ionic currents of Lymnaea neurons.

Evaluation of the potential in vitro antiproliferative effects of millimeter waves at some therapeutic frequencies on RPMI 7932 human skin malignant melanoma cells.

[Acoustic detection of absorption of millimeter-band electromagnetic waves in biological objects].

Reception of low-intensity millimeter-wave electromagnetic radiation by the electroreceptors in skates.

Effect of cyclophosphamide and 61.22 GHz millimeter waves on T-cell, B-cell, and macrophage functions.

Frequency and irradiation time-dependant antiproliferative effect of low-power millimeter waves on RPMI 7932 human melanoma cell line.

Hypothalamic effects of millimeter wave irradiation depend on location of exposed acupuncture zones in unanesthetized rabbits.

Some basic properties of biological tissues for potential biomedical applications of millimeter waves.

[The electrical activity of the hypothalamus in exposure to millimeter-wave radiation at biologically active points].

Electromagnetic millimeter wave induced hypoalgesia: frequency dependence and involvement of endogenous opioids.

Comparison of blood pressure and thermal responses in rats exposed to millimeter wave energy or environmental heat.

Modulation of neuronal activity and plasma membrane properties with low-power millimeter waves in organotypic cortical slices.

Thermal modeling of millimeter wave damage to the primate cornea at 35 GHz and 94 GHz.

Thermal response of tissues to millimeter waves: implications for setting exposure guidelines.

[Activity of natural killer cells of the spleen of mice exposed to low-intensity of extremely high frequency electromagnetic radiation].

Study of narrow band millimeter-wave potential interactions with endoplasmic reticulum stress sensor genes.

Effect of millimeter waves on natural killer cell activation.

Transmission electron microscopy study of the effects produced by wide-band low-power millimeter waves on MCF-7 human breast cancer cells in culture.

Morphological changes in skin nerves caused by electromagnetic radiation of the millimeter range.

The use of millimeter wavelength electromagnetic waves in cardiology.

Millimeter wave exposure reverses TPA suppression of gap junction intercellular communication in HaCaT human keratinocytes.

Millimeter wave induced reversible externalization of phosphatidylserine molecules in cells exposed in vitro.

[The simulation of the cooperative effect of development in a culture of early mouse embryos after irradiation with electromagnetic waves in the millimeter range].

Effects of Millimeter-Wave Electromagnetic Radiation on the Experimental Model of Migraine.

Effect of 99 GHz continuous millimeter wave electro-magnetic radiation on E. coli viability and metabolic activity.

Effect of low-intensity millimeter wave electromagnetic radiation on regeneration of the sciatic nerve in rats.

Millimeter waves thermally alter the firing rate of the Lymnaea pacemaker neuron.

Numerical model of heat transfer in the rabbit eye exposed to 60-GHz millimeter wave radiation.

[Power density analysis on millimeter waves irradiated into cell monolayers in culture dishes].

Effect of millimeter waves on cyclophosphamide induced suppression of the immune system.

Immunomodulating action of low intensity millimeter waves on primed neutrophils.

Suppression of pain sensation caused by millimeter waves: a double-blinded, cross-over, prospective human volunteer study.

[The effect of continuous millimeter low-intensity radiation on the Na+ ion transport in the frog skin].

[Effects of millimeter wave on gap junctional intercellular communication in human keratinocytes].

[The effect of electromagnetic radiation in the millimeter-wave range on the immune status of peptic ulcer patients].

Effect of millimeter waves on cyclophosphamide induced suppression of T cell functions.

Millimeter-wave effects on electric activity of crayfish stretch receptors.

Reflection and penetration depth of millimeter waves in murine skin.

Search for frequency-specific effects of millimeter-wave radiation on isolated nerve function.

Millimeter wave-induced modulation of calcium dynamics in an engineered skin co-culture model: role of secreted ATP on calcium spiking.

Millimeter wave absorption in the nonhuman primate eye at 35 GHz and 94 GHz.

[Effect of extremely high-frequency electromagnetic radiation on the function of skin sensory endings].

Induced movements of giant vesicles by millimeter wave radiation.

Sustained 35-GHz radiofrequency irradiation induces circulatory failure.

[The effects of electromagnetic radiation of extremely high frequency and low intensity on the growth rate of bacteria Escherichia coli and the role of medium pH].

[Effect of coherent extremely high-frequency and low-intensity electromagnetic radiation on the activity of membrane systems in Escherichia coli].

Effect of millimeter waves on cyclophosphamide induced NF-kappaB.

[Resonance effect of coherent millimeter-band electromagnetic waves on living organisms].

Large Metasurface Aperture for Millimeter Wave Computational Imaging at the Human-Scale.

[The effect of millimeter-range electromagnetic radiation on the evoked potentials from the vestibular cortical area of the cerebral hemispheres (an experimental study)].

Long-lasting (fatiguing) activity of isolated muscle fibres influenced by microwave electromagnetic field.

The mechanisms of athermal microwave biological effects.

[Experimental study on possibility of corneal injury by electromagnetic wave].

Multi-center feasibility study of microwave radiometry thermometry for non-invasive differential diagnosis of arterial disease in diabetic patients with suspected critical limb ischemia.

Tagging frogs with passive integrated transponders causes disruption of the cutaneous bacterial community and proliferation of opportunistic fungi.

Theme - Oxidative stress effects from mobile phone radiofrequency radiation

Titles

Ginkgo biloba prevents mobile phone-induced oxidative stress in rat brain.

