Effects of simultaneous combined exposure to CDMA and WCDMA electromagnetic fields on serum hormone levels in rats.

The differential effects of 200, 591, and 2,450 MHz radiation on rat brain energy metabolism.

RAPD Profiling, DNA Fragmentation, and Histomorphometric Examination in Brains of Wistar Rats Exposed to Indoor 2.5 Ghz Wi-Fi Devices Radiation.

[Autoimmune processes after long-term low-level exposure to electromagnetic fields (the results of an experiment). Part 4. Manifestation of oxidative intracellular stress-reaction after long-term non-thermal EMF exposure of rats].

Exposure to an 890-MHz mobile phone-like signal and serum levels of S100B and transthyretin in volunteers.

Effects of electromagnetic radiation on spatial memory and synapses in rat hippocampal CA1.

Developmental toxicity interactions of salicylic acid and radiofrequency radiation or 2-methoxyethanol in rats.

The effect of radiofrequency radiation on DNA and lipid damage in non-pregnant and pregnant rabbits and their newborns.

Effect of Short-term 900 MHz low level electromagnetic radiation exposure on blood serotonin and glutamate levels.

Effect of electromagnetic pulse exposure on brain micro vascular permeability in rats.

Alteration of adaptive behaviors of progeny after maternal mobile phone exposure.

Survivability and long-term stress reactivity levels following repeated exposure to nuclear magnetic resonance imaging procedures in rats.

[Autoimmune processes after long-term low-level exposure to electromagnetic fields (the results of an experiment). Part 2. General scheme and conditions of the experiment. Development of RF exposure conditions complying with experimental tasks. Animal's status during the long-term exposure].

Multigenerational effects of whole body exposure to 2.14 GHz W-CDMA cellular phone signals on brain function in rats.

Detrimental effect of electromagnetic pulse exposure on permeability of in vitro blood-brain-barrier model.

Effects of exposure to electromagnetic field from 915 MHz radiofrequency identification system on circulating blood cells in the healthy adult rat.

[Effects of 2000 muW/cm2; electromagnetic radiation on expression of immunoreactive protein and mRNA of NMDA receptor 2A subunit in rats hippocampus].

Effects of 1800-MHz radiofrequency fields on circadian rhythm of plasma melatonin and testosterone in male rats.

Effects of exposure of the ear to GSM microwaves: in vivo and in vitro experimental studies.

Age-Related Modulations of AQP4 and Caveolin-1 in the Hippocampus Predispose the Toxic Effect of Phoneutria nigriventer Spider Venom.

GSM radiation triggers seizures and increases cerebral c-Fos positivity in rats pretreated with subconvulsive doses of picrotoxin.

[Studies on the injury effects of hippocampus induced by high power microwave radiation in rat].

GSM-like radiofrequency exposure induces apoptosis via caspase-dependent pathway in infant rabbits.

Exposure to GSM 900-MHz mobile radiation impaired inhibitory avoidance memory consolidation in rat: Involvements of opioidergic and nitrergic systems.

Electromagnetic pulse exposure induces overexpression of beta amyloid protein in rats.

Effects of intrauterine and extrauterine exposure to GSM-like radiofrequency on distortion product otoacoustic emissions in infant male rabbits.

Effects of whole-body exposure to 915 MHz RFID on secretory functions of the thyroid system in rats.

[The assessment of modulated radiofrequence electromagnetic radiation on cognitive function in rats of different ages].

Life-Time Dosimetric Assessment for Mice and Rats Exposed in Reverberation Chambers of the 2-Year NTP Cancer Bioassay Study on Cell Phone Radiation.

Exposure setup to study potential adverse effects at GSM 1800 and UMTS frequencies on the auditory systems of rats.

The effects of 2100-MHz radiofrequency radiation on nasal mucosa and mucociliary clearance in rats.

[A comparative histochemical study of cytochrome oxidase activity in the somatosensory and auditory brain centers in the normal rat and after exposure to superhigh-frequency electromagnetic fields].

Estimates of absorption of radiofrequency radiation by the embryo and fetus during pregnancy.

MRI gradient fields increase brain mannitol space.

The identification of an intensity 'window' on the bioeffects of mobile telephony radiation.

Effects of 7 Hz-modulated 450 MHz electromagnetic radiation on human performance in visual memory tasks.

Dataset on significant role of Candesartan on cognitive functions in rats having memory impairment induced by electromagnetic waves.

Effects of electromagnetic radiation on morphology and TGF-beta3 expression in mouse testicular tissue.

Effects of radiofrequency exposure on the GABAergic system in the rat cerebellum: clues from semi-quantitative immunohistochemistry.

Metabolomic study of urinary polyamines in rat exposed to 915 MHz radiofrequency identification signal.

An international project to confirm Soviet-era results on immunological and teratological effects of RF field exposure in Wistar rats and comments on Grigoriev et al. [2010].

Radiotelemetry and wildlife: Highlighting a gap in the knowledge on radiofrequency radiation effects.

Non-thermal continuous and modulated electromagnetic radiation fields effects on sleep EEG of rats.

The Radiofrequency Radiation Dosimetry Handbook: reminiscences.

Effects of acute exposure to ultrahigh radiofrequency radiation on three antenna engineers.

Bioeffects of mobile telephony radiation in relation to its intensity or distance from the antenna.

Mediastinal fibrosis and radiofrequency radiation exposure: is there an association?

Effects of GSM-like radiofrequency on distortion product otoacoustic emissions in pregnant adult rabbits.

[The biological action of physical factors in the critical periods of embryogenesis].

Theme - DNA damage after microwave radiation

Titles

Evaluation of basal DNA damage and oxidative stress in Wistar rat leukocytes after exposure to microwave radiation.

The effect of electromagnetic field exposure on the formation of DNA single strand breaks in human cells.

Measurement of DNA damage after exposure to 2450 MHz electromagnetic radiation.

Human fibroblasts and 900 MHz radiofrequency radiation: evaluation of DNA damage after exposure and co-exposure to 3-chloro-4-(dichloromethyl)-5-hydroxy-2(5h)-furanone (MX).

Electromagnetic noise inhibits radiofrequency radiation-induced DNA damage and reactive oxygen species increase in human lens epithelial cells.

Influence of 1.8-GHz (GSM) radiofrequency radiation (RFR) on DNA damage and repair induced by X-rays in human leukocytes in vitro.

DNA Damage of Lymphocytes in Volunteers after 4 hours Use of Mobile Phone.

Studying the synergistic damage effects induced by 1.8 GHz radiofrequency field radiation (RFR) with four chemical mutagens on human lymphocyte DNA using comet assay in vitro.

Effect of superposed electromagnetic noise on DNA damage of lens epithelial cells induced by microwave radiation.

[DNA damage and repair induced by acute exposure of microwave from mobile phone on cultured human lens epithelial cells].

Intermittent extremely low frequency electromagnetic fields cause DNA damage in a dose-dependent way.

50-Hertz electromagnetic fields induce gammaH2AX foci formation in mouse preimplantation embryos in vitro.

Measurement of DNA damage after acute exposure to pulsed-wave 2450 MHz microwaves in rat brain cells by two alkaline comet assay methods.

Single- and double-strand DNA breaks in rat brain cells after acute exposure to radiofrequency electromagnetic radiation.

Exposure to 1800 MHz radiofrequency electromagnetic radiation induces oxidative DNA base damage in a mouse spermatocyte-derived cell line.

Measurements of alkali-labile DNA damage and protein-DNA crosslinks after 2450 MHz microwave and low-dose gamma irradiation in vitro.

Electromagnetic fields and the induction of DNA strand breaks.

Age-related effects on induction of DNA strand breaks by intermittent exposure to electromagnetic fields.

[Influence of 1.8 GHz microwave on DNA damage induced by ultraviolet C ray].

Non-thermal DNA breakage by mobile-phone radiation (1800 MHz) in human fibroblasts and in transformed GFSH-R17 rat granulosa cells in vitro.

DNA and chromosomal damage in response to intermittent extremely low-frequency magnetic fields.

The toxic effects of mobile phone radiofrequency (940 MHz) on the structure of calf thymus DNA.

Melatonin and a spin-trap compound block radiofrequency electromagnetic radiation-induced DNA strand breaks in rat brain cells.

Effects of in vitro exposure to power frequency magnetic fields on UV-induced DNA damage of rat lymphocytes.

Evaluating the combinative effects on human lymphocyte DNA damage induced by ultraviolet ray C plus 1.8 GHz microwaves using comet assay in vitro.

[Influence of 1.8 GHz microwave on DNA damage induced by 4 chemical mutagens].

Induction of DNA strand breaks by intermittent exposure to extremely-low-frequency electromagnetic fields in human diploid fibroblasts.

60 Hz magnetic field exposure induces DNA crosslinks in rat brain cells.

Combined effects of 872 MHz radiofrequency radiation and ferrous chloride on reactive oxygen species production and DNA damage in human SH-SY5Y neuroblastoma cells.

8-oxoG DNA glycosylase-1 inhibition sensitizes Neuro-2a cells to oxidative DNA base damage induced by 900 MHz radiofrequency electromagnetic radiation.

Evaluation of the genotoxicity of cell phone radiofrequency radiation in male and female rats and mice following subchronic exposure.

Radioprotective effects of honeybee venom (Apis mellifera) against 915-MHz microwave radiation-induced DNA damage in wistar rat lymphocytes: in vitro study.

Assessment of DNA sensitivity in peripheral blood leukocytes after occupational exposure to microwave radiation: the alkaline comet assay and chromatid breakage assay.

Assessment of genetic damage in peripheral blood of human volunteers exposed (whole-body) to a 200 muT, 60 Hz magnetic field.

Acute exposure to a 60 Hz magnetic field increases DNA strand breaks in rat brain cells.

Influence of a static magnetic field (250 mT) on the antioxidant response and DNA integrity in THP1 cells.

Investigation of co-genotoxic effects of radiofrequency electromagnetic fields in vivo.

Evaluation of genotoxic effects in human leukocytes after in vitro exposure to 1950 MHz UMTS radiofrequency field.

Adaptive response in mouse bone-marrow stromal cells exposed to 900-MHz radiofrequency fields: Gamma-radiation-induced DNA strand breaks and repair.

Short-term exposure to 50 Hz ELF-EMF alters the cisplatin-induced oxidative response in AT478 murine squamous cell carcinoma cells.

Measurement of DNA damage and apoptosis in Molt-4 cells after in vitro exposure to radiofrequency radiation.

Electromagnetic fields and health: DNA-based dosimetry.

Combinative exposure effect of radio frequency signals from CDMA mobile phones and aphidicolin on DNA integrity.

Magnetic-field-induced DNA strand breaks in brain cells of the rat.

Genotoxicity of radiofrequency signals. I. Investigation of DNA damage and micronuclei induction in cultured human blood cells.

DNA repair after gamma irradiation in lymphocytes exposed to low-frequency pulsed electromagnetic fields.

Epinephrine, DNA integrity and oxidative stress in workers exposed to extremely low-frequency electromagnetic fields (ELF-EMFs) at 132 kV substations.

Measurement of DNA damage after exposure to electromagnetic radiation in the cellular phone communication frequency band (835.62 and 847.74 MHz).

Effect of Radiofrequency Radiation on Human Hematopoietic Stem Cells.

Mobile phone signal exposure triggers a hormesis-like effect in Atm(+/+) and Atm(-/-) mouse embryonic fibroblasts.

Evaluation of genotoxic effects in human fibroblasts after intermittent exposure to 50 Hz electromagnetic fields: a confirmatory study.

Single strand DNA breaks in rat brain cells exposed to microwave radiation.

DNA damage, cell kinetics and ODC activities studied in CBA mice exposed to electromagnetic fields generated by transmission lines.

Acute low-intensity microwave exposure increases DNA single-strand breaks in rat brain cells.

The effect of electromagnetic field exposure on the formation of DNA lesions.

Single-strand DNA breaks in human hair root cells exposed to mobile phone radiation.

Sensitivity of spiral ganglion neurons to damage caused by mobile phone electromagnetic radiation will increase in lipopolysaccharide-induced inflammation in vitro model.

Oxidative DNA damage in rats exposed to extremely low frequency electro magnetic fields.

Ataxia telangiectasia mutated deficiency does not result in genetic susceptibility to 50 Hz magnetic fields exposure in mouse embryonic fibroblasts.

[Effects of 2,450 MHz microwave on DNA damage induced by three chemical mutagens in vitro].

In vitro assessment of clastogenicity of mobile-phone radiation (835 MHz) using the alkaline comet assay and chromosomal aberration test.

Effects of pulsed electric fields on DNA of human lymphocytes.

[Blocking 1800 MHz mobile phone radiation-induced reactive oxygen species production and DNA damage in lens epithelial cells by noise magnetic fields].

Adaptive response in mice exposed to 900 MHz radiofrequency fields: primary DNA damage.

Exposure of mammalian cells to 60-Hz magnetic or electric fields: analysis for DNA single-strand breaks.

Impact of radio frequency electromagnetic radiation on DNA integrity in the male germline.

Effect of GSTM1 and GSTT1 Polymorphisms on Genetic Damage in Humans Populations Exposed to Radiation From Mobile Towers.

DNA damage induced in brain cells of CBA mice exposed to magnetic fields.

[Effects of GSM 1800 MHz radiofrequency electromagnetic fields on DNA damage in Chinese hamster lung cells].

Loss of transforming activity of plasmid DNA (pBR322) in E. coli caused by singlet molecular oxygen.

Decreased DNA repair rates and protection from heat induced apoptosis mediated by electromagnetic field exposure.

Cytotoxic and genotoxic effect in RTG-2 cell line exposed to selected biocides used in the disinfection of cooling towers.

Mobile phone specific electromagnetic fields induce transient DNA damage and nucleotide excision repair in serum-deprived human glioblastoma cells.

Adaptive response in mice exposed to 900 MHZ radiofrequency fields: bleomycin-induced DNA and oxidative damage/repair.

14.6 mT ELF magnetic field exposure yields no DNA breaks in model system Salmonella, but provides evidence of heat stress protection.

Effect of Radiofrequency Radiation Emitted from 2G and 3G Cell Phone on Developing Liver of Chick Embryo - A Comparative Study.

Cell type-specific genotoxic effects of intermittent extremely low-frequency electromagnetic fields.

Biological effects of non-ionizing electromagnetic fields: Two sides of a coin.

Radiofrequency exposure and mammalian cell toxicity, genotoxicity, and transformation.

Studying the protein expression in human B lymphoblastoid cells exposed to 1.8-GHz (GSM) radiofrequency radiation (RFR) with protein microarray.

Mobile phone radiation induces mode-dependent DNA damage in a mouse spermatocyte-derived cell line: a protective role of melatonin.

An evaluation of genotoxicity in human neuronal-type cells subjected to oxidative stress under an extremely low frequency pulsed magnetic field.

Exposure of rat brain to 915 MHz GSM microwaves induces changes in gene expression but not double stranded DNA breaks or effects on chromatin conformation.

Radiofrequency (microwave) radiation exposure of mammalian cells during UV-induced DNA repair synthesis.

[Effect of low-intensity microwave of on mitomycin C-induced genotoxicity in vitro].

Effects of 1800 MHz RF-EMF exposure on DNA damage and cellular functions in primary cultured neurogenic cells.

Importance of DNA fragmentation in apoptosis with regard to TUNEL specificity.

Oxidative changes and apoptosis induced by 1800-MHz electromagnetic radiation in NIH/3T3 cells.

The genomic effects of cell phone exposure on the reproductive system.

Exposure to 1800 MHz radiofrequency radiation induces oxidative damage to mitochondrial DNA in primary cultured neurons.

Mitochondrial DNA damage and oxidative damage in HL-60 cells exposed to 900MHz radiofrequency fields.

Microwave miniprep of total genomic DNA from fungi, plants, protists and animals for PCR.

Exposure to 915 MHz radiation induces micronuclei in Vicia faba root tips.

[Pulse-modulated Electromagnetic Radiation of Extremely High Frequencies Protects Cellular DNA against Damaging Effect of Physico-Chemical Factors in vitro].

GSM 900 MHz cellular phone radiation can either stimulate or depress early embryogenesis in Japanese quails depending on the duration of exposure.

Microwaves from UMTS/GSM mobile phones induce long-lasting inhibition of 53BP1/gamma-H2AX DNA repair foci in human lymphocytes.

915 MHz microwaves and 50 Hz magnetic field affect chromatin conformation and 53BP1 foci in human lymphocytes from hypersensitive and healthy persons.

Synergism between electricity and ionizing radiation.

[Mechanisms of electromagnetic radiation damaging male reproduction].

Comments on "Radiofrequency electromagnetic fields (UMTS, 1,950 MHz) induce genotoxic effects in vitro in human fibroblasts but not in lymphocytes" by Schwarz et al. (Int Arch Occup Environ Health 2008: doi: 10.1007/s00420-008-0305-5).

Genotoxic effects of exposure to radiofrequency electromagnetic fields (RF-EMF) in HL-60 cells are not reproducible.

[Changes in the chromatin structure of lymphoid cells under the influence of low-intensity extremely high-frequency electromagnetic radiation against the background of inflammatory process].

Effect of 7 mT static magnetic field and iron ions on rat lymphocytes: apoptosis, necrosis and free radical processes.

[Cytophotometry of myelokaryocyte DNA following a single exposure to low-intensity UHF irradiation].

Genotoxicity of radiofrequency radiation. DNA/Genetox Expert Panel.

Effect of Mobile Phone Radiation on Cardiovascular Development of Chick Embryo.

Effects of gamma rays, ultraviolet radiation, sunlight, microwaves and electromagnetic fields on gene expression mediated by human immunodeficiency virus promoter.

Radiofrequency radiation (900 MHz)-induced DNA damage and cell cycle arrest in testicular germ cells in swiss albino mice.

Effect of exposure to 900 MHz radiofrequency radiation on intrachromosomal recombination in pKZ1 mice.

Evaluation of DNA damage in spinal cord and mutagenic effect of a Phalpha1beta recombinant toxin with analgesic properties from the Phoneutria nigriventer spider.

Microwaves from GSM mobile telephones affect 53BP1 and gamma-H2AX foci in human lymphocytes from hypersensitive and healthy persons.

Effects of co-exposure to extremely low frequency (ELF) magnetic fields and benzene or benzene metabolites determined in vitro by the alkaline comet assay.

Study of low-intensity 2450-MHz microwave exposure enhancing the genotoxic effects of mitomycin C using micronucleus test and comet assay in vitro.

Effects of radiofrequency electromagnetic waves (RF-EMW) from cellular phones on human ejaculated semen: an in vitro pilot study.

Oxidative and mutagenic effects of low intensity GSM 1800 MHz microwave radiation.

Effects of Long-Term Exposure to 60 GHz Millimeter-Wavelength Radiation on the Genotoxicity and Heat Shock Protein (Hsp) Expression of Cells Derived from Human Eye.

Investigation of potential genotoxic effects of low frequency electromagnetic fields on Escherichia coli.

[Impact of mobile phone radiation on the quality and DNA methylation of human sperm in vitro].

[Effects of low-intensity extremely high frequency electromagnetic radiation on chromatin structure of lymphoid cells in vivo and in vitro].

Characterisation of transcriptionally active and inactive chromatin domains in neurons.

Effect of microwave exposure on the ovarian development of Drosophila melanogaster.

Exposure to non-ionizing electromagnetic radiation of public risk prevention instruments threatens the quality of spermatozoids.

The biological effects of radiofrequency radiation: a critical review and recommendations.

Increase in the mitotic recombination frequency in Drosophila melanogaster by magnetic field exposure and its suppression by vitamin E supplement.

[Mechanisms of the combined effect of SHF electromagnetic radiation and hydrogen peroxide on the viability of microorganisms].

RNA-dependent DNA polymerase (reverse transcriptase) from avian myeloblastosis virus: a zinc metalloenzyme.

Theme - Chromosome damage in lymphocytes exposed to radiofrequency radiation

Titles

Chromosome damage and micronucleus formation in human blood lymphocytes exposed in vitro to radiofrequency radiation at a cellular telephone frequency (847.74 MHz, CDMA).

Cytogenetic studies in human blood lymphocytes exposed in vitro to 2.45 GHz or 8.2 GHz radiofrequency radiation.

Cytogenetic studies in human blood lymphocytes exposed in vitro to radiofrequency radiation at a cellular telephone frequency (835.62 MHz, FDMA).

Effects of modulated microwave radiation at cellular telephone frequency (1.95 GHz) on X-ray-induced chromosome aberrations in human lymphocytes in vitro.

Influence of radiofrequency radiation on chromosome aberrations in CHO cells and its interaction with DNA-damaging agents.

Increased levels of numerical chromosome aberrations after in vitro exposure of human peripheral blood lymphocytes to radiofrequency electromagnetic fields for 72 hours.

Comparison of chromosome aberrations in peripheral blood lymphocytes from people occupationally exposed to ionizing and radiofrequency radiation.

935 MHz cellular phone radiation. An in vitro study of genotoxicity in human lymphocytes.

Evaluation of genotoxic effects in human peripheral blood leukocytes following an acute in vitro exposure to 900 MHz radiofrequency fields.

Genetic damage in mammalian somatic cells exposed to radiofrequency radiation: a meta-analysis of data from 63 publications (1990-2005).

Mutagenic and morphologic impacts of 1.8GHz radiofrequency radiation on human peripheral blood lymphocytes (hPBLs) and possible protective role of pre-treatment with Ginkgo biloba (EGb 761).

Effects of 1-week and 6-week exposure to GSM/DCS radiofrequency radiation on micronucleus formation in B6C3F1 mice.

Influence of GSM signals on human peripheral lymphocytes: study of genotoxicity.

The repair of gamma-ray-induced chromosomal damage in human lymphocytes after exposure to extremely low frequency electromagnetic fields.

Exposure of human peripheral blood lymphocytes to electromagnetic fields associated with cellular phones leads to chromosomal instability.

Genetic damage in human cells exposed to non-ionizing radiofrequency fields: a meta-analysis of the data from 88 publications (1990-2011).

Incidence of micronuclei in human peripheral blood lymphocytes exposed to modulated and unmodulated 2450 MHz radiofrequency fields.

Effects of in vivo exposure to GSM-modulated 900 MHz radiation on mouse peripheral lymphocytes.

Clastogenic effects in human lymphocytes of power frequency electric fields: in vivo and in vitro studies.

Frequency of micronuclei in the blood and bone marrow cells of mice exposed to ultra-wideband electromagnetic radiation.

Micronucleus assay and lymphocyte mitotic activity in risk assessment of occupational exposure to microwave radiation.

Effect of nuclear magnetic resonance on chromosomes of mouse bone marrow cells.

In vitro lymphocyte proliferation induced by radio-frequency electromagnetic radiation under isothermal conditions.

Induction of adaptive response in human blood lymphocytes exposed to 900 MHz radiofrequency fields: influence of cell cycle.

Lymphocytes and low-frequency electromagnetic fields.

Chromosomal effects in lymphocytes of 400 kV-substation workers.

Effects of high-frequency electromagnetic fields on human lymphocytes in vitro.

Assessment of genotoxicity and genomic instability in rat primary astrocytes exposed to 872 MHz radiofrequency radiation and chemicals.

Increased chromatid-type chromosomal aberrations in mouse m5S cells exposed to power-line frequency magnetic fields.

Cytogenetic studies in human cells exposed in vitro to GSM-900 MHz radiofrequency radiation using R-banded karyotyping.

Genotoxic effects of 3 T magnetic resonance imaging in cultured human lymphocytes.

Age-dependent effects of in vitro radiofrequency exposure (mobile phone) on CD95+ T helper human lymphocytes.

Micronuclei in peripheral blood and bone marrow cells of mice exposed to 42 GHz electromagnetic millimeter waves.

Cytogenetic effects of 900 MHz (GSM) microwaves on human lymphocytes.

Radiofrequency electromagnetic fields (UMTS, 1,950 MHz) induce genotoxic effects in vitro in human fibroblasts but not in lymphocytes.

Elevated sister chromatid exchange frequencies in dividing human peripheral blood lymphocytes exposed to 50 Hz magnetic fields.

Chromosomal damage in human diploid fibroblasts by intermittent exposure to extremely low-frequency electromagnetic fields.

Micronuclei in the blood and bone marrow cells of mice exposed to specific complex time-varying pulsed magnetic fields.

Enhanced cytotoxic and genotoxic effects of gadolinium following ELF-EMF irradiation in human lymphocytes.

[Effects of electromagnetic radiation on health and immune function of operators].

[Chromosome abnormalities caused by computer video display monitors' radiation].

Effect of low-level pulsed electromagnetic fields on human chromosomes in vitro: analysis of chromosomal aberrations.

Effect of high-frequency electromagnetic fields with a wide range of SARs on chromosomal aberrations in murine m5S cells.

Cytogenetic effects of 935.2-MHz (GSM) microwaves alone and in combination with mitomycin C.

Effect of 900 MHz Electromagnetic Radiation on the Induction of ROS in Human Peripheral Blood Mononuclear Cells.

Analysis of chromosomal aberrations, sister chromatid exchanges and micronuclei among power linesmen with long-term exposure to 50-Hz electromagnetic fields.

A chromosomal study of workers with long-term exposure to radio-frequency radiation.

Induction of adaptive response in mice exposed to 900MHz radiofrequency fields: application of micronucleus assay.

Genetic damage in subjects exposed to radiofrequency radiation.

Investigation of the genotoxic effect of microwave irradiation in rat bone marrow cells: in vivo exposure.

[Effect of electromagnetic radiation on T-lymphocyte subpopulations and immunoglobulin level in human blood serum after occupational exposure].

Effects of low frequency electromagnetic fields on expression of lymphocyte subsets and production of cytokines of men and women employed in a museum.

Terahertz radiation increases genomic instability in human lymphocytes.

Cytogenetic damage in human lymphocytes following GMSK phase modulated microwave exposure.

Aneuploidy studies in human cells exposed in vitro to GSM-900 MHz radiofrequency radiation using FISH.

X-rays, microwaves and vinyl chloride monomer: their clastogenic and aneugenic activity, using the micronucleus assay on human lymphocytes.

[The effect of ultrahigh-frequency radiation on adaptation thresholds and the damages to blood system cells].

Erythropoietic changes in rats after 2.45 GJz nonthermal irradiation.

Cytogenetic observations in human peripheral blood leukocytes following in vitro exposure to THz radiation: a pilot study.

Effect of long-term 50 Hz magnetic field exposure on the micronucleated polychromatic erythrocytes of mice.

Interactive developmental toxicity of radiofrequency radiation and 2-methoxyethanol in rats.

Proflavin and microwave radiation: absence of a mutagenic interaction.

Effects of GSM-modulated 900 MHz radiofrequency electromagnetic fields on the hematopoietic potential of mouse bone marrow cells.

Follow up study on the immune response to low frequency electromagnetic fields in men and women working in a museum.

Adverse and beneficial effects in Chinese hamster lung fibroblast cells following radiofrequency exposure.

Cytogenetic effects of extremely low frequency magnetic field on Wistar rat bone marrow.

[Chromosome studies of personnel exposed to electromagnetic radiation at radar centers].

Evaluation of the cytogenotoxic damage in immature and mature rats exposed to 900 MHz radiofrequency electromagnetic fields.

Clastogenicity and aneuploidy in newborn and adult mice exposed to 50 Hz magnetic fields.

Effects of electromagnetic fields on the immune systems of occupationally exposed humans and mice.

954 MHz microwaves enhance the mutagenic properties of mitomycin C.

[Comparative effectiveness of different tests to determine the mutagenicity of certain factors in mammals. II. Frequency of anomalous sperm head in mice exposed to different factors].

Cytotoxic and genotoxic effects of high-frequency electromagnetic fields (GSM 1800 MHz) on immature and mature rats.

Interactions of radiofrequency radiation on 2-methoxyethanol teratogenicity in rats.

[The cytogenetic action of electromagnetic fields in the short-wave range].

In vitro fertilization of mouse ova by spermatozoa exposed isothermally to radio-frequency radiation.

Effect of Exposure to 900 MHz GSM Mobile Phone Radiofrequency Radiation on Estrogen Receptor Methylation Status in Colon Cells of Male Sprague Dawley Rats.

Adaptive response in mouse bone marrow stromal cells exposed to 900MHz radiofrequency fields: Impact of poly (ADP-ribose) polymerase (PARP).

Effects of electromagnetic fields produced by radiotelevision broadcasting stations on the immune system of women.

Assessment of radio-frequency electromagnetic radiation by the micronucleus test in bovine peripheral erythrocytes.

[Levels of immunoglobulin and subpopulations of T lymphocytes and NK cells in men occupationally exposed to microwave radiation in frequencies of 6-12 GHz].

Association of low job control with a decrease in memory (CD4+ CD45RO+) T lymphocytes in Japanese middle-aged male workers in an electric power plant.

Effects of extremely low-frequency electromagnetic fields on delayed chromosomal instability induced by bleomycin in normal human fibroblast cells.

[Proliferation of bone marrow cells upon exposure to constant magnetic fields of ultra-high strength].

The immune response of women with prolonged exposure to electromagnetic fields produced by radiotelevision broadcasting stations.

Acute exposure to 930 MHz CW electromagnetic radiation in vitro affects reactive oxygen species level in rat lymphocytes treated by iron ions.

The process of myelopoiesis in guinea pigs under conditions of a static magnetic field.

[Effect of electromagnetic radiation of millimetric wave band on genome of somatic cells].

Suppression of T-lymphocyte cytotoxicity following exposure to 60-Hz sinusoidal electric fields.

Reactive oxygen species formation and apoptosis in human peripheral blood mononuclear cell induced by 900 MHz mobile phone radiation.

Occupational exposure to high frequency electromagnetic fields and its effect on human immune parameters.

Does radio frequency radiation induce micronuclei frequency in exfoliated bladder cells of diabetic rats?

Radiofrequency radiation and the immune system. Part 3. In vitro effects on human immunoglobin and on murine T- and B-lymphocytes.

Leukocyte trafficking in response to magnetic resonance imaging.

Combined effects of traffic and electromagnetic fields on the immune system of fertile atopic women.

Developmental toxicity interactions of methanol and radiofrequency radiation or 2-methoxyethanol in rats.

Neoplastic transformation in C3H 10T(1/2) cells after exposure to 835.62 MHz FDMA and 847.74 MHz CDMA radiations.

Adaptive response in animals exposed to non-ionizing radiofrequency fields: some underlying mechanisms.

Probing lymphoma infiltration in spleen of AKR/J mice chronically exposed to electromagnetic fields for risk assessment--toward noninvasive modeling.

Combined exposure of ELF magnetic fields and x-rays increased mutant yields compared with x-rays alone in pTN89 plasmids.

Theme - Adverse effects of low-frequency EMF on cells

Titles

Extremely low frequency variable electromagnetic fields affect cancer and noncancerous cells in vitro differently: Preliminary study.

Effect of electromagnetic field exposure on chemically induced differentiation of friend erythroleukemia cells.

Extremely low-frequency electromagnetic fields cause G1 phase arrest through the activation of the ATM-Chk2-p21 pathway.

Extremely low frequency electromagnetic field exposure promotes differentiation of pituitary corticotrope-derived AtT20 D16V cells.

Effect of extremely low-frequency electromagnetic fields on antioxidant activity in the human keratinocyte cell line NCTC 2544.

Electromagnetic fields with frequencies of 5, 60 and 120 Hz affect the cell cycle and viability of human fibroblast BJ in vitro.

Bidirectional frequency-dependent effect of extremely low-frequency electromagnetic field on E. coli K-12.

Melatonin protects rat cerebellar granule cells against electromagnetic field-induced increases in Na(+) currents through intracellular Ca(2+) release.

Neuroprotective effects of lotus seedpod procyanidins on extremely low frequency electromagnetic field-induced neurotoxicity in primary cultured hippocampal neurons.

Pulsed Electromagnetic Field Stimulation Promotes Anti-cell Proliferative Activity in Doxorubicin-treated Mouse Osteosarcoma Cells.

Effects of low frequency electromagnetic field on proliferation of human epidermal stem cells: An in vitro study.

Extremely low-frequency electromagnetic field exposure enhances inflammatory response and inhibits effect of antioxidant in RAW 264.7 cells.

[Effects of extremely low frequency pulsed electromagnetic field on different-derived osteoblast-like cells].

Impact of extremely low frequency electromagnetic fields on CD4 expression in peripheral blood mononuclear cells.

[Effect of long-term power frequency electromagnetic field exposure on proliferation and apoptosis of SRA01/04 cells].

[Effect of pulsed electromagnetic field with different frequencies on the proliferation, apoptosis and migration of human ovarian cancer cells].

Extremely low frequency electromagnetic fields affect proliferation and mitochondrial activity of human cancer cell lines.

Effects of extremely low-frequency pulsed electromagnetic fields on morphological and biochemical properties of human breast carcinoma cells (T47D).

Correlation between pulsed electromagnetic fields exposure time and cell proliferation increase in human osteosarcoma cell lines and human normal osteoblast cells in vitro.

Influence of extremely low frequency electromagnetic fields on the swimming behavior of ciliates.

Suppression of a differentiation response in MC-3T3-E1 osteoblast-like cells by sustained, low-level, 30 Hz magnetic-field exposure.

Exposure of rats to extremely low-frequency electromagnetic fields (ELF-EMF) alters cytokines production.

Exposure to extremely low frequency electromagnetic fields alters the calcium dynamics of cultured entorhinal cortex neurons.

Effects of electromagnetic fields on molecules and cells.

Effect of intermittent and continuous exposure to electromagnetic fields on cultured hippocampal cells.

The impact of electromagnetic field at a frequency of 50 Hz and a magnetic induction of 2.5 mT on viability of pineal cells in vitro.

Induction of apoptotic cell death in human leukemic cell line, HL-60, by extremely low frequency electric magnetic fields: analysis of the possible mechanisms in vitro.

Acute effects of low-frequency electromagnetic fields on leukocyte-endothelial interactions in vivo.

Effects of 50 Hz pulsed electromagnetic fields on the growth and cell cycle arrest of mesenchymal stem cells: an in vitro study.

Haemopoietic cell proliferation in murine bone marrow cells exposed to extreme low frequency (ELF) electromagnetic fields.

Extremely low frequency electromagnetic field exposure affects fertilization outcome in swine animal model.

Effects of extremely low frequency electromagnetic fields on human fetal scleral fibroblasts.

Action of a 50 Hz magnetic field on proliferation of cells in culture.

In vitro evaluation of teratogenic effects by time-varying MR gradient fields on fetal human fibroblasts.

Chronic electromagnetic field exposure decreases HSP70 levels and lowers cytoprotection.

Effect of exposure to an extremely low frequency-electromagnetic field on the cellular collagen with respect to signaling pathways in osteoblast-like cells.

Effect of puerarin on matrix metalloproteinase-2 in human fetal scleral fibroblasts treated with low frequency electromagnetic fields.

Effects of extremely low frequency electromagnetic fields on intracellular calcium transients in cardiomyocytes.

[Biological effects of non-ionizing electromagnetic radiation].

Effects of 60 Hz extremely low frequency magnetic fields (EMF) on radiation- and chemical-induced mutagenesis in mammalian cells.

Exposure to ELF-pulse modulated X band microwaves increases in vitro human astrocytoma cell proliferation.

Bioelectromagnetic field effects on cancer cells and mice tumors.

A 700 MHz 1H-NMR study reveals apoptosis-like behavior in human K562 erythroleukemic cells exposed to a 50 Hz sinusoidal magnetic field.

Low intensity and frequency pulsed electromagnetic fields selectively impair breast cancer cell viability.

Cellular effects of electromagnetic fields.

50 Hz extremely low frequency electromagnetic fields enhance protein carbonyl groups content in cancer cells: effects on proteasomal systems.

Pulsed electromagnetic fields accelerate apoptotic rate in osteoclasts.

A short-term extremely low frequency electromagnetic field exposure increases circulating leukocyte numbers and affects HPA-axis signaling in mice.

Delineation of electric and magnetic field effects of extremely low frequency electromagnetic radiation on transcription.

Pulsed or continuous electromagnetic field induce p53/p21-mediated apoptotic signaling pathway in mouse spermatogenic cells in vitro and thus may affect male fertility.

Power-frequency electromagnetic fields and the capacitative calcium entry system in SV40-transformed Swiss 3T3 cells.

Transferrin receptors and natural killer cell lysis. A study using Colo 205 cells exposed to 60 Hz electromagnetic fields.

Electromagnetic fields and cells.

Calcium protects differentiating neuroblastoma cells during 50 Hz electromagnetic radiation.

A review of in vitro studies: low-frequency electromagnetic fields.

Electric and/or magnetic field effects on DNA structure and function in cultured human cells.

Effects of long-term 50Hz power-line frequency electromagnetic field on cell behavior in Balb/c 3T3 cells.

Low-intensity electromagnetic fields induce human cryptochrome to modulate intracellular reactive oxygen species.

Effect of extremely low frequency (ELF) magnetic field exposure on morphological and biophysical properties of human lymphoid cell line (Raji).

Effect of 0.2 T static magnetic field on human neurons: remodeling and inhibition of signal transduction without genome instability.

Exposure to 1.8 GHz electromagnetic fields affects morphology, DNA-related Raman spectra and mitochondrial functions in human lympho-monocytes.

Effects of 60-Hz fields, estradiol and xenoestrogens on human breast cancer cells.

Influence of a 50 hz extra low frequency electromagnetic field on spermatozoa motility and fertilization rates in rabbits.

Semi-quantitative proteomics of mammalian cells upon short-term exposure to non-ionizing electromagnetic fields.

[Experimental data on extremely low frequency (ELF) electromagnetic fields].

[Effect of static magnetic field on development toxicity of rat embryonic midbrain neurons cells].

[Flow cytometric analysis of the effects of 50 Hz magnetic fields on mouse spermatogenesis].

Dose dependence of acetylcholinesterase activity in neuroblastoma cells exposed to modulated radio-frequency electromagnetic radiation.

Increased apoptosis, changes in intracellular Ca2+, and functional alterations in lymphocytes and macrophages after in vitro exposure to static magnetic field.

Biomarkers of induced electromagnetic field and cancer.

IGF-II receptor number is increased in TE-85 osteosarcoma cells by combined magnetic fields.

Nonlinear cell response to strong electric fields.

Mechanisms underlying spontaneous calcium spiking in aequorin-loaded ROS 17/2.8 cells.

The effects of low-energy 60-Hz environmental electromagnetic fields upon the growth-related enzyme ornithine decarboxylase.

Effects of extremely low frequency electromagnetic fields on turkeys.

The Bioeffects Resulting from Prokaryotic Cells and Yeast Being Exposed to an 18 GHz Electromagnetic Field.

[Modeling of the effect of modulated electromagnetic radiation on animal cells].

2.45-Gz wireless devices induce oxidative stress and proliferation through cytosolic Ca(2)(+) influx in human leukemia cancer cells.

[Influence of electromagnetic radiation of different ranges on the transmembrane transport of Na+, K+, and Ca2+ ions in normal and tumor cells].

Reactive oxygen species levels and DNA fragmentation on astrocytes in primary culture after acute exposure to low intensity microwave electromagnetic field.

Analysis of the effect of a 60 Hz AC field on histamine release by rat peritoneal mast cells.

Intramembrane protein distribution in cell cultures is affected by 50 Hz pulsed magnetic fields.

Calcium homeostasis of isolated heart muscle cells exposed to pulsed high-frequency electromagnetic fields.

Do electromagnetic fields interact directly with DNA?

Extremely low frequency 7 Hz 100 microT electromagnetic radiation promotes differentiation in the human epithelial cell line HaCaT.

Effects of 60 Hz electromagnetic field exposure on testicular germ cell apoptosis in mice.

Antiproliferative effect of millimeter radiation on human erythromyeloid leukemia cell line K562 in culture: ultrastructural- and metabolic-induced changes.

A 3 milliTesla 60 Hz magnetic field is neither mutagenic nor co-mutagenic in the presence of menadione and MNU in a transgenic rat cell line.

Exposure to low frequency pulsed electromagnetic fields increases interleukin-1 and interleukin-6 production by human peripheral blood mononuclear cells.

Enhanced proliferation caused by a low frequency weak magnetic field in chick embryo fibroblasts is suppressed by radical scavengers.

The interaction between electromagnetic fields at megahertz, gigahertz and terahertz frequencies with cells, tissues and organisms: risks and potential.

In vitro evaluation of magnetic resonance imaging at 3.0 tesla on clonogenic ability, proliferation, and cell cycle in human embryonic lung fibroblasts.

Increased ornithine decarboxylase activity in cultured cells exposed to low energy modulated microwave fields and phorbol ester tumor promoters.

Subchronic effects on leukocyte-endothelial interactions in mice by whole body exposure to extremely low frequency electromagnetic fields.

Acute and chronic effects of exposure to a 1-mT magnetic field on the cytoskeleton, stress proteins, and proliferation of astroglial cells in culture.

Effects of weak environmental magnetic fields on the spontaneous bioelectrical activity of snail neurons.

Long-term effects of repetitive exposure to a static magnetic field (1.5 T) on proliferation of human fetal lung fibroblasts.

Modification of electrokinetic properties of nuclei in human buccal epithelial cells by electric fields.

Bioeffects induced by exposure to microwaves are mitigated by superposition of ELF noise.

Electromagnetic fields (UHF) increase voltage sensitivity of membrane ion channels; possible indication of cell phone effect on living cells.

Synaptosomal acetylcholinesterase activity variation pattern in the presence of electromagnetic fields.

Chicken embryo fibroblasts exposed to weak, time-varying magnetic fields share cell proliferation, adenosine deaminase activity, and membrane characteristics of transformed cells.

Low-frequency electromagnetic fields alter the replication cycle of MS2 bacteriophage.

Effects of exposure to electromagnetic radiation at 835 MHz on growth, morphology and secretory characteristics of a mast cell analogue, RBL-2H3.

Cell membrane lipid molecular dynamics in a solenoid versus a magnetically shielded room.

Studies on the possible biological effects of 50 Hz electric and/or magnetic fields: evaluation of some glycolytic enzymes, glycolytic flux, energy and oxido-reductive potentials in human erythrocytes exposed in vitro to power frequency fields.

Modelling the internal field distribution in human erythrocytes exposed to MW radiation.

Nonlinear dynamical law governs magnetic field induced changes in lymphoid phenotype.

Extremely low frequency electromagnetic fields and heat shock can increase microvesicle motility in astrocytes.

[Extremely low frequency electromagnetic radiation enhanced energy metabolism and induced oxidative stress in Caenorhabditis elegans].

Exposure to low-frequency pulsed electromagnetic fields increases mitogen-induced lymphocyte proliferation in Down's syndrome.

Injury by electrical forces: pathophysiology, manifestations, and therapy.

Joint actions of environmental nonionizing electromagnetic fields and chemical pollution in cancer promotion.

Cellular communication in clone 9 cells exposed to magnetic fields.

Spindle disturbances in human-hamster hybrid (A(L)) cells induced by the electrical component of the mobile communication frequency range signal.

Scientific evidence contradicts findings and assumptions of Canadian Safety Panel 6: microwaves act through voltage-gated calcium channel activation to induce biological impacts at non-thermal levels, supporting a paradigm shift for microwave/lower frequency electromagnetic field action.

Neoplastic transformation of C3H/10T1/2 cells following exposure to 120-Hz modulated 2.45-GHz microwaves and phorbol ester tumor promoter.

Effects of 50 Hz electromagnetic fields on rat cortical synaptosomes.

Effect of pulsed electromagnetic field exposure on adenosine receptors in rat brain.

[Effect of sinusoidal electricity magnetic fields on the proliferation and differentiation of osteoblasts in vitro].

A study of the electric field distribution in erythrocyte and rod shape cells from direct RF exposure.

Carcinogenesis and initiation of cell cycling by charge-induced membrane clusters may be due to mitogen receptors and Na+/H+ antiports.

The effect of a high frequency electromagnetic field in the microwave range on red blood cells.

[A static magnetic field loading system for in vitro cultured cells].

Mobile phones modulate response patterns of human brain activity.

Cytokine profile of human peripheral blood mononuclear cells exposed to 50 Hz EMF.

Low-Frequency Electromagnetic Field Exposure Enhances Extracellular Trap Formation by Human Neutrophils through the NADPH Pathway.

Alterations in protein kinase activity following exposure of cultured human lymphocytes to modulated microwave fields.

Offset of the vacuolar potential of Characean cells in response to electromagnetic radiation over the range 250 Hz-250 kHz.

Effect of 935-MHz phone-simulating electromagnetic radiation on endometrial glandular cells during mouse embryo implantation.

Human standing balance is affected by exposure to pulsed ELF magnetic fields: light intensity-dependent effects.

Effects of ELF (1-120 Hz) and modulated (50 Hz) RF fields on the efflux of calcium ions from brain tissue in vitro.

Influence of extremely low frequency magnetic fields on Ca2+ signaling and NMDA receptor functions in rat hippocampus.

A 50 Hz sinusoidal magnetic field does not damage MG-63 three-dimensional tumor spheroids but induces changes in their invasive properties.

A mechanism for action of oscillating electric fields on cells.

Electromagnetic fields (1.8 GHz) increase the permeability to sucrose of the blood-brain barrier in vitro.

ELF magnetic fields increase amino acid uptake into Vicia faba L. roots and alter ion movement across the plasma membrane.

Nonlinear determinism in the immune system. In vivo influence of electromagnetic fields on different functions of murine lymphocyte subpopulations.

Modulation of cell death in the rat thymus. Light and electron microscopic investigations.

Spindle disturbances in human-hamster hybrid (AL) cells induced by mobile communication frequency range signals.

Occupational exposure to static, ELF, VF and VLF magnetic fields and immune parameters.

Role of radical pairs and feedback in weak radio frequency field effects on biological systems.

Vacuolar hyperpolarizing offsets in characean cells exposed to mono- and bichromatic CW and to squarewave-modulated electromagnetic radiation in the band 200-1,000 MHz.

Evaluations of Acute and Sub-Acute Biological Effects of Narrowband and Moderate-Band High Power Electromagnetic Waves on Cellular Spheroids.

A 0.5 G, 60 Hz magnetic field suppresses melatonin production in pinealocytes.

Response of the seminiferous epithelium of the mouse exposed to low dose high energy (HZE) and electromagnetic radiation.

Initial studies on the effects of combined 60 Hz electric and magnetic field exposure on the immune system of nonhuman primates.

Induction of stress proteins by electromagnetic fields in cultured HL-60 cells.

Electromagnetic fields may act via calcineurin inhibition to suppress immunity, thereby increasing risk for opportunistic infection: Conceivable mechanisms of action.

The vacuolar potential of Characean cells subjected to electromagnetic radiation in the range 200-8,200 MHz.

Radiation and brain calcium: a review and critique.

Effects of a moderate-intensity static magnetic field on VEGF-A stimulated endothelial capillary tubule formation in vitro.

Low-amplitude, high-frequency electromagnetic field exposure causes delayed and reduced growth in Rosa hybrida.

[The laboratory detection of intra-cellular factors of anti-viral defense under community-acquired pneumonia in evaluation of effects of low-intensity microwave radiation].

Induced mitogenic activity in AML-12 mouse hepatocytes exposed to low-dose ultra-wideband electromagnetic radiation.

Are there modulated electromagnetic field effects on human conscious perception during attentional blink test?

Effects of electromagnetic radiation in the range 20-300 MHz on the vacuolar potential of characean cells.

Frohlich electromagnetic radiation from human leukocytes: implications for leukocyte adherence inhibition test.

Evaluation of health risks caused by radio frequency accelerated carcinogenesis: the importance of processes driven by the calcium ion signal.

Diacetyl and 2,3-pentanedione exposure of human cultured airway epithelial cells: Ion transport effects and metabolism of butter flavoring agents.

[Mechanism of the biological impact of weak electromagnetic fields and in vitro effects of degassing of blood].

Effects of 45-Hz magnetic fields on the functional state of the human brain.

Some characteristics of the glutathione cycle revealed by ionising and non-ionising electromagnetic radiation.

Magnetic Field Reference Levels for Arbitrary Periodic Waveforms for Prevention of Peripheral Nerve Stimulation.

Magnetism and cardiac arrhythmias.

Aluminum, calcium ion and radiofrequency synergism in acceleration of lymphomagenesis.

Low-frequency electromagnetic fields induce a stress effect upon higher plants, as evident by the universal stress signal, alanine.

Electromagnetic Fields and Stem Cell Fate: When Physics Meets Biology.

Inhibition of neuronal high-voltage activated calcium channels by the omega-phoneutria nigriventer Tx3-3 peptide toxin.

Effect of pulsed high frequency electromagnetic radiation on embryonic mouse palate in vitro.

[The physical mechanism of the effect of low-intensity electromagnetic radiation on biological cells].

[Changes in the acaricidal properties of organophosphorus compounds under the influence of magnetic resonance treatment].

Functional changes in human peripheral neutrophils in workers with different exposure to noxious agents.

Relationship between the Contents of Cyclins, Cyclin-Dependent Kinases, and Their Inhibitors in Whole Blood Mononuclear Leukocytes during the Postclinical Stage of Community-Acquired Pneumonia under the Influence of 1-GHz Microwaves.

Circadian locomotor activity of Musca flies: recording method and effects of 10 Hz square-wave electric fields.

The spark of life: electricity and regeneration.

Sensitive model with which to detect athermal effects of non-ionizing electromagnetic radiation.

Theme - Gene expression alterations following radiofrequency exposure

Titles

2.45 GHz radiofrequency fields alter gene expression in cultured human cells.

Whole-genome expression analysis in primary human keratinocyte cell cultures exposed to 60 GHz radiation.

Analysis of gene expression in a human-derived glial cell line exposed to 2.45 GHz continuous radiofrequency electromagnetic fields.

Analysis of gene expression in mouse brain regions after exposure to 1.9 GHz radiofrequency fields.

Analysis of proto-oncogene and heat-shock protein gene expression in human derived cell-lines exposed in vitro to an intermittent 1.9 GHz pulse-modulated radiofrequency field.

Characterization of biological effect of 1763 MHz radiofrequency exposure on auditory hair cells.

Using model organism Saccharomyces cerevisiae to evaluate the effects of ELF-MF and RF-EMF exposure on global gene expression.

Expression of cancer-related genes in human cells exposed to 60 Hz magnetic fields.

Effects on protein kinase C and gene expression in a human mast cell line, HMC-1, following microwave exposure.

Gene expression analysis of a human lymphoblastoma cell line exposed in vitro to an intermittent 1.9 GHz pulse-modulated radiofrequency field.

Mobile phone radiation causes changes in gene and protein expression in human endothelial cell lines and the response seems to be genome- and proteome-dependent.

Gene expression changes in human cells after exposure to mobile phone microwaves.

Gene expression profiles in white blood cells of volunteers exposed to a 50 Hz electromagnetic field.

Gene Expression Analysis in Human Peripheral Blood Cells after 900 MHz RF-EMF Short-Term Exposure.

In vitro study of the effects of ELF electric fields on gene expression in human epidermal cells.

Analysis of gene expression in two human-derived cell lines exposed in vitro to a 1.9 GHz pulse-modulated radiofrequency field.

[Global gene response to GSM 1800 MHz radiofrequency electromagnetic field in MCF-7 cells].

Biological effects of EMF exposure on Ets genes.

Evaluation of HSP70 expression and DNA damage in cells of a human trophoblast cell line exposed to 1.8 GHz amplitude-modulated radiofrequency fields.

Effects of the exposure to intermittent 1.8 GHz radio frequency electromagnetic fields on HSP70 expression and MAPK signaling pathways in PC12 cells.

2-GHz band CW and W-CDMA modulated radiofrequency fields have no significant effect on cell proliferation and gene expression profile in human cells.

Mobile phone radiation might alter protein expression in human skin.

Radiofrequency radiation (900 MHz) induces Egr-1 gene expression and affects cell-cycle control in human neuroblastoma cells.

Evaluation of bax, bcl-2, p21 and p53 genes expression variations on cerebellum of BALB/c mice before and after birth under mobile phone radiation exposure.

HSP70 expression in human trophoblast cells exposed to different 1.8 Ghz mobile phone signals.

Effects of exposure to a 1950 MHz radio frequency field on expression of Hsp70 and Hsp27 in human glioma cells.

Analysis of Gene Expression in Mice Testes Exposed to 1.765 GHz Microwave in Utero.

Modulation of heat shock protein response in SH-SY5Y by mobile phone microwaves.

Gene expression in human breast epithelial cells exposed to 60 Hz magnetic fields.

Gene and protein expression following exposure to radiofrequency fields from mobile phones.

Influence of high-frequency electromagnetic fields on different modes of cell death and gene expression.

Biological stress responses to radio frequency electromagnetic radiation: are mobile phones really so (heat) shocking?

A Genome-Wide mRNA Expression Profile in Caenorhabditis elegans under Prolonged Exposure to 1750MHz Radiofrequency Fields.