Mobile phone radiation-induced free radical damage in the liver is inhibited by the antioxidants N-acetyl cysteine and epigallocatechin-gallate.

The link between radiofrequencies emitted from wireless technologies and oxidative stress.

The protective effects of N-acetyl-L-cysteine and epigallocatechin-3-gallate on electric field-induced hepatic oxidative stress.

Modulation of wireless (2.45 GHz)-induced oxidative toxicity in laryngotracheal mucosa of rat by melatonin.

Effect of 900 MHz radiofrequency radiation on oxidative stress in rat brain and serum.

The protective effect of caffeic acid phenethyl ester (CAPE) on oxidative stress in rat liver exposed to the 900 MHz electromagnetic field.

Exposure to radiofrequency radiation induces oxidative stress in duckweed Lemna minor L.

The prophylactic effect of vitamin C on oxidative stress indexes in rat eyes following exposure to radiofrequency wave generated by a BTS antenna model.

Vitamin C protects rat cerebellum and encephalon from oxidative stress following exposure to radiofrequency wave generated by a BTS antenna model.

Effects of Electromagnetic Radiation Use on Oxidant/Antioxidant Status and DNA Turn-over Enzyme Activities in Erythrocytes and Heart, Kidney, Liver, and Ovary Tissues From Rats: Possible Protective Role of Vitamin C.

Long-term exposure to electromagnetic radiation from mobile phones and Wi-Fi devices decreases plasma prolactin, progesterone, and estrogen levels but increases uterine oxidative stress in pregnant rats and their offspring.

Oxidative stress and prevention of the adaptive response to chronic iron overload in the brain of young adult rats exposed to a 150 kilohertz electromagnetic field.

Effect of 900-, 1800-, and 2100-MHz radiofrequency radiation on DNA and oxidative stress in brain.

Melatonin reduces oxidative stress induced by chronic exposure of microwave radiation from mobile phones in rat brain.

Selenium supplementation ameliorates electromagnetic field-induced oxidative stress in the HEK293 cells.

Therapeutic approaches of melatonin in microwave radiations-induced oxidative stress-mediated toxicity on male fertility pattern of Wistar rats.

Effects of mobile phones on oxidant/antioxidant balance in cornea and lens of rats.

Effects of acute exposure to the radiofrequency fields of cellular phones on plasma lipid peroxide and antioxidase activities in human erythrocytes.

Exposure to static magnetic field of pregnant rats induces hepatic GSH elevation but not oxidative DNA damage in liver and kidney.

Effects of 837 and 1950 MHz radiofrequency radiation exposure alone or combined on oxidative stress in MCF10A cells.

Oxidative stress effects on the central nervous system of rats after acute exposure to ultra high frequency electromagnetic fields.

A cross-sectional study on oxidative stress in workers exposed to extremely low frequency electromagnetic fields.

Effects of melatonin on Wi-Fi-induced oxidative stress in lens of rats.

The effect of melatonin on the liver of rats exposed to microwave radiation.

Oxidative stress-mediated alterations on sperm parameters in male Wistar rats exposed to 3G mobile phone radiation.

Wi-Fi (2.45 GHz)- and mobile phone (900 and 1800 MHz)-induced risks on oxidative stress and elements in kidney and testis of rats during pregnancy and the development of offspring.

Effects of Low-Frequency Electromagnetic Field on Oxidative Stress in Selected Structures of the Central Nervous System.

Effect of low level microwave radiation exposure on cognitive function and oxidative stress in rats.

900 MHz pulse-modulated radiofrequency radiation induces oxidative stress on heart, lung, testis and liver tissues.

Exposure to mobile phone (900-1800 MHz) during pregnancy: tissue oxidative stress after childbirth.

The Effects of Melatonin on Oxidative Stress Parameters and DNA Fragmentation in Testicular Tissue of Rats Exposed to Microwave Radiation.

Exposure to cell phone induce oxidative stress in mice preantral follicles during in vitro cultivation: An experimental study.

[Effect of American Ginseng Capsule on the liver oxidative injury and the Nrf2 protein expression in rats exposed by electromagnetic radiation of frequency of cell phone].

Effects of acute electromagnetic field exposure and movement restraint on antioxidant system in liver, heart, kidney and plasma of Wistar rats: a preliminary report.

Effect of mobile phone exposure on apoptotic glial cells and status of oxidative stress in rat brain.

Effects of third generation mobile phone-emitted electromagnetic radiation on oxidative stress parameters in eye tissue and blood of rats.

Pathological Findings Observed in the Kidneys of Postnatal Male Rats Exposed to the 2100 MHz Electromagnetic Field.

Effects of exposure to 50 Hz electric field at different strengths on oxidative stress and antioxidant enzyme activities in the brain tissue of guinea pigs.

Melatonin modulates 900 Mhz microwave-induced lipid peroxidation changes in rat brain.

Biochemical modifications and neuronal damage in brain of young and adult rats after long-term exposure to mobile phone radiations.

The preventive effect of lotus seedpod procyanidins on cognitive impairment and oxidative damage induced by extremely low frequency electromagnetic field exposure.

900-MHz microwave radiation promotes oxidation in rat brain.

Influence of extremely-low-frequency magnetic field on antioxidative melatonin properties in AT478 murine squamous cell carcinoma culture.

2.45 GHz microwave irradiation-induced oxidative stress affects implantation or pregnancy in mice, Mus musculus.

In vitro free radical scavenging activities and effect of synthetic oligosaccharides on antioxidant enzymes and lipid peroxidation in aged mice.

The physiopathological effects of quercetin on oxidative stress in radiation of 4.5 g mobile phone exposed liver tissue of rat.

Assessment of oxidant/antioxidant status in saliva of cell phone users.

Effects of 900-MHz electromagnetic field emitted from cellular phone on brain oxidative stress and some vitamin levels of guinea pigs.

Chronic exposure to 50Hz magnetic fields causes a significant weakening of antioxidant defence systems in aged rat brain.

Effects of static magnetic field and cadmium on oxidative stress and DNA damage in rat cortex brain and hippocampus.

Melatonin protects rat thymus against oxidative stress caused by exposure to microwaves and modulates proliferation/apoptosis of thymocytes.

Oxidative mechanisms of biological activity of low-intensity radiofrequency radiation.

The effects of N-acetylcysteine and epigallocatechin-3-gallate on liver tissue protein oxidation and antioxidant enzyme levels after the exposure to radiofrequency radiation.

Oxidative stress-mediated skin damage in an experimental mobile phone model can be prevented by melatonin.

Long term exposure to cell phone frequencies (900 and 1800 MHz) induces apoptosis, mitochondrial oxidative stress and TRPV1 channel activation in the hippocampus and dorsal root ganglion of rats.

Impacts of exposure to 900 MHz mobile phone radiation on liver function in rats.

Static magnetic field affects oxidative stress in mouse cochlea.

Effects of cell phone radiation on lipid peroxidation, glutathione and nitric oxide levels in mouse brain during epileptic seizure.

The effect of electromagnetic radiation emitted by display screens on cell oxygen metabolism - in vitro studies.

Effects of electromagnetic radiation produced by 3G mobile phones on rat brains: magnetic resonance spectroscopy, biochemical, and histopathological evaluation.

Role of Mitochondria in the Oxidative Stress Induced by Electromagnetic Fields: Focus on Reproductive Systems.

Effect of selenium pre-treatment on plasma antioxidant vitamins A (retinol) and E (alpha-tocopherol) in static magnetic field-exposed rats.

Effect of cell phone use on salivary total protein, enzymes and oxidative stress markers in young adults: a pilot study.

Radiofrequency radiation emitted from Wi-Fi (2.4 GHz) causes impaired insulin secretion and increased oxidative stress in rat pancreatic islets.

[Corrective effects of electromagnetic radiation in a millimeter wavelength range on the parameters of oxidative stress after standard anti-helicobacterial therapy in patients with ulcer disease].

Oxidative effects of extremely low frequency magnetic field and radio frequency radiation on testes tissues of diabetic and healthy rats.

Investigation of the effects of distance from sources on apoptosis, oxidative stress and cytosolic calcium accumulation via TRPV1 channels induced by mobile phones and Wi-Fi in breast cancer cells.

Radiofrequency electromagnetic radiation from cell phone causes defective testicular function in male Wistar rats.

Effect of 950 MHz UHF electromagnetic radiation on biomarkers of oxidative damage, metabolism of UFA and antioxidants in the livers of young rats of different ages.

The influence of microwave radiation from cellular phone on fetal rat brain.

Effects of chronic exposure to 950 MHz ultra-high-frequency electromagnetic radiation on reactive oxygen species metabolism in the right and left cerebral cortex of young rats of different ages.

Effects of radiofrequency electromagnetic wave exposure from cellular phones on the reproductive pattern in male Wistar rats.

Radiations and male fertility.

Electromagnetic radiation (Wi-Fi) and epilepsy induce calcium entry and apoptosis through activation of TRPV1 channel in hippocampus and dorsal root ganglion of rats.

Immunohistopathologic demonstration of deleterious effects on growing rat testes of radiofrequency waves emitted from conventional Wi-Fi devices.

[Effect of electromagnetic field produced by mobile phones on the activity of superoxide dismutase (SOD-1) and the level of malonyldialdehyde (MDA)--in vitro study].

[Effects of extremely low frequency electromagnetic field and its combination with lead on the antioxidant system in mouse].

Mobile phone (1800MHz) radiation impairs female reproduction in mice, Mus musculus, through stress induced inhibition of ovarian and uterine activity.

[Interference of vitamin E on the brain tissue damage by electromagnetic radiation of cell phone in pregnant and fetal rats].

Evaluation of genotoxic effects in male Wistar rats following microwave exposure.

1800 MHz mobile phone irradiation induced oxidative and nitrosative stress leads to p53 dependent Bax mediated testicular apoptosis in mice, Mus musculus.

The 2100MHz radiofrequency radiation of a 3G-mobile phone and the DNA oxidative damage in brain.

[On the mechanism of cytogenetic effect of electromagnetic radiation: a role of oxidation homeostasis].

Neuroprotective effects of dietary supplement Kang-fu-ling against high-power microwave through antioxidant action.

Effect of extremely low frequency magnetic field on antioxidant activity in plasma and red blood cells in spot welders.

Antioxidants alleviate electric field-induced effects on lung tissue based on assays of heme oxygenase-1, protein carbonyl content, malondialdehyde, nitric oxide, and hydroxyproline.

Cell phone electromagnetic field radiations affect rhizogenesis through impairment of biochemical processes.