Impact of 60-GHz millimeter waves on stress and pain-related protein expression in differentiating neuron-like cells.

[Effects of GSM 1800 MHz radiofrequency electromagnetic fields on protein expression profile of human breast cancer cell MCF-7].

Gene expression and reproductive abilities of male Drosophila melanogaster subjected to ELF-EMF exposure.

Biological monitoring of non-thermal effects of mobile phone radiation: recent approaches and challenges.

Mobile-phone radiation-induced perturbation of gene-expression profiling, redox equilibrium and sporadic-apoptosis control in the ovary of Drosophila melanogaster.

The genotoxic effect of radiofrequency waves on mouse brain.

Connection between Cell Phone use, p53 Gene Expression in Different Zones of Glioblastoma Multiforme and Survival Prognoses.

Exposure to cell phone radiation up-regulates apoptosis genes in primary cultures of neurons and astrocytes.

In vivo modulation of ETS genes induced by electromagnetic fields.

Human health consequences of environmentally-modulated gene expression: potential roles of ELF-EMF induced epigenetic versus mutagenic mechanisms of disease.

Exposure to 2.45 GHz electromagnetic fields induces hsp70 at a high SAR of more than 20 W/kg but not at 5W/kg in human glioma MO54 cells.

Hsp70 is an independent stress marker among frequent users of mobile phones.

Study of p53 expression and post-transcriptional modifications after GSM-900 radiofrequency exposure of human amniotic cells.

Non-thermal activation of the hsp27/p38MAPK stress pathway by mobile phone radiation in human endothelial cells: molecular mechanism for cancer- and blood-brain barrier-related effects.

Exposure to global system for mobile communication (GSM) cellular phone radiofrequency alters gene expression, proliferation, and morphology of human skin fibroblasts.

Expression analysis of human HL60 cells exposed to 60 Hz square- or sine-wave magnetic fields.

p53, Rb and bcl-2 expression during the cell cycle: a study in phytohaemagglutinin stimulated lymphocytes and microwave irradiated lymphoid tissue sections.

Human skin cell stress response to GSM-900 mobile phone signals. In vitro study on isolated primary cells and reconstructed epidermis.

In vitro study of the stress response of human skin cells to GSM-1800 mobile phone signals compared to UVB radiation and heat shock.

Proteomic analysis on the alteration of protein expression in the early-stage placental villous tissue of electromagnetic fields associated with cell phone exposure.

Activity and expression of acetylcholinesterase in PC12 cells exposed to intermittent 1.8 GHz 217-GSM mobile phone signal.

Effect of 900 MHz electromagnetic fields on nonthermal induction of heat-shock proteins in human leukocytes.

In vitro effect of cell phone radiation on motility, DNA fragmentation and clusterin gene expression in human sperm.

Electromagnetic fields at a mobile phone frequency (900 MHz) trigger the onset of general stress response along with DNA modifications in Eisenia fetida earthworms.

Effects of a 2450 MHz high-frequency electromagnetic field with a wide range of SARs on the induction of heat-shock proteins in A172 cells.

Effect of GSM-900 and -1800 signals on the skin of hairless rats. III: Expression of heat shock proteins.

Analysis of the cellular stress response in MCF10A cells exposed to combined radio frequency radiation.

The Effect of Radiation Emitted by Cell Phone on The Gelatinolytic Activity of Matrix Metalloproteinase-2 and -9 of Mouse Pre-Antral Follicles during In Vitro Culture.

Effect of 3G cell phone exposure with computer controlled 2-D stepper motor on non-thermal activation of the hsp27/p38MAPK stress pathway in rat brain.

[Responses of thymocytes and splenocytes to low-intensity extremely high-frequency electromagnetic radiation in normal mice and in mice with systemic inflammation].

Analysis of proteome response to the mobile phone radiation in two types of human primary endothelial cells.

Mobile phone electromagnetic radiation activates MAPK signaling and regulates viability in Drosophila.

Novel electric power-driven hydrodynamic injection system for gene delivery: safety and efficacy of human factor IX delivery in rats.

Proto-oncogene mRNA levels and activities of multiple transcription factors in C3H 10T 1/2 murine embryonic fibroblasts exposed to 835.62 and 847.74 MHz cellular phone communication frequency radiation.

Effect of cell phone-like electromagnetic radiation on primary human thyroid cells.

Expression of the immediate early gene, c-fos, in mouse brain after acute global system for mobile communication microwave exposure.

[Effects of high power microwave on the expressions of Bcl-2 and C-myc proteins in the rat testis].

[The Impact of Electroacupuncture Intervention on Expression of 5-HTR 1 B/2 C Genes in Mice under Radiation Stimulation from Mobile Phone].

Cell phone use and parotid salivary gland alterations: no molecular evidence.

Electromagnetic fields may act directly on DNA.

Stimulation of ubiquitin-proteasome pathway through the expression of amidohydrolase for N-terminal asparagine (Ntan1) in cultured rat hippocampal neurons exposed to static magnetism.

Proteomic analysis of human lens epithelial cells exposed to microwaves.

[Effects of electromagnetic pulses on apoptosis and TGF-beta3 expression of mouse testis tissue].

[Changes in Ca(2+)concentration and caspase-3 expression and their relationship in Raji cells exposed to electromagnetic radiation].

Effects of pulsed electromagnetic fields on cartilage apoptosis signalling pathways in ovariectomised rats.

Upregulation of specific mRNA levels in rat brain after cell phone exposure.

Meta-proteomic analysis of protein expression distinctive to electricity-generating biofilm communities in air-cathode microbial fuel cells.

Response of Caenorhabditis elegans to wireless devices radiation exposure.

[The role of heat shock proteins HSP90 in the response of immune cells to centimeter microwaves].

Mechanism of short-term ERK activation by electromagnetic fields at mobile phone frequencies.

[Effects of electromagnetic radiation on RAF/MEK/ERK signaling pathway in rats hippocampus].

Electromagnetic-pulse-induced activation of p38 MAPK pathway and disruption of blood-retinal barrier.

Electromagnetic fields at mobile phone frequency induce apoptosis and inactivation of the multi-chaperone complex in human epidermoid cancer cells.

Electromagnetic wave irradiation promotes osteoblastic cell proliferation and up-regulates growth factors via activation of the ERK1/2 and p38 MAPK pathways.

Millimeter-wave exposure promotes the differentiation of bone marrow stromal cells into cells with a neural phenotype.

Electromagnetic pulse activated brain microglia via the p38 MAPK pathway.

Cytotoxicity of temozolomide on human glioblastoma cells is enhanced by the concomitant exposure to an extremely low-frequency electromagnetic field (100Hz, 100G).

Exposure to 50 Hz electromagnetic radiation promote early maturation and differentiation in newborn rat cerebellar granule neurons.

Analysis of the novel excretory cell expressed ECP-1 protein and its proposed ECP-1/IFC-2 fusion protein EXC-2 in the nematode Caenorhabditis elegans.

Microwave induced alteration in the neuron specific enolase gene expression.

Cytosolic calreticulin inhibits microwave radiation-induced microvascular endothelial cell injury through the integrin-focal adhesion kinase pathway.

Experimental study of millimeter wave-induced differentiation of bone marrow mesenchymal stem cells into chondrocytes.

Effect of 72 Hz pulsed magnetic field exposure on ras p21 expression in CCRF-CEM cells.

Bcl-2 and p53 immunoprofile in Kaposi's sarcoma.

The amelioration of phagocytic ability in microglial cells by curcumin through the inhibition of EMF-induced pro-inflammatory responses.

Cell phone use is associated with an inflammatory cytokine profile of parotid gland saliva.

Calreticulin protects rat microvascular endothelial cells against microwave radiation-induced injury by attenuating endoplasmic reticulum stress.

Qualitative effect on mRNAs of injury-associated proteins by cell phone like radiation in rat facial nerves.

p53 immunoreactivity in cutaneous PUVA tumors is similar to that in other non-melanoma skin neoplasms.

Effects of 2.45 GHz electromagnetic fields with a wide range of SARs on bacterial and HPRT gene mutations.

Microglia M1/M2 polarization contributes to electromagnetic pulse-induced brain injury.

900-MHz microwave radiation enhances gamma-ray adverse effects on SHG44 cells.

[The role of RKIP mediated ERK pathway in hippocampus neurons injured by electromagnetic radiation].

Isoflurane preconditioning ameliorates electromagnetic pulse-induced neural damage by shifting microglia polarization toward anti-inflammatory phenotype via upregulation of SOCS1.

Effects of prolonged exposure to moderate static magnetic field and its synergistic effects with alkaline pH on Enterococcus faecalis.

Abnormal physical architecture of the lipophilic domains of human sperm membrane in oligospermia: a logical cause for low fertility profiles.

[Ecological and biological characteristics of Drosophila melanogaster features depending on the dose of electromagnetic radiation of various types].

Construction and clinical significance of a predictive system for prognosis of hepatocellular carcinoma.

Theme - Adverse impacts of radiofrequency fields on sleep

Titles

Stimulation of the brain with radiofrequency electromagnetic field pulses affects sleep-dependent performance improvement.

Exposure to radiofrequency electromagnetic fields and sleep quality: a prospective cohort study.

Effects of mobile phone exposure (GSM 900 and WCDMA/UMTS) on polysomnography based sleep quality: An intra- and inter-individual perspective.

Environmental Radiofrequency Electromagnetic Fields Exposure at Home, Mobile and Cordless Phone Use, and Sleep Problems in 7-Year-Old Children.

Radio frequency electromagnetic field exposure in humans: Estimation of SAR distribution in the brain, effects on sleep and heart rate.

Wireless communication fields and non-specific symptoms of ill health: a literature review.

Cohort study on the effects of everyday life radio frequency electromagnetic field exposure on non-specific symptoms and tinnitus.

Memory performance, wireless communication and exposure to radiofrequency electromagnetic fields: A prospective cohort study in adolescents.

Exposure to pulse-modulated radio frequency electromagnetic fields affects regional cerebral blood flow.

Symptoms and the use of wireless communication devices: A prospective cohort study in Swiss adolescents.

Sleep after mobile phone exposure in subjects with mobile phone-related symptoms.

Cognitive performance measures in bioelectromagnetic research--critical evaluation and recommendations.

Sleep duration, quality, and timing and their associations with age in a community without electricity in Haiti.

Radiofrequency electromagnetic field exposure and non-specific symptoms of ill health: a systematic review.

Children's health and RF EMF exposure. Views from a risk assessment and risk communication perspective.

Human sleep under the influence of pulsed radiofrequency electromagnetic fields: a polysomnographic study using standardized conditions.

Conduct of a personal radiofrequency electromagnetic field measurement study: proposed study protocol.

Effects of electromagnetic fields emitted from W-CDMA-like mobile phones on sleep in humans.

International policy and advisory response regarding children's exposure to radio frequency electromagnetic fields (RF-EMF).

Effects of short- and long-term pulsed radiofrequency electromagnetic fields on night sleep and cognitive functions in healthy subjects.

Electromagnetic fields, such as those from mobile phones, alter regional cerebral blood flow and sleep and waking EEG.

Effects of electromagnetic fields emitted by mobile phones (GSM 900 and WCDMA/UMTS) on the macrostructure of sleep.

Individual variation in temporal relationships between exposure to radiofrequency electromagnetic fields and non-specific physical symptoms: A new approach in studying 'electrosensitivity'.

Mobile phone use, behavioural problems and concentration capacity in adolescents: A prospective study.

Towards 5G communication systems: Are there health implications?

Acute effects of electromagnetic fields emitted by GSM mobile phones on subjective well-being and physiological reactions: a meta-analysis.

A Prospective Cohort Study of Adolescents' Memory Performance and Individual Brain Dose of Microwave Radiation from Wireless Communication.

[Investigation of sleep disorders in the vicinity of high frequency transmitters].

Effect of a single 30 min UMTS mobile phone-like exposure on the thermal pain threshold of young healthy volunteers.

Quality Matters: Systematic Analysis of Endpoints Related to "Cellular Life" in Vitro Data of Radiofrequency Electromagnetic Field Exposure.

The effect of electromagnetic fields emitted by mobile phones on human sleep.

Mobile phone 'talk-mode' signal delays EEG-determined sleep onset.

The response of human bacteria to static magnetic field and radiofrequency electromagnetic field.

Exposure to radio-frequency electromagnetic fields and behavioural problems in Bavarian children and adolescents.

Human sleep EEG under the influence of pulsed radio frequency electromagnetic fields. Results from polysomnographies using submaximal high power flux densities.

[Effects of radio- and microwaves emitted by wireless communication devices on the functions of the nervous system selected elements].

Effects of radiation emitted by WCDMA mobile phones on electromagnetic hypersensitive subjects.

Electromagnetic radiation and behavioural response of ticks: an experimental test.

Effects of Sleep Quality on the Association between Problematic Mobile Phone Use and Mental Health Symptoms in Chinese College Students.

Investigating short-term exposure to electromagnetic fields on reproductive capacity of invertebrates in the field situation.

Could myelin damage from radiofrequency electromagnetic field exposure help explain the functional impairment electrohypersensitivity? A review of the evidence.

Association between exposure to radiofrequency electromagnetic fields assessed by dosimetry and acute symptoms in children and adolescents: a population based cross-sectional study.

Cochlear implants in the etiopathogenesis of glioblastoma--an interesting observation or independent finding?

Terrestrial Trunked Radio (TETRA) exposure and its impact on slow cortical potentials.

Influence of electromagnetic fields emitted by GSM-900 cellular telephones on the circadian patterns of gonadal, adrenal and pituitary hormones in men.

[Prevalence of insomnia in adults aged 18 to 60 years and exposure to electromagnetic fields in households of Barranquilla, Colombia].

"Triple M" Effect: A Proposed Mechanism to Explain Increased Dental Amalgam Microleakage after Exposure to Radiofrequency Electromagnetic Radiation.

The Effect of a Single 30-Min Long Term Evolution Mobile Phone-Like Exposure on Thermal Pain Threshold of Young Healthy Volunteers.

Pain, pain intensity and pain disability in high school students are differently associated with physical activity, screening hours and sleep.

Long-Term Evolution Electromagnetic Fields Exposure Modulates the Resting State EEG on Alpha and Beta Bands.

Microwaves emitted by cellular telephones affect human slow brain potentials.

Theme - Adverse effects of radiofrequency fields on cells

Titles

The effects of radiofrequency fields on cell proliferation are non-thermal.

Effects of RF-EMF Exposure from GSM Mobile Phones on Proliferation Rate of Human Adipose-derived Stem Cells: An In-vitro Study.

Effects of radiofrequency exposure emitted from a GSM mobile phone on proliferation, differentiation, and apoptosis of neural stem cells.

Are the young more sensitive than adults to the effects of radiofrequency fields? An examination of relevant data from cellular and animal studies.

Comparative study of cell cycle kinetics and induction of apoptosis or necrosis after exposure of human Mono Mac 6 cells to radiofrequency radiation.

Apoptosis induced by ultraviolet radiation is enhanced by amplitude modulated radiofrequency radiation in mutant yeast cells.

Review of possible modulation-dependent biological effects of radiofrequency fields.

An in vitro study of the effects of exposure to a GSM signal in two human cell lines: monocytic U937 and neuroblastoma SK-N-SH.

Ornithine decarboxylase activity is affected in primary astrocytes but not in secondary cell lines exposed to 872 MHz RF radiation.

Disturbance of cell proliferation in response to mobile phone frequency radiation.

Effects of chronic exposure to radiofrequency electromagnetic fields on energy balance in developing rats.

Exposure to 835 MHz radiofrequency electromagnetic field induces autophagy in hippocampus but not in brain stem of mice.

Continuous exposure to 900MHz GSM-modulated EMF alters morphological maturation of neural cells.

Enhancement of X-ray Induced Apoptosis by Mobile Phone-Like Radio-Frequency Electromagnetic Fields in Mouse Spermatocyte-Derived Cells.

Cell oxidation-reduction imbalance after modulated radiofrequency radiation.

Pulse modulated 900 MHz radiation induces hypothyroidism and apoptosis in thyroid cells: a light, electron microscopy and immunohistochemical study.

1950MHz Radio Frequency Electromagnetic Radiation Inhibits Testosterone Secretion of Mouse Leydig Cells.

Non-thermal biomarkers of exposure to radiofrequency/microwave radiation.

In vitro non-thermal oxidative stress response after 1800 MHz radiofrequency radiation.

Effect of radiofrequency electromagnetic field exposure on in vitro models of neurodegenerative disease.

Influence of a 902.4 MHz GSM signal on the human visual system: investigation of the discrimination threshold.

Biological indicators in response to radiofrequency/microwave exposure.

The protective effect of autophagy on mouse spermatocyte derived cells exposure to 1800MHz radiofrequency electromagnetic radiation.

Proliferation and apoptosis in a neuroblastoma cell line exposed to 900 MHz modulated radiofrequency field.

p25/CDK5 is partially involved in neuronal injury induced by radiofrequency electromagnetic field exposure.

Microwave exposure of neuronal cells in vitro: Study of apoptosis.

Apoptosis is induced by radiofrequency fields through the caspase-independent mitochondrial pathway in cortical neurons.

[Impact of radiofrequency/microwave radiation on cell and cytoskeleton structure].

Reaction of the immune system to low-level RF/MW exposures.

Exposure to Global System for Mobile Communication 900 MHz Cellular Phone Radiofrequency Alters Growth, Proliferation and Morphology of Michigan Cancer Foundation-7 Cells and Mesenchymal Stem Cells.

Exposure to 900 MHz radiofrequency radiation induces caspase 3 activation in proliferating human lymphocytes.

Proteomic analysis of continuous 900-MHz radiofrequency electromagnetic field exposure in testicular tissue: a rat model of human cell phone exposure.

Anthropogenic Radio-Frequency Electromagnetic Fields Elicit Neuropathic Pain in an Amputation Model.

Effect of high SARs produced by cell phone like radiofrequency fields on mollusk single neuron.

Investigation of the effects of 2.1 GHz microwave radiation on mitochondrial membrane potential (DeltaPsim), apoptotic activity and cell viability in human breast fibroblast cells.

Comparison of 864 MHz and 935 MHz microwave radiation effects on cell culture.

Free radical release and HSP70 expression in two human immune-relevant cell lines after exposure to 1800 MHz radiofrequency radiation.

Effects of GSM-modulated radiofrequency electromagnetic fields on B-cell peripheral differentiation and antibody production.

Effect of radiofrequency radiation in cultured mammalian cells: A review.

Effect of 835 MHz radiofrequency radiation exposure on calcium binding proteins in the hippocampus of the mouse brain.

Viability and phagocytosis of neutrophils exposed in vitro to 100-MHz radiofrequency radiation.

Effects of 3G cell phone exposure on the structure and function of the human cytochrome P450 reductase.

Possible effects of radiofrequency electromagnetic fields on in vivo C6 brain tumors in Wistar rats.

In-vitro exposure of neuronal networks to the GSM-1800 signal.

Mitochondrial hyperpolarization and cytochrome-c release in microwave-exposed MCF-7 cells.

Does MW Radiation Affect Gene Expression, Apoptotic Level, and Cell Cycle Progression of Human SH-SY5Y Neuroblastoma Cells?

Effect of exposure to the edge signal on oxidative stress in brain cell models.

Impact of 864 MHz or 935 MHz radiofrequency microwave radiation on the basic growth parameters of V79 cell line.

Effect of a 2.45-GHz radiofrequency electromagnetic field on neutrophil chemotaxis and phagocytosis in differentiated human HL-60 cells.

Effects of low intensity radiofrequency electromagnetic fields on electrical activity in rat hippocampal slices.

Effects of mobile phone type signals on calcium levels within human leukaemic T-cells (Jurkat cells).

Does exposure to a radiofrequency electromagnetic field modify thermal preference in juvenile rats?

Measurement of the 100MHz EMF radiation in vivo effects on zebrafish D. rerio embryonic development: A multidisciplinary study.

Microwave effects on the nervous system.

[Effects of radiofrequency electromagnetic fields on mammalian spermatogenesis].

Effects of simultaneous combined exposure to CDMA and WCDMA electromagnetic field on immune functions in rats.

Microwaves from Mobile Phones Inhibit 53BP1 Focus Formation in Human Stem Cells More Strongly Than in Differentiated Cells: Possible Mechanistic Link to Cancer Risk.

Effects of 900-MHz radio frequencies on the chemotaxis of human neutrophils in vitro.

Problems in assessment of risks from exposures to microwaves of mobile communication.

Bioassay for assessing cell stress in the vicinity of radio-frequency irradiating antennas.

Heart rate variability affected by radiofrequency electromagnetic field in adolescent students.

Mobile phone radiation alters proliferation of hepatocarcinoma cells.

A new in vitro exposure device for the mobile frequency of 900 MHz.

A radio-frequency system for in vivo pilot experiments aimed at the studies on biological effects of electromagnetic fields.

Modeling cell dynamics under mobile phone radiation.

Evaluation of the potential of mobile phone specific electromagnetic fields (UMTS) to produce micronuclei in human glioblastoma cell lines.

Exposure to radiation from single or combined radio frequencies provokes macrophage dysfunction in the RAW 264.7 cell line.

Responses of neurons to an amplitude modulated microwave stimulus.

Pathophysiology of cell phone radiation: oxidative stress and carcinogenesis with focus on male reproductive system.

An HF exposure system for mice with improved efficiency.

Cell phone radiation effects on cytogenetic abnormalities of oral mucosal cells.

Sleep EEG alterations: effects of different pulse-modulated radio frequency electromagnetic fields.

Effects of exposure to DAMPS and GSM signals on ornithine decarboxylase (ODC) activity: II. SH-SY5Y human neuroblastoma cells.

Design, optimization, realization, and analysis of an in vitro system for the exposure of embryonic stem cells at 1.71 GHz.

Cell physiological effects of radiofrequency electromagnetic fields.

Acute effect of exposure of mollusk single neuron to 900-MHz mobile phone radiation.

[Dependence of the non-thermal radiofrequency electromagnetic field bioeffects on the typological features of electroencephalogram in humans].

Age-dependent acute interference with stem and progenitor cell proliferation in the hippocampus after exposure to 1800 MHz electromagnetic radiation.

Biological effects of radiofrequency radiation: concepts and criteria.

Effects of radiofrequency electromagnetic fields on seed germination and root meristematic cells of Allium cepa L.

Effects of exposure to DAMPS and GSM signals on ornithine decarboxylase (ODC) activity: I. L-929 mouse fibroblasts.

An investigation of the effects of TETRA RF fields on intracellular calcium in neurones and cardiac myocytes.

Apoptotic cell death during Drosophila oogenesis is differentially increased by electromagnetic radiation depending on modulation, intensity and duration of exposure.

Biological effects of amplitude-modulated radiofrequency radiation.

Cell phone radiations affect early growth of Vigna radiata (mung bean) through biochemical alterations.

The use of FDTD in establishing in vitro experimentation conditions representative of lifelike cell phone radiation on the spermatozoa.

Effects of RF fields emitted from smart phones on cardio-respiratory parameters: a preliminary provocation study.

Exposure to 900 MHz electromagnetic field induces an unbalance between pro-apoptotic and pro-survival signals in T-lymphoblastoid leukemia CCRF-CEM cells.

Basis for optimization of in vitro exposure apparatus for health hazard evaluations of mobile communications.

In vitro effect of pulsed 900 MHz GSM radiation on mitochondrial membrane potential and motility of human spermatozoa.

The effect of pulsed 900-MHz GSM mobile phone radiation on the acrosome reaction, head morphometry and zona binding of human spermatozoa.

Prenatal exposure to radiofrequencies: effects of WiFi signals on thymocyte development and peripheral T cell compartment in an animal model.

Combined effects of flow-induced shear stress and electromagnetic field on neural differentiation of mesenchymal stem cells.

Long-term electromagnetic exposure of developing neuronal networks: A flexible experimental setup.

Influence of radiofrequency-electromagnetic waves from 3rd-generation cellular phones on fertilization and embryo development in mice.

Simulation of electromagnetic fields in the human body using Finite Integration Technique (FIT).

The implications of non-linear biological oscillations on human electrophysiology for electrohypersensitivity (EHS) and multiple chemical sensitivity (MCS).

Comparison of biological effects between continuous and intermittent exposure to GSM-900-MHz mobile phone radiation: Detection of apoptotic cell-death features.

[Effects of mobile phones and radar radiofrequencies on the eye].

Exposure to 1950-MHz TD-SCDMA electromagnetic fields affects the apoptosis of astrocytes via caspase-3-dependent pathway.

Intrauterine effects in animals exposed to radiofrequency and microwave fields.

Effect of cell phone radiation on neutrophil of mice.

In vitro effects of radiofrequency electromagnetic waves on bovine spermatozoa motility.

[Role of modulation in biological effects of electromagnetic radiation].

Numerical and experimental dosimetry of Petri dish exposure setups.

Effects of 2.45-GHz electromagnetic fields with a wide range of SARs on micronucleus formation in CHO-K1 cells.

Effect of cell phone usage on semen analysis in men attending infertility clinic: an observational study.

Modulation of oxidative phosphorylation (OXPHOS) by radiation- induced biophotons.

The possible global hazard of cell phone radiation on thyroid cells and hormones: a systematic review of evidences.

Radiofrequency-induced carcinogenesis: cellular calcium homeostasis changes as a triggering factor.

Mobile phone electromagnetic radiation affects Amyloid Precursor Protein and alpha-synuclein metabolism in SH-SY5Y cells.

Exposure to cell phone radiations produces biochemical changes in worker honey bees.

Human mesenchymal stem cells are sensitive to abnormal gravity and exhibit classic apoptotic features.

[Surface markers and functions of human dendritic cells exposed to mobile phone 1800 MHz electromagnetic fields].

Activation of the TRPV1 Thermoreceptor Induced by Modulated or Unmodulated 1800 MHz Radiofrequency Field Exposure.

Low power radiofrequency electromagnetic radiation for the treatment of pain due to osteoarthritis of the knee.

Calcium-binding proteins and GFAP immunoreactivity alterations in murine hippocampus after 1 month of exposure to 835 MHz radiofrequency at SAR values of 1.6 and 4.0 W/kg.

Alteration of glycine receptor immunoreactivity in the auditory brainstem of mice following three months of exposure to radiofrequency radiation at SAR 4.0 W/kg.

Radiofrequency (RF) effects on blood cells, cardiac, endocrine, and immunological functions.

Influence of electromagnetic waves, with maxima in the green or red range, on the morphofunctional properties of multipotent stem cells.

Can exposure to a terrestrial trunked radio (TETRA)-like signal cause symptoms? A randomised double-blind provocation study.

Potential protection of green tea polyphenols against 1800 MHz electromagnetic radiation-induced injury on rat cortical neurons.

Effects of 2450 MHz electromagnetic fields with a wide range of SARs on methylcholanthrene-induced transformation in C3H10T1/2 cells.

Assessment of intermittent UMTS electromagnetic field effects on blood circulation in the human auditory region using a near-infrared system.

Skin changes in "screen dermatitis" versus classical UV- and ionizing irradiation-related damage--similarities and differences.

Theme - Adverse effects of ELF magnetic field exposures

Titles

[Electromagnetic noise blocks the gap-junctional intercellular communication suppression induced by 50 Hz magnetic field].

Developmental effects of magnetic field (50 Hz) in combination with ionizing radiation and chemical teratogens.

The effect of extremely low frequency magnetic field on the conjunctiva and goblet cells.

Chronic exposure to an extremely low-frequency magnetic field induces depression-like behavior and corticosterone secretion without enhancement of the hypothalamic-pituitary-adrenal axis in mice.

Effect of coexposure to 50 Hz magnetic fields and an aneugen on human lymphocytes, determined by the cytokinesis block micronucleus assay.

[Superposition of noise magnetic fields inhibits clustering of fibroblast membrane surface receptors induced by 50 Hz magnetic fields in Chinese hamster lungs].

Extremely low frequency magnetic field induces hyperalgesia in mice modulated by nitric oxide synthesis.

The cardiovascular response to an acute 1800-microT, 60-Hz magnetic field exposure in humans.

Mouse early embryos obtained by natural breeding or in vitro fertilization display a differential sensitivity to extremely low-frequency electromagnetic fields.

Interaction of MF 50 Hz, 10 mT with high dose of X-rays: evaluation of embryotoxicity in chick embryos.

Effects on micronuclei formation of 60-Hz electromagnetic field exposure with ionizing radiation, hydrogen peroxide, or c-Myc overexpression.

Rodent cell transformation and immediate early gene expression following 60-Hz magnetic field exposure.

[A study on dose-effect of suppression to gap junctional intercellular communication function by 50-Hz magnetic fields].

Effect of magnetic field exposure on anchorage-independent growth of a promoter-sensitive mouse epidermal cell line (JB6).

Exposure to 60-Hz magnetic fields and proliferation of human astrocytoma cells in vitro.

Activation of Signaling Cascades by Weak Extremely Low Frequency Electromagnetic Fields.

Effects of ELF magnetic fields on protein expression profile of human breast cancer cell MCF7.

[Noise magnetic fields block co-suppression effect induced by power frequency magnetic field and phorbol ester].

The response of the human circulatory system to an acute 200-muT, 60-Hz magnetic field exposure.

Exposure of Drosophila melanogaster embryonic cell cultures to 60-Hz sinusoidal magnetic fields: assessment of potential teratogenic effects.

Non-thermal effects of power-line magnetic fields (50 Hz) on gene expression levels of pluripotent embryonic stem cells-the role of tumour suppressor p53.

[Abnormal shift of connexin 43 gap-junction protein induced by 50 Hz electromagnetic fields in Chinese hamster lung cells].

[Effects of power frequency magnetic field on gap junction intercellular communication of astrocytes].

Mutation induction by high-density, 50-Hz magnetic fields in human MeWo cells exposed in the DNA synthesis phase.

Micronucleus induction in Syrian hamster embryo cells following exposure to 50 Hz magnetic fields, benzo(a)pyrene, and TPA in vitro.

[Estimation of magnetic radiation effects on leucocytes].

[Effects of electromagnetic noise on the enhancement of stress-activated protein kinase(SAPK) phosphorylation induced by 50 Hz magnetic fields].

Micronucleus formation in human amnion cells after exposure to 50 Hz MF applied horizontally and vertically.

Immune function and host defense in rodents exposed to 60-Hz magnetic fields.

Effects of 50-Hz magnetic field exposure on hormone secretion and apoptosis-related gene expression in human first trimester villous trophoblasts in vitro.

Effects of whole-body 50-Hz magnetic field exposure on mouse Leydig cells.

Superposition of an incoherent magnetic field inhibited EGF receptor clustering and phosphorylation induced by a 1.8 GHz pulse-modulated radiofrequency radiation.

Effects of 50 Hz sinusoidal magnetic fields on Hsp27, Hsp70, Hsp90 expression in porcine aortic endothelial cells (PAEC).

Effect of 60 Hz magnetic field exposure on c-fos expression in stimulated PC12 cells.

Immune markers and ornithine decarboxylase activity among electric utility workers.

Neural mass modeling of power-line magnetic fields effects on brain activity.

Modulation of natural killer cell function after exposure to 60 Hz magnetic fields: confirmation of the effect in mature B6C3F1 mice.

Alteration of tight and adherens junctions on 50-Hz magnetic field exposure in Madin Darby canine kidney (MDCK) cells.

Genome-wide transcription analysis of Escherichia coli in response to extremely low-frequency magnetic fields.

Real-time detection of stimulus response in cultured neurons by high-intensity intermediate-frequency magnetic field exposure.

Magnetic field desensitizes 5-HT(1B) receptor in brain: pharmacological and functional studies.

Influence of combined AC-DC magnetic fields on free radicals in organized and biological systems. Development of a model and application of the radical pair mechanism to radicals in micelles.

A 1.8-GHz radiofrequency radiation induces EGF receptor clustering and phosphorylation in cultured human amniotic (FL) cells.

Theme - Adverse impacts of EMF on mammary cancer development

Titles

Acceleration of mammary tumorigenesis by exposure of 7,12-dimethylbenz[a]anthracene-treated female rats in a 50-Hz, 100-microT magnetic field: replication study.

A histopathological study on alterations in DMBA-induced mammary carcinogenesis in rats with 50 Hz, 100 muT magnetic field exposure.

Effects of magnetic fields on mammary tumor development induced by 7,12-dimethylbenz(a)anthracene in rats.

Significant differences in the effects of magnetic field exposure on 7,12-dimethylbenz(a)anthracene-induced mammary carcinogenesis in two substrains of Sprague-Dawley rats.

Effects of weak alternating magnetic fields on nocturnal melatonin production and mammary carcinogenesis in rats.

Do cocarcinogenic effects of ELF electromagnetic fields require repeated long-term interaction with carcinogens? Characteristics of positive studies using the DMBA breast cancer model in rats.

Effect of 26 week magnetic field exposures in a DMBA initiation-promotion mammary gland model in Sprague-Dawley rats.

Effect of 13 week magnetic field exposures on DMBA-initiated mammary gland carcinomas in female Sprague-Dawley rats.

Effects of GSM-900 microwaves on DMBA-induced mammary gland tumors in female Sprague-Dawley rats.

[Effects of mobile-phone microwave on dimethylbenz (a) anthracene induced mammary carcinoma development in rats].

Effects of 900 MHz GSM wireless communication signals on DMBA-induced mammary tumors in rats.

Developmental toxicity evaluation of ELF magnetic fields in Sprague-Dawley rats.

Developmental toxicity study of 60 Hz (power frequency) magnetic fields in rats.

In vivo exposure of rats to a weak alternating magnetic field increases ornithine decarboxylase activity in the mammary gland by a similar extent as the carcinogen DMBA.

A study on skin tumour formation in mice with 50 Hz magnetic field exposure.

Rat liver foci study on coexposure with 50 Hz magnetic fields and known carcinogens.

5-Iododeoxyuridine-125I incorporation in vivo after exposure to a 50 Hz magnetic field.

Study on potential effects of "902-MHz GSM-type Wireless Communication Signals" on DMBA-induced mammary tumours in Sprague-Dawley rats.

Anxiogenic effect of chronic exposure to extremely low frequency magnetic field in adult rats.

Acute and subchronic toxicity of 20 kHz and 60 kHz magnetic fields in rats.

Results of lifespan exposure to continuous and intermittent extremely low frequency electromagnetic fields (ELFEMF) administered alone to Sprague Dawley rats.

Chronic, low-level (1.0 W/kg) exposure of mice prone to mammary cancer to 2450 MHz microwaves.

Acute effects of 50 Hz magnetic field exposure on human visual task and cardiovascular performance.

Cancer promotion in a mouse-skin model by a 60-Hz magnetic field: II. Tumor development and immune response.

Repeated exposure of C3H/HeJ mice to ultra-wideband electromagnetic pulses: lack of effects on mammary tumors.

[Effects of chronic exposure of power frequency magnetic field on neurobehavior in rats].

Multigeneration reproductive toxicity assessment of 60-Hz magnetic fields using a continuous breeding protocol in rats.

Assessing the potential carcinogenic activity of magnetic fields using animal models.

Evaluation of the potential carcinogenicity of 60 Hz linear sinusoidal continuous-wave magnetic fields in Fischer F344 rats.

Effect of exposure to extremely low electro-magnetic field during prenatal period on mice spleen.

Effects of magnetic field exposure on the development of lung fibrosis elicited by industrial pollutants.

Effect of radiofrequency radiation exposure on mouse skin tumorigenesis initiated by 7,12-dimethybenz[alpha]anthracene.

Recent experimental data on Extremely Low Frequency (ELF) magnetic field carcinogenic risk: open questions.

Extremely low-frequency magnetic fields modulate nitric oxide signaling in rat brain.

[Modifying effect of light and electromagnetic field on development of mammary tumors induced by N-nitrosomethyl urea in female rats].

Effects of subchronic extremely low-frequency electromagnetic field exposure on biochemical parameters in rats.

Effects of gestational exposure to a video display terminal-like magnetic field (20-kHz) on CBA/S mice.

Evaluation of the developmental toxicity of 60 Hz magnetic fields and harmonic frequencies in Sprague-Dawley rats.

Testing electromagnetic fields for potential carcinogenic activity: a critical review of animal models.

Effects of aluminum and extremely low frequency electromagnetic radiation on oxidative stress and memory in brain of mice.

Skeletal muscle HSP72 and norepinephrine response to static magnetic field in rat.

Effect of chronic exposure to a GSM-like signal (mobile phone) on survival of female Sprague-Dawley rats: modulatory effects by month of birth and possibly stage of the solar cycle.

Long-term exposure of Sprague Dawley rats to 20 kHz triangular magnetic fields.

Spontaneous and nitrosourea-induced primary tumors of the central nervous system in Fischer 344 rats chronically exposed to 836 MHz modulated microwaves.

In vivo studies of the effect of magnetic field exposure on ontogeny of choline acetyltransferase in the rat brain.

Spontaneous and nitrosourea-induced primary tumors of the central nervous system in Fischer 344 rats exposed to frequency-modulated microwave fields.

Toxicity bioassay in Sprague-Dawley rats exposed to 20 kHz triangular magnetic field for 90 days.

A cerebral primitive neuroectodermal tumor in a squirrel monkey (Saimiri sciureus).

Indication of cocarcinogenic potential of chronic UMTS-modulated radiofrequency exposure in an ethylnitrosourea mouse model.

A case of hepatocellular carcinoma rupturing after angiography.

A case of recurring hepatocellular carcinoma with a solitary Virchow's lymph node metastasis.

Benzodiazepine system is involved in hyperalgesia in rats induced by the exposure to extremely low frequency magnetic fields.

[A case report of primary hepatic carcinoid with lymph node metastasis--treatment of hepatic arterial infusion to post-reoperative liver and radiation to metastasis of para-aortic lymph nodes].

Effects of mobile phone radiation on UV-induced skin tumourigenesis in ornithine decarboxylase transgenic and non-transgenic mice.

[A case of renal cell carcinoma in a horseshoe kidney].

Theme - Adverse health effects of magnetic fields associated with magnetic resonance imaging

Titles

Menometrorrhagia in magnetic resonance imaging operators with copper intrauterine contraceptive devices (IUDS): a case report.

Safety issues in magnetic resonance imaging.

[Magnetic resonance imaging : Recent studies on biological effects of static magnetic and highfrequency electromagnetic fields].

A review of the current use of magnetic resonance imaging in pregnancy and safety implications for the fetus.

Retrospective assessment of exposure to static magnetic fields during production and development of magnetic resonance imaging systems.

[Safety of magnetic resonance imaging in patients with implanted cardiovascular devices].

Implantable pulse generators (pacemakers) and electrodes: safety in the magnetic resonance imaging scanner environment.

Health risk assessment of occupational exposure to a magnetic field from magnetic resonance imaging devices.

Calculation of radiofrequency electromagnetic fields and their effects in MRI of human subjects.

Biological effects of exposure to magnetic resonance imaging: an overview.

The safety of MRI. Considerations for site planning and clinical use.

Interference with cardiac pacemakers by magnetic resonance imaging: are there irreversible changes at 0.5 Tesla?

Evaluation of occupational exposure in magnetic resonance sites.

Safety of strong, static magnetic fields.

Guidelines and recommendations for MR imaging safety and patient management. III. Questionnaire for screening patients before MR procedures. The SMRI Safety Committee.

Safety concerns related to magnetic field exposure.

Occupational exposure of healthcare and research staff to static magnetic stray fields from 1.5-7 Tesla MRI scanners is associated with reporting of transient symptoms.

Magnetic resonance imaging safety: implications for cardiovascular patients.

Exposure classification of MRI workers in epidemiological studies.

MRI magnetic field stimulates rotational sensors of the brain.

[Exposure to static magnetic field and health hazards during the operation of magnetic resonance scanners].

The effects of 1.5T magnetic resonance imaging on early murine in-vitro embryo development.

Effect of electromagnetic field accompanying the magnetic resonance imaging on human heart rate variability - a pilot study.

A comprehensive analysis of MRI research risks: in support of full disclosure.

Exposure to time varying magnetic fields associated with magnetic resonance imaging reduces fentanyl-induced analgesia in mice.

MRI effects on craniofacial size and crown-rump length in C57BL/6J mice in 1.5T fields.

RF-EMF exposure of fetus and mother during magnetic resonance imaging.

Effects of static magnetic fields on cognition, vital signs, and sensory perception: a meta-analysis.

Pilot study investigating the effect of the static magnetic field from a 9.4-T MRI on the vestibular system.

Exposure to static and time-varying magnetic fields from working in the static magnetic stray fields of MRI scanners: a comprehensive survey in the Netherlands.

Safety considerations in MR imaging.

Human exposure to 4.0-Tesla magnetic fields in a whole-body scanner.

Vestibular stimulation by magnetic fields.

EMF exposure variation among MRI sequences from pediatric examination protocols.

Adaptive suppression of power line interference in ultra-low field magnetic resonance imaging in an unshielded environment.

Exposure, health complaints and cognitive performance among employees of an MRI scanners manufacturing department.

[ECG changes caused by the effect of static magnetic fields of nuclear magnetic resonance tomography using magnets with a field power of 0.5 to 4.0 Telsa].

Development of hypertension after long-term exposure to static magnetic fields among workers from a magnetic resonance imaging device manufacturing facility.

An improved quasi-static finite-difference scheme for induced field evaluation in MRI based on the biconjugate gradient method.

A trail of artificial vestibular stimulation: electricity, heat, and magnet.

Prediction of specific absorption rate in mother and fetus associated with MRI examinations during pregnancy.

Effect of 1.5 tesla nuclear magnetic resonance imaging scanner on implanted permanent pacemakers.

MRI safety: everyone's job.

MR procedures: biologic effects, safety, and patient care.

Operational safety issues in MRI.

Biologic effects and potential hazards of nuclear magnetic imaging.

Novel mechanistic model and computational approximation for electromagnetic safety evaluations of electrically short implants.

[Possible mutagenic effects of magnetic fields].

[Effect of a static magnetic field (3.5 T) on the reproductive behavior of mice, on the embryo and fetal development and on selected hematologic parameters].

[Bacterial mutation in high magnetic fields and radiofrequency radiation].

Neurophysiology: vertigo in MRI machines.

Complex magnetic field exposure system for in vitro experiments at intermediate frequencies.

Magnetic-field-induced vertigo: a theoretical and experimental investigation.

Effects of magnetic stray fields from a 7 tesla MRI scanner on neurocognition: a double-blind randomised crossover study.

Effect of a 0.5-T static magnetic field on conduction in guinea pig spinal cord.

Cognitive, cardiac, and physiological safety studies in ultra high field magnetic resonance imaging.

Magnetic resonance imaging of the chest. Where we stand.

Exposure to static magnetic fields and risk of accidents among a cohort of workers from a medical imaging device manufacturing facility.

MR safety: past, present, and future from a historical perspective.

Pacemaker reed switch behavior in 0.5, 1.5, and 3.0 Tesla magnetic resonance imaging units: are reed switches always closed in strong magnetic fields?

Offline impedance measurements for detection and mitigation of dangerous implant interactions: an RF safety prescreen.

[Do strong static magnetic fields in NMR tomography modify tissue perfusion?].

Aneurysm clips: evaluation of magnetic field interactions and translational attraction by use of "long-bore" and "short-bore" 3.0-T MR imaging systems.

Modeling of the internal fields distribution in human inner hearing system exposed to 900 and 1800 MHz.

Safety aspects of switched gradient fields.

Effect on germination and early growth characteristics in sunflower (Helianthus annuus) seeds exposed to static magnetic field.

INFLUENCE OF STATIC ELECTRICITY ON RADON MEASUREMENT USING PASSIVE DETECTORS.

Theme - Health risks of power-line electromagnetic fields on humans

Titles

An examination of underlying physical principles. The interaction of power-line electromagnetic fields with the human body.

The establishment of frequency dependent limits for electric and magnetic fields and evaluation of indirect effects.

Health risks of electric and magnetic fields caused by high-voltage systems in Finland.

Electric field induced in the human body by uniform 50 Hz electric or magnetic fields: bibliography analysis and method for conservatively deriving measurable limits.

LEVELS OF EXTREMELY LOW-FREQUENCY ELECTRIC AND MAGNETIC FIELDS FROM OVERHEAD POWER LINES IN THE OUTDOOR ENVIRONMENT OF RAMALLAH CITY-PALESTINE.

Exposure of workers in the electric power industry to electric and magnetic fields.

Comparison of cardiac-induced endogenous fields and power frequency induced exogenous fields in an anatomical model of the human body.

Influence of 50 Hz electric and magnetic fields on the human heart.

Physiologic and dosimetric considerations for limiting electric fields induced in the body by movement in a static magnetic field.

The influence of 50 Hz electric and magnetic fields on the extrasystoles of human heart.

Computational estimation of magnetically induced electric fields in a rotating head.

[Evaluation of reports on environmental measurements of electromagnetic fields generated by high voltage transmission lines and substations].

Intensity of electric and magnetic fields from power lines within the business district of 60 Ontario communities.

Current densities in a pregnant woman model induced by simultaneous ELF electric and magnetic field exposure.

Basic restrictions in EMF exposure guidelines.

Numerical dosimetry at power-line frequencies using anatomically based models.

Impedance method computation of induced currents in a simple model of a child exposed to electromagnetic fields of an electric blanket.

[Effects of electromagnetic field emitted by electric blankets on brain catecholamine in fetal mice].

[Practical aspects of taking measurements of electromagnetic fields in the surrounding of overhead transmission lines].

Electric and magnetic field exposures for people living near a 735-kilovolt power line.

Nerves in a human body exposed to low-frequency electromagnetic fields.

Current densities and total contact currents for 110 and 220 kV power line tasks.

Evaluation and measurement of magnetic field exposure at a typical high-voltage substation and its power lines.

Current densities measured in human models exposed to 60-Hz electric fields.

Assessment of exposure to intermediate frequency electric fields and contact currents from a plasma ball.

Fetal exposure to low frequency electric and magnetic fields.

Dealing with uncertainty in formulating occupational and public exposure limits.

Limiting electric fields of HVDC overhead power lines.

Electric field prediction for a human body-electric machine system.

Evaluation of long-term exposure to the magnetic field produced from power lines.

Exposure Modelling of Extremely Low-Frequency Magnetic Fields from Overhead Power Lines and Its Validation by Measurements.

Comparison of cardiac and 60 Hz magnetically induced electric fields measured in anesthetized rats.

Summary and evaluation of guidelines for occupational exposure to power frequency electric and magnetic fields.

Effects of high-intensity power-frequency electric fields on implanted modern multiprogrammable cardiac pacemakers.

Evaluation of current densities and total contact currents in occupational exposure at 400 kV substations and power lines.

A system for simultaneous exposure of small animals to 60-Hz electric and magnetic fields.

Comparison of electric field exposure measurement methods under power lines.

Quandaries in the application of the ICNIRP low frequency basic restriction on current density.

Human body exposure to power lines: relation of induced quantities to external magnetic fields.

Measurement and Modeling of Personal Exposure to the Electric and Magnetic Fields in the Vicinity of High Voltage Power Lines.

Effects of electric and magnetic fields from high-power lines on female urinary excretion of 6-sulfatoxymelatonin.

60-Hertz electric-field exposures in transmission line towers.

Possible health effects of 50/60Hz electric and magnetic fields: review of proposed mechanisms.

Pacemaker interference by magnetic fields at power line frequencies.

Non-Hodgkin's lymphoma among electric utility workers in Ontario: the evaluation of alternate indices of exposure to 60 Hz electric and magnetic fields.

Fields and currents in the organs of the human body when exposed to power lines and VLF transmitters.

Assessment of the magnetic field exposure due to the battery current of digital mobile phones.

Health effects relevant to the setting of EMF exposure limits.

Neuroelectric mechanisms applied to low frequency electric and magnetic field exposure guidelines--part I: sinusoidal waveforms.

Pacemaker interference and low-frequency electric induction in humans by external fields and electrodes.

High-voltage overhead power lines in epidemiology: patterns of time variations in current load and magnetic fields.

Comparison of various safety guidelines for electronic article surveillance devices with pulsed magnetic fields.

Influence of human model resolution on computed currents induced in organs by 60-Hz magnetic fields.

Current densities and total contact currents associated with 400 kV power line tasks.

Frequency spectra from current vs. magnetic flux density measurements for mobile phones and other electrical appliances.

Possible mechanisms by which electric fields from power lines might affect airborne particles harmful to health.

Uncertainty evaluation in the measurement of power frequency electric and magnetic fields from AC overhead power lines.

Exposure to power-frequency electromagnetic fields in Denmark.

Induced current measurements in whole body exposure condition to radio frequency electric fields.

Assessment of foetal exposure to the homogeneous magnetic field harmonic spectrum generated by electricity transmission and distribution networks.

Survey of ELF magnetic field levels in households near overhead power lines in Serbia.

Dose response study of human exposure to 60 Hz electric and magnetic fields.

The monitoring results of electromagnetic radiation of 110-kV high-voltage lines in one urban location in Chongqing P.R. China.

Occupational exposure to power frequency fields in some electrical transformation stations in Romania.

[The ecological-hygienic aspects of the study of industrial-frequency magnetic fields].

Cardiac pacemakers in electric and magnetic fields of 400-kV power lines.

The interference threshold of cardiac pacemakers in electric 50 Hz fields.

Active medical implants and occupational safety--measurement and numerical calculation of interference voltage.

Current densities and total contact currents during forest clearing tasks under 400 kV power lines.

[Biological effects of electromagnetic fields (author's transl)].

Clinical study of interference with cardiac pacemakers by a magnetic field at power line frequencies.

Effects of a high-voltage direct-current transmission line on beef cattle production.

Acute effects of ELF electromagnetic fields: a field study of linesmen working with 400 kV power lines.

[Diseases in animals associated with exposure to electric and magnetic fields of 50/60 Hz: report of a case].

Powerline frequency electric and magnetic fields: a pilot study of risk perception.

[Duration of conscious reactions in persons exposed to an electric field of 50 Hz frequency].

Implantable cardioverter defibrillators in electric and magnetic fields of 400 kV power lines.

Effects of low frequency electric fields on synaptic integration in hippocampal CA1 pyramidal neurons: implications for power line emissions.

[Intensity of electromagnetic field and electric current on human bodies induced by electric blanket].

Memory loss risk assessment for the students nearby high-voltage power lines-a case study.

Theoretical limits on the threshold for the response of long cells to weak extremely low frequency electric fields due to ionic and molecular flux rectification.

An In Situ and In Silico Evaluation of Biophysical Effects of 27 MHz Electromagnetic Whole Body Humans Exposure Expressed by the Limb Current.

Interference with the pacemakers of two workers at electricity substations.

Sensitivity to electricity in the catfish, Parasilurus asotus.

Electric and magnetic fields generated by ac power lines: an application of advanced modelling tools in order to predict exposure levels.

[The characteristics of the electromagnetic situation close to overhead electric power transmission lines in St. Petersburg].

Human perception of electric fields and ion currents associated with high-voltage DC transmission lines.

[An experimental study of the sciatic nerve injury by high voltage electricity in rabbits].

Magnetic induction at 60 Hz in the human heart: a comparison between the in situ and isolated scenarios.

Exposure guidelines for low-frequency electric and magnetic fields: report from the Brussels workshop.

Power lines and ionizing radiation.

COMPUTATIONAL ASSESSMENT OF PREGNANT WOMAN MODELS EXPOSED TO UNIFORM ELF-MAGNETIC FIELDS: COMPLIANCE WITH THE EUROPEAN CURRENT EXPOSURE REGULATIONS FOR THE GENERAL PUBLIC AND OCCUPATIONAL EXPOSURES AT 50 Hz.

[Exposure of workers to electric and magnetic fields from radiofrequency dielectric heaters to process polyvinyl chloride material].

Effects of 50 Hz electric currents on vigilance and concentration.

Can disturbances in the atmospheric electric field created by powerline corona ions disrupt melatonin production in the pineal gland?

Experimental and numeric investigation about electromagnetic interference between implantable cardiac pacemaker and magnetic fields at power line frequency.

SAR changes in a human head model for plane wave exposure (500 - 2500 MHz) and a comparison with IEEE 2005 safety limits.

The possible consequences for cognitive functions of external electric fields at power line frequency on hippocampal CA1 pyramidal neurons.

Interference of 16.7-Hz electromagnetic fields on measured electrocardiogram.

Biological effects of a 765-kV transmission line: exposures and thresholds in honeybee colonies.

Power-frequency magnetic fields from electric blankets.

Electric fields in bone marrow substructures at power-line frequencies.

Analysis of the relationship between electromagnetic radiation characteristics and urban functions in highly populated urban areas.

Chronic exposure of primates to 60-Hz electric and magnetic fields: III. Neurophysiologic effects.

Exposure of the human body to professional and domestic induction cooktops compared to the basic restrictions.

Electricity and the heart.

[Occupational exposure of physical therapists to electric and magnetic fields and the efficacy of Faraday cages].