GSM base station electromagnetic radiation and oxidative stress in rats.

The Effects of Cell Phone Waves (900 MHz-GSM Band) on Sperm Parameters and Total Antioxidant Capacity in Rats.

Extremely low frequency electromagnetic field reduces oxidative stress during the rehabilitation of post-acute stroke patients.

Evaluation of selected biochemical parameters in the saliva of young males using mobile phones.

Protein oxidation under extremely low frequency electric field in guinea pigs. Effect of N-acetyl-L-cysteine treatment.

Selenium supplementation ameliorates static magnetic field-induced disorders in antioxidant status in rat tissues.

In vitro effects of 50 Hz magnetic fields on oxidatively damaged rabbit red blood cells.

[Protective effect of Liuweidihuang Pills against cellphone electromagnetic radiation-induced histomorphological abnormality, oxidative injury, and cell apoptosis in rat testes].

The impact of electromagnetic radiation of different parameters on platelet oxygen metabolism - in vitro studies.

Melatonin attenuates radiofrequency radiation (900 MHz)-induced oxidative stress, DNA damage and cell cycle arrest in germ cells of male Swiss albino mice.

The effect of 50 hz magnetic field of different shape on oxygen metabolism in blood platelets: in vitro studies.

[Protective effect of melatonin and vitamin E against prooxidative action of iron ions and static magnetic field].

The role of zinc supplementation in the inhibition of tissue damage caused by exposure to electromagnetic field in rat lung and liver tissues.

The influence of 1800 MHz GSM-like signals on hepatic oxidative DNA and lipid damage in nonpregnant, pregnant, and newly born rabbits.

Effect of rosmarinic acid on sertoli cells apoptosis and serum antioxidant levels in rats after exposure to electromagnetic fields.

Effects of electromagnetic radiation exposure on bone mineral density, thyroid, and oxidative stress index in electrical workers.

[Electromagnetic radiation of the terahertz range at the nitric oxide frequency in correction and prophylaxis of functional activity disorders in thrombocytes of white rats under long-term stress].

Wi-Fi is an important threat to human health.

The influence of 1800 MHz GSM-like signals on blood chemistry and oxidative stress in non-pregnant and pregnant rabbits.

[Effect of electromagnetic field produced by mobile phones on the activity of superoxide dismutase (SOD-1)--in vitro researches].

[Effects of nano-selenium on cognition performance of mice exposed in 1800 MHz radiofrequency fields].

Theme - Effect of radiofrequency exposure, especially prenatal exposure, on rats

Titles

Maternal exposure to a continuous 900-MHz electromagnetic field provokes neuronal loss and pathological changes in cerebellum of 32-day-old female rat offspring.

The effects of prenatal exposure to a 900-MHz electromagnetic field on the 21-day-old male rat heart.

The effects of exposure to electromagnetic field on rat myocardium.

900 MHz electromagnetic field exposure affects qualitative and quantitative features of hippocampal pyramidal cells in the adult female rat.

The effect of prenatal exposure to 1800 MHz electromagnetic field on calcineurin and bone development in rats.

Exposure to a 900 MHz electromagnetic field for 1 hour a day over 30 days does change the histopathology and biochemistry of the rat testis.

Effects of a unique electromagnetic field system on the fertility of rats.

Protective effects of luteolin on rat testis following exposure to 900 MHz electromagnetic field.

Evaluation of testicular degeneration induced by low-frequency electromagnetic fields.

Maternal mobile phone exposure alters intrinsic electrophysiological properties of CA1 pyramidal neurons in rat offspring.

Electromagnetic fields promote severe and unique vascular calcification in an animal model of ectopic calcification.

Effects of exposure to electromagnetic field (1.8/0.9 GHz) on testicular function and structure in growing rats.

The effects of prenatal long-duration exposure to 900-MHz electromagnetic field on the 21-day-old newborn male rat liver.

Common behaviors alterations after extremely low-frequency electromagnetic field exposure in rat animal model.

Pathological effects of prenatal exposure to a 900 MHz electromagnetic field on the 21-day-old male rat kidney.

Deleterious impacts of a 900-MHz electromagnetic field on hippocampal pyramidal neurons of 8-week-old Sprague Dawley male rats.

Pernicious effects of long-term, continuous 900-MHz electromagnetic field throughout adolescence on hippocampus morphology, biochemistry and pyramidal neuron numbers in 60-day-old Sprague Dawley male rats.

The effect of exposure of rats during prenatal period to radiation spreading from mobile phones on renal development.

Effects of extremely low frequency electromagnetic fields (100muT) on behaviors in rats.

Biological and morphological effects on the reproductive organ of rats after exposure to electromagnetic field.

An evaluation of the effects of long-term cell phone use on the testes via light and electron microscope analysis.

Effects of 900-MHz electromagnetic fields exposure throughout middle/late adolescence on the kidney morphology and biochemistry of the female rat.

Effects of electromagnetic field (1.8/0.9 GHz) exposure on growth plate in growing rats.

Effects of low-intensity electromagnetic fields on behavioral activity of rats.

Anxiety-like behavioural effects of extremely low-frequency electromagnetic field in rats.

Biochemical and pathological changes in the male rat kidney and bladder following exposure to continuous 900-MHz electromagnetic field on postnatal days 22-59.

The effects of an electromagnetic field on the boundary tissue of the seminiferous tubules of the rat: A light and transmission electron microscope study.

The effect of prenatal exposure to 900-MHz electromagnetic field on the 21-old-day rat testicle.

Testicular development evaluation in rats exposed to 60 Hz and 1 mT electromagnetic field.

Effect of electromagnetic irradiation produced by 3G mobile phone on male rat reproductive system in a simulated scenario.

Lasting hepatotoxic effects of prenatal mobile phone exposure.

Nonthermal effects of lifelong high-frequency electromagnetic field exposure on social memory performance in rats.

Effects of prenatal 900 MHz electromagnetic field exposures on the histology of rat kidney.

Neuroprotective effects of melatonin and omega-3 on hippocampal cells prenatally exposed to 900 MHz electromagnetic fields.

Microwave exposure affecting reproductive system in male rats.

Morphological and antioxidant impairments in the spinal cord of male offspring rats following exposure to a continuous 900MHz electromagnetic field during early and mid-adolescence.

Whole-body microwave exposure emitted by cellular phones and testicular function of rats.

Purkinje cell number decreases in the adult female rat cerebellum following exposure to 900 MHz electromagnetic field.

Effect of electromagnetic waves from mobile phone on immune status of male rats: possible protective role of vitamin D.

Changes in antioxidant capacity of blood due to mutual action of electromagnetic field (1800 MHz) and opioid drug (tramadol) in animal model of persistent inflammatory state.

Evaluation of hormonal change, biochemical parameters, and histopathological status of uterus in rats exposed to 50-Hz electromagnetic field.

Stress-related endocrinological and psychopathological effects of short- and long-term 50Hz electromagnetic field exposure in rats.

Impact of microwave at X-band in the aetiology of male infertility.

The effect on rat thymocytes of the simultaneous in vivo exposure to 50-Hz electric and magnetic field and to continuous light.

Effects on rat testis of 1.95-GHz W-CDMA for IMT-2000 cellular phones.

Disruption of the ovarian follicle reservoir of prepubertal rats following prenatal exposure to a continuous 900-MHz electromagnetic field.

Influence of electromagnetic field (1800 MHz) on lipid peroxidation in brain, blood, liver and kidney in rats.

[Effect of Guilingji Capsule on the fertility, liver functions, and serum LDH of male SD rats exposed by 900 mhz cell phone].

Zinc supplementation ameliorates electromagnetic field-induced lipid peroxidation in the rat brain.

A histopathological and biochemical evaluation of oxidative injury in the sciatic nerves of male rats exposed to a continuous 900-megahertz electromagnetic field throughout all periods of adolescence.

Effects of short-term exposure to powerline-frequency electromagnetic field on the electrical activity of the heart.

Altered operant behavior of adult rats after perinatal exposure to a 60-Hz electromagnetic field.

[Autoimmune processes after long-term low-level exposure to electromagnetic fields (the results of an experiment). Part 5. Impact of the blood serum from rats exposed to low-level electromagnetic fields on pregnancy, foetus and offspring development of intact female rats].

The effects of long-term exposure to a 2450 MHz electromagnetic field on growth and pubertal development in female Wistar rats.

Effects of mobile phone radiation on serum testosterone in Wistar albino rats.

Effects of exposure to 2100MHz GSM-like radiofrequency electromagnetic field on auditory system of rats.

Maternal mobile phone exposure adversely affects the electrophysiological properties of Purkinje neurons in rat offspring.

[Female genital toxicities of high-frequency electromagnetic field on rats].

Effects of exposure to electromagnetic field from mobile phone on serum hepcidin and iron status in male albino rats.

[State of the reproductive systemin male rats of 1st generation obtained from irradiated parents and exposed to electromagnetic radiation (897 MHz) during embryogenesis and postnatal development].

The effects of microwave emitted by cellular phones on ovarian follicles in rats.

Effects of prenatal exposure to a 900 MHz electromagnetic field on the dentate gyrus of rats: a stereological and histopathological study.

Effect of Modified Wuzi Yanzong Pill () on Tip60-Mediated Apoptosis in Testis of Male Rats after Microwave Radiation.

Influence of electromagnetic fields on reproductive system of male rats.

Effect of 910-MHz electromagnetic field on rat bone marrow.

Effects of electromagnetic radiation exposure on stress-related behaviors and stress hormones in male wistar rats.

Chronic prenatal exposure to the 900 megahertz electromagnetic field induces pyramidal cell loss in the hippocampus of newborn rats.

Effect of short duration electromagnetic field exposures on rat mass.

Hypospermatogenesis and spermatozoa maturation arrest in rats induced by mobile phone radiation.

[The delayed effects of modulated and non-modulated electromagnetic field on epileptiformic activity in rats].

Effect of extremely low frequency electromagnetic field on brain histopathology of Caspian Sea Cyprinus carpio.

Effects of chronic exposure to electromagnetic waves on the auditory system.

Influence of a 60 Hz, 3 microT, electromagnetic field on the somatic maturation of wistar rat offspring fed a regional basic diet during pregnancy.

The effect of extremely low-frequency electromagnetic fields on skin and thyroid amine- and peptide-containing cells in rats: an immunohistochemical and morphometrical study.

Effects of the electromagnetic field, 60 Hz, 3 microT, on the hormonal and metabolic regulation of undernourished pregnant rats.

[Early and Delayed Effects of Radio Frequency Electromagnetic Fields on the Reproductive Function and Functional Status of the Offspring of Experimental Animals].