Biological effects of exposure to static electric fields in humans and vertebrates: a systematic review.

Biological effects of electric and magnetic fields on productivity of dairy cows.

Computer screens and brain cancer.

[Clinical analysis of brain injury in patients injured by high voltage electricity].

Studies on eliminating interference by electromagnetic induction from power lines in ECG signals.

A Shear-Mode Piezoelectric Heterostructure for Electric Current Sensing in Electric Power Grids.

Provocation of electric hypersensitivity under everyday conditions.

Chronic exposure of primates to 60-Hz electric and magnetic fields: I. Exposure system and measurements of general health and performance.

Low-voltage electricity-induced lung injury.

Biophysical cancer transformation pathway.

The influence of electromagnetic interference and ionizing radiation on cardiac pacemakers.

Relationship of electric power quality to milk production of dairy herds - field study with literature review.

[Pathomorphological constellation in death resulting from high voltage electricity].

The urban decline of the house sparrow (Passer domesticus): a possible link with electromagnetic radiation.

[Injuries caused by electricity].

Compound injury from high-voltage electricity.

Exposure to static electric fields leads to changes in biogenic amine levels in the brains of Drosophila.

Effects of electric field reduction in visual display units on skin symptoms.

Do induction loops pose a hazard to health?

Effects of concurrent exposure to 60 Hz electric and magnetic fields on the social behavior of baboons.

Assessment of motor pathways by magnetic stimulation in human and veterinary medicine.

Cow sensitivity to electricity during milking.

Characteristics and potential human health hazards of charged aerosols generated by high-voltage power lines.

Elimination of power line interference from ECG signals using recurrent neural networks.

Neuroelectric mechanisms applied to low frequency electric and magnetic field exposure guidelines--part II: non sinusoidal waveforms.

Electromagnetic field strength levels surrounding electronic article surveillance (EAS) systems.

Suppression of power-line interference by analog notch filtering in the ECG signal for heart rate variability analysis: to do or not to do?

Return to arc welding following defibrillator implantation.

Fracture due to shock from domestic electricity supply.

Cascading failures in ac electricity grids.

Renal artery thrombosis due to high voltage electricity.

The potential of electricity transmission corridors in forested areas as bumblebee habitat.

Theme - Adverse effects of low-frequency electromagnetic fields on humans

Titles

An evaluation of the existing evidence on the carcinogenic potential of extremely low frequency magnetic fields.

Possible mechanisms by which extremely low frequency magnetic fields affect opioid function.

Effects of 60 Hz magnetic fields on teenagers and adults.

Do extremely low frequency magnetic fields enhance the effects of environmental carcinogens? A meta-analysis of experimental studies.

Biological interactions and potential health effects of extremely-low-frequency magnetic fields from power lines and other common sources.

Effects of extremely low-frequency magnetic field on growth and differentiation of human mesenchymal stem cells.

[Morphological characteristics and various theories on the mechanism of biological effect of magnetic fields].

Developmental effects of extremely low frequency electric and magnetic fields.

[Very low frequency electric and magnetic fields and the immune system].

Concern that "EMF" magnetic fields from power lines cause cancer.

Effects of low-frequency magnetic fields on embryonic development and pregnancy.

Perspectives on health effects of electric and magnetic fields.

Assessment of ELF magnetic fields produced by independent power lines.

Low-frequency magnetic fields and cancer. What you should know and what to tell your patients.

Extremely low frequency magnetic field (50 Hz, 0.5 mT) modifies fitness components and locomotor activity of Drosophila subobscura.

Extremely low frequency magnetic field effects on metabolite of Aspergillus niger.

Extremely-low frequency magnetic field effects on sulfate reducing bacteria viability.

Extremely low frequency (ELF) magnetic fields and apoptosis: a review.

Variability and consistency of electric and magnetic field occupational exposure measurements.

The genotoxic potential of electric and magnetic fields: an update.

Power frequency electromagnetic fields and health. Where's the evidence?

Interaction of static and extremely low frequency electric and magnetic fields with living systems: health effects and research needs.

[Biological influences of electromagnetic fields].

[Biological and health effects on electric and magnetic fields at extremely low frequencies].

[Biological effects of nonionizing radiation: low frequency electromagnetic fields].

Extremely low-frequency magnetic fields of transformers and possible biological and health effects.

EMF and health.

[Evaluation of the effects of electric and magnetic fields in humans].

Induction of kinetochore-positive and kinetochore-negative micronuclei in CHO cells by ELF magnetic fields and/or X-rays.

Epidemiological studies of work with video display terminals and adverse pregnancy outcomes (1984-1992).

Possible health hazards from exposure to power-frequency electric and magnetic fields--a COMAR Technical Information Statement.

Extremely low frequency (ELF) magnetic fields enhance chemically induced formation of apurinic/apyrimidinic (AP) sites in A172 cells.

Occupational exposure to intermediate frequency and extremely low frequency magnetic fields among personnel working near electronic article surveillance systems.

[The role of free radicals in mechanisms of biological function exposed to weak, constant and net magnetic fields].

Behavioural evidence that magnetic field effects in the land snail, Cepaea nemoralis, might not depend on magnetite or induced electric currents.

The effect of a 50 Hz magnetic field on cognitive function in humans.

Exposure assessment for electric and magnetic fields.

Assessment of occupational exposure to extremely low frequency magnetic fields in hospital personnel.

Origins of electromagnetic hypersensitivity to 60 Hz magnetic fields: A provocation study.

Exposure to magnetic fields of railway engine drivers: a case study in Italy.

Acute exposure to 50-Hz magnetic fields increases interleukin-6 in young healthy men.

A review of the literature on potential reproductive and developmental toxicity of electric and magnetic fields.

[Influence of low magnetic field on lipid peroxidation].

50-Hz magnetic field exposure system for small animals.

Typical exposure of children to EMF: exposimetry and dosimetry.

[Risks of electromagnetic fields for humans].

Low-frequency pulsed electromagnetic field exposure can alter neuroprocessing in humans.

A critical review of the genotoxic potential of electric and magnetic fields.

Occupational exposures of pharmacists and pharmaceutical assistants to 60 Hz magnetic fields.

Evaluation of in vitro effects of 50 and 60 Hz magnetic fields in regional EMF exposure facilities.

Exposure system to study hypotheses of ELF and RF electromagnetic field interactions of mobile phones with the central nervous system.

Exposure of welders and other metal workers to ELF magnetic fields.

Safety of the magnetic field generated by a neuronal magnetic stimulator: evaluation of possible mutagenic effects.

Exposure of high resolution fetuses in advanced pregnant woman models at different stages of pregnancy to uniform magnetic fields at the frequency of 50 Hz.

The epidemiology of electric and magnetic field exposures in the power frequency range and reproductive outcomes.

Food and Drug Administration low-level extremely-low-frequency magnetic field exposure facility.

Analyses of magnetic-field peak-exposure summary measures.

Increased resorptions in CBA mice exposed to low-frequency magnetic fields: an attempt to replicate earlier observations.

Cancer promotion in a mouse-skin model by a 60-Hz magnetic field: I. Experimental design and exposure system.

Influence of weak static and 50 Hz magnetic fields on the redox activity of cytochrome-C oxidase.

Evaluating alternative exposure indices in epidemiologic studies on extremely low-frequency magnetic fields.

Amyotrophic lateral sclerosis (ALS) and extremely-low frequency (ELF) magnetic fields: a study in the SOD-1 transgenic mouse model.

Can low-level 50/60 Hz electric and magnetic fields cause biological effects?

Effects of information and 50 Hz magnetic fields on cognitive performance and reported symptoms.

Electromagnetic radiation from VDT units: study of the effectiveness of an active shielding device.

Extremely low-frequency magnetic fields and heart disease.

The wonders of magnetism.

Human exposure to 60-Hz magnetic fields: neurophysiological effects.

Effects of extremely low-frequency magnetic field exposure on cognitive functions: results of a meta-analysis.

Long-term exposure to extremely low-frequency magnetic fields impairs spatial recognition memory in mice.

Human electrophysiological and cognitive effects of exposure to ELF magnetic and ELF modulated RF and microwave fields: a review of recent studies.

Biophysical mechanisms: a component in the weight of evidence for health effects of power-frequency electric and magnetic fields.

Cardiac autonomic control mechanisms in power-frequency magnetic fields: a multistudy analysis.

Magnetic fields of video display terminals and pregnancy outcome.

[Exposure to low electromagnetic fields and the carcinogenesis process].

Micronucleus induction in cells co-exposed in vitro to 50 Hz magnetic field and benzene, 1,4-benzenediol (hydroquinone) or 1,2,4-benzenetriol.

Evaluation of residential exposure to intermediate frequency magnetic fields.

Effect of 60-Hz magnetic fields on ultraviolet light-induced mutation and mitotic recombination in Saccharomyces cerevisiae.

The effect of 60-Hz magnetic fields on co-promotion of chemically induced skin tumors on SENCAR mice: a discussion of three studies.

Stochastic Dosimetry for the Assessment of Children Exposure to Uniform 50 Hz Magnetic Field with Uncertain Orientation.

Individual subject sensitivity to extremely low frequency magnetic field.

Assessment of magnetic field exposures for a mortality study at a uranium enrichment plant.

Human cognitive performance in a 3 mT power-line frequency magnetic field.

[Problem of studying influence of electric and magnetic fields on human health. Results and prospects].

Effects of magnetic field exposure on open field behaviour and nociceptive responses in mice.

Biological effects of extremely low-frequency electromagnetic fields: in vivo studies.

Effects in rodents of a 1-month exposure to magnetic fields (200-1200 Gauss).

Symptoms of the musculoskeletal system and exposure to magnetic fields in an aluminium plant.

Children's exposure to magnetic fields produced by U.S. television sets used for viewing programs and playing video games.

Provocation study of persons with perceived electrical hypersensitivity and controls using magnetic field exposure and recording of electrophysiological characteristics.

Implantable cardioverter defibrillator and 50-Hz electric and magnetic fields exposure in the workplace.

A study of heart rate and heart rate variability in human subjects exposed to occupational levels of 50 Hz circularly polarised magnetic fields.

Measuring exposed magnetic fields of welders in working time.

Intermittent exposures to nanoTesla range, 7 Hz, amplitude-modulated magnetic fields increase regeneration rates in planarian.

Cancer from exposure to 50/60 Hz electric and magnetic fields--a major scientific debate.

Chronic or intractable medical problems associated with prolonged exposure to unsuspected harmful environmental electric, magnetic or electro-magnetic fields radiating in the bedroom or workplace and their exacerbation by intake of harmful light and heavy metals from common sources.

Physiological variables and subjective symptoms by 60 Hz magnetic field in EHS and non-EHS persons.

[Analysis on outer hair cells hazards from occupational exposure to low frequency electric and magnetic fields and magnetic fields and its related factors].

Possible cocarcinogenic effects of ELF electromagnetic fields may require repeated long-term interaction with known carcinogenic factors.

Psychological effects of chronic exposure to 50 Hz magnetic fields in humans living near extra-high-voltage transmission lines.

Effects of short term exposure to 60 Hz electromagnetic fields on interleukin 1 and interleukin 6 production by peritoneal exudate cells.

Apoptosis in haemopoietic progenitor cells exposed to extremely low-frequency magnetic fields.

ELF magnetic fields in a city environment.

Assessing compliance with 60-hertz magnetic-field exposure guidelines.

[Epidemiological study of populations exposed to high levels of 50 Hz magnetic fields].

Temporally incoherent magnetic fields mitigate the response of biological systems to temporally coherent magnetic fields.

Evaluation of potential health effects of 10 kHz magnetic fields: a short-term mouse toxicology study.

Magnetic fields and radical reactions: recent developments and their role in nature.

Ambient 60-Hz magnetic flux density in an urban neighborhood.

Brief exposure to a 50 Hz, 100 microT magnetic field: effects on reaction time, accuracy, and recognition memory.

The influence of a temporary magnetic field on chicken hatching.

Characterization of Children's Exposure to Extremely Low Frequency Magnetic Fields by Stochastic Modeling.

Natural killer cell activity decreases in workers occupationally exposed to extremely low frequency magnetic fields exceeding 1 microT.

A quick and easy method for checking compliance of multi-frequency magnetic fields with ICNIRP's guidelines.

Measurement of low frequency magnetic fields from digital cellular telephones.

Magnetic fields of video display terminals and spontaneous abortion.

Epidemiologic studies of electric and magnetic fields and cancer: a case study of distortions by the media.

Non-ionizing electromagnetic radiation: a study of carcinogenic and cancer treatment potential.

Electromagnetic field exposure and cancer: a review of epidemiologic evidence.

[State of peripheral blood of technical personnel exposed to constant magnetic fields].

Magnetic field exposure and arrythmic risk: evaluation in railway drivers.

Prevalence of self-reported hypersensitivity to electric or magnetic fields in a population-based questionnaire survey.

Involvement of eddy currents in the mutagenicity of ELF magnetic fields.

The effects of weak magnetic fields on radical pairs.

Urban exposure to ELF magnetic field due to high-, medium- and low-voltage electricity supply networks.

[The effect of low-frequency electromagnetic fields on the development of experimental mammary tumors].

ECG changes in humans exposed to 50 Hz magnetic fields.

On the role of the interactions of ions with external magnetic fields in physiologic processes and their importance in chronobiology.

Relative-risk-estimate bias and loss of power in the Mantel test for trend resulting from the use of magnetic-field point-in-time ("spot") measurements in epidemiological studies based on an ordinal exposure scale.

[Mercury and creatinine in urine of employees exposed to magnetic fields. A study of a group electrolysis-operators in Norzink A/S in Odda].

Some non neoplastic effects of ELF magnetic fields in experimental animals.

Alternate indices of electric and magnetic field exposures among Ontario electrical utility workers.

[The effect of electromagnetic fields on living organisms: plants, birds and animals].

Calcium homeostasis and low-frequency magnetic and electric field exposure: A systematic review and meta-analysis of in vitro studies.

Exposure to magnetic field harmonics in the vicinity of indoor distribution substations.

Comparison between personal exposure to 60 Hz magnetic fields and stationary home measurements for people living near and away from a 735 kV power line.

A 60 Hz electric and magnetic field exposure facility for nonhuman primates: design and operational data during experiments.

Reduction of laser-induced retinal injury applying the combination of the 3D variable electric and magnetic fields in "vivo".

[Effect of magnetic fields on embryonic mortality].

Speculations on the influence of electromagnetism on genomic and associated structures.

Methodology of a study on the French population exposure to 50 Hz magnetic fields.

Hypersensitivity of human subjects to environmental electric and magnetic field exposure: a review of the literature.

MYC mRNA abundance is unchanged in subcultures of HL60 cells exposed to power-line frequency magnetic fields.

Do naturally occurring magnetic nanoparticles in the human body mediate increased risk of childhood leukaemia with EMF exposure?

Free radical mechanism for the effects of environmental electromagnetic fields on biological systems.

Facility for chronic exposure of rats to ELF magnetic fields.

Dynamic characteristics of membrane ions in multifield configurations of low-frequency electromagnetic radiation.

Flight deck magnetic fields in commercial aircraft.

Cardiovascular alterations in Macaca monkeys exposed to stationary magnetic fields: experimental observations and theoretical analysis.

Personal power-frequency magnetic field exposure in women recruited at an infertility clinic: association with physical activity and temporal variability.

Evaluating exposure cutpoint bias in epidemiologic studies of electric and magnetic fields.

Specific patterns of weak (1 microTesla) transcerebral complex magnetic fields differentially affect depression, fatigue, and confusion in normal volunteers.

Effects of 50 Hz magnetic field exposure on human heart rate variability with passive tilting.

Comment on "designing EMF experiments: what is required to characterize 'exposure'?".

[Effect of high intensity magnetic field on the processes of early growth in plant seeds and development of honeybees].

Low-frequency electromagnetic radiation enhances the induction of rat mammary tumors by nitrosomethyl urea.

Possible disruption of remote viewing by complex weak magnetic fields around the stimulus site and the possibility of accessing real phase space: a pilot study.

60 Hertz magnetic field exposure assessment for an investigation of leukemia in telephone lineworkers.

The heliogeophysical aspects of circumpolar health.

The effects of continuous exposure to 20-kHz sawtooth magnetic fields on the litters of CD-1 mice.

[Magnetic field on the deranged accommodation of visual detector terminal operators].

Macro- and trace element concentrations in blood plasma and cerebrospinal fluid of dairy cows exposed to electric and magnetic fields.

Assessment of occupational exposure patterns by frequency-domain analysis of time series data.

Field enhancement of nonreciprocal electromagnetic wave supported by magnetic surface plasmon.

Residential magnetic field measurements in France: comparison of indoor and outdoor measurements.

Sleep EEG alterations: effects of pulsed magnetic fields versus pulse-modulated radio frequency electromagnetic fields.

Hypothesis on a casual link between EMF and an evolutionary class of cancer and spontaneous abortion.

Exposure to alternating electromagnetic fields and effects on the visual and visuomotor systems.

Statistical review of the henhouse experiments: the effects of a pulsed magnetic field on chick embryos.

A pilot study on the reproductive risks of maternal exposure to magnetic fields from electronic article surveillance systems.

How do honeybees use their magnetic compass? Can they see the North?

Temporal trends and misclassification in residential 60 Hz magnetic field measurements.

The precautionary principle and electric and magnetic fields.

[Assessment of exposure to extremely low frequency magnetic field emitted from monitors].

Anthropogenic electromagnetic noise disrupts magnetic compass orientation in a migratory bird.

A comparison of rheumatoid arthritis and fibromyalgia patients and healthy controls exposed to a pulsed (200 microT) magnetic field: effects on normal standing balance.

An Investigation on the Effect of Extremely Low Frequency Pulsed Electromagnetic Fields on Human Electrocardiograms (ECGs).

Patient reactions to some electromagnetic fields from dental chair and unit: a pilot study.

Occupational 50 Hz magnetic field exposure measurements among female sewing machine operators in Hungary.

Anatomical localization of human detection of weak electromagnetic radiation: experiments with dowsers.

Paroxysmal itching in multiple sclerosis during treatment with external magnetic fields.

Natural very-low-frequency sferics and headache.

Nanoscale Design of Nano-Sized Particles in Shape-Memory Polymer Nanocomposites Driven by Electricity.

Effect of the alternative magnetic stimulation on peripheral circulation for regenerative medicine.

Influence of 50-Hz electromagnetic field on anurian (Xenopus laevis) metamorphosis.

Theme - Adverse effects of low-frequency magnetic fields on rodents

Titles

Influence of 60-Hertz magnetic fields on leukemia.

Long-term exposure of male and female mice to 50 Hz magnetic field: effects on fertility.

Effects of extremely low-frequency electromagnetic fields (ELF-EMF) exposure on B6C3F1 mice.

Deficits in spatial learning after exposure of mice to a 50 Hz magnetic field.

Eight-week toxicity study of 60 Hz magnetic fields in F344 rats and B6C3F1 mice.

Dominant lethal studies in male mice after exposure to a 50-Hz electric field.

Long term effects of a 50 Hz electric field on the life-expectancy of mice.

Effect of a 9 mT pulsed magnetic field on C3H/Bi female mice with mammary carcinoma. A comparison between the 12 Hz and the 460 Hz frequencies.

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in F344/N rats.

Effects of power frequency alternating magnetic fields on reproduction and pre-natal development of mice.

Hematopoietic neoplasia in C57BL/6 mice exposed to split-dose ionizing radiation and circularly polarized 60 Hz magnetic fields.

A gross morphologic, histologic, hematologic, and blood chemistry study of adult and neonatal mice chronically exposed to high magnetic fields.

Behavioral effects of long-term exposure to magnetic fields in rats.

Behavioral studies with mice exposed to DC and 60-Hz magnetic fields.

Carcinogenicity test of 50 Hz sinusoidal magnetic fields in rats.

Dominant lethal studies in male mice after exposure to a 50 Hz magnetic field.

Toxic effects of 50 Hz electromagnetic field on memory consolidation in male and female mice.

Behavioral sensitivity of rats to extremely-low-frequency magnetic fields.

Rats are not aversive when exposed to 60-Hz magnetic fields at 3.03 mT.

Effects of low-frequency magnetic fields on fetal development in rats.

Effect of pulsed magnetic fields on leukemia-prone AKR mice. No-effect on mortality through five generations.

Teratogenic effect of broad-band electromagnetic field on neonatal mice (Mus musculus).

Effect of a magnetic field on ascorbate system in mice.

Spatial learning deficit in the rat after exposure to a 60 Hz magnetic field.

Biologic effects of prolonged exposure to ELF electromagnetic fields in rats: II. 50 Hz magnetic fields.

Neurodevelopmental anomalies of the hippocampus in rats exposed to weak intensity complex magnetic fields throughout gestation.

Assessment of biological changes of continuous whole body exposure to static magnetic field and extremely low frequency electromagnetic fields in mice.

[VDT pulse magnetic field enhances teratogenic effect of ara-c in mice].

Electric field exposure and evidence of stress in mice.

Subchronic in vivo effects of a high static magnetic field (9.4 T) in rats.

Exposure to a theta-burst patterned magnetic field impairs memory acquisition and consolidation for contextual but not discrete conditioned fear in rats.

Radial maze proficiency of adult Wistar rats given prenatal complex magnetic field treatments.

Lymphoma development of simultaneously combined exposure to two radiofrequency signals in AKR/J mice.

Teratogenic effects of static magnetic field on mouse fetuses.

Effect of electric field in conditioned aversion response.

Acute exposure to a 50 Hz magnetic field impairs consolidation of spatial memory in rats.

Effects of radiofrequency electromagnetic fields (UMTS) on reproduction and development of mice: a multi-generation study.

Combined effects of complex magnetic fields and agmatine for contextual fear learning deficits in rats.

Enhanced mortality of rat pups following inductions of epileptic seizures after perinatal exposures to 5 nT, 7 Hz magnetic fields.

DEXA analysis on the bones of rats exposed in utero and neonatally to static and 50 Hz electric fields.

Gender- and age-specific impairment of rat performance in the Morris water maze following prenatal exposure to an MRI magnetic field.

Repeated exposure attenuates the behavioral response of rats to static high magnetic fields.

Metallothionein content increased in the liver of mice exposed to magnetic fields.

[Alternating magnetic field damages the reproductive function of murine testes].

Initial exposure to 30 kV/m or 60 kV/m 60 Hz electric fields produces temporary cessation of operant behavior of nonhuman primates.

Extremely low-frequency magnetic fields can impair spermatogenesis recovery after reversible testicular damage induced by heat.

Teratological evaluation of mouse fetuses exposed to a 20 kHz EMF.

Fetal loss in mice exposed to magnetic fields during early pregnancy.

Effects of pulsed magnetic fields on the developing mouse embryo.

The effect of the prenatal and post-natal long-term exposure to 50 Hz electric field on growth, pubertal development and IGF-1 levels in female Wistar rats.

Carcinogenicity study of GSM and DCS wireless communication signals in B6C3F1 mice.

Lymphoma induced in mice chronically exposed to very strong low-frequency electromagnetic field.

Short-term memory in mice is affected by mobile phone radiation.

Nonhuman primates will not respond to turn off strong 60 Hz electric fields.

[Effects of 1800 MHz GSM-like exposure on the gonadal function and hematological parameters of male mice].

Detection thresholds for 60 Hz electric fields by nonhuman primates.

Effects of exposure to a 50 Hz electric field on plasma levels of lactate, glucose, free Fatty acids, triglycerides and creatine phosphokinase activity in hind-limb ischemic rats.

Transient and cumulative memory impairments induced by GSM 1.8 GHz cell phone signal in a mouse model.

The effect of very low dose pulsed magnetic waves on cochlea.

Lymphoma development in mice chronically exposed to UMTS-modulated radiofrequency electromagnetic fields.

Effects of combined ferrous sulphate administration and exposure to static magnetic field on spatial learning and motor abilities in rats.

Autism-relevant social abnormalities in mice exposed perinatally to extremely low frequency electromagnetic fields.

Urinary 6-sulphatoxymelatonin excretion is increased in rats after 24 hours of exposure to vertical 50 Hz, 100 microT magnetic field.

Developmental effects of perinatal exposure to extremely weak 7 Hz magnetic fields and nitric oxide modulation in the Wistar albino rat.

Developmental profiles of growth-associated protein (Gap43), Ngfb, Bndf and Ntf4 mRNA levels in the rat forebrain after exposure to 60 Hz magnetic fields.

Prenatal exposures to LTP-patterned magnetic fields: quantitative effects on specific limbic structures and acquisition of contextually conditioned fear.

Effects of exposure to a 60-kV/m, 60-Hz electric field on the social behavior of baboons.

Effects of a 60 Hz magnetic field on central cholinergic systems of the rat.

Electromagnetic waves of 900 MHz in acute pentylenetetrazole model in ontogenesis in mice.

Reduced litter sizes following 48-h of prenatal exposure to 5 nT to 10 nT,0.5 Hz magnetic fields: implications for sudden infant deaths.

Effects of Electromagnetic Radiation from Smartphones on Learning Ability and Hippocampal Progenitor Cell Proliferation in Mice.

Rats avoid exposure to HVdc electric fields: a dose response study.

Biological effects of long-duration, high-field (4 T) MRI on growth and development in the mouse.

Behavioral in-effectiveness of high frequency electromagnetic field in mice.

Does static electric field from ultra-high voltage direct-current transmission lines affect male reproductive capacity? Evidence from a laboratory study on male mice.

Carcinogenicity study of 217 Hz pulsed 900 MHz electromagnetic fields in Pim1 transgenic mice.

Five-tesla static magnetic fields suppress food and water consumption and weight gain in mice.

[The effect of alternating electric field of industrial frequency on testicles of white mice].

Theta-gamma coupling in hippocampus during working memory deficits induced by low frequency electromagnetic field exposure.

[An ultrastructural analysis of the testes in mice subjected to long-term exposure to a 17-kHz electrical field].

Evaluation of mouse embryos produced in vitro after electromagnetic waves exposure; Morphometric study.

Biological accounts emerging from some kinds of electromagnetic waves in the environment.

Effect of electromagnetic waves on sensitivity of fungi of the genus Candida to miconazole.

Effects of exposure to static magnetic field on motor skills and iron levels in plasma and brain of rats.

Morphometric and structural study of the pineal gland of the Wistar rat subjected to the pulse action of a 52 Gauss, (50 Hz) magnetic field. Evolutive analysis over 21 days.

Direct suppressive effects of weak magnetic fields (50 Hz and 16 2/3 Hz) on melatonin synthesis in the pineal gland of Djungarian hamsters (Phodopus sungorus).

Effect of a 20 kHz sawtooth magnetic field exposure on the estrous cycle in mice.

[Pathomorphological reactions of the cerebral cortex nerve elements during treatment with an alternating magnetic field].

[Effect of an electric field of industrial frequency on selected biochemical parameters in the guinea pig liver].

Alterations in the rat electrocardiogram induced by stationary magnetic fields.

Effect of ELF electric field on some on biochemistry characters in the rat serum.

Repeated application of an electric field increases BDNF in the brain, enhances spatial learning, and induces infarct tolerance.

Pulsed magnetic field from video display terminals enhances teratogenic effects of cytosine arabinoside in mice.

Fetal radiofrequency radiation exposure from 800-1900 mhz-rated cellular telephones affects neurodevelopment and behavior in mice.

Liver and spleen morphology, ceruloplasmin activity and iron content in serum of guinea pigs exposed to the magnetic field.

[Effects of pregnant exposure to electromagnetic field emitted by electric blankets on brain catecholamine and behavior in offspring mice].

Variable E-cadherin expression in a MNU-induced colon tumor model in rats which exposed with 50 Hz frequency sinusoidal magnetic field.

Low frequency electromagnetic radiation and hearing.

Pretraining exposure to physiologically patterned electromagnetic stimulation attenuates fear-conditioned analgesia.

Influence of combined DC and AC magnetic fields on rat behavior.

Radiofrequency fields and teratogenesis.

Chronic exposure of primates to 60-Hz electric and magnetic fields: II. Neurochemical effects.

[Biological effects of pulsing electromagnetic fields (PEMFs) on ICR mice].

Effects of Simulated Mobile Phone Electromagnetic Radiation on Fertilization and Embryo Development.

Effect of low frequency, low amplitude magnetic fields on the permeability of cationic liposomes entrapping carbonic anhydrase: I. Evidence for charged lipid involvement.

The influences of extremely low frequency magnetic fields on drug-induced convulsion in mouse.

Effects of pulsed magnetic field treatment of soybean seeds on calli growth, cell damage, and biochemical changes under salt stress.

What is the impact of electromagnetic waves on epileptic seizures?

Intensity threshold for 60-Hz magnetically induced behavioral changes in rats.

Neuritin reverses deficits in murine novel object associative recognition memory caused by exposure to extremely low-frequency (50 Hz) electromagnetic fields.

[Standardization of electromagnetic fields of 3-30 MHz with reference to the time factor].

[Biological effects of the action of permanent magnetic fields of various intensities].

The influence of low intensity 50 Hz electromagnetic field exposure on blood Na, K and Cl concentrations in humans.

Effects of exposure of animals to ultra-wideband pulses.

A controlled trial of daily left prefrontal cortex TMS for treating depression.

[The reaction of the systems of hormonal mediator regulation to a weak geomagnetic field against a background of ionizing radiation exposure].

Theme - Effects of electromagnetic fields on chicken embryos

Titles

Effects of sinusoidal electromagnetic fields on histopathology and structures of brains of preincubated white Leghorn chicken embryos.

Teratogenic effects of sinusoidal extremely low frequency electromagnetic fields on morphology of 24 hr chick embryos.

Effects of MR exposure at 1.5 T on early embryonic development of the chick.

Histopathological and ultrastructural studies on the effects of electromagnetic fields on the liver of preincubated white Leghorn chicken embryo.

Study of potential health effects of electromagnetic fields of telephony and Wi-Fi, using chicken embryo development as animal model.

Development of preincubated chicken eggs following exposure to 50 Hz electromagnetic fields with 1.33-7.32 mT flux densities.

Effect of electric power network frequency magnetic field on embryonic development of Ascaris suum (Nematoda).

Development of chicken embryos in a pulsed magnetic field.

Influence of continuous electromagnetic fields on the stage, weight and stature of the chick embryo.

Growth Retardation Of Chick Embryo Exposed To A Low Dose Of Electromagnetic Waves.

Effects of the ELF-MFs on the development of spleens of preincubated chicken embryos.

Effects of exposing chicken eggs to a cell phone in "call" position over the entire incubation period.

Effects of 50 Hz electromagnetic fields on the histology, apoptosis, and expression of c-Fos and beta-catenin on the livers of preincubated white Leghorn chicken embryos.

Chick embryo development can be irreversibly altered by early exposure to weak extremely-low-frequency magnetic fields.

Effects of static electromagnetic fields on chick embryo pineal gland development.

Survival Assessment of Mouse Preimplantation Embryos After Exposure to Cell Phone Radiation.

Effect of ambient levels of power-line-frequency electric fields on a developing vertebrate.

Lethal and teratogenic effects of long-term low-intensity radio frequency radiation at 428 MHz on developing chick embryo.

Biological effects of continuous exposure of embryos and young chickens to electromagnetic fields emitted by video display units.

Effects of electromagnetic fields on fecundity in the chicken.

[The influence of ultrasound and constant magnetic field on gametes, zygotes, and embryos of the sea urchin].

Developmental changes in Drosophila melanogaster following exposure to alternating electromagnetic fields.

Effect of exposure to radio frequency radiation emitted by cell phone on the developing dorsal root ganglion of chick embryo: a light microscopic study.

First cell cycles of sea urchin Paracentrotus lividus are dramatically impaired by exposure to extremely low-frequency electromagnetic field.

Assessment of the effects of electromagnetic field modification on egg-laying hens in commercial flocks as indicated by production measures.

Superimposing spatially coherent electromagnetic noise inhibits field-induced abnormalities in developing chick embryos.

Sex-linked recessive lethal test of Drosophila melanogaster after exposure to 50-Hz magnetic fields.

Theme - Impact of static and low-frequency magnetic fields on melatonin secretion

Titles

Geomagnetic activity and human melatonin metabolite excretion.

Melatonin suppression by static and extremely low frequency electromagnetic fields: relationship to the reported increased incidence of cancer.

Human melatonin during continuous magnetic field exposure.

The influence of long-term exposure of mice to randomly varied power frequency magnetic fields on their nocturnal melatonin secretion patterns.

Geomagnetic disturbances are associated with reduced nocturnal excretion of a melatonin metabolite in humans.

Melatonin metabolite levels in workers exposed to 60-Hz magnetic fields: work in substations and with 3-phase conductors.

Magnetic fields and pineal function in humans: evaluation of nocturnal acute exposure to extremely low frequency magnetic fields on serum melatonin and urinary 6-sulfatoxymelatonin circadian rhythms.

Nocturnal excretion of a urinary melatonin metabolite among electric utility workers.

Multi-night exposure to 60 Hz magnetic fields: effects on melatonin and its enzymatic metabolite.

Chronic exposure to 2.9 mT, 40 Hz magnetic field reduces melatonin concentrations in humans.

Is melatonin the hormonal missing link between magnetic field effects and human diseases?

Chronic exposure to ELF magnetic fields during night sleep with electric sheet: effects on diurnal melatonin rhythms in men.

Reduced excretion of a melatonin metabolite in workers exposed to 60 Hz magnetic fields.

Melatonin and magnetic fields.

Examination of the melatonin hypothesis in women exposed at night to EMF or bright light.

Effects of 60-Hz magnetic field exposure on nocturnal 6-sulfatoxymelatonin, estrogens, luteinizing hormone, and follicle-stimulating hormone in healthy reproductive-age women: results of a crossover trial.

Increases in geomagnetic activity are associated with increases in thyroxine levels in a single patient: implications for melatonin levels.

Rapid-onset/offset, variably scheduled 60 Hz electric and magnetic field exposure reduces nocturnal serum melatonin concentration in nonhuman primates.

Nocturnal 6-hydroxymelatonin sulfate excretion in female workers exposed to magnetic fields.

Acute exposure to 50 Hz magnetic fields with harmonics and transient components: lack of effects on nighttime hormonal secretion in men.

Age-dependent association of exposure to television screen with children's urinary melatonin excretion?

Effects of electric and magnetic fields on nocturnal melatonin concentrations in dairy cows.

Relationship between amyloid beta protein and melatonin metabolite in a study of electric utility workers.

Non-linear relation of heart rate variability during exercise recovery with local geomagnetic activity.

Graded response of heart rate variability, associated with an alteration of geomagnetic activity in a subarctic area.

Evaluation of the nocturnal levels of urinary biogenic amines in men exposed overnight to 50-Hz magnetic field.

Nocturnal exposure to intermittent 60 Hz magnetic fields alters human cardiac rhythm.

[Biological effects produced by the influence of low frequency electromagnetic fields on hormone secretion].

Circasemiannual chronomics: half-yearly biospheric changes in their own right and as a circannual waveform.

Endocrine functions in young men exposed for one night to a 50-Hz magnetic field. A circadian study of pituitary, thyroid and adrenocortical hormones.

Effects of exposure to 16.7 Hz magnetic fields on urinary 6-hydroxymelatonin sulfate excretion of Swiss railway workers.

Chronic exposure to ELF fields may induce depression.

[Dependence of acoustic-motor reaction of healthy individuals from geomagnetic activity].

Is motivation influenced by geomagnetic activity?

Is geomagnetic activity a risk factor for sudden unexplained death in epilepsies?

[Exacerbation of hypertension and disturbances of the geomagnetic field].

Magnetic storm effect on the circulation of rabbits.

Exercise testing in the evaluation of human responses to powerline frequency fields.

Theme - Exposure to power lines and risk of childhood cancer

Titles

Distance from residence to power line and risk of childhood leukemia: a population-based case-control study in Denmark.

Living near overhead high voltage transmission power lines as a risk factor for childhood acute lymphoblastic leukemia: a case-control study.

Residential exposure to electric power transmission lines and risk of lymphoproliferative and myeloproliferative disorders: a case-control study.

Epidemiological study of power lines and childhood cancer in the UK: further analyses.

Exposure to Electromagnetic Fields of High Voltage Overhead Power Lines and Female Infertility.

Acute childhood leukemias and exposure to magnetic fields generated by high voltage overhead power lines - a risk factor in Iran.

Childhood cancer in relation to distance from high voltage power lines in England and Wales: a case-control study.

Residential mobility of populations near UK power lines and implications for childhood leukaemia.

Electromagnetic fields and cancer in children residing near Norwegian high-voltage power lines.

Magnetic fields and cancer in children residing near Swedish high-voltage power lines.

Exposure of children to residential magnetic fields in Norway: is proximity to power lines an adequate predictor of exposure?

Residential exposure to magnetic fields generated by 110-400 kV power lines in Finland.

Childhood cancer and magnetic fields from high-voltage power lines in England and Wales: a case-control study.

Estimating magnetic fields of homes near transmission lines in the California Power Line Study.

Proximity to overhead power lines and childhood leukaemia: an international pooled analysis.

Childhood leukaemia and distance from power lines in California: a population-based case-control study.

Childhood leukemia risk in the California Power Line Study: Magnetic fields versus distance from power lines.

Residential distance to high-voltage power lines and risk of neurodegenerative diseases: a Danish population-based case-control study.

Residential proximity to high-voltage power lines and risk of childhood hematological malignancies.

Magnetic fields and leukemia--risk for adults living close to power lines.

Overhead electricity power lines and childhood leukemia: a registry-based, case-control study.

Preterm birth among women living within 600 meters of high voltage overhead Power Lines: a case-control study.

Are children living near high-voltage power lines at increased risk of acute lymphoblastic leukemia?

Health responses to a new high-voltage power line route: design of a quasi-experimental prospective field study in the Netherlands.

Reanalysis of risks of childhood leukaemia with distance from overhead power lines in the UK.

Adult cancers near high-voltage overhead power lines.

Methods used to estimate residential exposure to 50 Hz magnetic fields from overhead power lines in an epidemiological study in France.

Magnetic fields of high voltage power lines and risk of cancer in Finnish adults: nationwide cohort study.

Risks of leukaemia among residents close to high voltage transmission electric lines.

Childhood leukaemia close to high-voltage power lines--the Geocap study, 2002-2007.

Risk of cancer in Finnish children living close to power lines.

Exposure to magnetic fields and childhood acute lymphocytic leukemia in Sao Paulo, Brazil.

"These Power Lines Make Me Ill": A Typology of Residents' Health Responses to a New High-Voltage Power Line.

Increased risk of childhood acute lymphoblastic leukemia (ALL) by prenatal and postnatal exposure to high voltage power lines: a case control study in Isfahan, Iran.

[Childhood leukaemia in a residential area with a high-voltage power line: approach according to the Dutch Community Health Services' guideline 'Cancer Clusters'].

Magnetic fields and childhood cancer: an epidemiological investigation of the effects of high-voltage underground cables.

Epidemiologic study of residential proximity to transmission lines and childhood cancer in California: description of design, epidemiologic methods and study population.

Residence near power lines and the risk of birth defects.

Leukaemia and residence near electricity transmission equipment: a case-control study.

Adult mortality from leukemia, brain cancer, amyotrophic lateral sclerosis and magnetic fields from power lines: a case-control study in Brazil.

Residential and occupational exposure to 50 Hz magnetic fields and malignant melanoma: a population based study.

Distance to high-voltage power lines and risk of childhood leukemia--an analysis of confounding by and interaction with other potential risk factors.

Residential and occupational exposure to 50 Hz magnetic fields and hematological cancers in Norway.

Childhood cancer and residential proximity to power lines. UK Childhood Cancer Study Investigators.

[Environmental exposure to electromagnetic fields and the risk of cancer].

Residential magnetic fields, contact voltage and their relationship: the effects of distribution unbalance and residential proximity to a transmission line.

Magnetic fields, leukemia, and central nervous system tumors in Swedish adults residing near high-voltage power lines.

Residential distance from high-voltage overhead power lines and risk of Alzheimer's dementia and Parkinson's disease: a population-based case-control study in a metropolitan area of Northern Italy.

Maternal exposure to magnetic fields from high-voltage power lines and the risk of birth defects.

Magnetic fields exposure from high-voltage power lines and risk of amyotrophic lateral sclerosis in two Italian populations.

Residence near power lines and mortality from neurodegenerative diseases: longitudinal study of the Swiss population.

Symptom reporting after the introduction of a new high-voltage power line: a prospective field study.

Risk of hematological malignancies associated with magnetic fields exposure from power lines: a case-control study in two municipalities of northern Italy.

Nocebo responses to high-voltage power lines: Evidence from a prospective field study.

Role of Electromagnetic Field Exposure in Childhood Acute Lymphoblastic Leukemia and No Impact of Urinary Alpha- Amylase--a Case Control Study in Tehran, Iran.

Residence near high voltage facilities and risk of cancer in children.

[Residence close to high-tension electric power lines and its association with leukemia in children].

Relation between suicide and the electromagnetic field of overhead power lines.

Methods used to calculate exposures in two epidemiological studies of power lines in the UK.

Risk of selected birth defects by maternal residence close to power lines during pregnancy.

The effects of electric power lines on the breeding ecology of greater sage-grouse.

Birth defects and high voltage power lines: an exploratory study based on registry data.

[Electromagnetic fields from high-voltage installations and cancer in childhood].

Understanding Local Policy Elites' Perceptions on the Benefits and Risks Associated with High-Voltage Power Line Installations in the State of Arkansas.

Maternal residential proximity to sources of extremely low frequency electromagnetic fields and adverse birth outcomes in a UK cohort.

Experimental validation of a statistical model for evaluating the past or future magnetic field exposures of a population living near power lines.

Residential exposure to overhead high-voltage lines and the risk of testicular cancer: results of a population-based case-control study in Hamburg (Germany).

Childhood cancer and exposure to corona ions from power lines: an epidemiological test.

[Epidemiological studies on neurotic disturbances, anxiety and depression disorders in a population living near an overhead high voltage transmission line (400 kV)].

Magnetic fields of transmission lines and depression.

Power lines and the geomagnetic field.

The relationship between residential proximity to extremely low frequency power transmission lines and adverse birth outcomes.

Effect of Power Line Interference on Microphone Calibration Measurements Made at or Near Harmonics of the Power Line Frequency.

Maternal proximity to extremely low frequency electromagnetic fields and risk of birth defects.

Morbidity experience in populations residentially exposed to 50 hz magnetic fields: methodology and preliminary findings of a cohort study.

Case-control study on maternal residential proximity to high voltage power lines and congenital anomalies in France.

Case-only study of interactions between DNA repair genes (hMLH1, APEX1, MGMT, XRCC1 and XPD) and low-frequency electromagnetic fields in childhood acute leukemia.

Environmental justice: a contrary finding for the case of high-voltage electric power transmission lines.

Comparison of Two Methods for Judging Distances Near Overhead Power Lines.

Relative contribution of residential and occupational magnetic field exposure over twenty-four hours among people living close to and far from a power line.

Depressive symptomatology in women and residential proximity to high-voltage transmission lines.

Childhood cancer occurrence in relation to power line configurations: a study of potential selection bias in case-control studies.

Power lines, roads, and avian nest survival: effects on predator identity and predation intensity.

Symptom prevalence and worry about high voltage transmission lines.

Re-examining the association between residential exposure to magnetic fields from power lines and childhood asthma in the Danish National Birth Cohort.

Comparison of three different ways of measuring distances between residences and high voltage power lines.

Association between high voltage overhead transmission lines and mental health: a cross-sectional study.

Residential proximity to electromagnetic field sources and birth weight: Minimizing residual confounding using multiple imputation and propensity score matching.

[Health effects of electromagnetic fields].

Association between exposure to electromagnetic fields from high voltage transmission lines and neurobehavioral function in children.

Theory of oncogene activation by chemicals and antioncogene inactivation by radiations - possible carcinogenic effect of power-lines.

Radiofrequency field exposure and cancer: what do the laboratory studies suggest?

Cancer cluster among young Indian adults living near power transmission lines in Bom Jesus do Tocantins, Para, brazil.

The Origin and Role of Trust in Local Policy Elites' Perceptions of High-Voltage Power Line Installations in the State of Arkansas.

A note on the charging of aerosols by overhead line corona.

[Heliogeophysical correlates of early biodemographic variables in the south of western Siberia].

Experimental evidence of a potentially increased thrombo-embolic disease risk by domestic electromagnetic field exposure.

Theme - Residential magnetic fields and childhood leukemia

Titles

A pooled analysis of magnetic fields, wire codes, and childhood leukemia. Childhood Leukemia-EMF Study Group.

Residential magnetic fields predicted from wiring configurations: II. Relationships To childhood leukemia.

Childhood leukemia and personal monitoring of residential exposures to electric and magnetic fields in Ontario, Canada.

Residential exposure to magnetic fields and acute lymphoblastic leukemia in children.

A case-control study of childhood leukemia in southern Ontario, Canada, and exposure to magnetic fields in residences.

Do studies of wire code and childhood leukemia point towards or away from magnetic fields as the causal agent?

Case-control study of childhood cancer and exposure to 60-Hz magnetic fields.

Power-frequency electric and magnetic fields and risk of childhood leukemia in Canada.

Exposure to residential electric and magnetic fields and risk of childhood leukemia.

Magnetic field exposure assessment in a case-control study of childhood leukemia.

Assessment of selection bias in the Canadian case-control study of residential magnetic field exposure and childhood leukemia.

Childhood leukemia and electromagnetic fields: results of a population-based case-control study in Germany.

[Infantile leukemia and exposure to 50/60 Hz magnetic fields: review of epidemiologic evidence in 2000].

Factors that explain the power line configuration wiring code-childhood leukemia association: what would they look like?

Electric and magnetic fields at power frequencies.

Residential magnetic field exposure and childhood brain cancer: a meta-analysis.

Childhood cancer in relation to a modified residential wire code.

Occupational and residential magnetic field exposure and leukemia and central nervous system tumors.

A pooled analysis of magnetic fields and childhood leukaemia.

Electrical power lines and childhood leukemia: a study from Greece.

Childhood leukemia, electric and magnetic fields, and temporal trends.

Residential mobility and childhood leukemia.

Residential wire codes: reproducibility and relation with measured magnetic fields.

Childhood leukemia: electric and magnetic fields as possible risk factors.

Childhood leukemia and magnetic fields in Japan: a case-control study of childhood leukemia and residential power-frequency magnetic fields in Japan.

Hypothesis: the risk of childhood leukemia is related to combinations of power-frequency and static magnetic fields.

Selection bias from differential residential mobility as an explanation for associations of wire codes with childhood cancer.

Do confounding or selection factors of residential wiring codes and magnetic fields distort findings of electromagnetic fields studies?

Residential magnetic fields and childhood leukemia: a meta-analysis.

Residential magnetic fields as a risk factor for childhood acute leukaemia: results from a German population-based case-control study.

The residential case-specular method to study wire codes, magnetic fields, and disease.

Wire codes, magnetic fields, and childhood cancer.

Residential EMF exposure and childhood leukemia: meta-analysis and population attributable risk.

The potential impact of bias in studies of residential exposure to magnetic fields and childhood leukemia.

Magnetic fields and childhood cancer--a pooled analysis of two Scandinavian studies.

Do magnetic fields cause increased risk of childhood leukemia via melatonin disruption?

[Electromagnetic residential fields and childhood cancers: state of epidemiological research].

[Synthesis of the epidemiological evidence concerning childhood leukemia in relation to exposure to 50 Hz. electric and magnetic fields].

Childhood leukemia and magnetic fields in infant incubators.

Electromagnetic fields and cancer risks.

[Risk of childhood leukemia and environmental exposure to ELF electromagnetic fields].

Magnetic fields and acute leukemia in children with Down syndrome.

Residential exposure to electromagnetic fields and childhood leukaemia: a meta-analysis.

Combined risk estimates for two German population-based case-control studies on residential magnetic fields and childhood acute leukemia.

Magnetic fields and acute lymphoblastic leukemia in children: a systematic review of case-control studies.

Adult and childhood leukemia near a high-power radio station in Rome, Italy.

Residential proximity to electricity transmission and distribution equipment and risk of childhood leukemia, childhood lymphoma, and childhood nervous system tumors: systematic review, evaluation, and meta-analysis.

Variation in cancer risk estimates for exposure to powerline frequency electromagnetic fields: a meta-analysis comparing EMF measurement methods.

Maternal occupational exposure to extremely low frequency magnetic fields during pregnancy and childhood leukemia.

Residential magnetic fields predicted from wiring configurations: I. Exposure model.

Estimating exposure in studies of residential magnetic fields and cancer: importance of short-term variability, time interval between diagnosis and measurement, and distance to power line.

Childhood leukemia in relation to radio frequency electromagnetic fields in the vicinity of TV and radio broadcast transmitters.

Pooled analysis of recent studies on magnetic fields and childhood leukaemia.

Occupational electric and magnetic field exposure and leukemia. A meta-analysis.

Description of a new computer wire coding method and its application to evaluate potential control selection bias in the Savitz et al. childhood cancer study.

Aetiology of childhood leukemia.

Maternal occupational exposure to electromagnetic fields before, during, and after pregnancy in relation to risks of childhood cancers: findings from the Oxford Survey of Childhood Cancers, 1953-1981 deaths.

Exposure to power-frequency magnetic fields and the risk of childhood cancer. UK Childhood Cancer Study Investigators.

Exposure to magnetic fields and survival after diagnosis of childhood leukemia: a German cohort study.

A case-control pilot study of traffic exposures and early childhood leukemia using a geographic information system.

Influence of power frequency electric and magnetic fields on human health.

Rate of occurrence of transient magnetic field events in U.S. residences.

Epidemiologic studies of electric and magnetic fields and cancer: strategies for extending knowledge.

Suggestion of concomitant changes of electric power consumption and childhood leukemia in Greece.

Association between childhood acute lymphoblastic leukemia and use of electrical appliances during pregnancy and childhood.

Nighttime exposure to electromagnetic fields and childhood leukemia: an extended pooled analysis.

The possible role of contact current in cancer risk associated with residential magnetic fields.

Leukemia in electric utility workers: the evaluation of alternative indices of exposure to 60 Hz electric and magnetic fields.

Exposure to radio-frequency electromagnetic fields from broadcast transmitters and risk of childhood cancer: a census-based cohort study.

Leukemia and lymphoma incidence in rodents exposed to low-frequency magnetic fields.

Do power frequency magnetic fields cause leukemia in children?

Viral contacts confound studies of childhood leukemia and high-voltage transmission lines.

Residential exposure to magnetic fields and risk of canine lymphoma.

[Occupational and residential exposure to electric and magnetic field and its relationship on acute myeloid leukemia in adults - A Meta-analysis].

Acute nonlymphocytic leukemia and residential exposure to power frequency magnetic fields.

Modification of the 1979 "Denver wire code" for different wire or plumbing types.

Risk of childhood leukemia in areas passed by high power lines.

Risk factors for leukemia in Thailand.

Determinants of power-frequency magnetic fields in residences located away from overhead power lines.

Risk of leukemia in children living near high-voltage transmission lines.

Los Angeles study of residential magnetic fields and childhood brain tumors.

Residential electric consumption and childhood cancer in Canada (1971-1986)

Selection bias and its implications for case-control studies: a case study of magnetic field exposure and childhood leukaemia.

Extremely low-frequency magnetic fields and childhood acute lymphoblastic leukemia: an exploratory analysis of alternative exposure metrics.

Childhood brain tumors and residential electromagnetic fields (EMF).

Power-frequency magnetic fields and childhood brain tumors: a case-control study in Japan.

Electromagnetic field exposures and childhood leukaemia in New Zealand.

Childhood cancer in relation to indicators of magnetic fields from ground current sources.

[A review of epidemiological studies on the relationship of residential electromagnetic exposure to cancer].

Investigation of the sources of residential power frequency magnetic field exposure in the UK Childhood Cancer Study.

Electric and magnetic fields and health outcomes--an overview.

Estimation of population attributable fractions from fitted incidence ratios and exposure survey data, with an application to electromagnetic fields and childhood leukemia.

The determinants of Canadian children's personal exposures to magnetic fields.

Correlation of year-to-year magnetic field exposure metrics among children in a leukemia survival study.

Contact voltage measured in residences: implications to the association between magnetic fields and childhood leukemia.

Exposure to power frequency electric fields and the risk of childhood cancer in the UK.

Investigation of increased incidence in childhood leukemia near radio towers in Hawaii: preliminary observations.

Adult glioma in relation to residential power frequency electromagnetic field exposures in the San Francisco Bay area.

A precautionary public health protection strategy for the possible risk of childhood leukaemia from exposure to power frequency magnetic fields.

[Leukemia mortality and incidence of infantile leukemia near the Vatican Radio Station of Rome].

A pooled analysis of extremely low-frequency magnetic fields and childhood brain tumors.

Health effects of magnetic fields generated from power lines: new clues for an old puzzle.

Association of childhood cancer with residential traffic density.

Designs and analyses for exploring the relationship of magnetic fields to childhood leukaemia: a pilot project for the Danish National Birth Cohort.

A Bayesian approach to hazard identification. The case of electromagnetic fields and cancer.

[Risk of neoplastic diseases in conditions of exposure to power magnetic fields--epidemiologic investigations].

Potential motion related bias in the worn dosimeter measurements of two childhood leukemia studies.

Early pregnancy loss and exposure to 50-Hz magnetic fields.

Extra low frequency electric and magnetic fields in the bedplace of children diagnosed with leukaemia: a case-control study.

Environmental factors and childhood acute leukemias and lymphomas.

Are the stray 60-Hz electromagnetic fields associated with the distribution and use of electric power a significant cause of cancer?

An alternate hypothesis for the association between electrical wiring configurations and cancer.

Magnetic field exposure and long-term survival among children with leukaemia.

Decreased survival for childhood leukemia in proximity to television towers.

Exposure to electromagnetic fields and risk of leukemia.

An evaluation of exposure metrics in an epidemiologic study on radio and television broadcast transmitters and the risk of childhood leukemia.

[Meta-analysis and its application in epidemiology].

Does our electricity distribution system pose a serious risk to public health?

Magnetic fields and leukaemia risks in UK electricity supply workers.

Childhood incidence of acute lymphoblastic leukaemia and exposure to broadcast radiation in Sydney--a second look.

50-Hz electromagnetic environment and the incidence of childhood tumors in Stockholm County.

Assessment of non-response bias in a survey of residential magnetic field exposure in Taiwan.

The relative merits of contemporary measurements and historical calculated fields in the Swedish childhood cancer study.

A population-based case-control study of radiofrequency exposure in relation to childhood neoplasm.

A unified approach to the analysis of case-distribution (case-only) studies.

A richer conceptualization of "exposure" for epidemiological studies of the "EMF mixture".

High incidence of acute leukemia in the proximity of some industrial facilities in El Bierzo, northwestern Spain.

Exposure measurement errors, risk estimate and statistical power in case-control studies using dichotomous analysis of a continuous exposure variable.

Deaths from electricity.

RF personal exposimetry on employees of elementary schools, kindergartens and day nurseries as a proxy for child exposures.

Attributable fractions: bias from broad definition of exposure.

Theme - Electromagnetic fields and cancer, especially breast cancer

Titles

Breast cancer and electromagnetic fields--a review.

Follow-up of radio and telegraph operators with exposure to electromagnetic fields and risk of breast cancer.

Electric power, pineal function, and the risk of breast cancer.

Electric blanket use and breast cancer in the Nurses' Health Study.

Electric blanket or mattress cover use and breast cancer incidence in women 50-79 years of age.

Electric blanket use and breast cancer risk among younger women.

Electric blanket use and breast cancer on Long Island.

Risk of premenopausal breast cancer and use of electric blankets.

Occupational exposure to electromagnetic field and breast cancer risk in a large, population-based, case-control study in the United States.

The relationship between electromagnetic field and light exposures to melatonin and breast cancer risk: a review of the relevant literature.

Residential and occupational exposures to 50-Hz magnetic fields and breast cancer in women: a population-based study.

Use of electric blankets and risk of postmenopausal breast cancer.

Electromagnetic fields and male breast cancer.

Environmental factors and breast cancer.

Electromagnetic fields and female breast cancer.

Environmental risk factors and female breast cancer.

Occupational and residential magnetic field exposure and breast cancer in females.

Role of melatonin on electromagnetic radiation-induced oxidative stress and Ca2+ signaling molecular pathways in breast cancer.

Occupational exposures to extremely low frequency magnetic fields and postmenopausal breast cancer.

Population-based case-control study of occupational exposure to electromagnetic fields and breast cancer.

Exposure to electromagnetic fields from use of electric blankets and other in-home electrical appliances and breast cancer risk.

Residential magnetic field exposure and breast cancer risk: a nested case-control study from a multiethnic cohort in Los Angeles County, California.

Evaluation of potential confounders in planning a study of occupational magnetic field exposure and female breast cancer.

Risk for leukaemia and brain and breast cancer among Danish utility workers: a second follow-up.

Breast cancer and electric power.

Residential exposure to 60-Hertz magnetic fields and adult cancers in Taiwan.

Occupational exposure to magnetic fields in relation to male breast cancer and testicular cancer: a Swedish case-control study.

The melatonin hypothesis: electric power and breast cancer.

Incidence of breast cancer in a Norwegian cohort of women with potential workplace exposure to 50 Hz magnetic fields.

Magnetic fields and breast cancer in Swedish adults residing near high-voltage power lines.

Electromagnetic fields and breast cancer on Long Island: a case-control study.

Occupational magnetic fields and female breast cancer: a case-control study using Swedish population registers and new exposure data.

A meta-analysis of epidemiologic studies of electric and magnetic fields and breast cancer in women and men.

Residential magnetic fields and the risk of breast cancer.

A cluster of male breast cancer in office workers.

Induction of tamoxifen resistance in breast cancer cells by ELF electromagnetic fields.

Electromagnetic field exposure and male breast cancer risk: a meta-analysis of 18 studies.

Relationship between exposure to extremely low-frequency electromagnetic fields and breast cancer risk: a meta-analysis.

Shift work, light at night, and breast cancer on Long Island, New York.

Extremely low-frequency electromagnetic fields exposure and female breast cancer risk: a meta-analysis based on 24,338 cases and 60,628 controls.

Use of electric bedding devices and risk of breast cancer in African-American women.

Epidemiological appraisal of studies of residential exposure to power frequency magnetic fields and adult cancers.

Magnetic fields and mammary cancer in rodents: a critical review and evaluation of published literature.

Breast cancer, occupation, and exposure to electromagnetic fields among Swedish men.

[Risk of cancer among Danish electricity workers. A cohort study].

Meta-analysis of extremely low frequency electromagnetic fields and cancer risk: a pooled analysis of epidemiologic studies.

Occupational magnetic field exposure and site-specific cancer incidence: a Swedish cohort study.

Risk of cancer among Danish utility workers--a nationwide cohort study.

Occupational exposures associated with male breast cancer.

Incidence of cancer in persons with occupational exposure to electromagnetic fields in Denmark.

Cancer incidence in California flight attendants (United States).

Overview of epidemiologic research on electric and magnetic fields and cancer.

Exposure to extremely low frequency magnetic fields among working women and homemakers.

Endometrial cancer incidence in relation to electric blanket use.

[Carcinogenic risk of extremely-low-frequency electromagnetic fields: state of the art].

Increased incidence of cancer in a cohort of office workers exposed to strong magnetic fields.

Socioeconomic status, social mobility and cancer occurrence during working life: a case-control study among French electricity and gas workers.

Extremely low frequency electromagnetic fields (EMF) and brain cancer in adults and children: review and comment.

Incidence of cancer in the vicinity of Korean AM radio transmitters.

Cancer incidence and magnetic field exposure in industries using resistance welding in Sweden.

Use of electric blankets and risk of testicular cancer.

Use of electric blankets and association with prevalence of endometrial cancer.

Personal radio use and cancer risks among 48,518 British police officers and staff from the Airwave Health Monitoring Study.

[Use of cellular telephones and risk of cancer. A Danish cohort study].

Cancer incidence near radio and television transmitters in Great Britain. I. Sutton Coldfield transmitter.

Cancer incidence among Norwegian airline pilots.

Radio-frequency radiation exposure from AM radio transmitters and childhood leukemia and brain cancer.

Biologically based epidemiological studies of electric power and cancer.

Cancer incidence vs. FM radio transmitter density.

A new electromagnetic exposure metric: high frequency voltage transients associated with increased cancer incidence in teachers in a California school.

Primary brain cancer in adults and the use of common household appliances: a case-control study.

Extremely low frequency electromagnetic fields and cancer: the epidemiologic evidence.

Cancer incidence near radio and television transmitters in Great Britain. II. All high power transmitters.

Epidemiological studies of radio frequency exposures and human cancer.

Cancer mortality and residence near electricity transmission equipment: a retrospective cohort study.

Effects of 50- or 60-hertz, 100 microT magnetic field exposure in the DMBA mammary cancer model in Sprague-Dawley rats: possible explanations for different results from two laboratories.

Brain tumor risk in children in relation to use of electric blankets and water bed heaters. Results from the United States West Coast Childhood Brain Tumor Study.

Electromagnetic fields: a cancer promoter?

Prostate cancer in relation to the use of electric blanket or heated water bed.

Cancer in radar technicians exposed to radiofrequency/microwave radiation: sentinel episodes.

Brain cancer risk and electromagnetic fields (EMFs): assessing the geomagnetic component.

Incidence of Seminoma Cancer in Staffs that Worked in Electromagnetic Waves Station; Three Cases Report.

Incidence of cancer in Norwegian workers potentially exposed to electromagnetic fields.

Human cancer from environmental pollutants: the epidemiological evidence.

Electric blanket use during pregnancy in relation to the risk of congenital urinary tract anomalies among women with a history of subfertility.

Magnetic field exposure related to cancer subtypes.

Increasing incidence of thyroid cancer in the Nordic countries with main focus on Swedish data.

[Electromagnetic fields: is there any probability of the risk of cancer?].

Electric Blanket Use and Risk of Thyroid Cancer in the Women's Health Initiative Observational Cohort.

Epidemiology and aetiological factors of male breast cancer: a ten years retrospective study in eastern Turkey.

Radio frequency radiation-related cancer: assessing causation in the occupational/military setting.

Spontaneous abortion and exposure to electric blankets and heated water beds.

[Environment and cancer risk].

[Geomagnetic field variation in early ontogenesis as a risk factor for oncopathology].

Cancer in the electric power industry.

The use of electric bed heaters and the risk of clinically recognized spontaneous abortion.

The role of household electromagnetic fields in the development of mammary tumors in women: clinical case-record observations.

[Evaluation of genotoxic and/or co-genotoxic effects in cells exposed in vitro to extremely-low frequency electromagnetic fields].

Trends in incidence of primary brain cancer in New Zealand, 1995 to 2010.

Myelogenous leukemia and electric blanket use.

Panel exploring pro and con arguments as to whether EMFs cause childhood brain cancer.

[Recent data from the literature on the biological and pathologic effects of electromagnetic radiation, radio waves and stray currents].

Chronic toxicity/oncogenicity evaluation of 60 Hz (power frequency) magnetic fields in B6C3F1 mice.

Biological effects of power-frequency fields as they relate to carcinogenesis.

[Age diseases depending on geomagnetic field activity inside the womb period].

[Enhancement of efficacy of neoadjuvant polychemotherapy in combined treatment of lung cancer].

Cancer versus FM radio polarization types.

Genetic damage in humans exposed to extremely low-frequency electromagnetic fields.

[Male breast tumors in railway engine drivers: investigation of 5 cases].

Exposure to electromagnetic fields during pregnancy with emphasis on electrically heated beds: association with birthweight and intrauterine growth retardation.

Melanoma incidence and frequency modulation (FM) broadcasting.

Malignant melanoma of the skin - not a sunshine story!

Multimodal treatment of hepatocellular carcinoma.

Theme - Mortality studies of electrical utility workers, focusing on electromagnetic field exposures

Titles

Magnetic field exposure in relation to leukemia and brain cancer mortality among electric utility workers.

A mortality study of electrical utility workers in Quebec.

Cohort and nested case-control studies of hematopoietic cancers and brain cancer among electric utility workers.

[Cancer mortality among electricity utility workers in a the state of Sao Paulo, Brazil].

Radiofrequency exposure and mortality from cancer of the brain and lymphatic/hematopoietic systems.

Magnetic field exposure and neurodegenerative disease mortality among electric utility workers.

Exposure to electromagnetic fields and suicide among electric utility workers: a nested case-control study.

[Preliminary study of cause-specific mortality of a population exposed to 50 Hz magnetic fields, in a district of Rome municipality].

Exposure to electromagnetic fields and suicide among electric utility workers: a nested case-control study.

Mortality from brain cancer and leukaemia among electrical workers.

Mortality in workers exposed to electromagnetic fields.

Comparative analyses of the studies of magnetic fields and cancer in electric utility workers: studies from France, Canada, and the United States.

Leukemia following occupational exposure to 60-Hz electric and magnetic fields among Ontario electric utility workers.

Mortality from amyotrophic lateral sclerosis, other chronic disorders, and electric shocks among utility workers.

Electromagnetic fields and health effects--epidemiologic studies of cancer, diseases of the central nervous system and arrhythmia-related heart disease.

Mortality of workers exposed to ionizing radiation at the French National Electricity Company.

Association between exposure to pulsed electromagnetic fields and cancer in electric utility workers in Quebec, Canada, and France.

[Mortality of personnel operating electric power objects with 500 kV voltage].

Electromagnetic fields, polychlorinated biphenyls, and prostate cancer mortality in electric utility workers.

Mortality of plastic-ware workers exposed to radiofrequencies.

Mortality among workers in the geothermal power plants at Larderello, Italy.

A population-based cohort study of occupational exposure to magnetic fields and cardiovascular disease mortality.

Exposure to 50-Hz electric field and incidence of leukemia, brain tumors, and other cancers among French electric utility workers.

Cancer in Korean war navy technicians: mortality survey after 40 years.

[Occupational exposure to electromagnetic fields and its health effects in electric energy workers].

Leukemia, brain tumors, and exposure to extremely low frequency electromagnetic fields in Swiss railway employees.

Electric and magnetic field exposure and brain cancer: a review.

[Remote effects of occupational and non-occupational exposure to electromagnetic fields of power-line frequency. Epidemiological studies].

Occupational exposures and brain cancer mortality: a preliminary study of east Texas residents.

[Mortality of people residing near electric power supply line with voltage of 500 kV].

Cancer incidence and mortality and proximity to TV towers.

Cardiovascular mortality and exposure to extremely low frequency magnetic fields: a cohort study of Swiss railway workers.

Mortality of persons resident in the vicinity of electricity transmission facilities.

A case cohort study of suicide in relation to exposure to electric and magnetic fields among electrical utility workers.

Mortality from neurodegenerative disease and exposure to extremely low-frequency magnetic fields: 31 years of observations on Swiss railway employees.

Refinements in magnetic field exposure assignment for a case-cohort study of electrical utility workers.

Leukaemia, brain tumours and exposure to extremely low frequency magnetic fields: cohort study of Swiss railway employees.

Magnetic field exposure and cardiovascular disease mortality among electric utility workers.

[Mortality indices for hemoblastoses in Rivno Province before and after the accident at the Chernobyl Atomic Electric Power Station].

Incidence of cancer among workers in Norwegian hydroelectric power companies.

Fatal occupational injuries among electric power company workers.

Exposure to electromagnetic fields and the risk of leukemia.

Biological effects on human health due to radiofrequency/microwave exposure: a synopsis of cohort studies.

Increased mortality in amateur radio operators due to lymphatic and hematopoietic malignancies.

Risk of severe cardiac arrhythmia in male utility workers: a nationwide danish cohort study.

Occupational magnetic field exposure, cardiovascular disease mortality, and potential confounding by smoking.

Invited commentary: electromagnetic fields and cancer in railway workers.

Multiple sclerosis among utility workers.

Annals of conflicting results: looking back on electromagnetic field research.

Ecological study on residences in the vicinity of AM radio broadcasting towers and cancer death: preliminary observations in Korea.

Feasibility of a cohort study on health risks caused by occupational exposure to radiofrequency electromagnetic fields.

[An epidemiological study of cancer morbidity and mortality among the population living in areas close to thermal and atomic electric power stations].

Practical limitations of epidemiologic methods.

Causes of death among Belgian professional military radar operators: a 37-year retrospective cohort study.

Effects upon health of occupational exposure to microwave radiation (radar).

Leukemia in telephone linemen.

Cancer incidence among welders: possible effects of exposure to extremely low frequency electromagnetic radiation (ELF) and to welding fumes.

Uncertainty in the relation between exposure to magnetic fields and brain cancer due to assessment and assignment of exposure and analytical methods in dose-response modeling.

Accidental deaths caused by electricity in Sweden, 1975-2000.

Cancer morbidity in subjects occupationally exposed to high frequency (radiofrequency and microwave) electromagnetic radiation.

Pregnancy outcomes after paternal radiofrequency field exposure aboard fast patrol boats.

Home and leisure injuries among the French electricity and gas company active employees: circumstances and short-term consequences.

Theme - Occupational exposure to electromagnetic fields, emphasizing neurodegenerative disease and cancer

Titles

Occupational exposures and the risk of amyotrophic lateral sclerosis.

Dementia and occupational exposure to magnetic fields.

Occupational exposure to magnetic fields in case-referent studies of neurodegenerative diseases.

Amyotrophic lateral sclerosis and occupational exposure to electromagnetic fields.

Occupational Exposures and Neurodegenerative Diseases-A Systematic Literature Review and Meta-Analyses.

Occupational magnetic field exposure and neurodegenerative disease.

Association between extremely low-frequency electromagnetic fields occupations and amyotrophic lateral sclerosis: a meta-analysis.

Paternal occupational exposure to electro-magnetic fields as a risk factor for cancer in children and young adults: a case-control study from the North of England.

Occupational exposure and amyotrophic lateral sclerosis in a prospective cohort.

Neurodegenerative diseases in welders and other workers exposed to high levels of magnetic fields.

Parental occupational exposure to magnetic fields and childhood cancer (Sweden).

Association between occupational exposure to power frequency electromagnetic fields and amyotrophic lateral sclerosis: a review.

Magnetic field exposure and neurodegenerative diseases--recent epidemiological studies.

Occupational and residential exposure to electromagnetic fields and risk of brain tumors in adults: a case-control study in Gironde, France.

Electrical occupations and neurodegenerative disease: analysis of U.S. mortality data.

Occupational exposure to magnetic fields and brain tumours in central Sweden.

Occupational exposure to extremely low frequency electric and magnetic fields and Alzheimer disease: a meta-analysis.

Amyotrophic Lateral Sclerosis and Occupational Exposures: A Systematic Literature Review and Meta-Analyses.

Case-Control Study on Occupational Exposure to Extremely Low-Frequency Electromagnetic Fields and the Association with Meningioma.

Occupational exposure to extremely low frequency magnetic fields and risk of Alzheimer disease: A systematic review and meta-analysis.

Occupational exposure to electromagnetic fields and Alzheimer disease.

Risk of childhood acute lymphoblastic leukaemia following parental occupational exposure to extremely low frequency electromagnetic fields.

Brain cancer and occupational exposure to magnetic fields among men: results from a Canadian population-based case-control study.

Occupational exposure to high-frequency electromagnetic fields and brain tumor risk in the INTEROCC study: An individualized assessment approach.

Occupational exposure to power frequency magnetic fields and risk of non-Hodgkin lymphoma.

Parental occupational exposure to extremely low frequency magnetic fields and childhood cancer: a German case-control study.

[News in occupational cancers].

Exposure to magnetic fields among electrical workers in relation to leukemia risk in Los Angeles County.

Occupational exposure to magnetic fields and the risk of brain tumors.

Occupational electric and magnetic field exposure and brain cancer: a meta-analysis.

Risk factors for Alzheimer disease: a population-based case-control study in Istanbul, Turkey.

Acute leukemia in electrical workers: a New Zealand case-control study.

Brain tumor risk in offspring of men occupationally exposed to electric and magnetic fields.

Work related etiology of amyotrophic lateral sclerosis (ALS): a meta-analysis.

Occupational exposure to low frequency magnetic fields and the risk of low grade and high grade glioma.

Occupational magnetic field exposure among women in Stockholm County, Sweden.

Occupational risk factors for cancer of the central nervous system: a case-control study on death certificates from 24 U.S. states.

Are occupational, hobby, or lifestyle exposures associated with Philadelphia chromosome positive chronic myeloid leukaemia?

Berkson error adjustment and other exposure surrogates in occupational case-control studies, with application to the Canadian INTEROCC study.

Paternal occupational exposure to radiofrequency electromagnetic fields and risk of adverse pregnancy outcome.

Electromagnetic field exposures and childhood cancers in New Zealand.

Occupational exposure to electromagnetic fields and acute leukaemia: analysis of a case-control study.

Maternal occupational exposure to extremely low frequency magnetic fields and the risk of brain cancer in the offspring.

Elevated risk of Alzheimer's disease among workers with likely electromagnetic field exposure.

[Epidemiological risk assessment of pathology development in occupational exposure to radiofrequency electromagnetic fields].

Review of the epidemiologic literature on EMF and Health.

Occupational risk factors in Alzheimer's disease: a review assessing the quality of published epidemiological studies.

Exposure to extremely low frequency electromagnetic fields and the risk of malignant diseases--an evaluation of epidemiological and experimental findings.

Interactions between occupational exposure to extremely low frequency magnetic fields and chemicals for brain tumour risk in the INTEROCC study.

The effect of male occupational exposure in infertile couples in Norway.

[Amyotrophic lateral sclerosis and exposure to metals and other occupational/environmental hazardous materials: state of the art].

Occupational exposure to radio frequency/microwave radiation and the risk of brain tumors: Interphone Study Group, Germany.

Relationships between occupational history and serum concentrations of organochlorine compounds in exocrine pancreatic cancer.

Risk agents related to work and amyotrophic lateral sclerosis: An occupational medicine focus.

[A case-control study on the risk factors of Alzheimer's disease in military elderly men].

Occupational exposures obtained by questionnaire in clinical practice and their association with semen quality.

Leukemia and occupational exposure to electromagnetic fields: review of epidemiologic surveys.

Occupational exposure to ionizing and non-ionizing radiation and risk of non-Hodgkin lymphoma.

Case-control study on occupational exposure to extremely low-frequency electromagnetic fields and glioma risk.

Risk of birth defects by parental occupational exposure to 50 Hz electromagnetic fields: a population based study.

Environmental risk factors for non-Hodgkin's lymphoma: a population-based case-control study in Languedoc-Roussillon, France.

Exposure to electromagnetic fields and risk of central nervous system disease in utility workers.

[Exposure to electromagnetic fields and risk of central nervous system diseases among employees at Danish electric companies].

Neurodegenerative diseases, suicide and depressive symptoms in relation to EMF.

Occupations with exposure to electromagnetic fields: a possible risk factor for Alzheimer's disease.

Occupational risk factors for lung cancer in the French electricity and gas industry: a case-control survey nested in a cohort of active employees.

Parental occupational exposures to electromagnetic fields and radiation and the incidence of neuroblastoma in offspring.

Occupational exposure to ionizing radiation and electromagnetic fields in relation to the risk of thyroid cancer in Sweden.

[Parental occupational exposures and autism spectrum disorder in children].

Acute leukaemia in workers exposed to electromagnetic fields.

Parental heat exposure and risk of childhood brain tumor: a Children's Oncology Group study.

Occupational magnetic field exposure and the risk of acoustic neuroma.

Leukemia risk and occupational electric field exposure in Los Angeles County, California.

Neurodegenerative disease and magnetic field exposure in UK electricity supply workers.

Occupational exposure to low frequency magnetic fields and dementia: a case-control study.

Occupation and malignant lymphoma: a population based case control study in Germany.

A nested case-control study of residential and personal magnetic field measures and miscarriages.

Need for a European approach to the effects of extremely low-frequency electromagnetic fields on cancer. ELF-EMF European Feasibility Study Group.

Incidence of leukaemia and brain tumours in some "electrical occupations".

A population-based prospective cohort study of personal exposure to magnetic fields during pregnancy and the risk of miscarriage.

Risk of cognitive impairment in relation to elevated exposure to electromagnetic fields.

Occupational factors of anxiety and depressive disorders in the French National Electricity and Gas Company. The Anxiety-Depression Group.

Occupational electromagnetic field exposures associated with sleep quality: a cross-sectional study.

Testicular cancer and electromagnetic fields (EMF) in the workplace: results of a population-based case-control study in Germany.

Occupational exposure to electromagnetic fields and the occurrence of brain tumors. An analysis of possible associations.

Occupational magnetic field exposure and myocardial infarction incidence.

Magnetic fields and brain tumour risks in UK electricity supply workers.

[The potential hazard for the development of leukemia from exposure to electromagnetic radiation (a review of the literature)].

Neuroblastoma and paternal occupation. A case-control analysis.

Self-reported electrical appliance use and risk of adult brain tumors.

Non-specific physical symptoms and electromagnetic field exposure in the general population: can we get more specific? A systematic review.

Occupational risk factors for acute leukaemia: a case-control study.

Occupational hazards for the male reproductive system.

Amyotrophic lateral sclerosis and environmental factors.

Environmental risk factors for brain tumors.

Occupational exposure to electromagnetic fields and sex-differential risk of uveal melanoma.

Maternal cumulative exposure to extremely low frequency electromagnetic fields and pregnancy outcomes in the Elfe cohort.

[Non dietetic environmental risk factors in prostate cancer].

[Environmental risk factors and epidemiologic study].

[Paternal exposure to occupational electromagnetic radiation and sex ratio of the offspring: a meta-analysis].

[Occupational risk and its prophylaxis for female workers engaged in radio-electronic instrument industry].

Interactive effect of chemical substances and occupational electromagnetic field exposure on the risk of gliomas and meningiomas in Swedish men.

[Delayed biological effect of electromagnetic fields action].

Prevalence of musculoskeletal disorders and related occupational causative factors among electricity linemen: A narrative review.

Paternal work in the power industry: effects on children at delivery.

Miscarriages among female physical therapists who report using radio- and microwave-frequency electromagnetic radiation.

Radiation exposure, socioeconomic status, and brain tumor risk in the US Air Force: a nested case-control study.

Risk factors, health risks, and risk management for aircraft personnel and frequent flyers.

Video display terminal use during pregnancy and reproductive outcome--a meta-analysis.

[Difficulties of expert testimony in microwave disease].

Radiofrequency electromagnetic fields; male infertility and sex ratio of offspring.

Exposure to magnetic fields and the risk of poor sperm quality.

Myeloid leukemias and myelodysplastic syndromes: chemical exposure, histologic subtype and cytogenetics in a case-control study.

[Evaluation of occupational risk caused by exposure to electromagnetic rays].

An apparently incongruous exposure-response relationship resulting from the use of job description to assess magnetic field exposure.

Carcinogenicity test in B6C3F1 mice after parental and prenatal exposure to 50 Hz magnetic fields.

Congenital malformations and exposure to high-frequency electromagnetic radiation among Danish physiotherapists.

[The IARC carcinogenicity evaluation of radio-frequency electromagnetic field: with special reference to epidemiology of mobile phone use and brain tumor risk].

Limitations of interview-based risk assessment of RF exposure from appliances.

Case-control study on uveal melanoma (RIFA): rational and design.

Gender-specific reproductive outcome and exposure to high-frequency electromagnetic radiation among physiotherapists.

Search for teratogenic risks with the aid of malformation registries.

[Effect of early pregnancy electromagnetic field exposure on embryo growth ceasing].

Development and evaluation of a tool for retrospective exposure assessment of selected endocrine disrupting chemicals and EMF in the car manufacturing industry.

Environmental risk factors in the history of male patients of an infertility clinic.

Environmental exposure assessment in European birth cohorts: results from the ENRIECO project.

Maternal exposure to magnetic fields during pregnancy in relation to the risk of asthma in offspring.

Life styles, anxiety, expertise: the perception of risk from electromagnetic fields.

Epidemiologic evidence relevant to radar (microwave) effects.

Exposure to electromagnetic fields during pregnancy.

A literature review of medical side effects from radio-frequency energy in the human environment: involving cancer, tumors, and problems of the central nervous system.

Does exposure to computers affect the routine parameters of semen quality?

Gender ratio of offspring and exposure to shortwave radiation among female physiotherapists.

Clinical teratology.

Electricity and bones.

[A historic case of Wegener's granulomatosis: the physicist who discovered the electromagnetic waves: Heinrich Hertz].

A possible association between fetal/neonatal exposure to radiofrequency electromagnetic radiation and the increased incidence of autism spectrum disorders (ASD).

Fourth Level Cluster 83 (668)
Theme - Adverse effects of mobile phone use, especially brain tumors, and brain and neural function

--Leaf Cluster 30 (321)

Theme - Adverse health symptoms from mobile phone use

Titles

The risk of subjective symptoms in mobile phone users in Poland--an epidemiological study.

Problematic Use of Mobile Phones in Australia...Is It Getting Worse?

Use of mobile phones and cancer risk.

Health hazards of mobile phones: an Indian perspective.

Nomophobia: A Cross-sectional Study to Assess Mobile Phone Usage Among Dental Students.

Evidence-based policy? The use of mobile phones in hospital.

A survey study of the association between mobile phone use and daytime sleepiness in California high school students.

Electroencephalographic, personality, and executive function measures associated with frequent mobile phone use.

[Radiation from mobile phone and the health].

Is human saliva an indicator of the adverse health effects of using mobile phones?

Use of mobile phones by medical staff at Queen Elizabeth Hospital, Barbados: evidence for both benefit and harm.

Mobile phone induced sensorineural hearing loss.

[Mobile phones radiate--risk to the health?].

An international prospective cohort study of mobile phone users and health (COSMOS): Factors affecting validity of self-reported mobile phone use.

Mobile phone use and location of glioma: a case-case analysis.

Exposure to mobile phone electromagnetic fields and subjective symptoms: a double-blind study.

Adverse effects of excessive mobile phone use.

Mobile phone radiation causes brain tumors and should be classified as a probable human carcinogen (2A) (review).

Are mobile phones harmful?

[Subjective symptoms related to mobile phone use--a pilot study].

Mobile phone radiation and the risk of cancer; a review.

Review on health effects related to mobile phones. Part II: results and conclusions.

Effects of thirty minutes mobile phone use on the human sensory cortex.

Significance of micronuclei in buccal smears of mobile phone users: A comparative study.

[Psychophysiological indicators for children using mobile phones. Communication 1. Current state of the problem].

Audiologic disturbances in long-term mobile phone users.

Does chronic exposure to mobile phones affect cognition?

Mobile phones: influence on auditory and vestibular systems.

Cellular phones: are they detrimental?

Analysis of mobile phone use among young patients with brain tumors in Japan.

Association of mobile phone radiation with fatigue, headache, dizziness, tension and sleep disturbance in Saudi population.

Association between vestibular schwannomas and mobile phone use.

Acute effects of 3G mobile phone radiations on frontal haemodynamics during a cognitive task in teenagers and possible protective value of Om chanting.

Ethical considerations of mobile phone use by patients in KwaZulu-Natal: Obstacles for mHealth?

The use of cell phone and insight into its potential human health impacts.

Mobile phones, in combination with a computer locator system, improve the response times of emergency medical services in central London.

Mobile phone use, school electromagnetic field levels and related symptoms: a cross-sectional survey among 2150 high school students in Izmir.

Mobile phone related-hazards and subjective hearing and vision symptoms in the Saudi population.

Thermal effects of mobile phones on human auricle region.

Mobile phones and health: a literature overview.

Radiation from mobile phone systems: Is it perceived as a threat to people's health?

Child and Adolescent Use of Mobile Phones: An Unparalleled Complex Developmental Phenomenon.

Micronucleus frequency in buccal mucosa cells of mobile phone users.

Exposure of magnetic bacteria to simulated mobile phone-type RF radiation has no impact on mortality.

The assessment of electromagnetic field radiation exposure for mobile phone users.

Mobile phones: Reservoirs for the transmission of nosocomial pathogens.

Headache, tinnitus and hearing loss in the international Cohort Study of Mobile Phone Use and Health (COSMOS) in Sweden and Finland.

Analysis of ear side of mobile phone use in the general population of Japan.

Questionnaire-based evaluation of mobile phone interference with medical-electrical equipment in Swedish hospitals.

Mobile Phone-Use Habits Among Adolescents: Predictors of Intensive Use.

[Effect of stress and intesity of mobile phone using on the health and subjective symptoms in GSM workers].

Epidemiological risk assessment of mobile phones and cancer: where can we improve?

Impact of one's own mobile phone in stand-by mode on personal radiofrequency electromagnetic field exposure.

Mobile phones, radiofrequency fields, and health effects in children--epidemiological studies.

Self-reported mobile phone use and semen parameters among men from a fertility clinic.

Recall of mobile phone usage and laterality in young people: The multinational Mobi-Expo study.

Psychological factors associated with self-reported sensitivity to mobile phones.

Real versus Simulated Mobile Phone Exposures in Experimental Studies.

Time trends (1998-2007) in brain cancer incidence rates in relation to mobile phone use in England.

Neurological changes induced by a mobile phone.

Survey of mobile phone use and their chronic effects on the hearing of a student population.

Mobile phone use and stress, sleep disturbances, and symptoms of depression among young adults--a prospective cohort study.

[SAR values of mobile phones. Safety evaluation and risk perception].

Assessment of extremely low frequency magnetic field exposure from GSM mobile phones.

EEG Changes Due to Experimentally Induced 3G Mobile Phone Radiation.

Effects of thirty-minute mobile phone exposure on saccades.

Cell phone radiation exposure on brain and associated biological systems.

Effects of chronic exposure of electromagnetic fields from mobile phones on hearing in rats.

Do mobile 'phones have a detrimental impact on auditory function?

[Hearing level and intensive use of mobile phones].

Preliminary report: symptoms associated with mobile phone use.

Validation of exposure assessment and assessment of recruitment methods for a prospective cohort study of mobile phone users (COSMOS) in Finland: a pilot study.

Studying the effects of mobile phone use on the auditory system and the central nervous system: a review of the literature and future directions.

Mobile-phone pulse triggers evoked potentials.

Association between General Health and Mobile Phone Dependency among Medical University Students: A Cross-sectional Study in Iran.

Mobile phones and children: is precaution warranted?

[Determining health policy for sensible mobile phone use--current world status].

Comparison of cytotoxic and genotoxic effects of plutonium-239 alpha particles and mobile phone GSM 900 radiation in the Allium cepa test.

Mobile phones: time to rethink and limit usage.

Bedtime mobile phone use and sleep in adults.

Mobile phones and seizures: drug-resistant epilepsy is less common in mobile-phone-using patients.

Estimation of head tissue-specific exposure from mobile phones based on measurements in the homogeneous SAM head.

Mobile phones, heat shock proteins and cancer.

Can evidence change belief? Reported mobile phone sensitivity following individual feedback of an inability to discriminate active from sham signals.

Distribution of RF energy emitted by mobile phones in anatomical structures of the brain.

Association between mobile phone use and depressed mood in Japanese adolescents: a cross-sectional study.

Effects of thirty-minute mobile phone use on visuo-motor reaction time.

The controversy about a possible relationship between mobile phone use and cancer.

Association between Excessive Use of Mobile Phone and Insomnia and Depression among Japanese Adolescents.

Electromagnetic interference of GSM mobile phones with the implantable deep brain stimulator, ITREL-III.

Association between overuse of mobile phones on quality of sleep and general health among occupational health and safety students.

Effect of mobile phones on micronucleus frequency in human exfoliated oral mucosal cells.

A study on the effect of prolonged mobile phone use on pure tone audiometry thresholds of medical students of Sikkim.

Factors that influence the radiofrequency power output of GSM mobile phones.

Analysis of mobile phone design features affecting radiofrequency power absorbed in a human head phantom.

Does the Brain Detect 3G Mobile Phone Radiation Peaks? An Explorative In-Depth Analysis of an Experimental Study.

Effects of mobile phone use on brain tissue from the rat and a possible protective role of vitamin C - a preliminary study.

Effects of a 902 MHz mobile phone on cerebral blood flow in humans: a PET study.

Analysis of the influence of handset phone position on RF exposure of brain tissue.

Are thyroid dysfunctions related to stress or microwave exposure (900 MHz)?

Exposure to mobile phone electromagnetic field radiation, ringtone and vibration affects anxiety-like behaviour and oxidative stress biomarkers in albino wistar rats.

Clear policies on mobile phones vital.

Personal exposure to mobile phone frequencies and well-being in adults: a cross-sectional study based on dosimetry.

Self-report of physical symptoms associated with using mobile phones and other electrical devices.

Mobile phones as mediators of health behavior change in cardiovascular disease in developing countries.

Experimental and numerical assessment of low-frequency current distributions from UMTS and GSM mobile phones.

Are men talking their reproductive health away?

The effect of mobile phone to audiologic system.

The effects of 884 MHz GSM wireless communication signals on headache and other symptoms: an experimental provocation study.

Associations between problematic mobile phone use and psychological parameters in young adults.

Effects on auditory function of chronic exposure to electromagnetic fields from mobile phones.

Mobile phones are good for you, p0.36! Observations on Keetley, Wood, Spong and Stough (2006).

Cordless telephone use: implications for mobile phone research.

Mobile phone exposure and spatial memory.

Prevalence of subjective poor health symptoms associated with exposure to electromagnetic fields among university students.

Mobile phone headache: a double blind, sham-controlled provocation study.

Human short-term exposure to electromagnetic fields emitted by mobile phones decreases computer-assisted visual reaction time.

Evaluation of the effects of mobile phones on the neural tube development of chick embryos.

Mobile telephone use is associated with changes in cognitive function in young adolescents.

Mobile phone use, blood lead levels, and attention deficit hyperactivity symptoms in children: a longitudinal study.

Is mobile phone radiation genotoxic? An analysis of micronucleus frequency in exfoliated buccal cells.

Mobile Phone, Computer, and Internet Use Among Older Homeless Adults: Results from the HOPE HOME Cohort Study.

Mobile phones carry the personal microbiome of their owners.

Mobile phones and sex work in South India: the emerging role of mobile phones in condom use by female sex workers in two Indian states.

Spatial memory performance of Wistar rats exposed to mobile phone.

The effect of the duration of exposure to the electromagnetic field emitted by mobile phones on human attention.

Interference of GSM mobile phones with communication between Cardiac Rhythm Management devices and programmers: A combined in vivo and in vitro study.

Guidance for exposure design of human studies addressing health risk evaluations of mobile phones.

Exposure to non-ionizing electromagnetic fields emitted from mobile phones induced DNA damage in human ear canal hair follicle cells.

Effects of mobile phone radiofrequency on the structure and function of the normal human hemoglobin.

Impact of head morphology on local brain specific absorption rate from exposure to mobile phone radiation.

Can the Accuracy of Home Blood Glucose Monitors be affected by the Received Signal Strength of 900 MHz GSM Mobile Phones?

Are some people sensitive to mobile phone signals? Within participants double blind randomised provocation study.

Women's mobile phone use in birth suite: A West Australian perspective.

Effect of mobile telephones on sperm quality: a systematic review and meta-analysis.

Social behavioral testing and brain magnetic resonance imaging in chicks exposed to mobile phone radiation during development.

[Effects of electromagnetic fields emitted by cellular phone on auditory and vestibular labyrinth].

Mobile phone hygiene: potential risks posed by use in the clinics of an Indian dental school.

Impact of Adolescents' Screen Time and Nocturnal Mobile Phone-Related Awakenings on Sleep and General Health Symptoms: A Prospective Cohort Study.

The association between use of mobile phones after lights out and sleep disturbances among Japanese adolescents: a nationwide cross-sectional survey.

The influence of direct mobile phone radiation on sperm quality.

The effect of mobile phone on the number of Purkinje cells: a stereological study.

Some ocular symptoms experienced by users of mobile phones.

Radio frequency exposure in mobile phone users: implications for exposure assessment in epidemiological studies.

Mobile phone use facilitates memory in male, but not female, subjects.

Use of mobile phones and changes in cognitive function in adolescents.

Assessment of the radio-frequency electromagnetic fields induced in the human body from mobile phones used with hands-free kits.

An epidemiological review of mobile telephones and cancer.

Interaction of mobile phones with superficial passive metallic implants.

The effect of electromagnetic field emitted by a mobile phone on the inhibitory control of saccades.

Effects of GSM 900 MHz on middle cerebral artery blood flow assessed by transcranial Doppler sonography.

How to encourage children to use mobile phones safely.

Effects of electromagnetic fields from mobile phones on depression and anxiety after titanium mesh cranioplasty among patients with traumatic brain injury.

Individual differences in the effects of mobile phone exposure on human sleep: rethinking the problem.

[Correlation of health literacy and mobile phone use dependence with psychopathological symptoms in middle school students].

Acute effects of using a mobile phone on CNS functions.

Effect of electromagnetic fields emitted by cellular phones on the latency of evoked electrodermal activity.

Evaluation of the effect of using mobile phones on male fertility.

Effect of prenatal exposure to mobile phone on pyramidal cell numbers in the mouse hippocampus: a stereological study.

Mobile phone use on a young person's unit.

Mobile phones: are children at higher risk?

Effects of mobile phone radiation on reproduction and development in Drosophila melanogaster.

Quantitative changes in testicular structure and function in rat exposed to mobile phone radiation.

The effects of the duration of mobile phone use on heart rate variability parameters in healthy subjects.

Specific absorption rate variation in a brain phantom due to exposure by a 3G mobile phone: problems in dosimetry.

[Acute ear trauma caused by failure of mobile phone/cellular phone].

Assessment of auditory evoked potential in long-term mobile phone users.

Is exposure to personal music players a confounder in adolescent mobile phone use and hearing health studies?

Interference to medical equipment from mobile phones.

Identifying seasonal mobility profiles from anonymized and aggregated mobile phone data. Application in food security.

Effects of mobile phone electromagnetic fields: critical evaluation of behavioral and neurophysiological studies.

Estimation of RF energy absorbed in the brain from mobile phones in the Interphone Study.

[Electromagnetic fields in the vicinity of DECT cordless telephones and mobile phones].

Thermal effects of mobile phones on facial nerves and surrounding soft tissue.

Intraoperative observation of changes in cochlear nerve action potentials during exposure to electromagnetic fields generated by mobile phones.

An old issue and a new look: electromagnetic hypersensitivity caused by radiations emitted by GSM mobile phones.

Can mobile phone emissions affect auditory functions of cochlea or brain stem?

Influence on the mechanisms of generation of distortion product otoacoustic emissions of mobile phone exposure.

Does acute exposure to the electromagnetic field emitted by a mobile phone influence visual evoked potentials? A pilot study.

The estimation of 3D SAR distributions in the human head from mobile phone compliance testing data for epidemiological studies.

The acute auditory effects of exposure for 60 minutes to mobile`s electromagnetic field.

Long-term digital mobile phone use and cognitive decline in the elderly.

Mobile Phone: A Possible Vector of Bacterial Transmission in Hospital Setting.

Electrophysiological Assessment of the Impact of Mobile Phone Radiation on Cognition in Persons With Epilepsy.

Mobile phone affects cerebral blood flow in humans.

Association between mobile phone use and semen quality: a systemic review and meta-analysis.

Effects of Mobile Phones on Children's and Adolescents' Health: A Commentary.

[Activity of vestibular organ in people using mobile phones professionally].

Analysis of three-dimensional SAR distributions emitted by mobile phones in an epidemiological perspective.

Perception of the electromagnetic field emitted by a mobile phone.

[Effects of electromagnetic fields generated by mobile phones on the nervous system].

Effects of high frequency electromagnetic field (EMF) emitted by mobile phones on the human motor cortex.

[Cellular phones and cancer: current status].

Local vasodilator response to mobile phones.

Electromagnetic hypersensitivity (EHS) and subjective health complaints associated with electromagnetic fields of mobile phone communication--a literature review published between 2000 and 2004.

Mobile phone types and SAR characteristics of the human brain.

Diverse radiofrequency sensitivity and radiofrequency effects of mobile or cordless phone near fields exposure in Drosophila melanogaster.

Biophysical evaluation of radiofrequency electromagnetic field effects on male reproductive pattern.

The semen quality of the mobile phone users.

Tinnitus and mobile phone use.

Association of excessive mobile phone use during pregnancy with birth weight: an adjunct study in Kumamoto of Japan Environment and Children's Study.

Is problematic mobile phone use explained by chronotype and personality?

Effects of mobile phone emissions on human brain activity and sleep variables.

Effect of Bluetooth headset and mobile phone electromagnetic fields on the human auditory nerve.

Cranial and postcranial skeletal variations induced in mouse embryos by mobile phone radiation.

Effects of exposure to a mobile phone on testicular function and structure in adult rabbit.

"MXing it up": how African adolescents may affect social change through mobile phone use.

Mobile-phone-based home exercise training program decreases systemic inflammation in COPD: a pilot study.

Effects of short-term radiation emitted by WCDMA mobile phones on teenagers and adults.

Diseases of modern living: neurological changes associated with mobile phones and radiofrequency radiation in humans.

GSM mobile phone radiation suppresses brain glucose metabolism.

The electromagnetic interference of mobile phones on the function of a gamma-camera.

Effects of mobile phone exposure on biochemical parameters of cord blood: A preliminary study.

[An analysis of the pathogenetic significance of irradiations from mobile phones].

Self-reported symptoms associated with exposure to electromagnetic fields: a questionnaire study.

The mobile phone decreases fructose but not citrate in rabbit semen: a longitudinal study.

Mobile phone use and subjective symptoms. Comparison of symptoms experienced by users of analogue and digital mobile phones.

Acute effects of the electromagnetic waves emitted by mobile phones on attention in emergency physicians.

Multiple assessment methods of prenatal exposure to radio frequency radiation from telecommunication in the Mothers and Children's Environmental Health (MOCEH) study.

Mobile phone use and possible cancer risk: Current perspectives in India.

Symptomatic complex partial status epilepticus manifesting as utilization behavior of a mobile phone.

Genotoxic and carcinogenic effects of non-ionizing electromagnetic fields.

"Mate! I'm running 10 min late": An investigation into the self-regulation of mobile phone tasks while driving.

Dose related shifts in the developmental progress of chick embryos exposed to mobile phone induced electromagnetic fields.

Growing concern over the safety of using mobile phones and male fertility.

Is there any exposure from a mobile phone in stand-by mode?

[Biological effects of mobile phone electromagnetic field on chick embryo (risk assessment using the mortality rate)].

MEMO--a mobile phone depression prevention intervention for adolescents: development process and postprogram findings on acceptability from a randomized controlled trial.

Relationship between Mobile Phone Addiction and the Incidence of Poor and Short Sleep among Korean Adolescents: a Longitudinal Study of the Korean Children & Youth Panel Survey.

Neurodevelopment for the first three years following prenatal mobile phone use, radio frequency radiation and lead exposure.

Electromagnetic safety of children using wireless phones: a literature review.

Histological and histochemical study of the protective role of rosemary extract against harmful effect of cell phone electromagnetic radiation on the parotid glands.

Mobile phone use for contacting emergency services in life-threatening circumstances.

Effect of Mobile Phone-Induced Electromagnetic Field on Brain Hemodynamics and Human Stem Cell Functioning: Possible Mechanistic Link to Cancer Risk and Early Diagnostic Value of Electronphotonic Imaging.

Fetal and neonatal responses following maternal exposure to mobile phones.

Is the effect of mobile phone radiofrequency waves on human skin perfusion non-thermal?

Systematic review and meta-analysis of psychomotor effects of mobile phone electromagnetic fields.

[Cell phone communication: hygienic characteristics, biological action, standardization (a review)].

Age-dependent tissue-specific exposure of cell phone users.

Comments on "Association of excessive mobile phone use during pregnancy with birth weight: an adjunct study in Kumamoto of Japan Environment and Children's Study".

Neuropsychological sequelae of digital mobile phone exposure in humans.

Effects of radiofrequency electromagnetic radiation (RF-EMF) on honey bee queen development and mating success.

Genotoxicity evaluation of electromagnetic fields generated by 835-MHz mobile phone frequency band.

A survey study on some neurological symptoms and sensations experienced by long term users of mobile phones.

Does evening exposure to mobile phone radiation affect subsequent melatonin production?

Nocebo as headache trigger: evidence from a sham-controlled provocation study with RF fields.

Mobile phones and elderly people: a noisy communication.

Recall of past use of mobile phone handsets.

Mobile phone use and willingness to pay for SMS for diabetes in Bangladesh.

Electromagnetic absorption in the head of adults and children due to mobile phone operation close to the head.

Preliminary evaluation of nanoscale biogenic magnetite-based ferromagnetic transduction mechanisms for mobile phone bioeffects.

[Mobile phones, web chat, and sex among Norwegian adolescents].

Comparison of FDTD-calculated specific absorption rate in adults and children when using a mobile phone at 900 and 1800 MHz.

Effects of the Effect of Ultra High Frequency Mobile Phone Radiation on Human Health.

Dosimetric comparison of the specific anthropomorphic mannequin (SAM) to 14 anatomical head models using a novel definition for the mobile phone positioning.

Can electromagnetic fields emitted by mobile phones stimulate the vestibular organ?

Analysis on the effect of the distances and inclination angles between human head and mobile phone on SAR.

The use of a 'phantom scalp' to assess the possible direct pickup of mobile phone handset emissions by electroencephalogram electrode leads.

[Change settings for visual analyzer of child users of mobile communication: longitudinal study].

Determinants of mobile phone output power in a multinational study: implications for exposure assessment.

Effects of electromagnetic radiation of mobile phones on the central nervous system.

Noncommunicable Disease Risk Factors and Mobile Phones: A Proposed Research Agenda.

Effect of mobile phone usage time on total antioxidant capacity of saliva and salivary immunoglobulin a.

Mobile cell-phones (M-phones) in telemicroscopy: increasing connectivity of isolated laboratories.

A new problem in inflammatory bladder diseases: use of mobile phones!

Effects of mobile phone exposure on metabolomics in the male and female reproductive systems.

The pattern of the electromagnetic field emitted by mobile phones in motor vehicle driving simulators.

Derangement of chick embryo retinal differentiation caused by radiofrequency electromagnetic fields.

Mobile-phone dispatch of laypersons for CPR in out-of-hospital cardiac arrest.

Numerical assessment of induced ELF currents in the human head due to the battery current of a digital mobile phone.

Moving the Agenda on Noncommunicable Diseases: Policy Implications of Mobile Phone Surveys in Low and Middle-Income Countries.

Effect of mobile phone use on salivary concentrations of protein, amylase, lipase, immunoglobulin A, lysozyme, lactoferrin, peroxidase and C-reactive protein of the parotid gland.

Wi-Fi technology--an uncontrolled global experiment on the health of mankind.

Phantom vibration and phantom ringing among mobile phone users: A systematic review of literature.

Structural and kinetic effects of mobile phone microwaves on acetylcholinesterase activity.

Tinnitus and cell phones: the role of electromagnetic radiofrequency radiation.

[Psychophysiological indicators for children using mobile phones. Communication 2. Results of four-year monitoring].

Who reaps the benefits, who bears the risks? Comparative optimism, comparative utility, and regulatory preferences for mobile phone technology.

Electromagnetic Fields of Mobile Phone Jammer Exposure on Blood Factors in Rats.

Effect of handheld mobile phone use on parotid gland salivary flow rate and volume.

[Mobile phone use as a risk factor for affection of the central nerve system--secondary publication].

ELF exposure from mobile and cordless phones for the epidemiological MOBI-Kids study.

The Effect of Electromagnetic Radiation due to Mobile Phone Use on Thyroid Function in Medical Students Studying in a Medical College in South India.

Long-term mobile phone use and the risk of vestibular schwannoma: a Danish nationwide cohort study.

Cellular phones for reducing battlefield stress: rationale and a preliminary research.

Assessment of SAR and thermal changes near a cochlear implant system for mobile phone type exposures.

Evaluation of the mobile phone electromagnetic radiation on serum iron parameters in rats.

Asymmetries in hip mineralization in mobile cellular phone users.

Mobile Phone Use Behaviors and Postures on Public Transportation Systems.

Radiofrequency Electromagnetic Radiation and Memory Performance: Sources of Uncertainty in Epidemiological Cohort Studies.

The effects of multivitamin supplementation on mood and general well-being in healthy young adults. A laboratory and at-home mobile phone assessment.

[Monitor of ECG signal and heart rate using a mobile phone with Bluetooth communication protocol].

Safe use of mobile phones in hospitals.

Exposure to mobile phone radiation opens new horizons in Alzheimer's disease treatment.

[Mobile telephones: a 'new risk'].

Predicting the biological effects of mobile phone radiation absorbed energy linked to the MRI-obtained structure.

Metal-framed spectacles and implants and specific absorption rate among adults and children using mobile phones at 900/1800/2100 MHz.

Mobile telephones: a comparison of radiated power between 3G VoIP calls and 3G VoCS calls.

A framework for spatial interaction analysis based on large-scale mobile phone data.

Self-reported depression and anxiety symptoms and usage of computers and mobile phones among working-age Finns.

Motivating men who have sex with men to get tested for HIV through the internet and mobile phones: a qualitative study.

The influence of handheld mobile phones on human parotid gland secretion.

Acute effects of 30 minutes of exposure to a smartphone call on in vitro platelet function.

[Effect of high-frequency EMF on public health and its neuro-chemical investigations].

Development of a problematic mobile phone use scale for Turkish adolescents.

Radiofrequency fields, transthyretin, and Alzheimer's disease.