The effects of electromagnetic waves emitted by the cell phones on the testicular tissue.

2.1 GHz electromagnetic field does not change contractility and intracellular Ca2+ transients but decreases beta-adrenergic responsiveness through nitric oxide signaling in rat ventricular myocytes.

The influence of electromagnetic radiation generated by a mobile phone on the skeletal system of rats.

Inhibitory effects of low doses of melatonin on induction of preneoplastic liver lesions in a medium-term liver bioassay in F344 rats: relation to the influence of electromagnetic near field exposure.

Effects of cellular phone emissions on sperm motility in rats.

[The physiological mechanisms of the regulation of zoosocial behavior in rats exposed to low-frequency electromagnetic fields].

The therapeutic effect of a pulsed electromagnetic field on the reproductive patterns of male Wistar rats exposed to a 2.45-GHz microwave field.

Postnatal development and behavior effects of in-utero exposure of rats to radiofrequency waves emitted from conventional WiFi devices.

Effects of prenatal exposure to WIFI signal (2.45GHz) on postnatal development and behavior in rat: Influence of maternal restraint.

Effect of Electromagnetic Waves from Mobile Phones on Spermatogenesis in the Era of 4G-LTE.

Exposure to radio-frequency electromagnetic waves alters acetylcholinesterase gene expression, exploratory and motor coordination-linked behaviour in male rats.

Post-continuous whole body exposure of rabbits to 650 MHz electromagnetic fields: effects on liver, spleen, and brain.

Effect of low-intensity extremely high frequency radiation on reproductive function in wistar rats.

[The neurotropic effects of low-intensity electromagnetic waves in rats with different typological characteristics of higher nervous activity].

[The progeny of male rats subjected to chronic exposure to a permanent magnetic field].

The influence of electric field exposure on bone growth and fracture repair in rats.

Effects of pulsed and sinusoidal electromagnetic fields on MMP-2, MMP-9, collagen type IV and E-cadherin expression levels in the rat kidney: an immunohistochemical study.

[Study on effects of bioelectric parameters of rats in electromagnetic radiation of HV transmission line].

Effect of chronic exposure to cellular telephone electromagnetic fields on hearing in rats.

[Bioeffects of chronic exposure to radiofrequency electromagnetic fields of low intensity (standardization strategy)].

[cts of prenatal exposure of 850-1900MHz mobile phone on the expression of PCNA and DCX in dentate gyrus of offspring rats].

Short-Term Exposure to Electromagnetic Fields Generated by Mobile Phone Jammers Decreases the Fasting Blood Sugar in Adult Male Rats.

Learning ability of young rats is unaffected by repeated exposure to a static electromagnetic field in early life.

Effects of exposure to electromagnetic field radiation (EMFR) generated by activated mobile phones on fasting blood glucose.

Histological characteristics of cutaneous and thyroid mast cell populations in male rats exposed to power-frequency electromagnetic fields.

Neural and behavioral teratological evaluation of rats exposed to ultra-wideband electromagnetic fields.

Effect of 50-Hz electromagnetic field on the retention of toxic radionuclides in rat tissues.

Influence of electromagnetic fields on bone mass and growth in developing rats: a morphometric, densitometric, and histomorphometric study.

[Cellphone electromagnetic radiation damages the testicular ultrastructure of male rats].

Effect of the pulsed electromagnetic field on the release of inflammatory mediators from adipose-derived stem cells (ADSCs) in rats.

Prevention of mobile phone induced skin tissue changes by melatonin in rat: an experimental study.

[The effects of extremely low frequency electromagnetic field exposure on the pH of the adult male semen and the motoricity parameters of spermatozoa in vitro].

Congenital anomalies in the offspring of rats after exposure of the testis to an electrostatic field.

Effect of a 1800 MHz electromagnetic field emitted during embryogenesis on chick development and hatchability.

[Systemic effects of the interaction of an organism and microwaves].

Prenatal exposure to non-ionizing radiation: effects of WiFi signals on pregnancy outcome, peripheral B-cell compartment and antibody production.

[Morphological structure of rat epiphysis exposed to electromagnetic radiation from communication devices].

The effects of microwave frequency electromagnetic fields on the development of Drosophila melanogaster.

Effects of low level electromagnetic field exposure at 2.45 GHz on rat cornea.

[Reaction of Reproductive System and Epididymal Spermatozoa .of Rats to Electromagnetic Radiation from Mobile Phone (1745 MHz) of Various Duration].

Excretion and tissue distribution of selenium following treatment of male F344 rats with benzylselenocyanate or sodium selenite.

[Immunomorphologic changes in the testes upon exposure to a microwave electromagnetic field].

Effects of 900 MHz electromagnetic field emitted by cellular phones on electrocardiograms of guinea pigs.

Effect of whole-body exposure to high-frequency electromagnetic field on the brain electrogeny in neurodefective and healthy mice.

Effect of Electromagnetic Wave on Bone Healing in Fixed and Unfixed Conditions.

Some immunological responses of common carp (Cyprinus carpio) fingerling to acute extremely low-frequency electromagnetic fields (50 Hz).

Effects of 60 Hz electromagnetic fields on early growth in three plant species and a replication of previous results.

Influence of 400, 900, and 1900 MHz electromagnetic fields on Lemna minor growth and peroxidase activity.

[Effect of fluctuating electromagnetic fields on the processes of growth and blastomogenesis].