Mobile phone mast effects on common frog (Rana temporaria) tadpoles: the city turned into a laboratory.

Analysis of RF exposure in the head tissues of children and adults.

SARs for pocket-mounted mobile telephones at 835 and 1900 MHz.

Intravital Computer Morphometry on Protozoa: A Method for Monitoring of the Morphofunctional Disorders in Cells Exposed in the Cell Phone Communication Electromagnetic Field.

Estimation of the SAR in the human head and body due to radiofrequency radiation exposure from handheld mobile phones with hands-free accessories.

Ants can be used as bio-indicators to reveal biological effects of electromagnetic waves from some wireless apparatus.

Regulating hearing aid compatibility of cell phones: results from a national survey.

Laughter counteracts enhancement of plasma neurotrophin levels and allergic skin wheal responses by mobile phone-mediated stress.

Recently published papers: take your predictions with a drop of saline... and breathe deeply before turning on your phone.

Interactions of problematic mobile phone use and psychopathological symptoms with unintentional injuries: a school-based sample of Chinese adolescents.

Critical comments on DNA breakage by mobile-phone electromagnetic fields [Diem et al., Mutat. Res. 583 (2005) 178-183].

Mobile phone-delivered reminders and incentives to improve childhood immunisation coverage and timeliness in Kenya (M-SIMU): a cluster randomised controlled trial.

Enhancement of allergic skin wheal responses in patients with atopic eczema/dermatitis syndrome by playing video games or by a frequently ringing mobile phone.

Pilot study of mobile phone technology in allergic rhinitis in European countries: the MASK-rhinitis study.

A closed-loop process to recover Li and Co compounds and to resynthesize LiCoO2 from spent mobile phone batteries.

Theme - Effects of mobile phones on brain and neural function

Titles

Mobile phone use for 5 minutes can cause significant memory impairment in humans.

Association between mobile phone use and inattention in 7102 Chinese adolescents: a population-based cross-sectional study.

Clinical features of headache associated with mobile phone use: a cross-sectional study in university students.

Predictors of mobile telephone use and exposure analysis in Australian adolescents.

Acute Effect of Electromagnetic Waves Emitted from Mobile Phone on Visual Evoked Potential in Adult Male : A Preliminary Study.

Analysis of the mobile phone effect on the heart rate variability by using the largest Lyapunov exponent.

Mobile Phone Use and The Risk of Headache: A Systematic Review and Meta-analysis of Cross-sectional Studies.

Acute mobile phone effects on pre-attentive operation.

Effect Of Electromagnetic Waves Emitted From Mobile Phone On Brain Stem Auditory Evoked Potential In Adult Males.

Acute effects of radiofrequency electromagnetic field emitted by mobile phone on brain function.

Psychophysiological tests and provocation of subjects with mobile phone related symptoms.

The cardiac effects of a mobile phone positioned closest to the heart.

Electromagnetic field of mobile phones affects visual event related potential in patients with narcolepsy.

Acute mobile phone operation affects neural function in humans.

Use of mobile and cordless phones and cognition in Australian primary school children: a prospective cohort study.

Effect of mobile phone radiation on heart rate variability.

[Effects of radiation emitted from mobile phones on short- term heart rate variability parameters].

Mobile phone use and health symptoms in children.

The sensitivity of human event-related potentials and reaction time to mobile phone emitted electromagnetic fields.

Factors associated with mental health among high school students in Iran: Does mobile phone overuse associate with poor mental health?

Mobile phone effects on children's event-related oscillatory EEG during an auditory memory task.

Examining the effects of electromagnetic fields emitted by GSM mobile phones on human event-related potentials and performance during an auditory task.

Estimating transmitted power density from mobile phone: an epidemiological pilot study with a software modified phone.

"Nomophobia": impact of cell phone use interfering with symptoms and emotions of individuals with panic disorder compared with a control group.

Mobile phone use and exposures in children.

The effect of mobile phone electromagnetic fields on the alpha rhythm of human electroencephalogram.

Use of mobile and cordless phones and change in cognitive function: a prospective cohort analysis of Australian primary school children.

Neurophysiological effects of mobile phone electromagnetic fields on humans: a comprehensive review.

[Effect of mobile phone electromagnetic emission on characteristics of cerebral blood circulation and neurohumoral regulations in humans].

Effects of 2G and 3G mobile phones on human alpha rhythms: Resting EEG in adolescents, young adults, and the elderly.

Acute mobile phones exposure affects frontal cortex hemodynamics as evidenced by functional near-infrared spectroscopy.

Effects of exposure to a mobile phone on sexual behavior in adult male rabbit: an observational study.

Effects of concurrent caffeine and mobile phone exposure on local target probability processing in the human brain.

Some ocular symptoms and sensations experienced by long term users of mobile phones.

Nasal colonization and bacterial contamination of mobile phones carried by medical staff in the operating room.

Headache and sferics.

--Leaf Cluster 25 (68)

Theme - Effects of cell phone radiation on cognitive function and hearing

Titles

Effects of GSM cellular phones on human hearing: the European project "GUARD".

Effects of weak mobile phone - electromagnetic fields (GSM, UMTS) on event related potentials and cognitive functions.

Mobile phone emission modulates event-related desynchronization of alpha rhythms and cognitive-motor performance in healthy humans.

Effects of pulsed and continuous wave 902 MHz mobile phone exposure on brain oscillatory activity during cognitive processing.

Effects of electromagnetic field emitted by cellular phones on the EEG during a memory task.

Effects of weak mobile phone - electromagnetic fields (GSM, UMTS) on well-being and resting EEG.

Assessment of potential effects of the electromagnetic fields of mobile phones on hearing.

Effects of electromagnetic field emitted by cellular phones on the EEG during an auditory memory task: a double blind replication study.

Human brain wave activity during exposure to radiofrequency field emissions from mobile phones.

Effects of electromagnetic fields emitted by cellular phones on the electroencephalogram during a visual working memory task.

Effects of radiofrequency radiation emitted by cellular telephones on the cognitive functions of humans.

Cognitive effects of radiation emitted by cellular phones: the influence of exposure side and time.

Mobile phone emission modulates interhemispheric functional coupling of EEG alpha rhythms.

Effects of mobile phone exposure on time frequency fine structure of transiently evoked otoacoustic emissions.

[Effects of electromagnetic field from cellular phones on selected central nervous system functions: a literature review].

Effects of UMTS cellular phones on human hearing: results of the European project EMFnEAR.

Is the brain influenced by a phone call? An EEG study of resting wakefulness.

Effect of acute exposure to radiofrequency electromagnetic fields emitted by a mobile phone (GSM 900 MHz) on electrodermal responsiveness in healthy human.

Human brain activity during exposure to radiofrequency fields emitted by cellular phones.

Effects of exposure to electromagnetic fields emitted by GSM 900 and WCDMA mobile phones on cognitive function in young male subjects.

Preattentive auditory information processing under exposure to the 902 MHz GSM mobile phone electromagnetic field: a mismatch negativity (MMN) study.

Pulsed and continuous wave mobile phone exposure over left versus right hemisphere: effects on human cognitive function.

Mobile phone emission increases inter-hemispheric functional coupling of electroencephalographic alpha rhythms in epileptic patients.

Electromagnetic fields produced by GSM cellular phones and heart rate variability.

Effect of a 902 MHz electromagnetic field emitted by mobile phones on human cognitive function: A replication study.

The effects of mobile-phone electromagnetic fields on brain electrical activity: a critical analysis of the literature.

Hypersensitivity symptoms associated with exposure to cellular telephones: no causal link.

Nonlinear heart rate variability measures under electromagnetic fields produced by GSM cellular phones.

Mobile phone emission modulates inter-hemispheric functional coupling of EEG alpha rhythms in elderly compared to young subjects.

A study of the effects of cellular telephone microwave radiation on the auditory system in healthy men.

Cognitive effects of cellular phones: a possible role of non-radiofrequency radiation factors.

Comparison of the effects of continuous and pulsed mobile phone like RF exposure on the human EEG.

Mobile phones exposure induces changes of contingent negative variation in humans.

Investigation of potential effects of cellular phones on human auditory function by means of distortion product otoacoustic emissions.

Effects of microwaves emitted by cellular phones on human slow brain potentials.

Effects of radiofrequency electromagnetic fields on the human nervous system.

Variations in electroencephalography with mobile phone usage in medical students.

Effects of 2G and 3G mobile phones on performance and electrophysiology in adolescents, young adults and older adults.

The excretion of 6-hydroxymelatonin sulfate in healthy young men exposed to electromagnetic fields emitted by cellular phone -- an experimental study.

Gender related differences on the EEG during a simulated mobile phone signal.

Cellular Phone Irradiation of the Head Affects Heart Rate Variability Depending on Inspiration/Expiration Ratio.

Effects of RF exposure of teenagers and adults by CDMA cellular phones.

Effects of 900 MHz electromagnetic fields exposure on cochlear cells' functionality in rats: evaluation of distortion product otoacoustic emissions.

Effects of the acute exposure to the electromagnetic field of mobile phones on human auditory brainstem responses.

Do mobile phones pose a potential risk to autonomic modulation of the heart?

Effects of intensive and moderate cellular phone use on hearing function.

A meta-analysis for neurobehavioural effects due to electromagnetic field exposure emitted by GSM mobile phones.

Mobile phone emissions modulate brain excitability in patients with focal epilepsy.

Mobile phone emissions and human brain excitability.

Effects of pulsed electromagnetic fields on cognitive processes - a pilot study on pulsed field interference with cognitive regeneration.

Scalp localization of human auditory cortical activity modified by GSM electromagnetic fields.

Effect of 902 MHz mobile phone transmission on cognitive function in children.

Physiological effects of RF exposure on hypersensitive people by a cell phone.

Effects of mobile phone signals over BOLD response while performing a cognitive task.

Effect of electromagnetic field emitted by cellular phones on fetal heart rate patterns.

Effects of W-CDMA 1950 MHz EMF emitted by mobile phones on regional cerebral blood flow in humans.

Does acute exposure to mobile phones affect human attention?

Effects of GSM signals during exposure to event related potentials (ERPs).

The effect of GSM and TETRA mobile handset signals on blood pressure, catechol levels and heart rate variability.

Thermal effects of mobile phone RF fields on children: a provocation study.

Controversies on electromagnetic field exposure and the nervous systems of children.

The influence of the call with a mobile phone on heart rate variability parameters in healthy volunteers.

[A study on the biological effects of exposure mobile-phone frequency EMF].

Effects of Bluetooth device electromagnetic field on hearing: pilot study.

Evaluation in humans of the effects of radiocellular telephones on the circadian patterns of melatonin secretion, a chronobiological rhythm marker.

Comparison of earphone radiation recorded from hearing impaired subjects and a resistor network simulator.

[The influence of hypogeomagnetic field on bioelectric activity of the brain in epilepsy].

Non-ionizing radiofrequency electromagnetic waves traversing the head can be used to detect cerebrovascular autoregulation responses.

--Leaf Cluster 14 (93)

Theme - Myriad adverse health effects from cellphones

Titles

Cell phone use and acoustic neuroma: the need for standardized questionnaires and access to industry data.

Cell-phone use and self-reported hypertension: national health interview survey 2008.

Cell phones: modern man's nemesis?

Impact of cell phone use on men's semen parameters.

A preliminary examination of cell phone use and helping behavior.

Cell phone use and behavioural problems in young children.

An analysis of the impact of cell phone use on depressive symptoms among Japanese elders.

Cell phones and brain tumors: a review including the long-term epidemiologic data.

Prenatal and postnatal exposure to cell phone use and behavioral problems in children.

Maternal cell phone use during pregnancy and child behavioral problems in five birth cohorts.

Maternal cell phone use in early pregnancy and child's language, communication and motor skills at 3 and 5 years: the Norwegian mother and child cohort study (MoBa).

Cell phones and tumor: still in no man's land.

Cell phones and male infertility: a review of recent innovations in technology and consequences.

Prenatal exposure to cell phone use and neurodevelopment at 14 months.

The effects of cell phone use on peripheral vision.

Factors associated with cell phone use in adolescents in the community of Madrid (Spain).

The Impact of Using Cell Phones After Light-Out on Sleep Quality, Headache, Tiredness, and Distractibility Among Students of a University in North of Iran.

Prospective study of pregnancy outcomes after parental cell phone exposure: the Norwegian Mother and Child Cohort Study.

Prenatal and Postnatal Cell Phone Exposures and Headaches in Children.

Cell-Phone Addiction: A Review.

Ambulatory cell phone injuries in the United States: an emerging national concern.

[Cell Phones and Risk of brain and acoustic nerve tumours: the French INTERPHONE case-control study].

Cell phone usage and erectile function.

Real-world cell phone radiofrequency electromagnetic field exposures.

Cell phone exposures and hearing loss in children in the Danish National Birth Cohort.

Cell Phone Information Seeking Explains Blood Pressure in African American Women.

Habits of cell phone usage and sperm quality - does it warrant attention?

Maternal cell phone use during pregnancy and child cognition at age 5years in 3 birth cohorts.

Cell phones and male infertility: dissecting the relationship.

Augmentative and alternative communication and cell phone use: one off-the-shelf solution and some policy considerations.

Cell phones and cancer: what is the evidence for a connection?

Cancer risks related to low-level RF/MW exposures, including cell phones.

Effect of cell-phone radiofrequency on angiogenesis and cell invasion in human head and neck cancer cells.

Is health literacy related to health behaviors and cell phone usage patterns among the text4baby target population?

Cell phone use and risk of thyroid cancer: a population-based case-control study in Connecticut.

Cell phones and children: follow the precautionary road.

Association between number of cell phone contracts and brain tumor incidence in nineteen U.S. States.

Maternal cell phone and cordless phone use during pregnancy and behaviour problems in 5-year-old children.

The effect of cell phone use on postural balance and mobility in older compared to young adults.

Cell phones change the way we walk.

Effects of cell phone use on semen parameters: Results from the MARHCS cohort study in Chongqing, China.

Multidrug-Resistant Bacteria Associated with Cell Phones of Healthcare Professionals in Selected Hospitals in Saudi Arabia.

Effect of cell phone exposure on physiologic and hematologic parameters of male medical students of Bijapur (Karnataka) with reference to serum lipid profile.

General health of students of medical sciences and its relation to sleep quality, cell phone overuse, social networks and internet addiction.

The role of anxiety in the perception of technological hazards - a cross-sectional study on cell phones and masts.

Effect of Cell Phone Radiations on Orofacial Structures: A Systematic Review.

The association of sleep and late-night cell phone use among adolescents.

Cell Phone Use and Child and Adolescent Reading Proficiency.

Reach for your cell phone at your own risk: The cognitive costs of media choice for breaks.

Effects of cell phone radiofrequency signal exposure on brain glucose metabolism.

A forecasting method to reduce estimation bias in self-reported cell phone data.

The incidence rate and mortality of malignant brain tumors after 10 years of intensive cell phone use in Taiwan.

Abnormal responses of electronic pocket dosimeters caused by high frequency electromagnetic fields emitted from digital cellular telephones.

[Cell phones: health risks and prevention].

Does cell phone use increase the chances of parotid gland tumor development? A systematic review and meta-analysis.

Prevalence of problematic cell phone use in an adult population in Spain as assessed by the Mobile Phone Problem Use Scale (MPPUS).

Use of mobile phone during pregnancy and the risk of spontaneous abortion.

Cell phones: the psychosocial risks.

Prenatal cell phone use and developmental milestone delays among infants.

Associations of Maternal Cell-Phone Use During Pregnancy With Pregnancy Duration and Fetal Growth in 4 Birth Cohorts.

Effect of cell phone magnetic fields on adjustable cerebrospinal fluid shunt valves.

Combined effects of varicocele and cell phones on semen and hormonal parameters.

Chatting in the face of the eyewitness: The impact of extraneous cell-phone conversation on memory for a perpetrator.

Risks to Health and Well-Being From Radio-Frequency Radiation Emitted by Cell Phones and Other Wireless Devices.

Effect of Mobile Phone Radiofrequency Electromagnetic Fields on.

Absorption of wireless radiation in the child versus adult brain and eye from cell phone conversation or virtual reality.

Is there a relationship between cell phone use and semen quality?

Cell phone-generated radio frequency electromagnetic field effects on the locomotor behaviors of the fishes Poecilia reticulata and Danio rerio.

Not So Smart: Cell Phone Use Hurts Our Patients and Profession.

Cell phone etiquette in the clinical arena: A professionalism imperative for healthcare.

Mobile Phones: Potential Sources of Nickel and Cobalt Exposure for Metal Allergic Patients.

[Risk perception of the general public of cell phone towers and cancer: trend and associated factors, 2005-2010].

Electromagnetic field and brain development.

Impacts of silver-coated antimicrobial screen covers on the cell-phone microbiome of resident physicians.

The effects of cell phone conversations on the attention and memory of bystanders.

Effects of cell-phone and text-message distractions on true and false recognition.

Vestibular schwannoma and cell-phones. Results, limits and perspectives of clinical studies.

The psychometric properties of cellular phone dependency questionnaire in students of Isfahan: A pilot study.

Multidrug-resistant bacteria isolated from cell phones in five intensive care units: Exploratory dispersion analysis.

[The health problems which can brougth by 3G cell phones to our country].

Exposure limits: the underestimation of absorbed cell phone radiation, especially in children.

Do people understand IARC's 2B categorization of RF fields from cell phones?

Allergic Contact Dermatitis to a Cell Phone.

Impact of pinna compression on the RF absorption in the heads of adult and juvenile cell phone users.

Do cell phones, iPods/MP3 players, siblings and friends matter? Predictors of child body mass in a U.S. Southern Border City Middle School.

The role of cellular phone usage by parents in the increase in ASD occurrence: A hypothetical framework.

Psychophysiological patterns during cell phone text messaging: a preliminary study.

From sweeteners to cell phones-Cancer myths and beliefs among journalism undergraduates.

Can Fish and Cell Phones Teach Us about Our Health?

Cell Phone Counseling Improves Retention of Mothers With HIV Infection in Care and Infant HIV Testing in Kisumu, Kenya: A Randomized Controlled Study.

Association between problematic cellular phone use and suicide: the moderating effect of family function and depression.

Symptoms of problematic cellular phone use, functional impairment and its association with depression among adolescents in Southern Taiwan.

Adolescent in-school cellphone habits: a census of rules, survey of their effectiveness, and fertility implications.

--Leaf Cluster 7 (44)

Theme - Risks from cell phone use, especially brain tumors

Titles

Validation of self-reported cellular phone use.

Cellular phone use and brain tumor: a meta-analysis.

[Symptoms reported by mobile cellular telephone users].

Risk of pituitary tumors in cellular phone users: a case-control study.

Cellular and cordless telephone use and the association with brain tumors in different age groups.

Cellular phones, cordless phones, and the risks of glioma and meningioma (Interphone Study Group, Germany).

Use of cellular telephones and the risk for brain tumours: A case-control study.

Further aspects on cellular and cordless telephones and brain tumours.

Cellular phone use and risk of benign and malignant parotid gland tumors--a nationwide case-control study.

Cellular-telephone use and brain tumors.

[In vitro and in vivo study of electromagnetic compatibility of cellular phones and pacemakers].

Cellular and cordless telephones and the risk for brain tumours.

Cellular phones and their hazards: the current evidence.

Use of cellular telephones and brain tumour risk in urban and rural areas.

Case-control study on the use of cellular and cordless phones and the risk for malignant brain tumours.

Characteristics of excessive cellular phone use in Korean adolescents.

Use of cellular or cordless telephones and the risk for non-Hodgkin's lymphoma.

Cellular telephone use and risk of intratemporal facial nerve tumor.

[Study of the influence of cellular phones and personal computers on schoolchildren's health: hygienic aspects].

Cellular telephone use and time trends for brain, head and neck tumours.

[Experimental data on radiofrequency].

Assessment of radiofrequency exposure from cellular telephone daily use in an epidemiological study: German Validation study of the international case-control study of cancers of the brain--INTERPHONE-Study.

Use of cellular and cordless telephones and risk of testicular cancer.

[Cellular phones and public health].

Estimation of relative exposure levels for cellular phone users using a neural network.

Cellular phone and cellular phone accessory dermatitis due to nickel allergy: report of five cases.

[Health risks of mobile phones].

Brain cancer incidence trends in relation to cellular telephone use in the United States.

Cellular phones and risk of brain tumors.

Correlation between cellular phone use and epithelial parotid gland malignancies.

[On the evaluation of the influence of cellular phones on their users].

Mobile Phone Use and the Risk of Parotid Gland Tumors: A Retrospective Case-Control Study.

Behavioral support to parents through a cellular-phone website that provides the degree of urgency for medical attention of a child.

Risk perception and public concerns of electromagnetic waves from cellular phones in Korea.

Frequent cellular phone use modifies hypothalamic-pituitary-adrenal axis response to a cellular phone call after mental stress in healthy children and adolescents: A pilot study.

The relationship between adolescents' well-being and their wireless phone use: a cross-sectional study.

New Zealand adolescents' cellphone and cordless phone user-habits: are they at increased risk of brain tumours already? A cross-sectional study.

Prevalence of headache among handheld cellular telephone users in Singapore: a community study.

[The electromagnetic fields of cellular phones and the health of children and of teenagers (the situation requiring to take an urgent measure)].

Patterns of cellular phone use among young people in 12 countries: Implications for RF exposure.

Use of wireless telephones and serum S100B levels: a descriptive cross-sectional study among healthy Swedish adults aged 18-65 years.

Risks for central nervous system diseases among mobile phone subscribers: a Danish retrospective cohort study.

The effect of feedback on attitudes toward cellular phone use while driving: a comparison between novice and experienced drivers.

Radio frequency electromagnetic fields: cancer, mutagenesis, and genotoxicity.

--Leaf Cluster 8 (106)

Theme - Risk of brain tumors/acoustic neuromas from mobile phone use

Titles

Mobile phone use and risk of glioma in 5 North European countries.

Mobile phone use and brain tumours in the CERENAT case-control study.

Use of mobile phones in Norway and risk of intracranial tumours.

Long-term mobile phone use and brain tumor risk.

Long-term use of cellular phones and brain tumours: increased risk associated with use for > or =10 years.

Mobile phone use and risk of glioma in adults: case-control study.

A case-case study of mobile phone use and acoustic neuroma risk in Japan.

Risk of brain tumours in relation to estimated RF dose from mobile phones: results from five Interphone countries.

Mobile phone use and risk of acoustic neuroma: results of the Interphone case-control study in five North European countries.

Mobile phones, cordless phones and the risk for brain tumours.

Mobile phone use and the risk of acoustic neuroma.

Case-control study of the association between malignant brain tumours diagnosed between 2007 and 2009 and mobile and cordless phone use.

Mobile phone use and glioma risk: A systematic review and meta-analysis.

Mobile phone use and risk of brain neoplasms and other cancers: prospective study.

Pooled analysis of case-control studies on acoustic neuroma diagnosed 1997-2003 and 2007-2009 and use of mobile and cordless phones.

Long-term mobile phone use and acoustic neuroma risk.

Mobile phone use and risk of brain tumours: a systematic review of association between study quality, source of funding, and research outcomes.

Mobile phone use and incidence of brain tumour histological types, grading or anatomical location: a population-based ecological study.

Pooled analysis of case-control studies on malignant brain tumours and the use of mobile and cordless phones including living and deceased subjects.

Mobile phone use and acoustic neuroma risk in Japan.

Mobile phone use, exposure to radiofrequency electromagnetic field, and brain tumour: a case-control study.

Meta-analysis of long-term mobile phone use and the association with brain tumours.

The anatomical distribution of cerebral gliomas in mobile phone users.

Meningioma patients diagnosed 2007-2009 and the association with use of mobile and cordless phones: a case-control study.

Epidemiologic evidence on mobile phones and tumor risk: a review.

Acoustic neuroma risk in relation to mobile telephone use: results of the INTERPHONE international case-control study.

The Intracranial Distribution of Gliomas in Relation to Exposure From Mobile Phones: Analyses From the INTERPHONE Study.

Childhood brain tumour risk and its association with wireless phones: a commentary.

Mobile phone use and risk for intracranial tumors.

Meningioma and mobile phone use--a collaborative case-control study in five North European countries.

Mobile phone use and glioma risk: comparison of epidemiological study results with incidence trends in the United States.

The controversy about a possible relationship between mobile phone use and cancer.

Mobile phones and brain tumours: a review of epidemiological research.

Meta-analysis of association between mobile phone use and glioma risk.

Mobile phones and head tumours. The discrepancies in cause-effect relationships in the epidemiological studies - how do they arise?

Mobile phone use and brain tumors in children and adolescents: a multicenter case-control study.

Mobile phone use and risk of intracranial tumors: a consistency analysis.

Pituitary tumor risk in relation to mobile phone use: A case-control study.

[Long-term use of mobile phone and its association with glioma: a systematic review and meta-analysis].

Mobile phones, brain tumors, and the interphone study: where are we now?

[Motivation and significance of IARC classification for mobile phone].

Mobile telephones and cancer--a review of epidemiological evidence.

The INTERPHONE study: design, epidemiological methods, and description of the study population.

Evaluation of Mobile Phone and Cordless Phone Use and Glioma Risk Using the Bradford Hill Viewpoints from 1965 on Association or Causation.

Pooled analysis of Swedish case-control studies during 1997-2003 and 2007-2009 on meningioma risk associated with the use of mobile and cordless phones.

Meta-analysis of mobile phone use and intracranial tumors.

[Association between radiation from mobile phones and tumour risk in adults].

Probabilistic Multiple-Bias Modeling Applied to the Canadian Data From the Interphone Study of Mobile Phone Use and Risk of Glioma, Meningioma, Acoustic Neuroma, and Parotid Gland Tumors.

Childhood brain tumours and use of mobile phones: comparison of a case-control study with incidence data.

Medical exposure to ionising radiation and the risk of brain tumours: Interphone study group, Germany.

Recall bias in the assessment of exposure to mobile phones.

Lost in laterality: interpreting "preferred side of the head during mobile phone use and risk of brain tumour" associations.

Wireless Phone Use and Risk of Adult Glioma: Evidence from a Meta-Analysis.

Using the Hill viewpoints from 1965 for evaluating strengths of evidence of the risk for brain tumors associated with use of mobile and cordless phones.

Mobile phone use and risk for intracranial tumors and salivary gland tumors - A meta-analysis.

Use of mobile phones and risk of brain tumours: update of Danish cohort study.

Mobile phone use and risk of tumors: a meta-analysis.

[Mobile phones and head tumours: it is time to read and highlight data in a proper way].

Cellular telephones and risk for brain tumors: a population-based, incident case-control study.

Changes in brain glioma incidence and laterality correlates with use of mobile phones--a nationwide population based study in Israel.

Survival of glioma patients in relation to mobile phone use in Denmark, Finland and Sweden.

Mobile phone use and the risk for malignant brain tumors: a case-control study on deceased cases and controls.

A case-control study of risk of leukaemia in relation to mobile phone use.

Validation of self-reported start year of mobile phone use in a Swedish case-control study on radiofrequency fields and acoustic neuroma risk.

Environmental risk factors for sporadic acoustic neuroma (Interphone Study Group, Germany).

Use of mobile and cordless phones and survival of patients with glioma.

Impact of random and systematic recall errors and selection bias in case--control studies on mobile phone use and brain tumors in adolescents (CEFALO study).

Electromagnetic fields and brain tumours: a commentary.

[Radio and microwave frequency radiation and health--an analysis of the literature].

Long-term and frequent cellular phone use and risk of acoustic neuroma.

Validation of short term recall of mobile phone use for the Interphone study.

Systematic review of wireless phone use and brain cancer and other head tumors.

Mobile phone use and incidence of glioma in the Nordic countries 1979-2008: consistency check.

Selection bias due to differential participation in a case-control study of mobile phone use and brain tumors.

Decreased survival of glioma patients with astrocytoma grade IV (glioblastoma multiforme) associated with long-term use of mobile and cordless phones.

Quantifying the impact of selection bias caused by nonparticipation in a case-control study of mobile phone use.

Analyses of temporal and spatial patterns of glioblastoma multiforme and other brain cancer subtypes in relation to mobile phones using synthetic counterfactuals.

Estimating associations of mobile phone use and brain tumours taking into account laterality: a comparison and theoretical evaluation of applied methods.

Mobile phone use and risk of parotid gland tumor.

Epidemiology of brain tumors.

Review of four publications on the Danish cohort study on mobile phone subscribers and risk of brain tumors.

Evaluation of carcinogenic effects of electromagnetic fields (EMF).

Use of wireless phones and the risk of salivary gland tumours: a case-control study.

Epidemiology and etiology of gliomas.

Epidemiology of Intracranial Gliomas.

The effects of recall errors and of selection bias in epidemiologic studies of mobile phone use and cancer risk.

Time trend in incidence of malignant neoplasms of the central nervous system in relation to mobile phone use among young people in Japan.

A three-dimensional point process model for the spatial distribution of disease occurrence in relation to an exposure source.

[Risk of major lymphoma subtypes and use of mobile phones].

Simulation of the incidence of malignant brain tumors in birth cohorts that started using mobile phones when they first became popular in Japan.

Risks of carcinogenesis from electromagnetic radiation of mobile telephony devices.

Current state of our knowledge on brain tumor epidemiology.

Mobile phones, cordless phones and rates of brain tumors in different age groups in the Swedish National Inpatient Register and the Swedish Cancer Register during 1998-2015.

Has the incidence of brain cancer risen in Australia since the introduction of mobile phones 29 years ago?

Inferring the 1985-2014 impact of mobile phone use on selected brain cancer subtypes using Bayesian structural time series and synthetic controls.

Location of gliomas in relation to mobile telephone use: a case-case and case-specular analysis.

Mobile phone use and risk of uveal melanoma: results of the risk factors for uveal melanoma case-control study.

[The probability of developing brain tumours among users of cellular telephones (scientific information to the decision of the International Agency for Research on Cancer (IARC) announced on May 31, 2011)].

[Risk of neoplastic diseases in conditions of exposure to radio- and microwave fields--epidemiologic investigations].

Effects of alternative styles of risk information on EMF risk perception.

Medical students' risk perceptions on decreased attention, physical and social risks in using mobile phones and the factors related with their risk perceptions.

The possible role of radiofrequency radiation in the development of uveal melanoma.

Mobile phones and multiple sclerosis--a nationwide cohort study in Denmark.

Mobile phone use and the risk of skin cancer: a nationwide cohort study in Denmark.

Use of wireless phones and serum beta-trace protein in randomly recruited persons aged 18-65 years: a cross-sectional study.

Exposure to wireless phone emissions and serum beta-trace protein.

Theme - Electromagnetic interference with cardiac pacemakers

Titles

The effects of mobile phones on pacemaker function.

[The effect of cell phones on pacemaker function].

Electromagnetic interference with implantable cardiac pacemakers by video capsule.

Influence of digital and analogue cellular telephones on implanted pacemakers.

[Pacemaker dysfunction during use of a mobile telephone].

Life after pacemaker implantation: management of common problems and environmental interactions.

[Cardiac pacemakers designed for magnetic resonance environment].

Interference with cardiac pacemakers by cellular telephones.

Pacemakers and magnetic resonance imaging: Current status and survey in Switzerland.

Influence of D-net (European GSM-Standard) cellular phones on pacemaker function in 50 patients with permanent pacemakers.

[Pacemaker dysfunction in the clinical practice].

Interference in pacemakers.

Interactions between pacemakers and security systems.

Electromagnetic interference with pacemakers caused by portable media players.

Electromagnetic compatibility of electronic implants--review of the literature.

Do European GSM mobile cellular phones pose a potential risk to pacemaker patients?

Electromagnetic interference in pacemakers in single-engine fixed-wing aircraft: a European perspective.

Pacemaker inhibition and asystole in a pacemaker dependent patient.

[Cardiac pacemaker dysfunction secondary to outside interference: a review].

Pacemakers: some of the risks and complications you are not warned about.

Is there a risk for interaction between mobile phones and single lead VDD pacemakers?

SAR evaluations of mobile phone close to a pacemaker implanted in human body.

[Is there any risk interaction between electromagnetic field generated by mobile phones and artificial pacemakers].

Electromagnetic interference with cardiac pacemakers and implantable cardioverter-defibrillators from low-frequency electromagnetic fields in vivo.

Induction ovens and electromagnetic interference: what is the risk for patients with implanted pacemakers?

Magnetic resonance imaging for patients with permanent pacemakers: initial clinical experience.

Magnetic interference of cardiac pacemakers from a surgical magnetic drape.

Electromagnetic compatibility study of the in-vitro interaction of wireless phones with cardiac pacemakers.

Do media players cause interference with pacemakers?

Electromagnetic interference of pacemakers by mobile phones.

Interference by cellular phones with permanent implanted pacemakers: an update.

Electrocardiographic "pacemaker pseudo-spikes" and radio frequency interference.

Pacemaker interference.

Reliability of electromagnetic filters of cardiac pacemakers tested by cellular telephone ringing.

Pacemaker interference by 60-Hz contact currents.

The effect of 50 Hz external electrical interference on implanted cardiac pacemakers.

Concerns about sources of electromagnetic interference in patients with pacemakers.

Selective interference with pacemaker activity by electrical dental devices.

Hospital pager systems may cause interference with pacemaker telemetry.

[Environment and permanent cardiac pacing].

Interference with cardiac pacing.

Electromagnetic interference of analog cellular telephones with pacemakers.

The effect of power frequency high intensity electric fields on implanted cardiac pacemakers.

The effect of radar on cardiac pacemakers.

Pacing in high field cardiac magnetic resonance imaging:.

Do induction cooktops interfere with cardiac pacemakers?

[Interference between cardiac pacemaker and electromagnetic anti-theft devices in stores].

[Effect of external electrical interference on pacemakers].

Effects of an increased air gap on the in vitro interaction of wireless phones with cardiac pacemakers.

Radiofrequency Scanning for Retained Surgical Items Can Cause Electromagnetic Interference and Pacing Inhibition if an Asynchronous Pacing Mode Is Not Applied.

Interference between mobile phones and pacemakers: a look inside.

[Electromagnetic interference of electrical dental equipment with cardiac pacemakers].

Electromagnetic interference of an external temporary pacemaker during maxillofacial and neck surgery.

Effect of electronic apex locators on cardiac pacemaker function.

Mode of operation induced by rapid external chest wall stimulation in patients with normally functioning QRS-inhibited (VVI) pacemakers.

Disturbances in the function of cardiac pacemaker caused by short wave and microwave diathermies and pulsed high frequency current.

Theme - Electromagnetic interference on implanted cardiac devices

Titles

Incidence of electromagnetic interference in implantable cardioverter defibrillators.

Effects of electromagnetic interference on implanted cardiac devices and their management.

Electromagnetic interference in cardiac rhythm management devices.

Surgical management of the patient with an implanted cardiac device: implications of electromagnetic interference.

Electromagnetic interference and implanted cardiac devices: the nonmedical environment (part I).

[The influence of non-ionizing electromagnetic fields on implantable cardiac medical devices].

Electromagnetic interference and implanted cardiac devices: the medical environment (part II).

Potential interference of small neodymium magnets with cardiac pacemakers and implantable cardioverter-defibrillators.

Implanted devices and electromagnetic interference: case presentations and review.

Are patients with cardiac implants protected against electromagnetic interference in daily life and occupational environment?

Safety of the colonoscope magnetic imaging device (ScopeGuide) in patients with implantable cardiac devices.

Intermittent, erratic behaviour of an implantable cardioverter defibrillator secondary to a hidden magnetic source of interference.

Shock whilst gardening--implantable defibrillators & lawn mowers.

An update on mobile phones interference with medical devices.

Characterization of electromagnetic interference of medical devices in the hospital due to cell phones.

Mobile phone interference with medical equipment and its clinical relevance: a systematic review.

Electromagnetic interference in implantable cardioverter defibrillators: present but rare.

Electromagnetic interference with implantable cardioverter-defibrillators at power frequency: an in vivo study.

Cellular phone interference with external cardiopulmonary monitoring devices.

Do airport metal detectors interfere with implantable pacemakers or cardioverter-defibrillators?

Electromagnetic interference of dental equipment with implantable cardioverter defibrillators.

Treatment of patients with cardiac pacemakers and implantable cardioverter-defibrillators during radiotherapy.

AANA Journal Course: update for nurse anesthetists. Arrhythmia management devices and electromagnetic interference.

In-vivo testing of digital cellular telephones in patients with implantable cardioverter-defibrillators.

[Magnets, pacemaker and defibrillator: fatal attraction?].

Induction ovens and electromagnetic interference: what is the risk for patients with implantable cardioverter defibrillators?

Electromagnetic Interference (EMI) and arrhythmic events in ICD patients undergoing gastrointestinal procedures.

Radiofrequency interference with medical devices. A technical information statement.

How do mobile phones affect electromedical devices?

Cell phones and electromagnetic interference revisited.

Patient safety and electromagnetic protection: a review.

[Return to work of a pacemaker bearing worker: the relationship between health problems and electromagnetic interferences].

Report of the American Medical Association (AMA) Council on Scientific Affairs and AMA recommendations to medical professional staff on the use of wireless radio-frequency equipment in hospitals.

Implantable cardioverter defibrillators and cellular telephones: is there any interference?

Wireless technologies and patient safety in hospitals.

[Magnetic resonance imaging in patients with pacemakers and implantable cardioverter-defibrillators: a systematic review].

[Medical implantable devices and electromagnetic compatibility].

Electromagnetic interference in critical care.

In vitro tests reveal sample radiofrequency identification readers inducing clinically significant electromagnetic interference to implantable pacemakers and implantable cardioverter-defibrillators.

[Do mobile telephones have adverse effects on the functions of implantable cardioverter defibrillators?].

A follow-up study of electromagnetic interference of cellular phones on electronic medical equipment in the emergency department.

Electromagnetic interference can cause hospital devices to malfunction, McGill group warns.

Electromagnetic interference from radio frequency identification inducing potentially hazardous incidents in critical care medical equipment.

Electromagnetic interference of endodontic equipments with cardiovascular implantable electronic device.

Is magnetic resonance safe in implanted cardiac devices patients?

Safety Considerations in Magnetic Resonance Imaging of Patients With Implanted Medical Devices.

Cardiac devices and electromagnetic interference revisited: new radiofrequency technologies and implications for dermatologic surgery.

State of the science: pacemaker and defibrillator interference from wireless communication devices.

Measurements of electromagnetic fields radiated from communication equipment and of environmental electromagnetic noise: impact on the use of communication equipment within the hospital.

Dosimetry of electromagnetic field exposure of an active armlet and its electromagnetic interference to the cardiac pacemakers using adult, child and infant models.

Implanted medical devices in workers exposed to radio-frequency radiation.

[Radiotherapy in patients with a pacemaker or an implantable cardioverter defibrillator].

Electromagnetic interference of communication devices on ECG machines.

Interference by new-generation mobile phones on critical care medical equipment.

[Use of mobile phones in hospitals do not jeopardise the safety of the patients].

Electromagnetic interference between external defibrillator and cardiac resynchronization therapy-pacemaker (CRT-P) devices.

Interference of electrical dental equipment with implantable cardioverter-defibrillators.

Electromagnetic interference of cardiac rhythmic monitoring devices to radio frequency identification: analytical analysis and mitigation methodology.

A practical procedure to prevent electromagnetic interference with electronic medical equipment.

Clinically significant magnetic interference of implanted cardiac devices by portable headphones.

Electromagnetic interference from GSM and TETRA phones with life-support medical devices.

Electromagnetic interference to infusion pumps. Update2008 from GSM mobile phones.

Electronic article surveillance systems and interactions with implantable cardiac devices: risk of adverse interactions in public and commercial spaces.

Electromagnetic immunity of infusion pumps to GSM mobile phones: a systematic review.

Avoidance behaviors in patients with implantable cardioverter defibrillators.

Electromagnetic interference of implantable cardiac devices from a shoulder massage machine.

Deaths associated with implantable cardioverter defibrillator failure and deactivation reported in the United States Food and Drug Administration Manufacturer and User Facility Device Experience Database.

Cochlear implants: in vitro investigation of electromagnetic interference at MR imaging--compatibility and safety aspects.

Electromagnetic interference with electronic medical equipment induced by automatic conveyance systems.

Possible electromagnetic interference with electronic medical equipment by radio waves coming from outside the hospital.

Interactions between electronic article surveillance systems and implantable cardioverter-defibrillators.

Risk of cellular phone interference with an implantable loop recorder.

Interference of electrocardiographic recordings by a mobile telephone.

Electromagnetic interference with infusion pumps from GSM mobile phones.

An implanted spherical head model exposed to electromagnetic fields at a mobile communication frequency.

Biomedical concerns in wireless communications.

In vitro study of the electromagnetic interaction between wireless phones and an implantable neural stimulator.

Safety aspects of radiofrequency power deposition in magnetic resonance.

Electromagnetic interference of bone-anchored hearing aids by cellular phones revisited.

Fatal collision? Are wireless headsets a risk in treating patients?

Ventricular fibrillation induced by radiofrequency energy delivery for premature ventricular contractions arising from the right ventricular outflow tract: is implantablecardioverterdefibrillator indicated?

Interaction of radio frequency electromagnetic fields and passive metallic implants--a brief review.

Use of mobile phones in ICU--why not ban?

Clinical testing of cellular phone ringing interference with automated external defibrillators.

Electromagnetic immunity of implantable pacemakers exposed to wi-fi devices.

Effect of digital cellular phones on tachyarrhythmia analysis of automated external defibrillators.

Interference with the operation of medical devices resulting from the use of radio frequency identification technology.

The impact of dental devices on neurostimulators.

Detection of refrigerator-associated 60 Hz alternating current as ventricular fibrillation by an implantable defibrillator.

Solutions to electromagnetic interference problems between cochlear implants and GSM phones.

[Electromagnetic fields of mobile telephone systems--thresholds, effects and risks for cochlear implant patients and healthy people].

[Interference testing in certification of medical equipment].

Assessment of the exposure to WLAN frequencies of a head model with a cochlear implant.

Mobile phones to improve the practice of neurology.

Is electromagnetic interference still a risk?

Cellular phone interference with the operation of mechanical ventilators.

[Electromagnetic fields in hospitals: wireless-LAN as a risk factor?].

[Influence of electromagnetic waves on portable electronic instruments in medicine].

Electromagnetic energy radiated from mobile phone alters electrocardiographic records of patients with ischemic heart disease.

Nullification of electromagnetic radiation: 50 Hz artifact during electroencephalogram recording.

Development of a silicon retinal implant: cortical evoked potentials following focal stimulation of the rabbit retina with light and electricity.

[Influence of the radiofrequency current on the left ventricular systolic function].

Smart phone: a popular device supports amylase activity assay in fisheries research.

Theme - Health risks from mobile phone base stations

Titles

Epidemiological evidence for a health risk from mobile phone base stations.

Mobile phone base stations and adverse health effects: phase 1 of a population-based, cross-sectional study in Germany.

Perception of mobile phone and base station risks.

Effect of mobile phone station on micronucleus frequency and chromosomal aberrations in human blood cells.

Public exposure to radio waves near GSM microcell and picocell base stations.

Mobile phone base stations and well-being--A meta-analysis.

Mobile phone base stations and adverse health effects: phase 2 of a cross-sectional study with measured radio frequency electromagnetic fields.

Assessment of exposure to mobile telecommunication electromagnetic fields.

Assessment of radiofrequency/microwave radiation emitted by the antennas of rooftop-mounted mobile phone base stations.

Electromagnetic field pattern in the environment of GSM base stations.

[Electormagnetic field of the mobile phone base station: case study].

Determination of exposure due to mobile phone base stations in an epidemiological study.

Variographic analysis of public exposure to electromagnetic radiation due to cellular base stations.

[Subjective symptoms reported by people living in the vicinity of cellular phone base stations: review].

Neurobehavioral effects among inhabitants around mobile phone base stations.

[Assessment of electromagnetic fields intensity emitted by cellular phone base stations in surrounding flats--a preliminary study].

Effects of short-term W-CDMA mobile phone base station exposure on women with or without mobile phone related symptoms.

Statistical analysis of electromagnetic radiation measurements in the vicinity of indoor microcell GSM/UMTS base stations in Serbia.

Estimates of Environmental Exposure to Radiofrequency Electromagnetic Fields and Risk of Lymphoma Subtypes.

[Level of microwave radiation from mobile phone base stations built in residential districts].

Do mobile phone base stations affect sleep of residents? Results from an experimental double-blind sham-controlled field study.

Effect of electromagnetic radiations from mobile phone base stations on general health and salivary function.

Use of portable exposure meters for comparing mobile phone base station radiation in different types of areas in the cities of Basel and Amsterdam.

[Investigation on the health of people living near mobile telephone relay stations: I/Incidence according to distance and sex].

Statistical analysis of electromagnetic radiation measurements in the vicinity of GSM/UMTS base station antenna masts.

Impact of radiofrequency radiation on DNA damage and antioxidants in peripheral blood lymphocytes of humans residing in the vicinity of mobile phone base stations.

Analysis of the effect of mobile phone base station antenna loading on localized SAR and its consequences for measurements.

Public safety assessment of electromagnetic radiation exposure from mobile base stations.

Survey of RF exposure levels from mobile telephone base stations in Australia.

Subjective complaints of people living near mobile phone base stations in Poland.

Time averaged transmitter power and exposure to electromagnetic fields from mobile phone base stations.

[Symptoms experienced by people in vicinity of base stations: II/ Incidences of age, duration of exposure, location of subjects in relation to the antennas and other electromagnetic factors].

[Danger of cellular telephones and their relay stations].

Mobile phone base stations and early childhood cancers: case-control study.

Exposure to non-ionizing electromagnetic radiation from mobile telephony and the association with psychiatric symptoms.

Feasibility of future epidemiological studies on possible health effects of mobile phone base stations.

Electromagnetic fields from mobile phone base station - variability analysis.

Assessment of RF radiation levels in the vicinity of 60 GSM mobile phone base stations in Iran.

Biological responses of mobile phone frequency exposure.

Radio frequency electromagnetic field compliance assessment of multi-band and MIMO equipped radio base stations.

A possible effect of electromagnetic radiation from mobile phone base stations on the number of breeding house sparrows (Passer domesticus).

Statistical analysis of electromagnetic radiation measurements in the vicinity of GSM/UMTS base station installed on buildings in Serbia.

A cross-sectional case control study on genetic damage in individuals residing in the vicinity of a mobile phone base station.

Does short-term exposure to mobile phone base station signals increase symptoms in individuals who report sensitivity to electromagnetic fields? A double-blind randomized provocation study.

Modeled and Perceived Exposure to Radiofrequency Electromagnetic Fields From Mobile-Phone Base Stations and the Development of Symptoms Over Time in a General Population Cohort.

Determination of safety distance limits for a human near a cellular base station antenna, adopting the IEEE standard or ICNIRP guidelines.

Subjective symptoms, sleeping problems, and cognitive performance in subjects living near mobile phone base stations.

Occupational exposure to base stations-compliance with EU directive 2004/40/EC.

Measurement and analysis of radiofrequency radiations from some mobile phone base stations in Ghana.

UMTS base station-like exposure, well-being, and cognitive performance.

Outdoor and indoor sources of residential radiofrequency electromagnetic fields, personal cell phone and cordless phone use, and cognitive function in 5-6 years old children.

[Increased occurrence of nuclear cataract in the calf after erection of a mobile phone base station].

Impact of a small cell on the RF-EMF exposure in a train.

A large-scale measurement, analysis and modelling of electromagnetic radiation levels in the vicinity of GSM/UMTS base stations in an urban area.

Determinants of exposure to electromagnetic fields from mobile phones.

Improving the efficiency of measurement procedures for assessing human exposure in the vicinity of mobile phone (GSM/DCS/UMTS) base stations.

Population exposure to electromagnetic fields generated by radio base stations: evaluation of the urban background by using provisional model and instrumental measurements.

On the safety assessment of human exposure in the proximity of cellular communications base-station antennas at 900, 1800 and 2170 MHz.

What input data are needed to accurately model electromagnetic fields from mobile phone base stations?

Methods of evaluating human exposure to electromagnetic fields radiated from operating base stations in Korea.

Non-specific physical symptoms in relation to actual and perceived proximity to mobile phone base stations and powerlines.

[Mobile communication: radiobiology problems and evaluation of danger].

Temporal and spatial variability of personal exposure to radio frequency electromagnetic fields.

The precautionary principle in the context of mobile phone and base station radiofrequency exposures.

Adolescents' risk perceptions on mobile phones and their base stations, their trust to authorities and incivility in using mobile phones: a cross-sectional survey on 2240 high school students in Izmir, Turkey.

Systematic review on the health effects of exposure to radiofrequency electromagnetic fields from mobile phone base stations.

Radiofrequency electromagnetic fields emitted from base stations of DECT cordless phones and the risk of glioma and meningioma (Interphone Study Group, Germany).

Mobile telecommunications and health: report of an investigation into an alleged cancer cluster in Sandwell, West Midlands.

Study of variations of radiofrequency power density from mobile phone base stations with distance.

Health risks from the use of mobile phones.

Mobile phones, mobile phone base stations and cancer: a review.

Animal carcinogenicity studies on radiofrequency fields related to mobile phones and base stations.

Association of Exposure to Radio-Frequency Electromagnetic Field Radiation (RF-EMFR) Generated by Mobile Phone Base Stations with Glycated Hemoglobin (HbA1c) and Risk of Type 2 Diabetes Mellitus.

Assessment of the temporal trend of the exposure of people to electromagnetic fields produced by base stations for mobile telephones.

Risk and benefit perceptions of mobile phone and base station technology in Bangladesh.

Clinically defined non-specific symptoms in the vicinity of mobile phone base stations: A retrospective before-after study.

Specific absorption rate and electric field measurements in the near field of six mobile phone base station antennas.

Output power levels from mobile phones in different geographical areas; implications for exposure assessment.

Influence of mobile phone traffic on base station exposure of the general public.

Residential exposure to RF-EMF from mobile phone base stations: Model predictions versus personal and home measurements.

Physics and biology of mobile telephony.

Longitudinal associations between risk appraisal of base stations for mobile phones, radio or television and non-specific symptoms.

Exposure assessment of mobile phone base station radiation in an outdoor environment using sequential surrogate modeling.

Exposure of farm workers to electromagnetic radiation from cellular network radio base stations situated on rural agricultural land.

Mobile phones. precautionary options.

Aggregated data from two double-blind base station provocation studies comparing individuals with idiopathic environmental intolerance with attribution to electromagnetic fields and controls.

GSM base stations: short-term effects on well-being.

Sensitivity to electricity--temporal changes in Austria.

How does long term exposure to base stations and mobile phones affect human hormone profiles?

Effects of exposure to GSM mobile phone base station signals on salivary cortisol, alpha-amylase, and immunoglobulin A.

Determinants and stability over time of perception of health risks related to mobile phone base stations.

[Cellular radio systems. Problems faced in assessing exposure to electromagnetic fields].

Effect of radiofrequency radiation on reproductive health.

Exposure assessment in front of a multi-band base station antenna.

Protect children from EMF.

Symptoms of ill health ascribed to electromagnetic field exposure--a questionnaire survey.

Spatial electromagnetic field intensity modelling of global system for mobile communication base stations in the Istanbul Technical University Ayazaga campus area.

[Protection against electromagnetic fields emitted by mobile phone facilities in Poland and the European Union countries].

Prevalence of nuclear cataract in Swiss veal calves and its possible association with mobile telephone antenna base stations.

[GSM fields and health: an updated literature review].

Knowledge and perceptions of the health effects of environmental hazards in the general population in Italy.

Dynamics of the public concern and risk communication program implementation.

Microwaves in the cold war: the Moscow embassy study and its interpretation. Review of a retrospective cohort study.

Health effects of living near mobile phone base transceiver station (BTS) antennae: a report from Isfahan, Iran.

Replication of heart rate variability provocation study with 2.4-GHz cordless phone confirms original findings.

[Reports on the impact of objects emitting electromagnetic fields on the environment: issues concerning their better understanding by non-specialists in telecommunication].

Cognitive and physiological responses in humans exposed to a TETRA base station signal in relation to perceived electromagnetic hypersensitivity.

Mortality by neoplasia and cellular telephone base stations in the Belo Horizonte municipality, Minas Gerais state, Brazil.

Are wireless phones safe? A review of the issue.

A novel method to assess human population exposure induced by a wireless cellular network.

[Metrology of pulse modulated electromagnetic fields with diode-type meters].

Radiofrequency radiation injures trees around mobile phone base stations.

Comparison of temporal realistic telecommunication base station exposure with worst-case estimation in two countries.

[Cellular telephones and their relay stations: a health risk?].

[Evaluation of the levels of radiofrequency electromagnetic fields in the territory of the city of Bari in outside and inside environments].

A geographical model of radio-frequency power density around mobile phone masts.

[Ecological aspects of electromagnetic radiation emitted by mobile stations of communication means].

Assessment of nuclear abnormalities in exfoliated cells from the oral epithelium of mobile phone users.

Occupational exposure to radiofrequency fields in antenna towers.

Joint minimization of uplink and downlink whole-body exposure dose in indoor wireless networks.

Theme - Electromagnetic hypersensitivity

Titles

Does electromagnetic hypersensitivity originate from nocebo responses? Indications from a qualitative study.

Symptoms, personality traits, and stress in people with mobile phone-related symptoms and electromagnetic hypersensitivity.

Electromagnetic field induced biological effects in humans.

Development and evaluation of the electromagnetic hypersensitivity questionnaire.

Hypothesis on how to measure electromagnetic hypersensitivity.

[Subjective non-specific symptoms related with electromagnetic fields: description of 2 cases].

Characteristics of perceived electromagnetic hypersensitivity in the general population.

Electromagnetic hypersensitivity--an increasing challenge to the medical profession.

Idiopathic environmental intolerance attributed to electromagnetic fields (formerly 'electromagnetic hypersensitivity'): An updated systematic review of provocation studies.

Cognitive and neurobiological alterations in electromagnetic hypersensitive patients: results of a case-control study.

Becoming electro-hypersensitive: A replication study.

Hypersensitivity to RF fields emitted from CDMA cellular phones: a provocation study.

Electromagnetic hypersensitivity: fact or fiction?

IEI-EMF provocation case studies: A novel approach to testing sensitive individuals.

A systematic review of treatments for electromagnetic hypersensitivity.

[Hypersensitivity syndrome].

Electromagnetic hypersensitivity: a systematic review of provocation studies.

Symptom attribution and risk perception in individuals with idiopathic environmental intolerance to electromagnetic fields and in the general population.

Polluted places or polluted minds? An experimental sham-exposure study on background psychological factors of symptom formation in 'Idiophatic Environmental Intolerance attributed to electromagnetic fields'.

Is There a Connection Between Electrosensitivity and Electrosensibility? A Replication Study.

Idiopathic environmental intolerance attributed to electromagnetic fields (IEI-EMF): a systematic review of identifying criteria.

Electromagnetic hypersensitivity (EHS) in occupational and primary health care: A nation-wide survey among general practitioners, occupational physicians and hygienists in the Netherlands.

"Hypersensitivity to Electricity" in the Office; Symptoms and Improvement.

Do people with idiopathic environmental intolerance attributed to electromagnetic fields display physiological effects when exposed to electromagnetic fields? A systematic review of provocation studies.

Hypersensitivity to electricity: working definition and additional characterization of the syndrome.

Are media warnings about the adverse health effects of modern life self-fulfilling? An experimental study on idiopathic environmental intolerance attributed to electromagnetic fields (IEI-EMF).

Medical and social prognosis for patients with perceived hypersensitivity to electricity and skin symptoms related to the use of visual display terminals.

Blood laboratory findings in patients suffering from self-perceived electromagnetic hypersensitivity (EHS).

Representative survey on idiopathic environmental intolerance attributed to electromagnetic fields in Taiwan and comparison with the international literature.

Can explicit suggestions about the harmfulness of EMF exposure exacerbate a nocebo response in healthy controls?

Idiopathic environmental intolerance attributed to electromagnetic fields: a content analysis of British newspaper reports.

A cognitive-behavioral treatment of patients suffering from "electric hypersensitivity". Subjective effects and reactions in a double-blind provocation study.

Development and evaluation of an electromagnetic hypersensitivity questionnaire for Japanese people.

Increasing levels of saliva alpha amylase in electrohypersensitive (EHS) patients.

Are media reports able to cause somatic symptoms attributed to WiFi radiation? An experimental test of the negative expectation hypothesis.

Electrical hypersensitivity in humans--fact or fiction?

Electromagnetic hypersensitivity: evidence for a novel neurological syndrome.

Effect of short exposure to radiofrequency electromagnetic fields on saliva biomarkers: a study on the electrohypersensitive individuals.

[Electromagnetic fields hypersensitivity].

Heavy metal exposure in patients suffering from electromagnetic hypersensitivity.

[Controversies around electromagnetic fields and electromagnetic hypersensitivity. The construction of "low noise" public problems].

Coping and self-image in patients with visual display terminal-related skin symptoms and perceived hypersensitivity to electricity.

Neurophysiological effects of flickering light in patients with perceived electrical hypersensitivity.

Effects of personalised exposure on self-rated electromagnetic hypersensitivity and sensibility - A double-blind randomised controlled trial.

Psychologic aspects of patients with symptoms presumed to be caused by electricity or visual display units.

Odontologic survey of referred patients with symptoms allegedly caused by electricity or visual display units.

Reliable disease biomarkers characterizing and identifying electrohypersensitivity and multiple chemical sensitivity as two etiopathogenic aspects of a unique pathological disorder.

[Idiopathic environmental intolerance: 2 disabling entities to recognize].

Neurophysiological study of patients with perceived 'electrical hypersensitivity'.

Description of persons with symptoms presumed to be caused by electricity or visual display units--oral aspects.

Provocation with stress and electricity of patients with "sensitivity to electricity".

Functional brain MRI in patients complaining of electrohypersensitivity after long term exposure to electromagnetic fields.

Association of tinnitus and electromagnetic hypersensitivity: hints for a shared pathophysiology?

The microwave syndrome or electro-hypersensitivity: historical background.

[Pseudostenocardia due to exposure to "electrosmog"].

Altered cortical excitability in subjectively electrosensitive patients: results of a pilot study.

An assessment of the autonomic nervous system in the electrohypersensitive population: a heart rate variability and skin conductance study.

Provocation of the electromagnetic distress syndrome.

Skin problems from visual display units. Provocation of skin symptoms under experimental conditions.

Cognitive behavioural therapy for patients with electric sensitivity - a multidisciplinary approach in a controlled study.

Self-reporting of symptom development from exposure to radiofrequency fields of wireless smart meters in victoria, australia: a case series.

Improvement of gastroesophageal reflux symptoms after radiofrequency energy: a randomized, sham-controlled trial.

Does "electromagnetic pollution" cause illness? An inquiry among Austrian general practitioners.

"Struggle to obtain redress": Women's experiences of living with symptoms attributed to dental restorative materials and/or electromagnetic fields.

Environmental illness: fatigue and cholinesterase activity in patients reporting hypersensitivity to electricity.

The views of primary care physicians on health risks from electromagnetic fields.

Review of extensive workups of 34 patients overexposed to radiofrequency radiation.

Providing cell phone numbers and e-mail addresses to patients: The patient's perspective, a cross sectional study.

[Effects of millimetric electromagnetic waves on regional blood flow and effectiveness of multimodal therapy of patients with pulmonary tuberculosis].

Environmental illness: evaluation of salivary flow, symptoms, diseases, medications, and psychological factors.

30-MINUTES-TUMT. Use of the visual analogue scale to investigate patients' pain perception, different cocktail options and tolerability during 30 minutes' treatment.

Non-ionizing radiation exposure causing ill-health and alopecia areata.

Low-frequency pulsed electromagnetic field therapy in fibromyalgia: a randomized, double-blind, sham-controlled clinical study.

Electrohypersensitivity: a functional impairment due to an inaccessible environment.

Accidental exposure to electromagnetic fields from the radar of a naval ship: a descriptive study.

[Mechanism of biotropic effects of regional electromagnetic fields in patients with left ventricular ischemic dysfunction].

A comparision of percutaneous radiofrequency trigeminal neurolysis and microvascular decompression of the trigeminal nerve for the treatment of tic douloureux.

Medical aspects of radiofrequency radiation overexposure.

Prospective, randomized, single-blind, sham treatment-controlled study of the safety and efficacy of an electromagnetic field device for the treatment of chronic low back pain: a pilot study.

Atrial fibrillation therapies: lest we forget surgery.

Non-resection approaches for colorectal liver metastases.

[Indices of thrombocyte conductance and permeability in microwave fields in ischemic and hemorrhagic stroke patients].

Health care utilisation and attitudes towards health care in subjects reporting environmental annoyance from electricity and chemicals.

Appendix 5 – Potential Impact of Wireless Radiation Exposure on the Opioid Crisis and Coronavirus Pandemic

A5-A. Potential Impact on Opioid Crisis

The previous findings of wireless radiation adverse effects reported in Chapter 2 of this monograph are based on ***hard evidence*** and have been ***validated*** in numerous studies. The present section on the link of wireless radiation to the opioid crisis is based on ***hard evidence*** as well, but the link of wireless radiation to the opioid crisis is ***not as far along in the validation process***. It should be viewed as a hypothesis at this point, and serve as a basis for discussion and further research.

The opioid crisis (drug dependence and overdosing) has become of increasing concern since the 1990s (coincidentally, when mobile networking technology was being introduced on a larger scale). This appendix addresses potential relationships between wireless radiation and increasing dependence on drugs.

"Over the past two decades, the United States has experienced a growing crisis of substance abuse and addiction that is illustrated most starkly by the rise in deaths from drug overdoses. Since 2000, the annual number of drug overdose deaths has quadrupled from 17,500 to 70,000 in 2017…..Most of these deaths involved opioids, including heroin, prescription painkillers, and synthetic opioids such as fentanyl." [Planalp, Hest, Lahr, 2019].

According to the US Department of Health and Human Services [HHS, 2019], 47,600 people died from overdosing on opioids in 2018, 10.3 million people misused prescription opioids in 2018, and 2 million people had an opioid misuse disorder in 2018. While there can be myriad contributing factors to such a widespread disorder, wireless radiation exposure (which increased dramatically over the same period that drug overdose deaths increased dramatically) may be a significant contributing factor. The reasons follow.

An analogy to climate change would be helpful in framing the perspective. The contribution of fossil fuel combustion to anthropogenic (man-made) climate change is ***conceptually*** similar to the contribution of wireless radiation to opioid overuse. The climate change analogy will be presented initially, since it crystallizes the nature of the causative effect. It will then be followed by the analogous details of the wireless radiation link.

The main contributing factor to anthropogenic climate change is the combustion of fossil fuels. The combustion process produces two major products relevant to climate change: carbon dioxide (CO2) and fossil sulphates/nitrates [Dutton, 2019].

CO2 from fossil fuel combustion percolates to the upper atmosphere and remains there for decades. It is transparent to the high frequency solar radiation and is partially absorbent of the lower frequency radiation returning from the Earth, thereby trapping some of the incoming solar energy in the atmosphere (and especially the ocean). Decades are required for the Earth's

global mean surface temperature to come into equilibrium with the levels of CO2 in the atmosphere.

The fossil sulphates and nitrates rise in the atmosphere, form small particles called aerosols, remain there for very short periods of time (days or weeks), then precipitate to Earth. They increase the effective albedo of the atmosphere (the albedo is a measure of the reflectiveness of the Earth's atmosphere to the incoming solar radiation), and this partial mirroring effect reduces the level of solar flux reaching the Earth's surface.

Thus, from the perspective of climate change, there is 1) an apparent *positive short-term* effect from the aerosol shielding of the solar radiation, and 2) a *negative long-term* effect from the energy trapping of the CO2. ***The positive short-term effect is masking the harmful effects of the negative long-term effect!***

What is the analogy of the climate change phenomena described above to the impact of wireless radiation on the opioid crisis? Consider the endogenous opioid system. This innate pain-relieving system "consists of widely scattered neurons that produce three opioids: beta-endorphin, the met- and leu-enkephalins, and the dynorphins. These opioids act as neurotransmitters and neuromodulators at three major classes of receptors, termed mu, delta, and kappa, and produce analgesia" and other effects [Holden et al, 2005].

It has been shown many times that one impact of wireless radiation (at myriad frequencies) is release of endogenous opioids [e.g., Radzievsky et al, 2008; Lai et al, 1983]. This release of endogenous opioids can enable analgesic effects by itself [Wu et al, 2012], or can enhance the analgesic effects of exogenous analgesics [Emilie et al, 2012; Thomas et al, 1979]. This has been demonstrated at pulsed millimeter-wave frequencies [Miryutova et al, 2001; Radzievsky et al, 2008; Hura et al, 2011], WiFi frequencies [Maillefer and Quock, 1992], mobile phone frequencies [Bodera et al, 2019], radiofrequencies [Foley-Nolan, 1992], and extremely low frequencies [Ozdemir et al, 2017; Demirkazik et al, 2019]. Additionally, as has been demonstrated by the results of the current monograph, wireless radiation at all the above frequencies has resulted in serious mid-term and especially long-term adverse health effects.

Therefore, analogous to the climate change example, wireless radiation exposure, especially at cell phone, WiFi, and millimeter-wave pulsed and modulated frequencies, generates ***1) analgesic and pleasurable short-term effects and 2) serious adverse mid- and long-term effects***. There would be some exceptions for the short-term, such as electrohypersensitivity (EHS) sufferers, who are immediately affected adversely by wireless radiation exposure.

For most people, the enhanced analgesic short-term effects of the wireless radiation would in effect mask the long-term damage from this radiation, analogous to the short-term positive effects from the aerosols masking the long-term negative effects from the CO2 in the climate change example.

Consider the following cases. In the first case, a person with ordinary pains and aches starts using a cell phone or WiFi system. There will be an almost immediate feeling of less pain and pleasurable sensations, similar to that experienced after a modest period of exercise (another stimulant of endogenous opioids) [Boecker et al, 2008]. This feeling can last for a short to intermediate length of time, after which another bout of stimulation is required to release further endogenous opioids. The cell phone/WiFi user will get conditioned to associating the immediate positive feelings with the wireless radiation-emitting devices. As time proceeds, the latent longer-term adverse effects of the wireless radiation will result in various levels of increasing discomfort and unpleasant symptoms, if not outright diseases. The immediate analgesic effects from the wireless devices will become even more important, but may be insufficient to overcome the increased levels of discomfort due to prolonged wireless radiation exposure. The individual will then be forced to use 1) exogenous opioids and narcotics and 2) wireless radiation devices to help attenuate the increasing feelings of discomfort, leading to possible addiction.

In the second case, a person with serious pain-producing disease or injury starts using a cell phone or WiFi system. This person has already been prescribed pain-killers of various types. Research has shown that wireless radiation of selected frequency characteristics in the parameter ranges discussed above not only exhibits an enhanced analgesic effect in its own right, but can enhance further the analgesic effects of exogenous analgesics [Emilie et al, 2012; Thomas et al, 1979]. Again, this person will become conditioned to the short-term analgesic and analgesic-enhancing effects of the wireless radiation devices. And, again, the increasing levels of discomfort eventually produced by prolonged wireless radiation exposure (augmented in many cases by adverse long-term effects of prolonged analgesics (https://www.painedu.org/pain-medications-long-term/) will increase the need for 1) further wireless radiation exposure and 2) additional exogenous analgesics. This positive feedback mechanism will lead to ***two forms of addiction***: exogenous pain-killers and wireless radiation.

Finally, consider the following. Alcohol has been shown to have analgesic effects [Thompson et al, 2017]. In Lai's experiments involving microwave irradiation and consumption of a mixture containing ethanol, microwave irradiation enhanced consumption of ethanol by about 25% [Lai et al, 1984]. As Lai pointed out, microwave irradiation may stress the rats, and consumption of ethanol may serve to reduce stress. So, the microwave irradiation triggers the release of endogenous opioids, producing a calming/analgesic effect, and at the same time increases stress or other adverse symptoms, driving the rodents to seek analgesia from an external source.

The above examples focus on positive short-term analgesic effects from wireless radiation followed by negative long-term addictive effects. There is no reason to believe this short-term long-term dichotomy is limited to analgesic effects. Wireless radiation ***short-term performance enhancements*** of many types accompanied by ***long-term detrimental effects*** cannot be ruled out (witness such effects for anabolic steroids on the performance of athletes in myriad sports [Vorona and Niesshlag, 2018], where short-term athletic performance is enhanced, with long-term adverse health consequences).

While the non-wireless radiation determinants of the opioid crisis should not be downplayed, a credible component of the opioid crisis may be the downward spiral of the self-re-enforcing positive feedback mechanisms generated by the wireless radiation. While there are obviously cultural influences, peer-presssure influences, over-prescribing of medications, etc, the pain and discomfort induced by the wireless radiation exposure may directly impact increased use of wireless radiation devices.

There is some overlap between the opioid crisis and the increased suicide crisis in the USA relative to wireless radiation exposure [Cheatle, 2011, 2016; Racine et al, 2017]. There are the same reasons existing for an increase in discomfort due to wireless radiation exposure, and the increase in suicide-related opioid abuse from wireless radiation, but the suicide crisis will not be addressed further in the current monograph.

A5-B. Potential Impact on Coronavirus Pandemic

The previous findings of wireless radiation adverse effects reported in Chapter 2 of this monograph are based on ***hard evidence*** and have been ***validated*** in numerous studies. The present section linking wireless radiation to exacerbation of the coronavirus pandemic is based on ***hard evidence*** as well, but the link of wireless radiation to exacerbation of the coronavirus pandemic is ***not as far along in the validation process***. It should be viewed as a hypothesis at this point, and serve as a basis for discussion and further research.

The fundamental hypothesis in this section is that wireless radiation weakens the immune system, and a weakened immune system increases the chances that exposure to the coronavirus (or any virus) will translate into symptoms/disease.

Almost a decade ago, I published a paper on potential treatments for SARS [Kostoff, 2011], the China-based pandemic of 2002-2003 that was associated with another coronavirus. As in the present China-based coronavirus pandemic, the SARS zoonotic virus/disease was thought to originate with infected bats. These bats then infected other species, which were then sold in open-air markets, and eventually infected their buyers.

Approximately 8,000 people globally presented with SARS symptoms, and approximately 10% of those who presented died. However, those who succumbed were not a random ten percent. Most had many co-morbidities, and it appeared their immune systems could not handle yet another insult.

The SARS pandemic was not ended with drugs or vaccines. None of these measures worked. Instead, quarantine and good hygiene contributed most to ending the pandemic.

After the pandemic ended, a number of physicians (especially in Asia) reviewed the records of all patients they had examined for various health issues (or standard annual physical examinations) during the pandemic, and concentrated especially on the blood test results. There were many cases where the coronavirus antibodies had shown up in the blood tests, ***but the patient had exhibited none of the SARS symptoms***.

In other words, the patient's adaptive immune system was sufficiently strong to operate properly and neutralize the coronavirus to which the patient had been exposed!

To me, that was the key finding, and contributed to the approach I have taken for developing protocols to reverse chronic diseases [e.g., Kostoff, Porter, and Buchtel, 2018].

There are on the order of 300,000 viruses, many/most of which have zoonotic potential. To develop vaccines for all of these viruses (before an epidemic or pandemic strikes) is unreasonable (based on present technology) because of the sheer numbers involved. To develop vaccines for any specific virus ***during*** an epidemic or pandemic (which was the mainstream approach taken for the coronavirus during the SARS pandemic of 2002-2003) is completely unrealistic, because of the lead times required for vaccine development, efficacy testing, ***credible*** mid-and long-term safety testing, and implementation.

Those who succumbed during the SARS pandemic had 1) myriad co-morbidities and 2) weakened immune systems unable to neutralize the SARS coronavirus. Having a strong immune system that allowed a smooth transition from innate immune system operation to adaptive immune system operation ***was the one intrinsic defense that worked!*** The SARS experience showed that the best and most realistic approach for defense against any potential viral attack is reversing immune-degrading lifestyles well before any pandemic or epidemic outbreaks. In that case, the immune system would be sufficiently strong to be able to handle viral exposure on its own without the emergence of serious symptoms, as was the case with those exposed to the SARS coronavirus (with coronavirus antibodies in their serum) who exhibited no (or minimal) symptoms.

This gets to the link between wireless radiation exposure and the latest coronavirus pandemic. Wireless radiation adversely affects the immune system (see boxed references at end of this section). To the degree that non-ionizing radiation exposure (superimposed on the myriad toxic stimuli to which many people are exposed by choice or imposition) degrades the operation of the innate and adaptive immune systems, it would increase the likelihood that the immune system could not counteract the exposure to the coronavirus (or any other virus) as nature intended. Thus, ***wireless radiation would contribute to the exacerbation of adverse effects from coronavirus exposure***. The bottom line is that exposures to essentially ALL the exogenous immune-damaging toxic stimuli (including, but not limited to, wireless radiation) need to be removed before resistance to viruses of any type can be improved substantially.

Appendix 6 – Funding Source Bias on Research Outcomes

Upton Sinclair, noted muckracker and one-time candidate for Governor of California, once stated: "It is difficult to get a man to understand something, when his salary depends upon his not understanding it!" (https://www.brainyquote.com/quotes/upton_sinclair_138285). In a nutshell, this crystallizes the central problem of integrity and credibility of the biomedical literature, especially for topics of commercial, military, and political sensitivity.

There have been many studies addressing how researcher and institutional conflicts-of-interest relate to their published findings. The following article titles reflect only the tip of the iceberg of biased outcomes related to funding sources. Since research manipulations to achieve a predetermined agenda tend not to be advertised (e.g., see section 3.2.2 of Kostoff [2016]), what eventually sees the light of day is truly the very small tip of a very large iceberg. In these sensitive topical areas, ***bias may in fact be closer to the norm than to the exception***!

Appendix 7 – Adverse Effects of Wireless Radiation Related to Implants and Appendages

A7-A. Overview

Adverse impacts of wireless radiation on myriad medical implants and appendages don't get much discussion in the literature, especially passive medical implants (A7-B2), non-medical implant analogues (A7-B3), and metallic appendages (defined below), and especially with regard to radiofrequency radiation. The FCC has raised concerns about the interactions of RF radiation with passive implants. Paragraph 230 of [FCC, 2013] states: "Electrically conductive objects in or on the body may interact with sources of RF energy in ways that are not easily predicted. Examples of conductive objects in the body include implanted metallic objects. Examples of conductive objects on the body include eyeglasses, jewelry, metallic accessories, etc."

A number of articles in the database addressed non-organic implants, which are foreign bodies inserted into humans and animals for medical purposes. Non-organic implants addressed in the present database are typically not rejected by the immune system like organic foreign substances (although some adjuvants such as metal could induce autoimmune responses [Loyo et al, 2013]). Non-rejection does not imply safety, especially from exposure to wireless radiation.

There were two major types of implants covered by the database articles showing adverse effects: active implants that produced electrical signals mainly for controlling heart irregularities (e.g., pacemakers, defibrillators) and hearing deficiencies (e.g., cochlear implants), and passive metallic implants for structural support (e.g., dental implants, bone pins, plates, etc). The active implants also have a passive component, since their structural components are imbedded in, and interactive with, the incoming RF. Additionally, there are articles addressing adverse effects from wireless radiation in the vicinity of **metallic** appendages (e.g., eyeglasses, jewelry, etc).

The external EMF from microwaves (and other sources) could 1) impact the electrical operation of the active implants adversely, 2) increase the Specific Absorption Rate (SAR) values of tissue in the vicinity of the passive implants substantially, and 3) increase the flow rate and acidity of saliva. While the EMF effects on the cochlear implants could adversely affect auditory capability, EMF effects on the heart-related implants could potentially be life-threatening. The increased SAR values around the passive metal implants could result in increased tissue temperatures, and could adversely impact integration and longevity of the passive metallic implants. In the mouth, the combination of 1) increased tissue temperatures in proximity to the implant, and 2) increased saliva flow rate and acidity, could lead to 3) increased leaching of heavy metals from metallic orthodontic structures. This also raises the question: what other adverse health effects from the exposure of both the active and passive implants to increasing levels of wireless radiation have not been identified or addressed or reported?

While Table A7-1 shows that substantial research has been done on exogenous electrical interference with cardiac pacemakers and defibrillators, the impacts of automotive-based electrical sources on these active implants have not been promulgated widely. Appendix 8 addresses the larger issue of automotive-based wireless radiation at myriad frequencies, including adverse impacts on these active implants.

A7-B. Specific Impacts from Passive Implants

A7-B1. Overview

This sub-section of Appendix 7 examines two types of passive implants: passive metallic medical implants (dental implants, orthodontic structures, nails, plates, etc) and passive micro/nano implant analogues. The former types of implants are well-known, and the latter are much less well-known, especially in their interactions with radiofrequency radiation. The latter include exogenous nanoparticles that could also enhance absorption of RF radiation. Section A7-B2 focuses on the passive metallic medical implants, and section A7-B3 focuses on passive micro/nano implant analogues.

A7-B2. Impacts from Passive Metallic Medical Implants

The potential interference from external electromagnetic fields on implanted devices that emit electromagnetic signals is somewhat obvious, and has been the subject of extensive study. Some relevant documentation will be presented later. Less studied is the impact from external electromagnetic fields on passive metallic medical implants and appendages. What are the technical issues surrounding these EMF-implant interactions?

A good summary of these interactions is contained in Virtanen et al [2006]. The following excerpts are most relevant, and critical issues are highlighted.

"When a conductive object like an implant lies close to the source of the EM field, it affects the shape of the radiated field and thus the SAR distribution. Within a perfectly conducting object, the E field disappears; and outside the implant E field, ***lines bend perpendicular to the surface of the implant***. If the surface area is small, a ***dense EM flux may arise near the implant***. In lossy tissues, this leads to ***higher power absorption near the implant*** compared to the same tissue volume with no implant present. Correspondingly, tissue volumes with lower power absorption also occur as the implant redistributes the SAR pattern. This phenomenon may especially occur with implants that are thin…..or have sharp edges or tips…..Furthermore, the ***conductive implant may couple with a radiating source***, for example, an antenna. The coupling can be either conductive, magnetic, or both…..As a consequence, a ***current oscillating on an antenna induces a current on the implant***, too. Furthermore, the ***induced surface current produces a secondary EM field, which contributes to the power absorption, that is, SAR, in tissues around the implant…..Hence the implant acts as a weak radiating antenna…..or a re-radiator…..***in tissues. At high frequencies, the induced current flows in a thin surface layer of the implant, that is, at the implant–tissue interface, which may even slightly warm up due to ohmic losses…..However, this warming is marginal compared to warming of surrounding tissues.

The size of an implant is essential when evaluating its effect on the SAR distribution…..If the implant is very small compared to the wavelength, it does not have a strong effect on the SAR distribution…..Generally intermediate size implants, with dimensions close to the wave length, and ***especially those with resonance dimensions***, may cause strong EM fields around themselves, and thus ***enhanced SAR may occur around such an implant***. Large implants

again may cause a ***major change in the SAR distribution***, since they may ***scatter or reflect the field…..***

In addition to other size-related effects, the size affects the magnitude of induced currents…..A special case of this is the ***implant with a resonance dimension…..***The length, which apparently causes the highest SAR enhancement is about lT/3, where lT is the wavelength in the media…..or lT/2…..An implant with such a dimension may even ***cause enhancement of SAR1g or SAR10g by a factor of 2–3…..*** The shape of an implant is an important factor…..Pin- or rod-shaped implants ***may act as antennas and re-radiate the external field***…..Rings and other loop structures may act as induction loops and thus ***carry high induced currents***…..A gap in the loop or rod would ***induce high SAR in the gap***…..Sharp corners and tips in the implant may cause ***concentration of the EM flux around them***.

One essential factor in the interaction is the orientation of an implant with respect to the external source, that is, polarization of the field in the far field…..Especially for pin- or rod-like structures, the orientation parallel to the electric field or antenna is the worst case…..In this orientation, the ***implant may act like an antenna*** as described earlier. For arbitrary-shaped implants, the mutual inductance of an antenna and an implant depends on their orientation with respect to each other and other geometrical factors. The higher the mutual inductance, the stronger is the interaction…..

Since dielectric properties of tissues vary, the ***tissues that surround an implant have a great impact on the SAR distribution…..***If tissues have high conductivity and relative permittivity, they are very lossy and ***SAR around the implant can be high***…..

However, in bone, the ***SAR enhancement due to an implant is assumingly higher because of lower base level***. In general, the larger the relative difference between the dielectric properties, especially conductivity, of the two media, the ***greater is the bending of the EM field when it enters the more lossy media***. Hence ***larger averaged SAR values can be expected in small volumes on the boundary***. Furthermore, the dielectric properties affect the wavelength of EM field. In certain (plane wave) cases, the distance between the implant and the skin surface may match the wavelength in tissue so that constructive interference occurs in the surface layers…..This may ***cause elevated SAR in the surface***…..Similar phenomena may also occur in other layered structures…..

As a consequence of the described effects, the maximum SAR may occur at a different location with and without the implant in the EM field…..Usually the SAR will be at maximum either on the surface of the body, that is, in the skin, or in the tissue with the highest water content. However, due to the interaction of implant and RF field, the ***location of the highest SAR may be shifted to the proximity of the implant***. This is an important fact for RF exposure evaluation."

Key takeaways from this summary are that resonance between the incoming EMF waves and the implants can contribute to increased SAR levels, and these increased SAR levels can occur in the bone or soft tissue adjacent to the implant(s).

Implants, both active and passive, are cornerstones of modern medical treatment, and are big business. Many of the implant-related articles read for this monograph attempted to downplay the significance of the EMF effects on passive implants. While some acknowledged that substantial increases in SAR are possible, especially near the implant(s), some/many concluded that while SAR was indeed increased, the values averaged over the appropriate volume (as allowed by the FCC) were small, and well under the FCC exposure limits.

This is misleading. Stating that exposure levels well below those allowed by the FCC (which bear no relation to safety) are somehow 'safe' is disingenuous! There can be very high SAR levels in volumes smaller than those allowed by the FCC, and this could have a dual impact. The bonding between the implant and surrounding media could be impacted adversely, and the myriad other adverse effects associated with SAR levels of that magnitude could be operable. Many of the articles identified the presence of 'hot spots", where the SARs were very high, but the effect was numerically attenuated by averaging over a somewhat larger area.

Additionally, most of these measurements/computations were for single stressors only (the incoming EMF radiation). Adding the real-life combinations of other toxic stimuli would tend to exacerbate the effect, perhaps substantially. Finally, the measurements and computations tended to end with a demonstration of the increase in SAR level. That's equivalent to performing a chest x-ray on someone who smoked his first cigarette, and then writing a paper that smoking had little effect on the lungs and other structures! What are the long-term effects of the incoming wireless radiation on the passive implants and their supportive tissue/bone, both in terms of structural integrity and increased incidence of non-communicable disease impacts? The question about long-term effects and combined toxic stimuli applies to the operation of the active implants as well.

A recent paper addressing adverse effects of RF impacts on osseointegration (dental implant integration with underlying bone) illustrates the issues raised above [Kavyashree et al, 2019]. "Forty-eight implants were placed in tibia and femur bone of rabbits, and after 90 days the rabbits were sacrificed and bone surrounding the implant was retrieved…..Significantly less bone-to-implant contact and bone area surrounding implant threads were found in the test groups compared to the control group. There was a significant difference in regular bone formation…..among the three groups…..Implants exposed to cell phone radiation showed more inflammatory reaction when compared to the nonexposed implants, thus indicating that ***cellular phone overuse could affect the maturation of bone and thus delay osseointegration***."

If other toxic stimuli were co-exposed along with EMF radiation, and if longer-term data were taken, more severe impacts could be expected. Similar effects could be expected for other types of implants!

Table A7-1 contains an implant taxonomy. The format is category heading followed by a few selected references. The active implant categories cover cardiac, cochlear, and other devices, and the passive implant categories cover imbedded implants and appendages.

A sub-category of passive implants called Metal Release was created. This category reflects adverse effects of wireless radiation that are almost unknown to the general public. The

focus is on increased corrosive abilities of saliva due to wireless radiation exposure, and the subsequent release/leaching of metal from myriad orthodonic structures in the mouth. Many of these metals are heavy metals, such as nickel and chromium, which can be extremely dangerous when released into the body. Most of the references in Table A7-1 in this Metal Release category deal with nickel release from orthodonic appliances.

In these circumstances, the mobile phone radiation stimulates the parotid glands, causing them to produce more saliva. Not only is the flow of saliva increased, but its properties are altered, including reduction of pH. Additionally, as the larger passive implant category has shown, there will be some preferential heating at the saliva-orthodonic appliance interface. The net effect will be to increase corrosion of the metal appliance, resulting in release of nickel. ***Given that children are major customers for many of these dental appliances as well as increasingly major users of cell phones, WiFi, etc, these children will be adversely impacted by the wireless radiation through myriad pathways!***

Table A7-1 – Implant Taxonomy

A7-B3. Impacts from Passive Macro/Nano Implant Analogues

The FCC regulations for RF exposure limits are based on an ***average exposure*** over a six-minute period for occupational applications, and thirty-minute period for the general public. For near-field exposures, the guidelines can be summarized as follows: "Whole-Body SAR is averaged over the entire body; Partial-body SAR is averaged over any 1 g of tissue in the shape of a cube; SAR for hands, wrists, feet and ankles is averaged over any 10 g of tissue in the shape of a cube.

SAR limits are not applicable above 6.0 GHz; MPE limits for field strength and power density should be applied. Categorical exclusion of routine MPE evaluation for mobile transmitters does not apply to portable devices operating above 6.0 GHz" (https://transition.fcc.gov/oet/ea/presentations/files/oct05/RF_Exposure_Concepts_Support_KC.pdf).

Averaging processes attenuate the extremes. In particular, within the thirty-minute averaging window used for general population exposure averaging (above), there could be many examples of RF power fluxes exceeding the FCC guidelines, perhaps substantially. Given that the FCC Guidelines are based on thermal limits not being exceeded, this means that (within the thirty-minute averaging window) temperatures (and related thermal stresses) could reach peak values capable of inflicting serious damage. Neufeld and Kuster [2018] examined RF heating of skin in the >10 GHz region, and concluded: "Transient exposure with high PAR [peak-to-average ratio] can lead to large temperature oscillations, with peak temperature increases in the skin reaching tens of degrees, thus exceeding tissue damage thresholds after short exposure durations." The computations were made "at an intensity resulting in a temperature increase of 1 K at ***continuous exposure***".

Would implant analogues, such as imbedded nanoparticles in the heated tissue, change the characteristics of tissue heating from the pulsed RF described above? Section 2E contains the statement "At the millimeter carrier wavelengths characteristic of high performance 5G, one can expect resonance phenomena with small-scale human structures [Betzalel, 2018], as well as resonances with insects/insect components [Thielens et al, 2018, 2020]." Can this enhanced heating of tissue due to high-frequency pulsed RF be extended to nanoparticle-imbedded tissue?

These implant analogues could include e.g. tattoos using nanoparticle materials, nanoparticles from cosmetics and air pollution, possibly nanoparticles from forced-air occupational situations, etc. These analogues could be metallic or non-metallic. Whether they would be heated by RF, and how that would vary by particle characteristics, RF characteristics, and surrounding tissue properties, is an open question. Collins et al [2014] conclude, for gold nanoparticles: "The chief conclusion is that in some cases gold nanoparticles immersed in RF fields heat, and in other cases they do not."

There is a substantial literature on RF heating of nanoparticles within tissue, motivated by applications to hyperthermia treatment of diseased tissue, especially cancer [e.g., Huang et al, 2008; Gupta et al, 2010; Hanson et al, 2011; Cardinal et al, 2008; Xu et al, 2008; Tamarov et al, 2016; Ocampo-Garcia et al, 2015; San et al, 2013; Pantano et al, 2017; Nordebo et al, 2017; Nguyen et al, 2016; Mironava et al, 2017; Mackeyev et al, 2017; Liu et al, 2015; Letfullin et al,

2015; Kim et al, 2013; Corr et al, 2012; Collins et al, 2014; Chaurasia et al, 2016; Amini et al, 2018; Glazer et al, 2010; Dennis and Ivkov, 2013; Sassaroli et al, 2012; Moran et al, 2009; Gannon et al, 2008]. The references/bibliography at the end of this section contain more examples of RF (and other pulsed) heating of nanoparticles, including some non-tissue-related heating.

There is not uniform consensus on heating mechanisms. While myriad specific approaches are used for RF heating of nanoparticle-imbedded tissue for cancer therapy, Glazer and Curley [2011] provide a reasonable summary of the technical issues involved. They state: "RF field therapy is a non-invasive method to expose cancers to nonionizing radiation that is relatively nontoxic in and of itself….. nanoparticle-mediated RF field hyperthermia induces heating on the scale of approximately 100 μm. Fortunately, noninvasive RF fields easily penetrate human tissues and pass through the entire body with minimal perturbations until the RF fields interact with metal….. The size of the field can be scaled from small, animal-sized devices….. up to very large volumes that could theoretically treat small (local tumor) or large regions of the human body. Samples (cells, animals or, theoretically, patients) are placed in an RF field created by a parallel plate capacitor ….. This establishes a directional electromagnetic field that passes through tissues and organs without significant absorbance. Metal, however, absorbs RF energy and quickly releases heat to the surrounding region. Nanoparticles in general, and metal nanoparticles specifically, are utilized because of this general principle, as well as their unique qualities that absorb even more energy (and release even more heat), due to their very small size and quantum characteristics.

Recent advancements in nanotechnology have resulted in multiple types of nanoparticles that can be targeted with antibodies, peptides/proteins and sugar residues to cancer cells….. Thermal therapy is induced with either focused laser irradiation, manipulation of magnetic fields or RF field exposure….. While these nanoparticles may be more selective than specific, animal studies have demonstrated promising results without major toxicity….. nanoparticles induce intracellular hyper-thermia. Unique physicochemical properties of metallic and non-metallic nanoparticles result in different heating rates for various types of non-ionizing radiation exposure….. We have found that solid gold nanoparticles less than 50 nm in diameter are safely taken up by macrophages in the liver and spleen without major toxicity….. large nanoparticles with a large aspect ratio (i.e., rods or tubes) have been associated with fibrosis and cellular injury….. Nanoparticle heating in RF fields is a very complex phenomenon. The end result is that RF fields induce nanoparticle heating rates of 1–3°C/s in various solutions and at various power levels…..Most RF field devices are based on shortwave RF fields (13.56 MHz) as licensing agencies permit this frequency for 'medical use'….. The power of these devices is typically from 100–800 W. The energy transfer efficiency from the field generator to actual field strength varies amongst the devices; determining the exact field strength is problematic….. The RF electrical field strength in general, however, is approximately 5–15 kV/m…..

In a nanoparticle concentration and field strength-dependent manner, nanoparticles in aqueous solutions can reach boiling temperatures in 2–3 min. Interestingly, deionized water negligibly heats in RF fields, while antibody solutions (e.g., with ions or proteins) typically heat around

five- to ten-times less than nanoparticle solutions….. In the RF field, SWNTs heat in the range of 2–6°C/s, slighter faster than gold…..

There remains some controversy regarding the mechanism in which nanoparticles heat in an RF field. Our group has demonstrated that gold nanoparticles heat primarily via Joule heating….. This work has demonstrated that gold nanoparticles behave as 'mini-resistors', where free electrons on the surface have limitations to their movement. In this way, friction is created at the individual nanoparticle level, which release heat into the surrounding aqueous solution. Furthermore, based on these findings, one would predict less heating for larger nanoparticles as well as much less for aggregates where there are far fewer limitations placed on the movement of electrons."

Extrapolation from the cancer (and similar) therapy use of nanoparticles for hyperthermia destruction of diseased tissue to heating of nanoparticles imbedded in near-surface tissue by communications-level RF powers is not straight-forward. The therapeutic situation involves high-power RF targeting nanoparticles with desired pre-selected properties at specific locations to achieve high temperatures, whereas the communications situation involves low-power RF interacting with nanoparticles of unknown properties at unknown locations constrained to low temperature increases. Additionally, the RF therapy situation has typically involved RF frequencies in the MHz range, whereas the RF communications scenario (especially for 5G) would involve frequencies in the GHz range (high-band 5G would be in the 10s of GHz).

It is unclear how the effects on tissue surrounding these micro/nanoscale implant analogues would relate to those of the macro-implants of the previous section. More detailed computations are required to identify specific temperature excursions and related thermal stresses for specific nanoscale implant anologues.

As mentioned previously, there may also be electromagnetic and thermal resonances with insects and other small living creatures and substances. For insects, there could be resonances based on overall body dimensions [e.g., Thielens, 2018, 2020], and/or resonances based on specific appendage dimensions. Insects are a critical part of the ecological chain, and severe functional damage may occur even if only critical organs or appendages are damaged. If antennae are heated, or experience even moderate cyclic thermal stresses, that may be sufficient to disable the insect, and eliminate their functional contribution to the ecological chain.

Additionally, for insects, heating at different spatial macroscales may be sufficient to cause damage, as well as microscale heating. More detailed insect heating computations at the microscale, and at the macroscale (covering the spectrum of full body resonance to critical appendage resonance) are required before declarations of safety become credible.

Appendix 8 – Adverse Effects of Automotive-Based Wireless Radiation

A8-A. Overview

The modern automobile is a powerful source of wireless radiation at myriad frequencies, and is subject to external wireless radiation at myriad frequencies as well. The trend has not been to reduce these sources, but rather to add equipment both to the vehicle and to the external environment that will increase the wireless radiation flux associated with the vehicle substantially. The numbers and types of sources are not well-known, even among those experts and laymen concerned about adverse effects from wireless radiation. This appendix will address only a few of those sources.

Some/much of the appendix is based on recent personal experience. Over a year ago, I began looking for a new car. My previous vehicle had almost none of the wireless add-ons that are promoted extensively by the automotive industry, and I had hoped to replace it with a similar wireless-free vehicle.

I spent perhaps six months part-time test-driving vehicles, taking some EMF measurements in selected vehicles, and researching myriad vehicles on the Web. This appendix uses some of my findings as a starting point to identify the full scope of the radiation flux exiting and entering the vehicle.

A8-B. Specific Automotive Wireless Radiation Sources

During this automotive evaluation process, I received a very informative response from Dr. Theodore Metsis. It is summarized at the following link (http://www.radiationdangers.com/automotive-radiation/automotive-radiation/). Of particular interest is the diagram at the beginning of the article, showing radars and wireless sensors in modern cars. I would recommend the reader study that diagram in detail, to better appreciate how ubiquitous are these sources of wireless radiation. Not all the wireless radiation enters the cabin, since some/much is outward-directed, but some/much of it will enter the cabins of other cars on the road.

However, that diagram tells only part of the story. Assume there is a car pool commuting to work from the suburbs of a major city. It is not uncommon (in today's world) for a one-way trip to take from one-two hours, or more. Even in a regular car, or mid-size SUV, there might be four or so passengers. They may be using cell phones, WiFi, or both, thereby adding to the radiation from the automotive-based sensors/transmitters. For example, in an experiment comparing cell phone-Bluetooth use inside and outside a car, Dhami [2015] concluded "The increase in radiation power density with the use of Bluetooth was observed to be 313% higher as compared to phone alone when measured outside the car…..The power density was observed to have increased by 393% when cell-phone and Bluetooth were used inside the car with windows rolled up as compared to using no phone/Bluetooth."

There will be cell towers lining the sides of a major highway, thereby increasing the radiation to the occupants substantially. Depending on conditions, there may be substantial air pollution to which the occupants are exposed. Additionally, the prolonged sitting is very dangerous, and is a contributing factor to many serious diseases [Kostoff, 2015]. If the vehicle is new, there may be substantial out-gassing of toxic chemicals from the interior materials (https://www.ecocenter.org/newsletter/2012-02/dangers-lurk-behind-new-car-smell). Combined exposure to the wireless radiation, air pollution and other toxic substances, coupled with prolonged sitting and continual impacts from the car's motions, produces a synergistic effect that exacerbates adverse impacts from any of the constituent components substantially.

A8-B1. Automotive ELF

About a decade ago, the Israeli Ministry of Environmental Protection undertook an evaluation of the safety of hybrid vehicles with respect to emissions of non-ionizing radiation. The following excerpt summarizes their findings, and the context (https://www.thetruthaboutcars.com/2010/03/israel-preps-worlds-first-hybrid-car-radiation-scale/):

"Not exactly flower power, the radiation in question is cast by the electromagnetic field made by alternating current (AC) flowing from the batteries in the back to the engine up front. The medical implications of this non ionizing radiation, similar to radiation from cellphone antennas, are not yet clear.

The Australian Radiation Protection and Nuclear Safety Agency (ARPANSA) recommends a limit of 1,000 mG (milligauss) for a 24-hour exposure period. While other guidelines pose similar limits, the International Agency for Research on Cancer (IARC) deemed extended exposure to electromagnetic fields stronger than 2 mG to be a "possible cause" for cancer. ***Israel's Ministry of Health recommends a maximum of 4 mG***.

The ministry's foray into this topic is a culmination of a public outcry resulting from publications in the media regarding possible dangers from radiation in hybrid cars. Last year, Israeli automotive website Walla! Cars conducted a series of tests on the previous generation Toyota Prius, Honda Insight and Honda Civic Hybrid, and recorded radiation figures of ***up to 100 mG during acceleration***. Measurements also peaked when the batteries were either full (and in use) or empty (and being charged from the engine), while ***normal driving at constant speeds yielded 14 to 30 mG*** on the Prius, depending on the area of the cabin."

Over the past couple of decades (bracketing the Israeli study), a number of researchers have conducted studies measuring EMF emissions in conventional gasoline/diesel-powered cars, hybrids, and electric vehicles. Some of these studies are listed in the first part of Table A8-1. The results are all over the map. One reason is that "there are alternating magnetic fields produced by its engine, control systems, air conditioning, sound, video, communications, etc. In vehicles with tyres, one has to add the magnetic field produced by the magnetized metal of the wheels" [Paniagua et al, 2017]. Additionally, the results vary by location, vehicle speed, and braking/acceleration.

The findings of [Paniagua et al, 2017] are instructive, and provide a good summary of magnetic fields found in fossil-fuel powered cars. "Other works, however, detect magnetic fields inside cars with values that are comparable to ours. Thus, for example, Milham et al…..found a range of 0.2 to 2.0μT, Stankowski et al…..0.1 to 9.5μT, and Halgamuge et al…..0.3 to 3.5μT. These studies used instrumentation that measures magnetic fields with frequencies ***above 5 Hz***.

As in our study, Stankowski et al…..found magnetic fields that were higher in the rear seats than in the front seats, and higher at floor level than at the seat and head levels. The reason for the differences between the two sets of studies lies in the frequency ranges used. The rotating wheels produce spectral peaks that coincide with the rotation frequency, typically 6–12 Hz…..and are ***not detectable when using instrumentation whose lowest frequency threshold is 30–40 Hz***. This instrumentation detects the magnetic fields generated by the motor and the electrical systems of the vehicle, but not those generated by the effect of wheel rotation. One can therefore conclude that the magnetic fields from the rotating wheels represent a very important part of the total magnetic field inside the vehicles." The maximum exposures reported in the study by [Panigua et al, 2017] were about twenty milligauss (1 μT=10 milligauss).

In a 2014 article on hybrids [Karabetsos et al, 2014], Figure 8 (cruising at 80-120 kilometers/hour) shows exposures in the right-rear seat reaching over 20% of 1998 ICNIRP limits for the general public. The article does not provide actual magnetic field numbers for these exposures, nor does it provide the frequencies at which these magnetic fields were measured. The 1998 ICNIRP limits are a function of frequency.

The article states: "it was observed that the major components of the magnetic flux density appeared at frequencies lower than 100 Hz." In this frequency spectrum, the ICNIRP limits range from 400,000 milligauss at 1 Hz to 500 milligauss at 100 Hz. So, the actual measurement of ~20% of ICNIRP limit could range from 80,000 milligauss to 100 milligauss, depending on the frequency(s) at which the measurements were made. For reference, the ICNIRP limits for power frequency (60 Hz) are 830 milligauss (for the general public), far above the levels shown as dangerous in the Israeli reference above, and other references in the biomedical literature.

In Vasilev et al, [2015], magnetic field measurements were made in myriad electric vehicles and hybrids. The two major sources of magnetic fields were traction currents and wheels. The findings for each were as follows: "Therefore, if the traction current has variations up to ±300 A, the magnetic field could also have variations of up to ±300 μT." The upper limit translates to ***3,000 milligauss***! "The permanent magnetization of steel belted tires is a well known source of in-vehicle magnetic fields…..Our measurements show that this phenomenon is responsible for a magnetic field inside the car of up to 2 μT at the wheel frequency fw (which ranges from 0 to 20 Hz for speeds ranging from 0 to 130 km/h)." This upper limit translates to twenty milligauss, and is similar to the upper limit above reported by Panigua et al, [2017].

References to other studies are shown in the first section of Table A8-1. The hybrids and EVs are associated with larger magnetic fields (especially at acceleration and braking), due mainly to large electrical power transfers for all operations. My own measurements in hybrids

showed magnetic fields around the driver could range up to 15-30 milligauss, depending on the vehicle. However, the meter I used had a lower limit of 40 Hz, so I could not measure the powerful magnetic fields shown by the above studies to occur at the extremely low frequencies. However, in my view, chronic exposure even to the 15-30 milligauss I measured is something to be avoided at all costs, much less the larger fields at the lower frequencies!

In many of the references shown in Table A8-1 (and beyond), the authors don't present actual magnetic field numbers, but rather magnetic fields ***normalized to ICNIRP*** recommended exposure limits. They usually conclude that, because the ratios are less than one, therefore, the vehicles are safe. This is fallacious and disingenuous, since the ICNIRP recommended limits have nothing to do with safety (based on exposures shown to cause harm in the biomedical literature) and everything to do with providing cover for the wireless radiation promoters.

Additionally, many of the guidelines tend to be based on single stressor experiments. Vehicle cabins expose their occupants to many types of toxic stimuli (described initially in this appendix), and the synergies will reduce the levels of EMF exposure at which damage occurs, sometimes dramatically.

A8-B2. Automotive Radar

Radar has become ubiquitous on modern automotive vehicles. Many of the new 'safety' systems use radar in their operation, and in-cabin radars have been proposed to further enhance 'safety'. How safe are these radar add-ons, and what are their potential radiation levels?

The FCC used to have a requirement that when cars were stopped, such as in a traffic jam or at a traffic light, any onboard radars would have to reduce power to minimize longer-term exposure to humans. In 2009, Toyota applied to relax these rules, for reasons described in the linked document below. Naturally, the FCC complied with the request, as per the following 2012 directive addressing vehicle radar systems:
https://www.federalregister.gov/documents/2012/08/13/2012-19732/operation-of-radar-systems-in-the-76-77-ghz-band.

The FCC promulgated the following emission limits:

"In lieu of separate emission limits for in-motion and not-in-motion, the Commission proposed to increase the average power density limit to 88 μW/cm2 at 3 meters (average EIRP of 50 dBm) and to decrease the peak power density limit to 279 μW/cm2 at 3 meters (peak EIRP of 55 dBm) for vehicular radar systems regardless of the direction of illumination."

Converting units, the average power density limit would be 88*10^4 microwatts/square meter, or 880,000 microwatts/square meter, ***at three meters***. So, in slow moving traffic on a superhighway, if there was six meters separation between the bumper of the car behind and the driver of the car ahead (a conservative estimate in bumper-to-bumper traffic), there could be as much as ***220,000 microwatts/square meter radiating the front vehicle***, if the radars were operating at the allowable limit. Some bands would be absorbed by the glass at these frequencies, and other bands would penetrate the glass. There could also be side radar coming from cars other than the rear car.

However, pedestrians or highway workers would not have whatever protections from wireless radiation are afforded by vehicle structures. For example, a person walking on a crosswalk in front of stopped traffic could even be closer to the bumper than three meters, and could be exposed directly full body to a ***million microwatts/square meter***, or more, if the radars were operating at the allowable limit! Children walking close to a vehicle would be even more vulnerable, since they are closer to the horizontal plane of bumper antennas. And, these numbers carry the assumption of being radiated from one car only. If there are multiple cars, with some emissions spreading to the side, then the cumulative exposures could be well above the FCC exposure limits at selected points. Walking on streets in high traffic areas may become a dangerous pastime, and few people realize it!

Are there sources of radar potentially entering the vehicle cabin other than those from the 'safety' sensors? The answer is yes (at least in the future and maybe in the present), as shown in the following article: https://www.eetimes.com/document.asp?doc_id=1333330.

The author of the above article states:

"For example, the digital processing capability inside the mmWave sensor can filter out noise, said Wasson, allowing TI's radar chips to detect very small movements, even the breathing that indicates the presence of a person or animal inside a vehicle.

Wasson noted that "child occupancy detection" is likely to become a feature in the Euro NCAP roadmap. This, he believes, will open the door for TI's radars in body, chassis, and in-cabin applications. As tier ones and OEMs look for the right sensing technology to enable such detection possibilities, Wasson noted that radars are much better-positioned.

Radar, for example can "see" through a blanket to determine whether a child is underneath. TI's radar chips can even distinguish between a person and a static object like a duffel bag, explained Wasson, because their on-chip digital signal processing can detect a heartbeat."

The aim seems to be to deliberately flood the cabin with radar RFR, for various detection purposes. The article makes no mention about potential power levels.