Effects of broad band electromagnetic fields on HSP70 expression and ischemia-reperfusion in rat hearts.

[The effect of electromagnetic radiation in the millimeter range on the development of disorders in the liver induced by ether anesthesia (experimental research)].

Cell Phone Radiation Effect on Bone-to-Implant Osseointegration: A Preliminary Histologic Evaluation in Rabbits.

The Effects of Electromagnetic Fields Generated from 1800 MHz Cell Phones on Erythrocyte Rheological Parameters and Zinc Level in Rats.

[The biological activity of a decameter-range electromagnetic field with a frequency of 24 MHz].

[Effect of discontinuous short-wave electromagnetic field irradiation on the state of the endocrine glands].

Effects of microwaves (950 MHZ mobile phone) on morphometric and apoptotic changes of rabbit epididymis.

Effect of high frequency electromagnetic wave stimulation on muscle injury in a rat model.

[Respondence to electricity in the muscles of rat's jaw].

Hematological and toxicogenomic effects of ferromagnetic screening of natural electromagnetic fields.

The effects of 910-MHz electromagnetic field on rat cranial arachnoid and dura mater collagen. The axial periodicity of collagen fibrils.

Effect of electromagnetic radiation modulated by biostructures on the course of alloxan-induced diabetes mellitus in rats.

[The interaction of changes in the genitalia in the pathogenesis of sterility in men].

[Evaluation of magnesium, zinc, copper and calcium levels in workers exposed to organic solvents, hydrogen cyanide and harmful physical factors].

Induction of macrophage migration inhibitory factor precedes the onset of acute tonsillitis.

Theme - Effect of radiofrequency radiation on rat brain

Titles

Effects of early-onset radiofrequency electromagnetic field exposure (GSM 900 MHz) on behavior and memory in rats.

Mobile phone radiation and the developing brain: behavioral and morphological effects in juvenile rats.

GFAP expression in the rat brain following sub-chronic exposure to a 900 MHz electromagnetic field signal.

Blood-brain barrier permeability and nerve cell damage in rat brain 14 and 28 days after exposure to microwaves from GSM mobile phones.

Effect of a chronic GSM 900 MHz exposure on glia in the rat brain.

Effect of mobile telephony on blood-brain barrier permeability in the fetal mouse brain.

Biochemical and histological studies on adverse effects of mobile phone radiation on rat's brain.

Blood-brain barrier and electromagnetic fields: effects of scopolamine methylbromide on working memory after whole-body exposure to 2.45 GHz microwaves in rats.

Effects of GSM modulated radio-frequency electromagnetic radiation on permeability of blood-brain barrier in male & female rats.

Effect of 900 MHz radio frequency radiation on beta amyloid protein, protein carbonyl, and malondialdehyde in the brain.

Histopathological examinations of rat brains after long-term exposure to GSM-900 mobile phone radiation.

Effects of GSM and UMTS mobile telephony signals on neuron degeneration and blood-brain barrier permeation in the rat brain.

Cognitive impairment in rats after long-term exposure to GSM-900 mobile phone radiation.

Genotoxic potential of 1.6 GHz wireless communication signal: in vivo two-year bioassay.

One-year, simultaneous combined exposure of CDMA and WCDMA radiofrequency electromagnetic fields to rats.

A confirmation study of Russian and Ukrainian data on effects of 2450 MHz microwave exposure on immunological processes and teratology in rats.

Long term and excessive use of 900 MHz radiofrequency radiation alter microRNA expression in brain.

Radio frequency radiation effects on protein kinase C activity in rats' brain.

Confirmation studies of Soviet research on immunological effects of microwaves: Russian immunology results.

Long-term effects of 900 MHz radiofrequency radiation emitted from mobile phone on testicular tissue and epididymal semen quality.

Nerve cell damage in mammalian brain after exposure to microwaves from GSM mobile phones.

Biological and morphological effects on the brain after exposure of rats to a 1439 MHz TDMA field.

Report of final results regarding brain and heart tumors in Sprague-Dawley rats exposed from prenatal life until natural death to mobile phone radiofrequency field representative of a 1.8GHz GSM base station environmental emission.

8-Oxo-7, 8-dihydro-2'-deoxyguanosine as a biomarker of DNA damage by mobile phone radiation.

Glial markers and emotional memory in rats following acute cerebral radiofrequency exposures.

Histological and cytological examination of rat reproductive tissue after short-time intermittent radiofrequency exposure.

Acute exposure to GSM 900-MHz electromagnetic fields induces glial reactivity and biochemical modifications in the rat brain.

[Autoimmune processes after long-term low-level exposure to electromagnetic fields (the results of an experiment). Part 3. The effect of the long-term non-thermal RF EMF exposure on complement-fixation antibodies against homologenous tissue].

Effects of 2.4 GHz radiofrequency radiation emitted from Wi-Fi equipment on microRNA expression in brain tissue.

Blood-brain barrier disruption by continuous-wave radio frequency radiation.

Effect of long-term (2 years) exposure of mouse brains to global system for mobile communication (GSM) radiofrequency fields on astrocytic immunoreactivity.

Effect of long-term mobile communication microwave exposure on vascular permeability in mouse brain.

The effects of pulsed 860 MHz radiofrequency radiation on the promotion of neurogenic tumors in rats.

Micronucleus frequency in erythrocytes of mice after long-term exposure to radiofrequency radiation.

Fifty-gigahertz microwave exposure effect of radiations on rat brain.