Another potential in-cabin source would be radar aimed at the driver continuously, to insure alertness and awareness. For example, consider the following statement:

"Sudipto Bose, director of marketing for automotive radar at Texas Instruments, points out that in-cabin radar offers a number of benefits. It can alert parents if they've left children in a car, and it can be used for gesture controls, which let drivers control navigation, phone and stereo with hand motions. This proximity radar could also identify if a driver's attention is not focused out the windshield.....If automakers take Texas Instruments up on its new radar sensors, a production vehicle with radar-based gesture control would still be two to five years away (https://www.cnet.com/roadshow/news/volkswagen-invests-100-million-to-develop-solid-state-battery-tech/)."

There appears to be a developing market focused on occupancy sensing using radar. For example, "So radar is no longer the preserve of complex and costly, high-end markets, it's ready for 100% reliable infant presence detection in cars. Whether our children's movements are major, minor or finer, they'll be detected and the driver can be automatically reminded: 'Don't forget, you have someone very precious in the back seat of your car.' (https://www.xethru.com/blog/posts/hot-car-deaths-radar-tech-can-help-save-lives)".

As another example: "Startup Caaresys imagines its radar-based system monitoring the respiration and heart rates of everyone in the car, with a particular focus on sensing a child that might be hidden from view in the back and potentially left behind in the car (https://www.cnet.com/roadshow/news/in-car-monitoring-surveillance-technology-privacy/)."

Novelic (https://www.novelic.com/applications-and-system-solutions/) offers radar-based sensors for car interiors, including: Seat Occupancy Sensor; Vital Signs Detection Sensor; Passenger Detection Sensor; "Baby left in a car" Sensor; Driver and Passengers Fatigue Sensor; Driver and Passengers Emotion Sensor. Other non-car applications include: Baby crib monitoring; Assistive Living for Elderly People; Visual Impairments Sensor; Emotion Sensor.

Azcom (http://www.services.azcomtech.com/index.php/services/mmwave-sensors/automobile-in-cabin-monitoring/) promotes continuous in-cabin monitoring as follows: "In case of autonomous vehicles, it will also be critical to continuously monitor vehicle occupancy without creating privacy concerns. Radar sensors, combined with special ad hoc algorithms, are well-suited for such applications."

There are even nascent efforts to make some of these systems mandatory. For example, "U.S. lawmakers and European safety regulators are considering rules that could mandate "child presence detection" systems aimed at avoiding hot-car deaths of unattended children. That has suppliers scrambling to develop new systems for automakers, according to interviews with several high-tech suppliers at a recent industry conference here….."The moment you have regulation, things are going to move fast," Melamed told Automotive News. "The timelines are very, very close."" (https://www.autonews.com/regulation-safety/safety-idea-gets-mandate)

Also, it's not clear how the FCC exposure limits (which are already six orders of magnitude higher than exposures shown in the biomedical literature to cause damage) would apply to limit in-cabin radiation levels. Would they apply to each source, or to the total radiation? The former seems more likely, since it is unclear how they would enforce the latter. If that is the case, cabin occupants could be exposed theoretically to radiation levels in excess of the FCC present limits.

In sum, the occupants of a hybrid vehicle with a full load of passengers will be subject to:

*ELF-EMF from the tires and other sources unique to hybrids

*RFR from the passengers' cell phones

*RFR from Bluetooth

*RFR from the WiFi 'hot spot' and the devices communicating with the hot spot

*RFR from the myriad cell towers that dot the sides of most highways

*RFR from the radar sensors of other cars

*RFR from on-board radar sensors to detect motions and driver alertness within the cabin

Almost all these radiation sources will also be operable in a gasoline-powered car, and there will be some radiation reflections within the cabin because of the surrounding metal.

Our studies on combinations of toxic stimuli including non-ionizing radiation [Kostoff et al, 2018; Kostoff and Lau, 2013, 2017] showed that adverse health effects are exacerbated when non-ionizing radiations of different characteristics are combined. What would be the effects of the above complex combination that goes well beyond EMF constituents?

The middle part of Table A8-1 contains references to other studies showing deliberate radar impingement on vehicle occupants.

A8-B3. Automotive Wireless Networks

The past decade has seen an increasing number of wireless networks that are fully or partially intra-vehicular. The final segment of Table A8-1 presents only a small part of the studies that have been done to expand these intra-vehicular wireless networks. The remainder of this appendix addresses two of these many intra-vehicular networks, and it is based on my personal experience with these two networks.

A8-B3a. Keyless Access Network

As mentioned at the beginning of this appendix, about six months ago I bought a new car. One of the features in the particular model trim is the ability to open the doors and allow engine ignition with a key fob in proximity. This capability is not unique to the model I bought. Far from it! My search process showed that the push-button start capability is rapidly becoming ubiquitous in new cars. The strenuous process of turning a key in a lock is thereby bypassed.

According to the Owner's Manual, my new car has a 130+ KHz continuously operating wireless network that allows 1) the doors to be opened and closed, and 2) the ignition to be started by push-button, when the key fob is within proximity of the car. The Owner's Manual also states that the radio waves from the network could potentially interfere with an implanted pacemaker or defibrillator, and accompanies this statement with a Warning icon.

Luckily, according to the Owner's Manual, this wireless system/function can be disabled. The disabling is allowed not because of any manufacturer-stated concern for the adverse effects of wireless radiation on normal humans. It is allowed because it could potentially interfere with the operation of pacemakers and other similar devices.

The Owner's Manual provides two approaches to disabling the keyless access capability, thereby converting the key fob to effectively a key with some remote-control functions (like the TV remote-control). Disabling this capability is not a simple process, as I discovered. I was not able to do it myself, even though two alternative methods were provided in the Owner's Manual.

The dealer from whom I bought the vehicle said the disabling was not possible, and the second dealer I visited required two technicians to experiment before they could finally disable it.

Here's the critical point of this narrative. The technicians (and other service personnel) of the second dealer told me ***no one had ever requested this disabling before***! From the first dealer's feedback, I'm sure they had never received such a request either.

This means that the customers with implanted electrical devices who purchase these vehicles are (for the most part) not disabling the 130+ KHz wireless network. My guess is they don't even know about this network. None of the salespeople I had at any of the dealerships who offered test drives in cars with keyless access function (and in my case there were probably half a dozen different brands I drove that had this capability) asked whether I had an implantable electrical device (I don't) nor mentioned the presence of the 130+ KHz network, or any other frequency applicable to their model/brand. I doubt whether any of them knew!

Here's the bottom line. If people with implantable devices are not motivated to eliminate these wireless networks, where there exists a rather obvious potential danger to health, how will healthy (or relatively healthy) people become motivated to avoid wireless systems/radiation?

Whatever dangers the 130+ KHz network (or different frequency networks of other brands performing the same function) would pose in isolation, I suspect the adverse effects would be amplified substantially in combination with the other toxic stimuli sources I mentioned in previous sections. While one could make arguments about some applications of wireless radiation being useful/justified in extreme emergencies, installing a potentially harmful wireless network to eliminate inserting a key into a lock is technology gone mad!

A8-B3b. Tire Pressure Monitoring System

Another intra-vehicular source of wireless radiation entering the automobile cabin is the tire pressure monitoring system (TPMS). TPMS has been mandated in the USA by the TREAD Act, and has been installed on all cars for the past decade. (https://en.wikipedia.org/wiki/Tire-pressure_monitoring_system). It is mandated and used in many other countries as well.

There are myriad types of these sensors. Most Direct TPMS deploy tire pressure sensors on each wheel of a vehicle. As tire pressure data is collected for each tire, it is sent to one or more TPMS receivers, using RF (radio frequency) technology. The majority of Direct TPMS installations transmit their data via UHF (Ultra High Frequency) radio. TPMS data is typically transmitted in one of two frequency ranges, which depends on the geographical location of the TPMS: about 433MHz in Europe, and at 315MHz in most other parts of the world. https://tpms247.com/blogs/tpms-faq/73376901-tpms-frequencies-315-mhz-433mhz.

I didn’t find any articles addressing adverse health effects from the TPMS. That doesn’t mean they don’t exist. There may be myriad reasons why I didn’t find adverse health effects.

A8-B4. Other

The latter part of Table A8-1 alludes to many other types of networks being studied, as well as optimizing some already implemented. Most of these are not mentioned in my new car Owner's Manual, since I assume they don't affect pacemakers and defibrillators (at least according to whomever has responsibility for monitoring such systems). The only way to fully understand the levels of wireless radiation to which vehicle occupants are being subjected is through detailed measurements of the wireless radiation environment.

This would include full spectrum monitoring (from 1 Hz for ELF to >100 GHz for millimeter-wave communications and detection). Testing would be done under at least four conditions:

- no passengers and in an EMF quiet zone, with all on-board electronics operating;
- with passengers using myriad wireless devices, in EMF quiet zone, and with all on-board electronics operating;
- no passengers and in a typical urban business high EMF antenna concentration zone, and with all on-board electronics operating;
- with passengers using myriad wireless devices, in high EMF high antenna concentration zone, and with all on-board electronics operating.

Those results should begin to provide some idea of the complex and potentially dangerous wireless radiation environment that many commuters face.

ABOUT THE AUTHOR

Ronald Neil Kostoff received a Ph. D. in Aerospace and Mechanical Sciences from Princeton University in 1967. He has worked for Bell Laboratories, Department of Energy, Office of Naval Research, and MITRE Corp. He invented the Wake Shield for producing high vacuum in low orbit, and used in manned space missions for research and development. He has published over 200 peer-reviewed articles, served as Guest Editor of four journal Special Issues since 1994, obtained two text mining system patents, and presently is a Research Affiliate at Georgia Institute of Technology.

He has published on numerous medical topics in the peer-reviewed literature, including:

- potential treatments for
    - Multiple Sclerosis,
    - Parkinson's Disease,
    - Raynaud's Phenomenon,
    - Cataracts,
    - SARS,
    - Vitreous Restoration,
    - Peripheral Neuropathy/Peripheral Arterial Disease
    - Alzheimer's Disease, and
    - Chronic Kidney Disease;
- potential causes of Chronic Kidney Disease;
- potential causes of Alzheimer's Disease;
- potential causes of Peripheral Neuropathy/Peripheral Arterial Disease
- potential impacts of Electromagnetic Fields on health; and
- synergistic effects of toxic stimuli combinations.

His recent publications in toxicology have shown that regulatory exposure limits to toxic stimuli are, on average, orders of magnitude too high compared to exposures shown to cause damage in the biomedical literature, and are not protecting the public from harmful substances.

He is listed in:

- Who's Who in America, 60th Edition (2006),
- Who's Who in Science and Engineering, 9th Edition (2006), and
- 2000 Outstanding Intellectuals of the 21st Century, 4th Edition, (2006).

XXX, rappresentato e difeso dall'Avv.to Danilo MINA di Brescia, domiciliatario giusta delega a margine del ricorso in appello

RICORRENTE APPELLANTE

OGGETTO:

Prestazione: indennità rendita vitalizia INAIL o equivalente – altre ipotesi

c o n t r o

I.N.A.I.L., in persona del Direttore Regionale pro tempore, rappresentato e difeso dall'Avv.to Sabina LUPO ed elettivamente domiciliato presso l'Avvocatura Distrettuale I.N.A.I.L di Brescia giusto mandato generale alle liti

RESISTENTE APPELLATO

In punto: appello a sentenza n. 471/08 del 15/05/2008 del Tribunale di Brescia.

CONCLUSIONI

Del ricorrente appellante:

come da ricorso in appello

Del resistente appellato:

come da memoria di costituzione e risposta

Svolgimento del processo

Con ricorso al Tribunale di Brescia, giudice del lavoro, depositato il 6.7.2007 Innocente XXX conveniva l'INAIL per sentirlo condannare a corrispondergli le prestazioni di legge in riferimento ad una grave e complessa patologia cerebrale che aveva origine professionale. Esponeva, in fatto, di aver svolto attività di dirigente d'azienda dal 1981, e, da ultimo, presso la S.p.a. Sangiacomo dal 2.9.1991 al 26.9.2003; che in tale mansione aveva utilizzato il telefono cellulare e il cordless per una media di 5 - 6 ore al giorno e per un periodo di 12 anni; che, essendo destrimane, teneva l'apparecchio all'orecchio sinistro in quanto con la mano destra rispondeva al telefono fisso collocato sulla scrivania o prendeva note e appunti; che detta attività gli aveva provocato una grave patologia per la quale il 17.11.03 aveva chiesto all'INAIL le corrispondenti prestazioni di legge, che l'Istituto aveva rifiutato la richiesta, negando il nesso causale fra l'attività lavorativa e le affezioni denunciate. Pertanto insisteva nella domanda, deducendo prova per testi sulle modalità lavorative ed allegando un'approfondita relazione medico-legale del neurochirurgo dott.Giuseppe Grasso.

L'INAIL si opponeva al ricorso, sempre sotto il profilo della

carenza del nesso causale, e deduceva controprova orale, producendo varia documentazione.

Esperita l'istruttoria testimoniale, che accertava in fatto l'uso intenso di cellulare e cordless, ed assunta consulenza tecnica d'ufficio, il primo giudice respingeva la domanda per carenza del nesso causale, aderendo alle considerazioni svolte dal CTU, aspramente criticate dal ricorrente.

Appellava il XXX, depositando ulteriore e ponderoso elaborato del consulente di parte, riportandosi alle considerazioni critiche ivi svolte e chiedendo che, previo rinnovo della consulenza, l'INAIL fosse condannato alle prestazioni di legge.

Si costituiva l'INAIL per la conferma, ricordando l'inesistenza di studi scientifici attendibili in ordine alla nocività delle onde elettromagnetiche.

Questa Corte rinnovava la consulenza e, a fronte delle osservazioni svolte dall'INAIL, concedeva termine all'appellante per depositare le sue controdeduzioni: all'esito, all'udienza odierna, le parti discutevano e la Corte decideva con sentenza del cui dispositivo veniva data immediata lettura.

Motivi della decisione

La CTU disposta in questo grado di giudizio, molto documentata ed accuratamente motivata, individua il nesso, quanto meno concausale, tra l'utilizzo dei telefoni e la patologia.

Innanzitutto, occorre osservare che l'allegato utilizzo di cellulare e radiotelefono per molte ore lavorative (5-6 ore / die) e

l'uso principalmente dell'orecchio sinistro, che consentiva il libero impiego della mano destra per note scritte, hanno trovato piena conferma testimoniale e non sono più oggetto di contestazione da parte dell'INAIL.

Da questo dato, che quantifica il livello di esposizione, doveva dunque partire il consulente per la sua indagine sul nesso causale.

Dall'anamnesi clinica risulta che nel giugno 2002 è comparsa ipoanestesia (perdita parziale della sensibilità) dell'emiviso di sinistra: eseguita la Risonanza Magnetica Nucleare veniva formulata diagnosi di "neurinoma del Ganglio di Gasser" che è un tumore benigno che colpisce i nervi cranici, in particolare il nervo acustico, mentre più rara è la localizzazione al V nervo cranico (Trigemino), come nel caso in specie. Secondo la spiegazione fornita dal consulente, deriva dalle cellule (cellule di Schwann) della guaina di rivestimento da cui anche la denominazione di Schwannoma. La localizzazione anatomica di questo tumore dà ragione della severità delle manifestazioni cliniche correlate.

Subiva quindi un intervento neurochirurgico l'8 novembre 2002 (Ospedale S. Anna di Lucerna) con resezione branca mandibolare del nervo in quanto non dissociabile, asportazione del ganglio di Gasser, ma permaneva residuo tumorale dimostrato a RMN post operatoria.

Gli esiti post intervento possono così essere riassunti: 1) ulcera corneale sin. (da iposecrezione lacrimale e disturbo

neurologico). Attuò vari trattamenti per risolverla. E' in atto un trattamento cronico con autosiero. Graduale deficit del visus (3-4 diottrie); 2)Sindrome algo-distrofica dell'emiviso di sinistra con dolore cronico severo. Attuati vari e ripetuti trattamenti con farmaci attivi sul dolore neuropatico con scarso o nullo beneficio. Dall'agosto 1.08.2005 assunzione orale di morfina (Oxicontin 20mg x3 /die) in associazione con pregabalin (Lyrica 75mg x 3. trattamento del dolore neuropatico periferico e centrale negli adulti). Valutazione dolore di 5-6 con scala numerica verbale (scala di valutazione del dolore cronico. Valori da 1-nessun dolore- a 10-il peggiore dolore immaginabile-. Il dolore si considera controllato per un indice ~4); 3) Persistenti parestesie sempre all'emiviso; 4) Disturbi della meccanica masticatoria da mal occlusione secondaria ad atrofia dei muscoli temporale massetere di sinistra (attua fisiochinesiterapia per mantenere il trofismo); 5) Incostante diplopia (visione doppia, in senso orizzontale o verticale, di uno stesso oggetto) 6) Epilessia parziale complessa a genesi temporale da encefalomalacia (rammollimento cerebrale legato al trauma chirurgico con perdita di funzione possibile origine di foci epilettogeni); 7) Deficit cognitivo (disturbo della fissazione mnesica e ed attenzione); 8) Disturbo dell'adattamento (Nel Diagnostic and Statistical Manual of mental disorders [DSM-N] i disturbi dell'adattamento sono definiti come "sintomi emozionali o comportamentali clinicamente significativi" che si sviluppano "in risposta a uno o più fattori stressanti psicosociali identificabili"); 9) sindrome del lobo temporale (sindrome complessa

da danno del lobo temporale con vari disturbi-olfattivi, gustativi, dell'equilibrio, visivi, disturbi uditivi e psichiatrici)

Tutte queste situazioni cliniche sono ampiamente documentate negli atti. Ogni patologia è suffragata da consulenze cliniche specialistiche, anche ripetute, e da opportune indagini strumentali ed ematochimiche.

Nel 2003 diagnosi di neoformazione surrenalica di destra 5x3 cm con normofunzione. Intervento 30.06.2004 Istituto Europeo di Oncologia con diagnosi istologica di feocromocitoma (tumore raro con possibile secrezione di catecolamine [sostanze ormoni e neurotrasmettitori- prodotte dalla porzione interna del surrene e da alcuni neuroni] II tumore in presenza di secrezione di catecolamine si caratterizza per una sindrome clinica peculiare).

Nel caso in specie, non fu dimostrata secrezione di catecolamine.

E' seguito da uno psichiatra dal 2003 ed è in terapia con paroxetina; due ricoveri c/o Servizio Psichiatrico di Diagnosi e Cura l'ultimo nel marzo 2008.

Attuale terapia comprende Morfina orale, Pregabalin, Paroxetina (farmaco antidepressivo appartenente alla classe degli SSRI-inibitori selettivi della ricaptazione della serotonina), Dolore attuale riferito 5-6 con scala numerica verbale.

Si presente come soggetto magro in mediocri condizioni generali. Normale sanguinificazione. Sensorio normale orientamento spazio temporale. Tono dell'umore depresso. Crisi di pianto in corso

della valutazione clinica. Paresi del VII nervo cranico con ipostenia del muscolo orbicolare. Anestesia dolorifica abolita sensibilità tattile. Asimmetria degli emivisi. Dolorabilità alla pressione su articolazione temporo-mandibolare sin. Lieve tendenza all'intrarotazione mano dx in estensione.

La prima valutazione del consulente è che gli esiti della neoplastica son assolutamente severi e del tutto documentati e che la qualità di vita del sig. XXX è sicuramente gravemente compromessa da tali esiti.

Quanto alla questione centrale (non essendovi contestazione sulle conseguenze subite dall'appellante) relativa al nesso causale tra l'uso dei telefoni e insorgere della patologia, il consulente osserva innanzitutto che, vel periodo in cui ha lavorato alla San Giacomo SPA per i primi 3 anni utilizzava telefono cellulare - cordless (deposte 5-6 h al di), dal 1993-4 al cordless fu associato l'uso di telefono cellulare fino al settembre 2003.

Orbene, i telefoni mobili (cordless) e i telefoni cellulari funzionano attraverso le onde -elettromagnetiche. Secondo il CTU "In letteratura gli studi sui tumori cerebrali per quanto riguarda il neurinoma considerano il tumore con localizzazione al nervo acustico che è il più frequente. Trattandosi del medesimo istotipo è del tutto logico assimilare i dati al neurinoma del trigemino".

Nella CTU, con una tabella molto chiara a cui ci si riporta, sono riassunti alcuni studi dal 2005 al 2009. "In tre di essi (Hardell group) e si evidenzia un aumento significativo del rischio relativo di

neurinoma. (Rischio relativo: misura di associazione fra l'esposizione ad un particolare fattore di rischio e l'insorgenza di una definita malattia, calcolata come il rapporto fra i tassi di incidenza negli esposti [numeratore] e nei non esposti [denominatore]. Esempio: un rischio relativo di 3 sta a significare che il tasso di incidenza negli esposti è 3 volte maggiore dei non esposti. Nella tabella il rischio relativo è derivato dall'odd ratio)

Un recente lavoro, sempre del gruppo di Hardel (Mobile phones, cordless phones and the risk far brain tumours L. Hardell and M. Carlberg INTERNATIONAL JOURNAL OF O COLOGY 35: 5-17, 2009), che si basa sulla revisione degli studi già pubblicati dallo stesso gruppo, considera altri elementi quali: età dell'esposizione, ipsilaterlaità e tempo di esposizione. Per quanto riguarda il neurinoma (dell'acustico) i risultati indicano un Odd ratio per l'uso del cordless di 1,5 e per il telefono cellulare di 1,7. Considerando l'uso> di 10 anni, gli Odd ratio sono rispettivamente di 1,3 e di 1,9.

L'Odds ratio è il rapporto tra la frequenza con la quale un evento si verifica in un gruppo di pazienti e la frequenza con la quale lo stesso evento si verifica in un gruppo pazienti di controllo. Se il valore dell'odds ratio è superiore a 1 significa che la probabilità che si verifichi l'evento considerato (per esempio una malattia) in un gruppo (per esempio tra gli esposti) è superiore rispetto a quella di un altro gruppo (per esempio tra i non esposti). Significato opposto ha un valore inferiore a 1 (riduzione del rischio legato all'esposizione). Se il valore è pari a 1 significa che non vi è differenza tra i gruppi. In caso

di eventi rari l'odds ratio ha un valore molto vicino a quello del rischio relativo. L'odds ratio è una misura particolarmente utile negli studi caso-controllo come stima del rischio relativo, che in questo tipo di studi non può essere misurato direttamente.

Una recente review della The International Commission on Non-Ionizing Radiation Protection (Exposure to high frequency electromagnetic fields, biological effects and health consequences 100 kHz-300 GHz. Review of the scientific evidence on dosimetry, biologicaI effects, epidemiological observations, and health consequences concerning exposure to high frequency electromagnetic fields 100 kHz to 300 GHz, 2009) evidenzia i limiti degli studi epidemiologici fin'ora attuati. I principali "bias" riguardano la modalità di arruolamento, spesso l'assenza di un gruppo di controllo con ricorso a registri di popolazione, l'impossibilità di standardizzare l'entità e la durata complessiva di esposizione. Gli autori concludono che, allo stato attuale, non vi è una convincente evidenza del ruolo delle radiofrequenze nella genesi dei tumori, ma aggiungono che gli studi non ne hanno escluso l'associazione (pag 336 "Results of epidemiological studies to date give no consistent or convincing evidence of a causal relation between RF exposure and any adverse health effect. On the other hand, these studies have too many deficiencies to rule out an association").

A questo punto è utile dedicare spazio ad un'altra review del tutto autorevole.

Kundi nel 2009 (The Controversy about a Possible

Relationship between Mobile Phone Use and Cancer Michael Kundi Environ Health Perspect. 2009 March; 117,3: 316-324) L'autore conferma i dubbi che gli studi epidemiologici inducono per quanto riguarda il tempo di esposizione e conclude per rischio individuale basso, ma presente. L'esposizione può incidere sulla storia naturale della neoplasia in vari modi: interagendo nella fase iniziale di induzione, intervenendo sul tempo di sviluppo dei tumori a lenta crescita, come i neurinomi, accelerandola ed evitando la possibile naturale involuzione.

L'analisi della letteratura non porta a un giudizio esaustivo, ma con tutti i limiti insiti nella tipologia degli studi, un rischio aggiuntivo per i tumori cerebrali, ed in particolare per il neurinoma, è documentato dopo esposizione per anni (>10) a radiofrequenze emesse da telefoni portatili e cellulari.

Il dato anamnestico di esposizione supera il limite dei 10 anni.

Il tempo di esposizione è elemento valutativo molto rilevante. Nello studio di 2006 l'esposizione per più di 10 anni comportava un rischio relativo calcolato di 2,9 sicuramente significativo (pur considerando i limiti metodologici già illustrati) Si tratta quindi di una situazione "individuale" che gli esperti riconducono al "modello probabilistico-induttivo" ed alla "causalità debole" (Angelo Fiori Atti VI Convegno Nazionale di Medicina Legale Previdenziale 2006), che ha comunque valenza in sede previdenziale.

Un ruolo quindi, almeno concausale, delle radiofrequenze

nella genesi della neoplasia che ha patito il sig. XXX è "probabile" (probabilità qualificata)" (vedi CTU dott. Di Stefano pag. 8 e 9).

L'esito della malattia ha condotto ad una menomazione stimata nella misura, incontestata, del 80%.

L'Inail ha criticato l'elaborato sostenendo in primo luogo che la prima asserzione del CTU sarebbe errata: utilizzare gli studi relativi al neurinoma dell'acustico per analizzare un caso di neurinoma del trigemino non sarebbe possibile in quanto si tratterebbe di tumore a diversa localizzazione in quanto relativa a diverso distretto anatomico.

La censura non merita accoglimento: infatti, come correttamente spiegato dal consulente, i due neurinomi appartengono al medesimo distretto corporeo in quanto entrambi i nervi interessati si trovano nell'angolo ponto-cerebellare, che è una porzione ben definita e ristretta dello spazio endocranico certamente compresa nel campo magnetico che si genera dall'utilizzo dei telefoni cellulari e cordless.

Una seconda censura riguarda gli studi utilizzati dal CTU per rispondere positivamente al quesito: si tratterebbe infatti di studi su un basso numero di casi mentre lo studio del 2000 dell'OMS ha escluso effetti negativi sulla salute. Anche questa censura però non coglie nel segno.

Lo studio dell'OMS, risalente appunto al 2000 e basato su dati, ovviamente, ancora più risalenti, non tiene conto dell'uso più recente, ben più massiccio e diffuso, di tali apparecchi e del fatto che

si tratta di tumori a lenta insorgenza: pertanto gli studi del 2009, basati su dati più recenti, sono di per sé più attendibili. Inoltre, come ha osservato nelle controdeduzioni il ct di parte del XXX, non si tratta di studi su un basso numero di casi, ma, al contrario, del tutto esaustivo in quanto tratta di 678 casi, che sono il numero totale che si verifica in un anno in Italia (trattandosi di tumore non frequente). Inoltre, a differenza dello studio della IARC, co-finanziato dalla ditte produttrici di telefoni cellulari, gli studi citati dal dott. Di Stefano sono indipendenti.

Naturalmente, secondo il costante insegnamento della Suprema Corte, nel caso di malattia professionale non tabellata, come anche in quello di malattia ad eziologia multifattoriale, la prova della causa di lavoro, che grava sul lavoratore, deve essere valutata in termini di ragionevole certezza, nel senso che, esclusa la rilevanza della mera possibilità dell'origine professionale, questa può essere invece ravvisata in presenza di un rilevante grado di probabilità. A tale riguardo, il giudice deve non solo consentire all'assicurato di esperire i mezzi di prova ammissibili e ritualmente dedotti, ma deve altresì valutare le conclusioni probabilistiche del consulente tecnico in tema di nesso causale, considerando che la natura professionale della malattia può essere desunta con elevato grado di probabilità dalla tipologia delle lavorazioni svolte, dalla natura dei macchinari presenti nell'ambiente di lavoro, dalla durata della prestazione lavorativa e dall'assenza di altri fattori extralavorativi, alternativi o concorrenti, che possano costituire causa della malattia.

Nel caso di specie, il CTU ha spiegato i valori di odd ratio che lo portano a sostenere la probabilità qualificata del ruolo, quanto meno, concausale, dell'uso dei telefoni nella causazione dell'infortunio, ma, per rendere più evidente la reale portata di quanto affermato, appare utile dar conto dell'esempio che il ct di parte ha fatto nelle contro-osserazioni depositate il 25.11.2009. Partendo dai dati indicati dal CTU, il dott. Grasso afferma essere utile confrontare il dato di rischio individuale ottenuto dal consulente (2,9) con quello ricavato per il fattore di rischio, universalmente riconosciuto, dell'esposizione alle radiazioni ionizzanti. Afferma il dott. Grasso: "Orbene: nei soggetti esposti a 1Gy di RI, come i sopravvissuti alle esplosioni atomiche giapponesi di Hiroshima e Nagasaki, è stato accertato un rischio relativo di tipo oncologico di 1,39 per "tutti i tumori" con un minimo di 1,22 per i tumori di "utero e cervice" ed un massimo di 4,92 per la "leucemia", il che significa che il rischio oncogeno medio delle RI è inferiore a quello che si ha per l'esposizione alle radio frequenze in riferimento ai neurinomi endocranici" (vedi relazione dott. Grasso depositata il 25.11.2009 pag.7 e 8).

Appare, quindi, evidentemente integrato il requisito di elevata probabilità che integra il nesso causale richiesto dalla normativa.

Ne consegue che l'INAIL deve essere condannato a corrispondere al XXX la rendita per malattia professionale prevista per l'invalidità all'80%, con arretrati ed interessi di legge.

Le spese seguono la soccombenza e si liquidano per il primo

grado in €.1.800,00 (di cui euro 650 per diritti) e per il presente grado in €.2.000,00 (di cui euro 700 per diritti) con distrazione in favore del procuratore antistatario. Le spese di CTU restano definitivamente a carico dell'INAIL.

P.Q.M.

In riforma della sentenza n. 471/08 del Tribunale di Brescia condanna l'INAIL a corrispondere all'appellante la rendita per malattia professionale prevista per l'invalidità all'80%, con arretrati ed interessi di legge; condanna l'INAIL alla rifusione delle spese di ambo i gradi liquidate per il I grado in €.1.800,00 e per il presente grado in €.2.000,00.

Brescia 10.12.2009

Il Consigliere est. Il Presidente

COMMENT

Appeals that matter or not on a moratorium on the deployment of the fifth generation, 5G, for microwave radiation

LENNART HARDELL[1,3] and RAINER NYBERG[2,4]

Received September 21, 2019; Accepted January 3, 2020

DOI: 10.3892/mco.2020.1984

Abstract. Radiofrequency (RF) radiation in the frequency range of 30 kHz-300 GHz is classified as a 'possible' human carcinogen, Group 2B, by the International Agency for Research on Cancer (IARC) since 2011. The evidence has since then been strengthened by further research; thus, RF radiation may now be classified as a human carcinogen, Group 1. In spite of this, microwave radiations are expanding with increasing personal and ambient exposure. One contributing factor is that the majority of countries rely on guidelines formulated by the International Commission on Non-Ionizing Radiation Protection (ICNIRP), a private German non-governmental organization. ICNIRP relies on the evaluation only of thermal (heating) effects from RF radiation, thereby excluding a large body of published science demonstrating the detrimental effects caused by non-thermal radiation. The fifth generation, 5G, for microwave radiation is about to be implemented worldwide in spite of no comprehensive investigations of the potential risks to human health and the environment. In an appeal sent to the EU in September, 2017 currently >260 scientists and medical doctors requested for a moratorium on the deployment of 5G until the health risks associated with this new technology have been fully investigated by industry-independent scientists. The appeal and four rebuttals to the EU over a period of >2 years, have not achieved any positive response from the EU to date. Unfortunately, decision makers seem to be uninformed or even misinformed about the risks. EU officials rely on the opinions of individuals within the ICNIRP and the Scientific Committee on Emerging and Newly Identified Health Risks (SCENIHR), most of whom have ties to the industry. They seem to dominate evaluating bodies and refute risks. It is important that these circumstances are described. In this article, the warnings on the health risks associated with RF presented in the 5G appeal and the letters to the EU Health Commissioner since September, 2017 and the authors' rebuttals are summarized. The responses from the EU seem to have thus far prioritized industry profits to the detriment of human health and the environment.

Key words: appeals, microwave radiation, radiofrequency radiation, radiofrequency electromagnetic field, EMF, 5G, EU, WHO, moratorium, health risks, non-ionizing radiation guidelines

Introduction

Over the years, numerous international appeals on radiofrequency (RF) radiation and health and the environment have been published (e.g., www.emfscientist.org). These seem to have had little or no impact on those proposing limits on RF radiation and on the deployment of this technology. On the contrary, ambient RF radiation exposure has increased and is a potential health risk based on the current knowledge of the biological effects of RF radiation (1-8). There seems to be an 'unholy' alliance between the telecom industry and certain scientists, organizations (even WHO), and some politicians, thus reducing the potential for precautionary actions (9,10).

The International Agency for Research on Cancer (IARC) of WHO in 2011 classified RF radiation in the frequency range of 30 kHz-300 GHz as a 'possible' human carcinogen, Group 2B (11,12). Since then, the evidence of the adverse effects of RF radiation has strengthened based on human epidemiological (7,8,13) and animal studies (14-16). These results add scientific evidence to a previous evaluation (17). Thus, RF radiation may now be classified as a human carcinogen, Group 1. That is the strongest classification, which is the same as that for e.g., asbestos and smoking.

The IARC cancer classification seems to have had little or no impact on protecting the public against risks associated with RF exposure. A major hampering factor has been the exposure guidelines by the International Commission on Non-Ionizing Radiation Protection (ICNIRP) based only on the acute and very short-term thermal (heating) effects of RF radiation. These guidelines are used by the majority of countries worldwide. These guidelines were initially published approximately 20 years ago (18) and were updated in 2009 (19); however, no changes were made to adapt to the

rapidly increasing evidence of the harmful effects of RF and new RF signal characteristics and exposure from new technologies. ICNIRP, with the support of the WHO (10) and the major telecom companies, has made considerable efforts to convince countries worldwide to follow their guidelines. However, with the deployment of the 5th generation of microwave radiation, 5G, even the obsolete ICNIRP guidelines may be exceeded and may become an obstacle for the deployment of 5G (20). Thus, ICNIRP is preparing new guidelines that are briefly commented on below. However, as already published (9,10), the ICNIRP guidelines may be contradictory to a vast number of existing scientific reports demonstrating the harmful effects of RF radiation (21). Furthermore, there may perhaps also be conflicts of interests in terms of ties to the industry.

ICNIRP

On July 11, 2018, the ICNIRP released a draft of the guidelines for limiting exposure to time-varying electric, magnetic and electromagnetic fields (100 kHz-300 GHz). It was open for public consultations until October 9, 2018. Appendix B was based on the assessment of the health risks based on a literature survey (https://www.icnirp.org/en/activities/public-consultation/index.html).

Of note, in the background material to the new ICNIRP guidelines, the IARC classification from 2011 of RF exposure as class 2B, 'possibly' carcinogenic to humans (11,12) was not included. Notably, one of the ICNIRP commission members, Martin Röösli (https://www.icnirp.org/en/about-icnirp/commission/index.html), was also one of the IARC experts evaluating the scientific RF carcinogenicity in May, 2011 (https://monographs.iarc.fr/wp-content/uploads/2018/06/mono102-F05.pdf), which classified RF exposure as a class 2B 'possible' carcinogen. Thus, he should be aware of the IARC classification. Of note, one of the authors of this article (L.H.) was a member of the IARC expert group.

Below, eight excerpts/quotes from the 2018 ICNIRP draft guidelines are presented (https://www.icnirp.org/cms/upload/consultation_upload/ICNIRP_RF_Guidelines_PCD_2018_07_11.pdf). These assertions in the ICNIRP evaluation do not seem to represent the valid evaluation of the published literature on the health risks associated with RF:

i) ***Brain physiology and function.*** *'In summary, there is no evidence of effects of radiofrequency EMF [electromagnetic field] on physiological processes or eye pathology that impair health in humans. Some evidence of superficial eye damage has been shown in rabbits at exposures of at least 1.4 kW m-2, although the relevance of this to humans has not been demonstrated'.*

ii) ***Auditory, vestibular, and ocular function.*** *'In summary, no effects on auditory, vestibular, or ocular function relevant to human health have been substantiated'.*

iii) ***Neuroendocrine system.*** *'In summary, the lowest level at which an effect of radiofrequency EMF on the neuroendocrine system has been observed is 4 W kg-1 (in rodents and primates), but there is no evidence that this translates to humans or is relevant to human health. No other effects have been substantiated'.*

iv) ***Neurodegenerative diseases.*** *'In summary, no adverse effects on neurodegenerative diseases have been substantiated'.*

v) ***Cardiovascular system, autonomic nervous system and thermoregulation.*** *'In summary, no effects on the cardiovascular system, autonomic nervous system, or thermoregulation that compromise health have been substantiated for exposures with whole body average SARs below approximately 1 W kg-1, and there is some evidence that 4 W kg-1 is not sufficient to alter body core temperature in hamsters. However, there is strong evidence that whole body exposures in rats that are sufficient to increase body core temperature by several degrees centigrade can cause serious adverse health effects in rats'.*

vi) ***Immune system and hematology.*** *'The few human studies have not indicated any evidence that radiofrequency EMF affects health in humans via the immune system or haematology'.*

vii) ***Fertility, reproduction and childhood development.*** *'In summary, no adverse effects of radiofrequency EMF exposure on fertility, reproduction or development relevant to human health have been substantiated'.*

viii) ***Cancer.*** *'In summary, no effects of radiofrequency EMF on cancer have been substantiated'.*

Since the ICNIRP 2018 draft guidelines excluded a large number of science-based evidence of health hazards from RF radiation, numerous rebuttals have been sent to the ICNIRP. However, it remains unknown as to whether these rebuttals have been taken into account or not.

Thus, the ICNIRP does not acknowledge the health effects caused by RF radiation. This has been rebutted by several scientists (21-24).

Details and proofs of scientific misinterpretation were outlined in a comprehensive response by Dr Martin Pall (21). He demonstrated that the denials of scientific facts concerning health risks seem to be the rule in the Health Risk Assessments of the ICNIRP 2018 Draft Guidelines. ICNIRP confirmed that Pall's response was received on October 8, 2018 (tinyurl.se/pall). As outlined above in all eight summarizing statements, the ICNIRP denies that any scientific reports exist which demonstrate harmful effects below the ICNIRP guidelines. However, as Dr Pall demonstrated, a large number of peer-reviewed studies have been published over a period of >20 years contradicting the ICNIRP evaluations. Independent peer-reviewed scientific articles (1,7,8) have demonstrated the harmful effects even far below the current public safety limits based on ICNIRP 1998 reference levels 10 W/m^{2}for 2-300 GHz and 2-10 W/m^2 for 400 to 2,000 MHz (18).

The ICNIRP also seems to have disregarded previously published animal studies (14-16) on carcinogenesis. The NTP results have been discussed in a commentary (25) and clarified to that degree that they should have been considered in full. These findings supported human epidemiology results on cancer risks from RF radiation (6,26). The final new ICNIRP guidelines have yet to be published.

In fact, a hint of the ICNIRP final document may be found in a presentation by the ICNIRP chairman Eric van Rongen at a meeting held on April 17, 2019 https://www.anfr.fr/fileadmin/mediatheque/documents/expace/workshop-5G/20190417-Workshop-ANFR-ICNIRP-presentation.pdf.

van Rongen stated that there is no evidence that RF EMF causes diseases, such as cancer and that the US NTP (14-15) and Ramazzini Institute (16) studies are not convincing for carcinogenesis. ICNIRP seems still to hold the view, which is clearly beneficial to the industry, that only thermal effects exist for RF radiation and not any non-thermal effects, which have been proven in research by the majority of scientists in this field.

ICNIRP recently published a note on the NTP and Ramazzini Institute animal studies (27). Some of their incorrect statements are commented on below. The ICNIRP claims that there is no verified mechanism for RF radiation carcinogenesis, in spite of well-designed studies showing the contrary, e.g., oxidative stress (25,28) and DNA damage (25,29). The ICNIRP claims that the histopathological evaluation was not blinded in these studies; however, this is not true, as supported by the methods described in these studies. Furthermore, the ICNIRP claims that the body core temperature was increased in the NTP study (15) and suggested it to be a factor increasing cancer risk, although heat is not a known carcinogen. The ICNIRP also claims that only the Hardell group found an increased risk for acoustic neuroma although the Interphone study had similar findings (7). ICNIRP does not seem to take into account the concordance between the tumor types found in human epidemiological and animal studies. These are just a few examples.

It is noteworthy that ICNIRP repeats certain debatable statements in spite of being rebutted by Melnick (25) and should have been known to the 13 ICNIRP Commission members (https://www.icnirp.org/en/about-icnirp/commission/index.html) with their names listed at the end of the article (27). Perhaps this ICNIRP article lacks scientific authorization. As previously suggested, they seem to create doubt (30,31). Thus, one must be cautious when also interpreting other publications by the 13 Commission members.

The ICNIRP points out an important scientific problem: How incorrect data can achieve lives of their own and gain respectability and credence with inappropriate repetition. Corrections and clarifications (25), seem to have difficult time to counteract any possible errors, which is to the disadvantage of both good science and public health. Of note, President Franklin D. Roosevelt stated that *'Repetition does not transform a lie into a truth'* (https://www.azquotes.com/quote/377323).

Finland, in a new regulation, 1045/2018, dated December 15, 2018, allowed higher average radiation, 200 W, in narrow areas of 1x1 cm (1 cm^2) (please see Table 1.5, Note 3 (in Swedish): (https://www.finlex.fi/data/sdliite/liite/6943.pdf). This was probably decided in order to accommodate the steerable, beam-formed, narrow 5G fields, which will be used by most 5G equipment. The Director of the Radiation Safety Agency in Finland claims that this is no problem, as if you disperse the effect of 200 W (on 1 cm^2) upon a whole square meter it will still be within the ICNIRP guideline of 10 W/m^2 (private communication from Petteri Tiippana, 2018, please see https://www.dropbox.com/s/89cm7bmb4l0em8w/200W%3Am2-STUK.pdf?dl=0).

On top of the other flaws which ICNIRP members are presenting, they also suggest that only the 'mean values' of RF radiation should be measured. However, the interferences and the supra-additive effects between pulses from different RF radiation sources can lead to 'hundreds of thousands higher density' short-time pulses than the power density mean values with the guideline of 10 W/m^2. This has been well-documented in a report from the Finnish Radiation Safety Agency (32). Panagopoulos (29) has clearly demonstrated that using mean values for RF radiation may underestimate the risk. Intensity, frequency, exposure duration, polarization, pulsing and modulation are crucial parameters for the bioactivity. Puranen (32) states that the instant effect density can be much stronger than the mean values. However, the guidelines only consider the mean values.

Appeals to the EU and responses from the EU

The impact of the many international appeals on RF radiation safety, if any, is unclear. However, they will be historical documents on warnings that have been thus far ignored by the EU and the WHO. This is exemplified below.

The deployment of 5G for microwave radiation has given increasing awareness and concern among individuals regarding the risks to human health and the environment resulting in massive protests and even a moratorium in certain EU countries and US cities (https://tinyurl.se/5gstoppers). 5G uses a different technology compared with previous generations, such as 2G, 3G and 4G. In the following, our 5G appeal to EU is discussed (www.5Gappeal.eu). This has currently been signed by >260 scientists and medical doctors from a number of countries. It is still open for endorsement.

a) The 5G Appeal, September 13, 2017 and response. Below, the full text, with included links to references, is presented although it can also be found online (www.5gappeal.eu), and also at (https://www.environmentandcancer.com/5g-appeal/).

Scientists and doctors warn of potential severe health effects of 5G. *'We the undersigned scientists and doctors recommend a moratorium on the roll-out of the fifth generation, 5G, for telecommunication until potential hazards for human health and the environment have been fully investigated by scientists independent from industry. 5G will substantially increase exposure to radiofrequency electromagnetic fields (RF-EMF)*

on top of the 2G, 3G, 4G, Wi-Fi, etc. for telecommunications already in place. RF-EMF has been proven to be harmful for humans and the environment'.

5G leads to the marked increase of mandatory exposure to wireless radiation. *'5G technology is effective only over short distance. [The range of 5G radiation is decreased due to its increased carrier frequency (up to ~100 GHz) compared to previous mobile telephony generations and other existing microwave telecommunications radiations such as Wi-Fi (up to 2.6 GHz), and according to Rayleigh's law which explains that the intensity of scattered electromagnetic radiation (Jscat) is proportional to f 4 (where f is the frequency of the radiation) when the dimensions of the scattering particles - such as the molecules of the air, of the building materials, etc. - are smaller than the wavelength (which is the case for all mobile telephony radiations): Jscat ∝ f 4 (33)]. It is poorly transmitted through solid material. Many new [base] antennas will be required and full-scale implementation will result in antennas every 10 to 12 houses in urban areas,* ***thus massively increasing mandatory exposure****'.*

'[Moreover, apart from the increase in background exposure, 5G is likely to induce significant thermal effects in addition to the already non-thermal ones, again due to its significantly higher frequency (34)]'.

'With "the ever more extensive use of wireless technologies," (35) nobody can avoid to be exposed. Because on top of the increased number of 5G-transmitters (even within housing, shops and in hospitals) according to estimates, "10 to 20 billion connections" (36) (to refrigerators, washing machines, surveillance cameras, self-driving cars and buses, etc.) will be parts of the Internet of Things. All these together can cause a substantial increase in the total, long term RF-EMF exposure to all EU citizens'.

Harmful effects of RF-EMF exposure have already been proven. *'Over 230 scientists from >40 countries [now 252 scientists from 43 nations] (37) have expressed their "serious concerns" regarding the ubiquitous and increasing exposure to EMF generated by electric and wireless devices already before the additional 5G roll-out. They refer to the fact that "numerous recent scientific publications have shown that EMFs affect living organisms at levels well below most international and national guidelines". Effects include increased cancer risk, cellular stress, increase in harmful free radicals, genetic damages, structural and functional changes of the reproductive system, learning and memory deficits, neurological disorders, and negative impacts on general well-being in humans. Damage goes well beyond the human race, as there is growing evidence of harmful effects (38) to both plants (39) and animals (40)'.*

'After the scientists' appeal was written in 2015 additional research has convincingly confirmed serious health risks from RF-EMF fields from wireless technology. The world's largest study (25 million US dollar) National Toxicology Program (NTP) (41), shows statistically significant increase in the incidence of brain and heart cancer in animals exposed to EMF [intensities] below the ICNIRP (International Commission on Non-Ionizing Radiation Protection) guidelines followed by most countries. These results support results in human epidemiological studies (17) on RF radiation and brain tumour risk. A large number of peer-reviewed scientific reports (2) demonstrate harm to human health from EMFs'.

'The International Agency for Research on Cancer (IARC), the cancer agency of the World Health Organization (WHO), in 2011 concluded that EMFs of frequencies 30 KHz - 300 GHz are possibly carcinogenic to humans (Group 2B) (12,42). However, new studies like the NTP study mentioned above and several epidemiological investigations including the latest studies on mobile phone use and brain cancer risks confirm that RF-EMF radiation is carcinogenic to humans (17)'.

'The EUROPA EM-EMF Guideline 2016 (1) states that "there is strong evidence that long-term exposure to certain EMFs is a risk factor for diseases such as certain cancers, Alzheimer's disease, and male infertility…Common EHS (electromagnetic hypersensitivity) symptoms include headaches, concentration difficulties, sleep problems, depression, lack of energy, fatigue, and flu-like symptoms"'.

'An increasing part of the European population is affected by ill health symptoms that have for many years been linked to exposure to EMF and wireless radiation in the scientific literature. The International Scientific Declaration on EHS & multiple chemical sensitivity (MCS), Brussels (43), declares that: "In view of our present scientific knowledge, we thereby stress all national and international bodies and institutions… to recognize EHS and MCS as true medical conditions which acting as sentinel diseases may create a major public health concern in years to come worldwide i.e. in all the countries implementing unrestricted use of electromagnetic field-based wireless technologies and marketed chemical substances… ***Inaction is a cost to society*** *and is not an option anymore… we unanimously acknowledge this serious hazard to public health…that major primary prevention measures are adopted and prioritized, to face this* ***worldwide pan-epidemic*** *in perspective"'.*

Precautions. *'The Precautionary Principle (44) was adopted by EU 2005 (45): "When human activities may lead to morally unacceptable harm that is scientifically plausible but uncertain, actions shall be taken to avoid or diminish that harm"'.*

'The Council of Europe Resolution 1815 (46): "Take all reasonable measures to reduce exposure to electromagnetic fields, especially to radio frequencies from mobile phones, and particularly the exposure to children and young people who seem to be most at risk from head tumours…Assembly strongly recommends that the ALARA (as low as reasonably achievable) principle is applied, covering both the so-called thermal effects and the athermic [non-thermal] or biological effects of electromagnetic emissions or radiation" and to "improve risk-assessment standards and quality"'.

'The Nuremberg code (47) applies to all experiments on humans, thus including the roll-out of 5G with new, higher

RF-EMF exposure. All such experiments: "should be based on previous knowledge (e.g., an expectation derived from animal experiments) that justifies the experiment. No experiment should be conducted, where there is an a priori reason to believe that death or disabling injury will occur; except, perhaps, in those experiments where the experimental physicians also serve as subjects," Nuremberg code pts 3-5 (47). Already published scientific studies show that there is "a priori reason to believe" in real health hazards'.

'The European Environment Agency (48) is warning for "Radiation risk from everyday devices" in spite of the radiation being below the WHO/ICNIRP standards (49). EEA also concludes: "There are many examples of the failure to use the precautionary principle in the past, which have resulted in serious and often irreversible damage to health and environments…harmful exposures can be widespread before there is both 'convincing' evidence of harm from long-term exposures, and biological understanding [mechanism] (50) of how that harm is caused"'.

'Safety guidelines' protect the industry, not health. *'The current ICNIRP "safety guidelines" are obsolete. All proofs of harm mentioned above arise although the radiation is below the ICNIRP "safety guidelines" (49). Therefore new safety standards are necessary. The reason for the misleading guidelines is that "conflict of interest of ICNIRP members (10) due to their relationships with telecommunications or electric companies undermine the impartiality that should govern the regulation of Public Exposure Standards for non-ionizing radiation…To evaluate cancer risks it is necessary to include scientists with competence in medicine, especially oncology'.*

'The current ICNIRP/WHO guidelines for EMF are based on the obsolete hypothesis that "The critical effect of RF-EMF exposure relevant to human health and safety is heating of exposed tissue" (51). However, scientists have proven that many different kinds of illnesses and harms are caused without heating ("non-thermal effect") (52) at radiation levels well below ICNIRP guidelines'.

The authors thus urge the EU to carry out the following. *i) 'To take all reasonable measures to halt the 5G RF-EMF expansion until independent scientists can assure that 5G and the total radiation levels caused by RF-EMF (5G together with 2G, 3G, 4G, and WiFi) will not be harmful for EU-citizens, especially infants, children and pregnant women, as well as the environment'. ii) 'To recommend that all EU countries, especially their radiation safety agencies, follow Resolution 1815 and inform citizens, including, teachers and physicians, about health risks from RF-EMF radiation, <u>how</u> and <u>why</u> to avoid microwave radiation, particularly in/near e.g., daycare centers, schools, homes, workplaces, hospitals and elderly care'. iii) 'To appoint immediately, without industry influence, an EU task force of independent, truly impartial EMF-and-health scientists with no conflicts of interest (to re-evaluate the health risks and: a) To decide about new, safe "maximum total exposure standards" for all microwave radiation within EU. b) To study the total and cumulative exposure affecting EU-citizens. c) To create rules that will be prescribed/enforced within the EU about how to avoid exposure exceeding new EU "maximum total exposure standards" concerning all kinds of EMFs in order to protect citizens, especially infants, children and pregnant women'. iv) 'To prevent the wireless/telecom industry through its lobbying organizations from persuading EU-officials to make decisions about further propagation of RF radiation including 5G in Europe'. v) 'To favor and implement wired digital telecommunication instead of wireless'.*

First reply from the EU. A reply from the EU was sent on October 13, 2017 by the Directorate-General Health and Food Safety (Public health, country knowledge, crisis management) in Luxembourg. It was not replied to by the Commissioner Andriukaitis, but instead by Mr. John F. Ryan, Director (for the full text please see: http://www.5gappeal.eu/wp-content/uploads/2018/06/reply_ryan.pdf). Some paragraphs are presented below:

'It is worth underlining that for the Commission health protection is always taken into account in all of its proposals. There is consistent evidence presented by national and international bodies (International Commission on Non Ionising Radiation Protection - ICNIRP, Scientific Committee on Emerging and Newly Identified Health Risks - SCENIHR) that exposure to electromagnetic fields does not represent a health risk, if it remains below the limits set by Council Recommendation 1999/519/EC (https://ec.europa.eu/health//sites/health/files/electromagnetic_fields/docs/emf_rec519_en.pdf)'.