The effect of chronic exposure to 835.62 MHz FDMA or 847.74 MHz CDMA radiofrequency radiation on the incidence of spontaneous tumors in rats.

Effect of an acute 900MHz GSM exposure on glia in the rat brain: a time-dependent study.

Does prolonged radiofrequency radiation emitted from Wi-Fi devices induce DNA damage in various tissues of rats?

The effect of radiofrequency radiation generated by a Global System for Mobile Communications source on cochlear development in a rat model.

Mutagenic response of 2.45 GHz radiation exposure on rat brain.

Effect of GSM-900 and -1800 signals on the skin of hairless rats. I: 2-hour acute exposures.

Long-term study of 435 MHz radio-frequency radiation on blood-borne end points in cannulated rats. Part II: methods, results, and summary.

Exposure to GSM 900 MHz electromagnetic fields affects cerebral cytochrome c oxidase activity.

GSM and DCS wireless communication signals: combined chronic toxicity/carcinogenicity study in the Wistar rat.

Evidence for mobile phone radiation exposure effects on reproductive pattern of male rats: role of ROS.

Microglial activation as a measure of stress in mouse brains exposed acutely (60 minutes) and long-term (2 years) to mobile telephone radiofrequency fields.

DNA damage in rat brain cells after in vivo exposure to 2450 MHz electromagnetic radiation and various methods of euthanasia.

Commentary on the utility of the National Toxicology Program study on cell phone radiofrequency radiation data for assessing human health risks despite unfounded criticisms aimed at minimizing the findings of adverse health effects.

Effect of in utero wi-fi exposure on the pre- and postnatal development of rats.

Cerebral radiofrequency exposures during adolescence: Impact on astrocytes and brain functions in healthy and pathologic rat models.

The effect of 2100 MHz radiofrequency radiation of a 3G mobile phone on the parotid gland of rats.

Expression of the water channel protein, aquaporin-4, in mouse brains exposed to mobile telephone radiofrequency fields.

Effects of mobile phone radiation (900 MHz radiofrequency) on structure and functions of rat brain.

Effects of 900 MHz radiofrequency on corticosterone, emotional memory and neuroinflammation in middle-aged rats.

Circadian rhythmicity of antioxidant markers in rats exposed to 1.8 GHz radiofrequency fields.

[Effects of electromagnetic pulse on blood-brain barrier permeability and tight junction proteins in rats].

Effects of head-only exposure of rats to GSM-900 on blood-brain barrier permeability and neuronal degeneration.

Effects of 900 MHz radiofrequency radiation on skin hydroxyproline contents.

Effects of gestational exposure to 1.95-GHz W-CDMA signals for IMT-2000 cellular phones: Lack of embryotoxicity and teratogenicity in rats.

In utero and early-life exposure of rats to a Wi-Fi signal: screening of immune markers in sera and gestational outcome.

The effect of radiofrequency radiation on DNA and lipid damage in female and male infant rabbits.

Effect of global system for mobile communication (gsm)-like radiofrequency fields on vascular permeability in mouse brain.

Does head-only exposure to GSM-900 electromagnetic fields affect the performance of rats in spatial learning tasks?

The effects of mobile phones on apoptosis in cerebral tissue: an experimental study on rats.

Survival and cancer in laboratory mammals exposed to radiofrequency energy.

The effects of simultaneous combined exposure to CDMA and WCDMA electromagnetic fields on rat testicular function.

Teratogenic effects of 27.12 MHz radiofrequency radiation in rats.

The effects of 860 MHz radiofrequency radiation on the induction or promotion of brain tumors and other neoplasms in rats.

Effect of long-term exposure of 2.4 GHz radiofrequency radiation emitted from Wi-Fi equipment on testes functions.

Effects of continuous low-level exposure to radiofrequency radiation on intrauterine development in rats.

Electromagnetic fields and the blood-brain barrier.

Effects of 20-MHz radiofrequency radiation on rat hematology, splenic function, and serum chemistry.

Effects of GSM-like radiofrequency irradiation during the oogenesis and spermiogenesis of Xenopus laevis.

Effects of mobile phone electromagnetic fields at nonthermal SAR values on melatonin and body weight of Djungarian hamsters (Phodopus sungorus).

Expression of the immediate early gene, c-fos, in fetal brain after whole of gestation exposure of pregnant mice to global system for mobile communication microwaves.

Electromagnetic field effect or simply stress? Effects of UMTS exposure on hippocampal longterm plasticity in the context of procedure related hormone release.

Effect of GSM-900 and -1800 signals on the skin of hairless rats. II: 12-week chronic exposures.

Exposure to cell phone radiofrequency changes corticotrophin hormone levels and histology of the brain and adrenal glands in male Wistar rat.

Neurodegenerative changes and apoptosis induced by intrauterine and extrauterine exposure of radiofrequency radiation.

Rat fertility and embryo fetal development: influence of exposure to the Wi-Fi signal.

Effects of prenatal and postnatal exposure to GSM-like radiofrequency on blood chemistry and oxidative stress in infant rabbits, an experimental study.

Heat shock protein induction in fetal mouse brain as a measure of stress after whole of gestation exposure to mobile telephony radiofrequency fields.

Micronucleus induction after whole-body microwave irradiation of rats.

Effects of GSM-Frequency Electromagnetic Radiation on Some Physiological and Biochemical Parameters in Rats.