'The Scientific Committee on Emerging and Newly Identified Health Risks, which is independent of the Commission, has a standing mandate to provide this update'.

'It has already produced five opinions. The last opinion was adopted in January 2015 on "Potential health effects of exposure to electromagnetic fields". (https://ec.europa.eu/health/scientific_committees/emerging/docs/scenihr_o_041.pdf)'.

'These scientific opinions have not provided any scientific justification for revising the exposure limits (basic restrictions and reference levels) under Council Recommendation 1999/519/EC'.

'Digital technologies and mobile communication technologies, including high speed internet, will be the backbone of Europe's future economy, allowing all citizens to be connected. At the same time, all citizens deserve appropriate protection against electromagnetic fields from all types of sources including from wireless devices'.

'Most 5G networks are expected to use smaller cells than previous generations with lower electromagnetic fields exposure levels. This is confirmed by the experience so far gained. The introduction of 3G and 4G has not increased exposure from environmental fields and this has been published also in peer-reviewed journals. In particular, the introduction of 3G has lowered exposure of mobile phone users for calls, compared to 2G'.

'Related to the issue of the alleged conflicts of interests, the Commission is not aware of any conflicts of interests of members of international bodies such as ICNIRP or the members of SCENIHR. Please be informed that the Ombudsman conclusion in case 208/2015/P concerning conflicts of interests in a Commission expert group on electromagnetic fields is that there was no maladministration by the European Commission (https://www.ombudsman.europa.eu/en/cases/decision.faces/en/78175/html.bookmark)'.

'Please be assured that the Commission will pursue scrutiny of the independent scientific evidence available to ensure the highest health protection of our citizens'.

Comment: There are obvious misconceptions in this reply such as: *'The introduction of 3G and 4G has not increased exposure from environmental fields and this has been published also in peer-reviewed journals'*. On the contrary, numerous peer-reviewed articles have demonstrated that exposure to ambient RF radiation has increased substantially, as discussed (3-6).

In addition, the statement that: *'the Commission is not aware of any conflicts of interests of members of international bodies such as ICNIRP or the members of SCENIHR'* does not represent the scientific evidence of inherent conflicts of interest both in ICNIRP and SCENIHR (9,10). The very Commission seems to be ill-informed or even misinformed, as the EU seems to take information mainly from these two fraudulent organizations, but not from independent researchers. The EU does not seem to rely on sound science and thereby downplays the RF-related risks (7-12,53,54).

b) First rebuttal to the EU and the response. On November 13, 2017, a rebuttal was sent to the EU Commissioner of Health, Dr Andriukaitis. The whole letter can be found at: https://www.environmentandcancer.com/letter-to-vytenis-andriukaitis-13-11-2017/.

'We suppose that you know that Director John F. Ryan, October 13, 2017 replied (Ares 2017 5015409 - Reply to the EU 5G-appeal, and that he said: "There is ***consistent evidence*** *that exposure to electromagnetic fields* ***does not represent a health risk… if below the limits*** *…" His conclusion is based on the opinions of ICNIRP and SCENIHR'.*

'As early as February 1, 2016, in a Comment on SCENIHR to Mr. Ryan it was shown in article and letter by Drs. *[Sage], Carpenter and Hardell, representing BioInitiative and ECERI, that: "The evidence in the SCENIHR Final Opinion on EMF* ***clearly and convincingly establishes the potential for health effects of exposure to electromagnetic fields*** *[EMF]. Based on the evidence provided in this Opinion, the Committee is obligated to draw to the attention of the [EU] Commission that EMF is a new and emerging problem that may pose an actual or potential threat"' (55).*

'In spite of all this, Mr Ryan in his reply to us still continues to claim that EMF 'does not represent a health risk' and - without any other references than ICNIRP and SCENIHR - defends industry's standpoint that EMFs are harmless if below the ICNIRP "safety guidelines". In addition he ignores the IARC evaluations on both ELF-EMF and RF-EMF to be 'possible' human carcinogens, Group 2B'.

'In the 5G-Appeal we urge EU to appoint a truly independent expert group of EMF-and-health researchers (contrary to ICNIRP and SCENIHR) to decide about new safe guidelines for EMF exposure. It is imperative to ***immediately apply EU:s Precautionary Principle (and ALARA)*** *enabling rapid response to stop distribution of 5G products in order to diminish the harm that has already been proven by scientists. A* ***European pan-epidemic*** *may follow if you don't do so'.*

Second reply from EU on 29 November, 2017. This was sent from the European Commission, Cabinet of Commissioner Vytenis Andriukaitis, Head of Cabinet Brussels, written by Arūnas Vinciunas. The full reply can be found at: http://www.5gappeal.eu/wp-content/uploads/2018/06/reply_vinciunas.pdf).

'When Mr Ryan answered your email, in which you stated your disagreement with the Commission's stance on the 5G appeal, he presented the conclusions of roughly two decades of research on the potential health effects of EMF, and the views expressed in the Scientific Opinions produced by the independent Scientific Committees. [ICNIRP - International Commission on Non-Ionizing Radiation Protection and SCENIHR - Scientific Committee on Emerging and Newly Identified Health Risks]. The Committee's last Opinion on EMF, published in 2015, is based on hundreds of peer-reviewed studies published worldwide and is the fourth Opinion on EMF published since EMF legislation was adopted in 1999. The Committee's conclusion in this latest Opinion was based on exposure studies, epidemiological studies and in vivo and in vitro studies, and studies on any suggestions of causality were considered for the weighting'.

'The Commission services are confident that the advice provided by the Scientific Committees is unbiased, accurate and scientifically sound and therefore do not feel it necessary to appoint an independent expert group of EMF-and-health researchers to discuss new safe guidelines for EMF exposure'.

'The recourse to the EU's Precautionary Principle to stop the distribution of 5G products appears too drastic a measure. We first need to see how this new technology will be applied and how the scientific evidence will evolve. Please rest assured that the Commission will keep abreast of future developments in view of safeguarding the health of the European citizens at the highest level possible and in line with its mandate'.

Comment: This reply from EU is far from adequate. It does not represent a sound evaluation of the RF-related radiation risks based on published peer-reviewed studies. This is again outlined in our response to the EU.

c) Second rebuttal to the EU and the response. On January 17, 2018, a letter was sent to Dr. Vytenis Andriukaitis, EU Commissioner of Health. Sections of this letter are presented

below and the full text can be found at: https://www.environmentandcancer.com/letter-to-vytenis-andriukaitis-and-donald-tusk-17-01-18/.

'Following the letter and the Scientist Appeal calling for a moratorium on 5G ("The 5G Appeal"), which we sent to your office, we received a response from Director John F. Ryan on October 13, 2017 and then, upon our reply, a letter from Mr. Arūnas Vinciūnas dated 29.11.2017'.

'Despite the conclusive evidence presented in our letters, both Director Ryan and Mr. Vinciūnas gave generic responses and continued to claim that EMF "does not represent a health risk". In doing so they only refer to ICNIRP and SCENIHR opinions without explaining why they disregarded the compelling evidence and references under the 5G-Appeal headline: "Harmful effects of RF-EMF exposure are already proven"'.

'The ICNIRP exposure limits are dependent on an unproven hypothesis that "only heat from EMF can cause health hazards". This hypothesis has clearly been rejected in a large number of scientific studies'.

'Both EU officials defend the industry-supportive standpoint that EMFs are harmless if below the ICNIRP "guidelines". However, many of the scientists on both ICNIRP's and SCENIHR's committees are connected to the telecom industry with obvious conflicts of interest'.

'Mr Vinciūnas stated in his letter: "The recourse to the EU's Precautionary Principle to stop the distribution of 5G products appears ***too drastic a measure****." Mr Vinciūnas finishes his letter: "we need to see … how the scientific* ***evidence will evolve****"'.*

'According to Communication from the Commission on the precautionary principle: "Whether or not to invoke the Precautionary Principle is a decision exercised where scientific information is insufficient, inconclusive, or uncertain and where there are indications that the possible effects on the environment, or human, animal or plant health may be potentially dangerous and inconsistent with the chosen level of protection." That describes the situation with 5G perfectly. Existing data shows that 5G frequencies [radiations] are hazardous. However, additional studies will be necessary to fully determine the extent of the risk'.

Third reply from the EU. This letter was replied to on April 27, 2018 by Mr. Arūnas Vinčiūnas from the Cabinet of Commissioner Vytenis Andriukaitis. For the full third reply to our appeals please see: https://www.environmentandcancer.com/answer-from-arunas-vinciunas-27-04-2018/.

'Thank you very much for your letter of 15 March 2018 which was also transmitted by email on 19 March. Commissioner Andriukaitis has asked me to reply to you on his behalf'.

'Finally, let me refer to the previous correspondence you have had with John F. Ryan, Director of Public Health and me (29 November 2017, 13 October 2017 and 19 February 2018) where we have comprehensively explained our position with regard to the arguments you have raised. It is my view that we have now extensively deliberated on the matter and that we should refrain from further repetition'.

'Please rest assured that the Commission will remain committed to safeguarding the health of the European citizens, at the highest level possible and in line with his mandate'.

d) Third rebuttal to the EU and the response. This rebuttal had the title *"Request for a moratorium on the 5G rollout. Request for guidelines based on independent research. Request for documents showing that 5G is safe"*. On May 20, 2019 a letter with these requests was sent to Dr Karmenu Vella, EU Commissioner of Environment and Dr Vytenis Andriukaitis, EU Commissioner of Health. For the full text please see: https://www.environmentandcancer.com/letter-to-vytenis-andriukaitis-20-05-2019/.

'We make reference to the Precautionary Principle (PP) (56) It "enables a rapid response to be given in the face of a possible danger to human health…institutions may take protective measures without having to wait until the reality… of risks become apparent … preventive action should be taken" (57). Research confirms 5G to be a risk to all life on earth'.

'With this communication we touch upon three points:' i) 'Firstly, we request in the 5G Appeal to EU (www.5gappeal.eu), of which you are a public servant and representative, to declare an immediate ***moratorium*** *on 5G deployment. The 5G appeal to EU is now confirmed by 230+ truly independent scientists and physicians from 36 countries. The Space 5G appeal (58) has more than 83,000 affirmations from 168 countries. According to PP (56) and EU IP/00/96 (59) "protection of health takes precedence over economic considerations."' ii) 'Secondly, we ask for groups of truly industry-independent researchers to establish* ***new guidelines for exposure****. An "In-depth analysis" of the deployment of 5G (60), published by EU in April 2019, needs to be seriously considered. It stated that" One aspect, for example, that is not well understood today is the unpredictable propagation patterns that could result in unacceptable levels of human exposure to electromagnetic radiation."(p. 6)'. iii) 'Thirdly, with this letter we are formally requesting, in accordance with Art. 42 (61) on EU Fundamental Rights,* ***access to all documents*** *in your possession, either created by you or at your disposal, related to the effects of EMF to human health and the environment. Once in possession of such a list, we will decide which of those documents, if any, are of interest and show that 5G is safe. The list of the documents, and the ways to access them, should be sent to the email addresses below'.*

'We note that, while the EU is eagerly promoting the rollout of 5G, a new EU report admits (60) "the problem is that currently it is not possible to accurately simulate or measure 5G emissions in the real world" (p. 12). *"Significant concern is emerging over the possible impact on health and safety arising from potentially much higher exposure to radiofrequency electromagnetic radiation arising from 5G" (p. 4). The EU report also stresses dangers: "Increased exposure*

may result not only from the use of much higher frequencies in 5G but also from the potential for the aggregation of different signals, their dynamic nature, and the complex interference effects that may result, especially in dense urban areas." (p. 11)'.

Fourth reply from the EU. Finally, a response was delivered by the EU on September 5, 2019, although with reference to the wrong date of our letter. It was sent by Arunas Vinciunas from the Cabinet of Commissioner Vytenis Andriukaitis. The full response can be read at: https://www.environmentandcancer.com/answer-from-arunas-vinciunas-05-09-2019/.

'Thank you for your email of 7 July 2019 to Commissioner Andriukaitis in which you request to halt the 5G expansion in the EU immediately in order to allow a moratorium for industry independent research. Commissioner Andriukaitis has asked me to reply to you on his behalf'.

'In my latter note to you I already expressed my view that we had extensively deliberated on the matter and that we should refrain from further repetition'.

'As regards your request to halt the launch of the new 5G technology, I would like to confirm the view already expressed in my note of 29 November 2017 to you that stopping the distribution of 5G products appears too drastic a measure. I repeat that first there is a need to see how this new technology will be applied and how the scientific evidence will evolve'.

'Concerning your call for a scientific evaluation and new guidelines for exposure, the second point you have raised, let me stress that the Commission will review the situation once the review of the guidelines issued by the International Commission on Non-Ionizing Protection (ICNIRP) will be finalised which is expected in due course'.

'As regards your third point, documents related to the effects of electromagnetic fields to human health and the environment, please be referred to the opinion of the Commission's Scientific Committee on Emerging and Newly Identified Health Risks of 20 January 2015 on potential health effects of exposure to electromagnetic fields (EMF) (https://ec.europa.eu/health/scientific_committees/emerging/docs/scenihr_o_041.pdf) that provides an extensive list of references to scientific literature on this issue'.

Comment on the fourth reply from the EU appeal: There is no new evidence of the safety in this letter from EU compared with the earlier replies. Of note, the EU relies on documentation of risk only on old and biased selection of references in one single report from SCENIHR (https://ec.europa.eu/health/scientific_committees/emerging/docs/scenihr_o_041.pdf). Thus, EU officials still seem to base the evaluation of the health risks on reports from the ICNIRP and SCENIHR that have been seriously criticized. Of note, the EU relies on a report from 2015 as to scientific publications on the safety of 5G, a technology that was not developed during that time. This suggests that perhaps the EU is reluctant to deal with the safety issues associated with 5G technology.

e) Fourth rebuttal to the EU. On October 24, 2019 a fourth rebuttal was sent to the EU (https://www.environmentandcancer.com/letter-to-arunas-vinciunas-24-10-2019). We wrote that *'Specifically now, as we wish to assist the Commissioner in giving due response, it can be further specified from this side that we need the **list of documents** related to EMFs created by RF/Radiofrequencies (so: not by ELF) and even more specifically, to the list of those documents based on which the Commission is basing its current position that 5G should not be stopped nor subject to a moratorium (see the statement of your letter that "first there is a need to see how this new technology will be applied and how the scien6fic evidence will evolve"). We leave aside our total disagreement on the merits of such position at this time: formally, we are entitled to receive from you such a list of documents based on which the Commissioner determined that 5G is safe. Based on that list we will decide which of those documents, are of interest. Please provide such list by email no later than October 31, 2019. This is urgent'.*

Fifth reply from the EU. In this response, dated December 19, 2019, it was stated that new ICNIRP guidelines are expected. Thus, the same approach to this issue as previously and no new commitment (https://www.environmentandcancer.com/answer-from-martin-seychell-19-12-2019).

Appeals to the Nordic Prime Ministers

The 5G Appeal was also sent to the Nordic Prime Ministers (https://www.environmentandcancer.com/letter-to-nordic-ministers-27-6-2018/); (https://www.environmentandcancer.com/letter-to-nordic-ministers-5-3-2019/). The only reply, dated March 29, 2019, was sent from the Swedish government (Ministry of Enterprise and Innovation, Mari Mild). It was stated that the government relies on Swedish Radiation Safety Authority (SSM) and their yearly update of health risks and that no new health risks have been reported. According to the letter there is no reason for a moratorium on the deployment of 5G, see (in Swedish) (https://www.miljoochcancer.com/svar-fran-naringsdepartementet-29-3-2019/). SSM relies on ICNIRP.

Discussion

Our experience with the EU and the Governments of the Nordic countries suggests that the majority of decision makers are scientifically uninformed on health risks from RF radiation (62). In addition, they seem to be uninterested to being informed by scientists representing the majority of the scientific community, i.e., those scientists who are concerned about the increasing evidence or even proof of harmful health effects below the ICNIRP guidelines (www.emfscientist.org). Instead, they rely on evaluations with inborn errors of conflicts, such as ICNIRP. In fact, the ICNIRP, with the support of WHO and major telecommunications companies, has been rather successful in implementing their views in the EU and worldwide. Their guidelines seem to be based on the omission of scientific facts. Thus, their possible ignorance of the health risks is of concern, as well as their reluctance to adhere to warnings from large numbers of scientists around the world.

It is striking that 5G is deployed without previous scientific evaluation of health risks. Not only cancer risks, but also other health effects such as fertility, cognitive and neurobehavioral effects, oxidative stress and electromagnetic hypersensitivity (EHS) have been associated with RF exposure [for a more detailed discussion on this tope, please see previous publications (1,7,8,28,35)]. It is thus noteworthy that the ICNIRP thermal paradigm is still used for the evaluation of the health risks associated with RF radiation. One issue of major concern is that there seems to be conflicts of interest among persons in the evaluating groups. Furthermore the same persons may often be found in different bodies, thereby in fact citing themselves representing a cartel (https://www.saferemr.com/2018/07/icnirps-exposure-guidelines-for-radio.html). This has been outlined in peer-reviewed publications (9,10).

This is also an ethical question. Thus, it would not be possible to test a new drug on individuals without information and signed permission by each individual. Certainly, this principle should apply to 5G that is furthermore, mandatory. Exposure to RF radiation from 5G must be regarded as a medical experiment with potential health risks, some known and expected based on current knowledge, some unknown since this is a new untested technology. A letter of information to those exposed must be sent for informed consent. However, it must be concluded that such a letter, affirming no risk, cannot be formulated based on the limited number of studies on 5G, in fact most of them with no assurance of no risks.

This is also a moral question for all the individuals involved in the propagation of 5G. It is to be noted that individuals within e.g., ICNIRP, national governmental bodies and the EU, partly a cartel, seem to neglect scientific warnings. They instead seem to follow the no-risk paradigm. It is thus questionable as to how it is possible to thereby disregard the diseases caused by this technology and to not consider the affected persons.

Taking the history of e.g., tobacco and smoking and the long period of time it took for cancer classification into account, it is fully understandable that RF radiation is still in the beginning of that history. However, if no action is currently taken, the costs to society will most likely be very high in terms of premature deaths, deteriorated public health and damage to the ecological system. It is however, important to publish the history of neglected RF radiation warnings. The EU seems to perhaps lacking in that respect. It must be concluded that the polluter has to pay the full cost of harm from this technology (63). Those in responsible positions in governments and organizations intended to protect the public and the environment from harm (WHO and ICNIRP), but who fail to do so by ignoring the increasing warnings from scientists worldwide about the dangers of 5G, should also be held responsible for the harm to the public that they thereby induce (64). No doubt damage to the environment by the business sector may be substantial (https://www.theguardian.com/environment/2010/feb/18/worlds-top-firms-environmental-damage).

The EU principle that the Polluter Pays (Article 191, pt 2) states: *'Union policy on the environment shall aim at* ***a high level of protection taking*** *into account the diversity of situations in the various regions of the Union.* ***It shall be based on the precautionary principle*** *and on the principles that* ***preventive action should be taken****, that environmental damage should as a priority be rectified at source and that* ***the polluter should pay****'.* (https://eur-lex.europa.eu/LexUriServ/LexUriServ.do?uri=CELEX:12008E191:EN:HTML).

'*The fundamental principle of this Directive should therefore be that an operator whose activity has caused the environmental damage or the imminent threat of such damage is to be held financially liable, in order to induce operators to adopt measures and develop practices to minimise the risks of environmental damage so that their exposure to financial liabilities is reduced' (65) (https://eur-lex.europa.eu/legal-content/EN/TXT/HTML/?uri=CELEX:32004L0035&from=EN).*

The industry tries to convince us that the super high frequencies of 5G are so weak and its millimeter waves will penetrate only the outer surface of the skin. The opposite was proven in USSR research already in 1977 (https://www.cia.gov/library/reading-room/docs/CIA-RDP88B01125R000300120005-6.pdf). High frequencies (37-60 GHz), which will be used in 5G, caused several kinds of detrimental effects in experimental rats. The high frequencies seem to be worse than the lower frequencies. The USSR experiments were made more than 40 years ago - when we had no digital pulsed radiation - with a generator producing sinus curves. Peaks of pulsed radiation used in 5G with unpredictable intensity changes seem to be an important parameter for the bioactivity of RF radiation (29).

In conclusion, this article demonstrates that the EU has given mandate to a 13-member, non-governmental private group, the ICNIRP, to decide upon the RF radiation guidelines. The ICNIRP, as well as SCENIHR, are well shown not to use the sound evaluation of science on the detrimental effects of RF radiation, which is documented in the research which is discussed above (9,10,21-24,54,55). These two small organizations are producing reports which seem to deny the existence of scientific published reports on the related risks. It should perhaps be questioned whether it is in the realm of protecting human health and the environment by EU and whether the safety of EU citizens and the environment can be protected by not fully understanding the health-related risks.

REPUBBLICA ITALIANA

IN NOME DEL POPOLO ITALIANO

Il Tribunale Amministrativo Regionale per il Lazio

(Sezione Terza Quater)

ha pronunciato la presente

SENTENZA

sul ricorso numero di registro generale 8373 del 2018, proposto da

Associazione per la prevenzione e la lotta all'elettrosmog, in persona del legale rappresentante pro tempore, rappresentata e difesa dagli avvocati Renato Ambrosio, Stefano Bertone, Chiara Ghibaudo, Luigi M. Angeletti, con domicilio digitale come da PEC da Registri di Giustizia e domicilio eletto presso lo studio dell'avv.to Marco De Fazi in Roma, via della Giuliana n. 44;

contro

Ministero della Salute; Ministero dello Sviluppo Economico; Ministero dell'Istruzione, dell'Università e della Ricerca; Ministero dell'Ambiente e della Tutela del Territorio e del Mare, in persona del legale rappresentante pro tempore, rappresentati e difesi dall'Avvocatura Generale dello Stato, domiciliata ex lege in Roma, via dei Portoghesi n. 12;

nei confronti

Brondi s.p.a., in persona del legale rappresentante pro tempore, rappresentata e difesa dagli avvocati Riccardo Prandi, Alessandro Massaia, Gianluca Contaldi, con domicilio digitale come da PEC da Registri di Giustizia e domicilio eletto presso lo studio dell'avv.to Gianluca Contaldi in Roma, via Pier Luigi da Palestrina n. 63;

per l'accertamento e la declaratoria dell'illegittimità

dell'inerzia serbata dalle Autorità intimate in relazione all'atto di diffida del 28 giugno 2017, formulato dalla ricorrente e diretto a promuovere l'adozione di tutti i provvedimenti finalizzati all'informazione capillare della popolazione, compresa la fascia dei soggetti più a rischio (bambini, adolescenti) sui rischi a breve e lungo termine per la salute dovuti all'uso dei telefoni mobili (cellulari e cordless) e sulle indispensabili misure cautelative da adottare durante il loro utilizzo;

per il conseguente accertamento dell'obbligo di provvedere in capo alle Autorità intimate in relazione al medesimo atto di diffida, mediante l'adozione di ogni idoneo provvedimento espresso, finalizzato ad assicurare alla popolazione idonea informazione sui rischi per la salute dei cittadini, a breve e lungo termine, quali descritti nelle più recenti acquisizioni scientifiche, dovuti all'uso dei telefoni mobili (cellulari e cordless) e sulle indispensabili misure cautelative da adottare durante il loro utilizzo, con particolare riferimento alla fascia dei soggetti più a rischio (bambini, adolescenti);

nonché per l'accertamento

dell'obbligo in capo al Ministero della Salute, e/o al Ministero dell'Ambiente, e/o al Ministero dello Sviluppo Economico (già Ministero dell'Industria) e/o al Ministero dell'Istruzione, dell'Università e della Ricerca, tenendo conto della multiculturalità presente in Italia, di provvedere all'emanazione senza ritardo del decreto di cui all'art. 12 della legge 22 febbraio 2001, n. 36 "Legge quadro sulla protezione dalle esposizioni a campi elettrici, magnetici ed elettromagnetici", anche al fine di indicare al pubblico "le informazioni che i fabbricanti di apparecchi e dispositivi, in particolare di uso domestico, individuale o lavorativo, generanti campi elettrici, magnetici ed elettromagnetici, sono tenuti a fornire agli utenti, ai lavoratori e alle lavoratrici, mediante apposite etichettature o schede informative";

Visti il ricorso e i relativi allegati;
Visti gli atti di costituzione in giudizio del Ministero della Salute, del Ministero dello Sviluppo Economico, del Ministero dell'Istruzione dell'Università e della Ricerca, del Ministero dell'Ambiente e della Tutela del Territorio e del Mare e della società Brondi s.p.a.
Visti tutti gli atti della causa;
Relatore nella camera di consiglio del giorno 13 novembre 2018 il dott. Paolo Marotta e uditi per le parti i difensori come specificato nel verbale;

Con ricorso notificato in data 30 giugno 2018 e depositato il 13 luglio successivo, l'Associazione ricorrente ha impugnato il silenzio – inadempimento asseritamente formatosi sulla istanza – diffida del 28 – 30 giugno 2017, diretta all'adozione da parte delle Autorità intimate di tutte le iniziative finalizzate ad informare la popolazione sui danni a breve e lungo termine connessi all'uso dei telefoni mobili (cordless e cellulari).
La parte ricorrente ha formulato anche istanza cautelare.
A fondamento della propria legittimazione ad agire, la ricorrente richiama il proprio Statuto e segnatamente l'art. 6 dello Statuto, che individua quale scopo dell'associazione quello di tutelare la salute degli esseri viventi e dell'ambiente dall'esposizione ai campi magnetici ed elettromagnetici.
Quale fondamento giuridico dell'obbligo di provvedere, la ricorrente richiama le seguenti fonti normative: l'art. 32 della Costituzione; la legge 13 marzo 1958 n. 296; gli artt. 1, 4, 10 e 12 della l. 22 febbraio 2001 n. 36 (legge quadro sulla protezione dalle esposizioni ai campi elettrici, magnetici ed elettromagnetici), la direttiva 1999/5/CE; l'art. 2043 c.c.
Si sono costituite le Amministrazioni intimate, eccependo, in via preliminare, l'inammissibilità del ricorso sotto diversi profili e contestando, nel merito, la fondatezza delle doglianze formulate dalla parte ricorrente.
Si è costituita in giudizio anche la società Brondi s.p.a., eccependo l'inammissibilità del ricorso per difetto di giurisdizione del giudice adito, il difetto di legittimazione della ricorrente, l'insussistenza dell'obbligo di provvedere, il difetto di integrità del contraddittorio, il difetto dei presupposti per la concessione della misura cautelare.
Con memoria depositata in data 13 ottobre 2018 la ricorrente, pur riconoscendo l'inammissibilità del rito del silenzio nei confronti degli atti di natura normativa, si è soffermata a considerare la mancata attuazione della campagna di informazione e di educazione ambientale, di cui all'art. 10 della l. n. 36/2001.
Nel corso del giudizio le parti costituite hanno avuto modo di rappresentare compiutamente le rispettive tesi difensive.
All'udienza camerale del 13 novembre 2018, su richiesta delle parti, come da verbale, il ricorso è stato trattenuto in decisione.
Preliminarmente, in accoglimento della eccezione sollevata dalle Amministrazioni resistenti, deve essere dichiarata l'inammissibilità parziale del ricorso, per difetto assoluto di giurisdizione, in ordine al mancato esercizio da parte delle Amministrazioni intimate di poteri di natura normativa.
In prima istanza, infatti, l'Associazione ricorrente si duole dell'inerzia delle Amministrazioni intimate rispetto alla attuazione dell'art. 12, comma 1, della l. n. 36/2001, a norma della quale: "1. Con decreto del Ministro dell'ambiente, di concerto con il Ministro della sanità, previo parere del Comitato e sentite le competenti Commissioni parlamentari, sono stabilite, entro centoventi giorni dalla data di entrata in vigore della presente legge, tenendo conto anche degli orientamenti e degli atti dell'Unione europea in materia di inquinamento elettromagnetico, tutela dei consumatori e istruzioni per l'uso dei prodotti, le informazioni che i fabbricanti di apparecchi e dispositivi, in particolare di uso domestico, individuale o lavorativo, generanti campi elettrici, magnetici ed elettromagnetici, sono tenuti a fornire agli utenti, ai lavoratori e alle lavoratrici, mediante apposite etichettature o schede informative. Le

informazioni devono riguardare, in particolare, i livelli di esposizione prodotti dall'apparecchio o dal dispositivo, la distanza di utilizzo consigliata per ridurre l'esposizione al campo elettrico, magnetico ed elettromagnetico e le principali prescrizioni di sicurezza. Con lo stesso decreto sono individuate le tipologie di apparecchi e dispositivi per i quali non vi è emissione di campo elettrico, magnetico ed elettromagnetico, o per i quali tali emissioni sono da ritenersi cosi basse da non richiedere alcuna precauzione".

Orbene, risulta non controverso tra le parti che questa disposizione normativa non ha ancora trovato attuazione. Sennonché il rito del silenzio – inadempimento non può essere utilizzato per costringere le Amministrazioni intimate alla adozione del decreto ministeriale, cui fa riferimento la disposizione normativa sopra richiamata, costituendo esso un atto di natura normativa (più precisamente, regolamentare).

Per pacifica giurisprudenza infatti, è esclusa, ai sensi dell'art. 7, co. 1, ultimo periodo, c.p.a., la possibilità di sindacare, con lo speciale rito del silenzio, la mancata adozione, da parte degli organi titolari del relativo potere, di atti normativi (leggi, atti aventi forza di legge, regolamenti), venendo in rilievo ambiti nei quali l'Amministrazione esprime scelte di natura politica (Consiglio di Stato, sez. V, 22 gennaio 2015 n. 273).

Ne consegue che la domanda formulata dalla odierna ricorrente deve essere considerata in parte qua inammissibile, per difetto assoluto di giurisdizione, dovendo ritenersi che la mancata adozione del decreto ministeriale, di cui all'art. 12 della l. n. 36/2001, assuma rilevanza solo sul piano della responsabilità politica degli organi di governo e, comunque, non sia coercibile sul piano giuridico con il ricorso al rito del silenzio – inadempimento.

Sempre in via preliminare, deve essere esaminata l'eccezione di inammissibilità del ricorso, per difetto di legittimazione attiva dell'Associazione ricorrente, sollevata dalle Amministrazioni resistenti. Queste ultime sostengono che, non figurando tra le Associazioni di protezione ambientale individuate con decreto del Ministro dell'Ambiente di cui all'art. 13 della l. n. 349/1986, l'Associazione ricorrente sarebbe priva di legittimazione ad agire.

L'eccezione è infondata.

Ritiene il Collegio di aderire a quell'orientamento giurisprudenziale secondo il quale l'esplicita legittimazione, ai sensi degli artt. 13 e 18 della legge 8 luglio 1986, n. 349, delle Associazioni ambientalistiche di dimensione nazionale e ultraregionale all'azione giudiziale non esclude, di per sé sola, analoga legittimazione ad agire in un ambito territoriale ben circoscritto, e ciò anche per i comitati che si costituiscono al precipuo scopo di proteggere l'ambiente, la salute e/o la qualità della vita delle popolazioni residenti su tale circoscritto territorio. Le previsioni normative citate hanno introdotto un criterio di legittimazione "legale" "aggiuntivo", e non "sostitutivo", rispetto ai criteri elaborati precedentemente dalla giurisprudenza per l'azionabilità in giudizio dei c.d. "interessi diffusi". Ne consegue che il giudice amministrativo può riconoscere, caso per caso, la legittimazione a impugnare atti amministrativi a tutela dell'ambiente a favore di associazioni locali (indipendentemente dalla loro natura giuridica), purché le stesse a) perseguano statutariamente in modo non occasionale obiettivi di tutela ambientale, b) abbiano un adeguato grado di rappresentatività e stabilità e c) svolgano la propria attività in un'area di afferenza ricollegabile alla zona in cui è situato il bene a fruizione collettiva che si assume leso (Consiglio di Stato, sez. V, 17 ottobre 2012 n. 5295; in senso conforme, Consiglio di Stato, sez. VI, 12 giugno 2015 n. 2894).

Orbene, dagli atti depositati in giudizio emerge che:

- l'Associazione ricorrente è stata costituita ai sensi della l. 7 dicembre 2000 n. 383;
- lo Statuto dell'Associazione stabilisce, all'art. 5, che la durata dell'Associazione è illimitata, e all'art. 6, che lo scopo principale dell'Associazione medesima è quello di "promuovere, attraverso l'azione dei suoi Soci, la tutela della salute e della integrità degli esseri viventi e dell'ambiente dall'esposizione ai campi elettrici, magnetici ed elettromagnetici, statici o variabili, generati artificialmente e da tutte le forme di inquinamento chimico, fisico, radioattivo e biologico";
- l'ambito di operatività dell'Associazione è individuato nel territorio della Regione Veneto (art. 7 dello Statuto).

Ritiene conseguentemente il Collegio che conformemente all'orientamento giurisprudenziale sopra richiamato non vi siano ragioni per denegare alla Associazione ricorrente la legittimazione ad agire per la tutela della salute e

dell'ambiente dall'inquinamento elettromagnetico indotto dall'uso dei telefoni mobili (cellulari e cordless).

Il Collegio non ravvisa poi la necessità di disporre l'integrazione del contraddittorio, sulla base della eccezione sollevata dalla società Brondi s.p.a., non venendo in rilievo rispetto alla fattispecie dedotta in giudizio controinteressati in senso tecnico.

Nel merito, il Collegio rileva che, facendo seguito ad altre precedenti istanze, l'Associazione ricorrente, con istanza del 28 giugno 2017, ha diffidato il Ministero della Salute, il Ministero dell'Ambiente e il Ministero dello Sviluppo Economico ad adottare i seguenti atti:

a) ad emanare il decreto di cui all'art. 12 della l. n. 36/2001;

b) ad eseguire una campagna informativa rivolta alla intera popolazione, avente ad oggetto la indicazione delle modalità d'uso e dei rischi per la salute e per l'ambiente connessi all'uso di telefoni cellulari e cordless.

Con il ricorso in esame, dopo essersi lungamente soffermata sui rischi per la salute e per l'ambiente derivanti da un uso improprio degli apparecchi di telefonia mobile soprattutto per gli utenti più giovani di età, sulla base delle ultime ricerche scientifiche, l'Associazione ricorrente ha chiesto l'annullamento del silenzio – inadempimento formatosi per effetto dell'inerzia delle Amministrazioni intimate e che venga accertato l'obbligo delle predette Amministrazioni di provvedere, entro un determinato termine.

Orbene, come sopra evidenziato, la domanda (processuale) dell'Associazione ricorrente diretta ad ottenere l'emanazione del decreto ministeriale di cui all'art. 12 della l. n. 36/2001, è inammissibile per difetto assoluto di giurisdizione, venendo in rilievo il mancato esercizio di poteri di natura normativa.

Rimane invece da scrutinare la fondatezza della domanda formulata dalla ricorrente con riferimento al mancato avvio da parte dei Ministeri competenti ratione materiae di una campagna informativa rivolta alla intera popolazione, avente ad oggetto l'indicazione delle modalità d'uso e dei rischi per la salute e per l'ambiente connessi all'uso degli apparecchi di telefonia mobile (telefoni cellulari e cordless).

L'Associazione ricorrente individua il fondamento giuridico della predetta richiesta nell'art. 10 della l. n. 36/2001, a norma del quale: "Il Ministro dell'ambiente, di concerto con i Ministri della sanità (ora Ministro della salute, n.d.r.), dell'università e della ricerca scientifica e tecnologica e della pubblica istruzione (ora Ministro dell'Istruzione, dell'Università e della Ricerca, n.d.r.), promuove lo svolgimento di campagne di informazione e di educazione ambientale ai sensi della legge 8 luglio 1986 n. 349".

Nel corso del giudizio, l'Associazione ricorrente ha prodotto alcuni documenti tratti dalla letteratura scientifica, dai quali emerge che l'utilizzazione inadeguata dei telefoni cellulari o cordless, comportando l'esposizione di parti sensibili del corpo umano ai campi elettromagnetici, può avere effetti nocivi per la salute umana, soprattutto con riguardo ai soggetti più giovani e, quindi, più vulnerabili, potendo incidere negativamente sul loro sviluppo psico – fisico.

Orbene, i rischi per la salute paventati dall'Associazione ricorrente non sono stati efficacemente contestati dalle Amministrazioni resistenti, che si sono limitate ad invocare l'inammissibilità anche di questa seconda richiesta.

A tale riguardo, ritiene il Collegio che le campagne informative e di educazione ambientale di cui all'art. 10 della l. n. 36/2001 non possano essere sussunte nella categoria degli atti meramente materiali, come sostenuto dalle Amministrazioni resistenti, ma debbano essere ascritte al genus degli atti amministrativi generali, in quanto sono rivolte ad una pluralità indefinita di soggetti, trovano il fondamento giuridico in norme di rango legislativo, presuppongono lo svolgimento di un'attività istruttoria finalizzata alla individuazione dei rischi connessi all'esposizione del corpo umano ai campi elettromagnetici e alla individuazione delle precauzioni da adottare (sia da parte degli utenti che dei produttori dei predetti apparecchi) per limitarne gli effetti potenzialmente nocivi per la salute e hanno lo scopo di sensibilizzare gli utenti in merito ad un uso più consapevole degli apparecchi di telefonia mobile, al fine di salvaguardare il diritto alla salute che è un diritto costituzionalmente tutelato (art. 32 della Costituzione).

Dagli atti depositati in giudizio risulta che già, con nota prot. n. 0001080 –P del 16 gennaio 2012, il Ministero della Salute, in riscontro ad una precedente richiesta di uno dei procuratori della Associazione ricorrente, evidenziava: "…. il tema dei possibili rischi per la salute conseguenti all'uso del cellulare è alla costante attenzione del Ministero della Salute, in particolare a seguito della classificazione stabilita dall'Agenzia Internazionale per la Ricerca sul Cancro nel 2011, di agente possibilmente cancerogeno per l'uomo (categoria 2B) per i campi elettromagnetici in radiofrequenza".

Nella medesima nota, il Ministero della Salute, ha evidenziato che il Consiglio Superiore di Sanità, nel parere del 15 novembre 2011, tenuto conto della posizione formalmente assunta dall'Istituto Superiore di Sanità, "… ha rilevato che allo stato delle conoscenze scientifiche non è dimostrato alcun nesso di causalità tra esposizione a radiofrequenze e patologie tumorali, rimarcando tuttavia come l'ipotesi di un rapporto causale non possa essere del tutto esclusa in relazione ad un uso molto intenso del telefono cellulare…" e che lo stesso Consiglio Superiore di Sanità "… ha quindi raccomandato di mantenere vivo l'interesse della ricerca e della sorveglianza sul tema, in attesa che le nuove conoscenze risolvano le attuali aree di incertezza, suggerendo nel contempo l'avvio di una campagna d'informazione al pubblico al fine di promuovere e incoraggiare un uso responsabile del telefono, soprattutto in relazione ai bambini che tendono ad essere avvicinati all'uso del telefono cellulare in età sempre più precoce", precisando infine: "La campagna di informazione è in fase di preparazione e sarà basata sul quadro delle conoscenze desumibili dalle più autorevoli fonti e organismi nazionali e internazionali".

Nonostante il ragguardevole lasso di tempo intercorso, la preannunciata campagna informativa non risulta essere stata ancora attuata.

Deve conseguentemente essere dichiarato l'obbligo del Ministero dell'Ambiente, del Ministero della Salute e del Ministero dell'Istruzione, dell'Università e della Ricerca, ciascuno per il proprio ambito di competenza, di provvedere, in attuazione di quanto disposto dall'art. 10 della l. n. 36/2001, ad adottare una campagna informativa, rivolta alla intera popolazione, avente ad oggetto la individuazione delle corrette modalità d'uso degli apparecchi di telefonia mobile (telefoni cellulari e cordless) e l'informazione dei rischi per la salute e per l'ambiente connessi ad un uso improprio di tali apparecchi.

La predetta campagna di informazione e di educazione ambientale dovrà essere attuata nel termine di sei mesi dalla notifica o, se anteriore, dalla comunicazione in via amministrativa della presente sentenza, avvalendosi dei mezzi di comunicazione più idonei ad assicurare una diffusione capillare delle informazioni in essa contenute.

In ragione dell'accoglimento parziale delle domande formulate dall'Associazione ricorrente, ricorrono all'evidenza valide ragioni per disporre l'equa compensazione delle spese di giudizio.

P.Q.M.

Il Tribunale Amministrativo Regionale per il Lazio (Sezione Terza Quater), definitivamente pronunciando sul ricorso, come in epigrafe proposto, così dispone:

- dichiara inammissibile, per difetto assoluto di giurisdizione, la domanda di annullamento del silenzio – inadempimento sulla istanza della ricorrente relativa alla emanazione del decreto ministeriale, di cui all'art. 12 della l. n. 36/2001;

- accoglie la domanda di annullamento del silenzio – inadempimento sulla istanza presentata dalla ricorrente, sulla base dell'art. 10 della l. n. 36/2001, e, per l'effetto, dichiara l'obbligo del Ministero dell'Ambiente, del Ministero della Salute e del Ministero dell'Istruzione, dell'Università e della Ricerca, ciascuno per il proprio ambito di competenza, di provvedere (nei termini e con le modalità indicate in motivazione) ad adottare una campagna informativa, rivolta alla intera popolazione, avente ad oggetto l'individuazione delle corrette modalità d'uso degli apparecchi di telefonia mobile (telefoni cellulari e cordless) e l'informazione dei rischi per la salute e per l'ambiente connessi ad un uso improprio di tali apparecchi.

Spese compensate.

Ordina che la presente sentenza sia eseguita dall'autorità amministrativa.

Così deciso in Roma nella camera di consiglio del giorno 13 novembre 2018 con l'intervento dei magistrati:

Giuseppe Sapone, Presidente

Pierina Biancofiore, Consigliere

Radiofrequency radiation from nearby mobile phone base stations-a case comparison of one low and one high exposure apartment

TARMO KOPPEL[1], MIKKO AHONEN[2], MICHAEL CARLBERG[3], LENA K. HEDENDAHL[3] and LENNART HARDELL[3]

[1]Department of Labour Environment and Safety, Tallinn University of Technology, Tallinn 19086; [2]Institute of Environmental Health and Safety, Tallinn 11615, Estonia; [3]The Environment and Cancer Research Foundation, SE-702 17 Örebro, Sweden

Received May 10, 2019; Accepted August 5, 2019

DOI: 10.3892/ol.2019.10899

Abstract. Radiofrequency (RF) radiation in the frequency range of 30-300 GHz has, since 2011, been classified as a 'possible' human carcinogen by Group 2B, International Agency for Research on Cancer (IARC) at WHO. This was based on a number of human epidemiology studies on increased risk for glioma and acoustic neuroma. Based on further human epidemiology studies and animal studies, the evidence on RF radiation carcinogenesis has increased since 2011. In previous measurement studies, it has been indicated that high environmental RF radiation levels are present in certain areas of Stockholm Sweden, including in one apartment. Field spatial distribution measurements were performed in the previously measured apartment in Stockholm, which exhibited high RF radiation from nearby base stations. Based on the RF broadband analyzer spot measurements, the maximum indoor E-field topped at 3 V m^{-1} in the bedroom at the 7th floor. The maximum outdoor exposure level of 6 V m^{-1} was encountered at the 8th floor balcony, located at the same elevation and only 6.16 m away from the base station antennas. For comparison, a measurement was made in a low exposure apartment in Stockholm. Here, the maximum indoor field 0.52 V m^{-1} was measured at the corner window, with direct line of sight to the neighboring house with mobile phone base station antennas. The maximum outdoor field of 0.75 V m^{-1} was measured at the balcony facing the same next-door building with mobile phone base station antennas. The minimum field of 0.10 V m^{-1} was registered on the apartment area closest to the center of the building, demonstrating the shielding effects of the indoor walls. Good mobile phone reception was achieved in both apartments. Therefore, installation of base stations to risky places cannot be justified using the good reception requirement argument.

Key words: radiofrequency radiation, microwaves, mobile phone, base stations, exposure, health, building

Introduction

Public exposure to radiofrequency (RF) electromagnetic fields (EMF) in today's cities may be caused by a number of sources, including mobile phone base stations, TV and radio towers, wireless local area networks (WLAN), emergency services radio network, RF-identification systems, microwave ovens, anti-theft gates etc. Additionally, individual's exposure may be significantly elevated by personal usage of mobile and cordless phones, 2-way radios, WLAN, Bluetooth and other wireless devices. In this study we have focused on the exposure from mobile phone base station antennas. Exposure in two apartments positioned close to mobile phone base station antennas is measured in detail.

Developments in telecommunications technologies have led to widespread use of mobile devices connected to the network in constantly increasing loads. This has resulted also in the public's exposure to RF EMFs. Temporal trends in RF EMF exposure in everyday environments were investigated across European cities of Basel, Ghent and Brussels in 2011-2012 (1). Within a year total RF exposure levels in all investigated outdoor locations combined raised 57.1%. The increase in exposure was most notably observed in outdoor locations due to mobile phone base stations (1).

In many European countries on-site RF exposure measurements have been conducted since the 1990's. Most studies have focused on the mobile communications' frequency bands. A comparative analysis concluded that due to the developments in telecommunications technology, the RF exposure is continuously increasing and is estimated >65% of the total exposure (2). Based on the personal exposure measurements in the EU, the mean RF is generally from 0.10 to 0.26 V m^{-1}; however most of these studies are based on outdoor measurements.

RF field exposure literature in Europe was reviewed, comparing indoor levels to outdoor levels (3). The mean RF

exposure from spot measurements in homes was determined to be 0.29 V m^{-1} and for outdoor 0.54 V m^{-1}. In outdoor studies the exposure levels rarely exceeded 1.0 V m^{-1}, whereas the highest exposure contributor was the downlink i.e., radiation from mobile phone base station antenna. A finding of the systematic review was that there was no distinct difference in exposure levels between European countries. However, studies done by different researchers across the Europe have used different procedures limiting the comparability between studies (3).

RF levels are exponentially higher when located closer to the mobile phone base station antenna. Therefore, proper safety measures must be applied when protecting public from the excess RF radiation. One of the main safety principles is creating sufficient distance between the public and the RF sources. This requirement may not be met in certain housing conditions. Mobile phone base stations installed on rooftops may become very close to people in nearby apartments.

RF field exposure from a mobile phone base station antenna, located at the rooftop showed that allowable maximum safety levels were exceeded when being closer than 30 m to the base station antenna (4). With the increasing distance, the RF power density is increasingly affected by the landscape topography, buildings, and trees that induce reflection and absorption. Also, RF power density depends on the numbers of channels in use by the base station antenna, the number of time intervals used and other mobile communication specific factors. The base station's maximum RF level varies across the day, which is an indicator of the mobile communications' service load. Also, RF power density distribution is greatly determined by the antenna's directional pattern. Values were measured highest in the balconies within the main radiation lobe of the antenna (4).

We have previously reported results from our measurements of RF radiation levels at certain places in Stockholm, Sweden such as at the Central Railway station (5), the Old Town (6), and in the City (7). High radiation was measured at a square, Järntorget, in the Old Town as further displayed in a recent publication displaying RF E-field distribution (8). Most of the radiation was downlink.

Of special concern is our results of measurements in a Stockholm apartment for everyday living purposes (9). Two groups of base stations are located close to the apartment. The total mean RF radiation level was 3,811 $\mu W/m^2$ (range 15.2-112,318 $\mu W/m^2$) for the measurement of the whole apartment, including balconies. Particularly high levels were measured on three balconies and in 3 of 4 bedrooms. High mean exposure levels in the bedrooms of growing children (one at 2,531 $\mu W/m^2$ and the other at 1,471 $\mu W/m^2$) with maximum peaks at 11,803 and 13,739 $\mu W/m^2$, respectively, may have deleterious effects on their physical and mental health (9,10).

The aim of this study was to further investigate radiation levels in the high exposure apartment (9) and to compare it with a low exposure apartment showing RF E-field distribution. This was a measurement study with no involvement of test persons. Thus, no ethical permission was needed.

Materials and methods

In the present study RF field levels were investigated in two apartments near mobile phone base station antennas. One of the apartments represented a high exposure living area, while the other was of low exposure area. Both of the apartments were near to mobile phone base stations but located at different city districts in Stockholm, Sweden. The locations of the base stations close to the apartment with high RF radiation exposure are shown in Figs. 1 and 2, whereas the base stations relating to the low exposure apartment are shown in Fig. 3.

The high exposure apartment's outdoor areas were positioned close to the mobile phone base station antennas, being as close as 6 m. The low exposure apartment's balcony was about 40 m away from the base station antennas, since these were installed on the neighboring building and significantly higher on the roof.

Field spatial distribution measurements were conducted in the investigated apartments. The following analyses bring forth the low and high exposure determinant factors. RF electric field was measured at each room of the apartments. Depending on the room size, the room was divided into two to ten quadrants (smaller imaginary squares). At each quadrant a spot measurement was conducted. At each spot the field was measured with slow circular movements to cover the area of about 1 m^2 at heights of 0.7-2 m. At each spot, the average and maximum electric field in Volts per meter (V m^{-1}) was recorded representing the measurement period of about 1 min.

The measurements were conducted on a working day during business hours (afternoon) in January 2019.

Field perturbation by the measurer was minimized by distancing the meter from the body-the meter was held at arm's length, with the extending probe outward. The measurements area was therefore at about 0.8-0.9 m from the investigator.

Spot distance to mobile phone base station antenna was measured by targeting the closest antenna element. Distance was measured by laser distance meter STABILA LE50, which provides precise distance measurements up to 100 m with the resolution of 0.001 m at the accuracy ±1.5 mm/m.

The measurements were conducted with a RF broadband analyzer, Narda NBM-520, with a E-field probe E0391 (Narda-Safety-Test-Solutions GmbH, Pfullingen, Germany). The Narda NBM-series meter is capable of time and spatial averaging and determining the maximum level during the period monitored. Narda EF0391 probe is intended by the manufacturer for base station measurements and has a frequency range from 100 kHz to 3 GHz.

The broadband meter Narda EF0391 covers a large range of RF transmissions, including different telecommunications protocols: frequency modulation (FM) radio broadcasting; television (TV) broadcasting; TETRA emergency services (police, rescue, etc.); global system for mobile communications (GSM) second generation mobile communications; universal mobile telecommunications systems (UMTS) third generation mobile communications, 3G; long-term evolution (LTE) fourth generation mobile communications standard, 4G; digital European cordless telecommunications (DECT) cordless telephone systems standard; Wi-Fi wireless local area network protocol, 2.45 GHz; worldwide interoperability for microwave access (WIMAX) wireless communication standard for high speed voice, data and internet.

Mobile communications' service coverage reception level was confirmed using an Android mobile phone, showing service coverage in decibel milliwatts (dBm).

Figure 1. A view from the high exposure apartment's balcony, this was one of the highest exposure areas in the apartment's main floor with the RF field topping at 5.1 V m^{-1}, base station antenna as 11.87 m away from the fence. RF, radiofrequency.

Figure 2. A view from the high exposure apartment's balcony, a set of mobile phone base station antennas are 6 m away from the fence; this was the highest radiation area, with the RF exposure topping at 6 V m^{-1}, even though the antennas sector was positioned away from the balcony. RF, radiofrequency.

In the present study, measurement data are presented both in tables and visual views. Spatial distribution of the RF levels is presented in a heat map view. Heat map is possible only by a volume of spatially scattered spot measurements. Heat map is also seen by some other authors as a way to communicate the measurements data in a comprehensible way to the public (11).

The measurement data, specifically average spot measurement values, were entered to the contour map software 3DFIELD ver. 4.5.2.0 (by Vladimir Galouchko) and spatial field distribution maps were drawn. Field distribution maps were based on the spot measurements using 1 min time averaging.

Conversion from V m^{-1}, to W/m^2, see also Table I. In most of our earlier studies we have used the EME Spy 200 from Satimo and preferred to show our results in power flux density in W/m^2 and μW/m^2 for RF radiation. In the current measurements the broadband analyzer Narda NBM-520 measures in V m^{-1} and the contour map software 3DFIELD is also constructed for measurements in V m^{-1}.

To convert from electric field strength, E, in V m^{-1} to power flux density in W/m^2, S, use the formula: $S=0.002654 \times E^2$

Figure 3. View to the low exposure apartment (rectangle). Mobile phone base station antennas are visible on the neighboring building (circled); the highest RF exposure level was on the balcony, which had the line of sight to both of the antennas. However due to the elevation difference, the balcony had highest electric field only 0.75 V m^{-1}; based on spot measurements maximum readings over 1-min period; base station antennas' sector include the investigated building. Rectangle, low exposure apartment; circle, neighboring building. RF, radiofrequency.

Statistical methods. The data was analyzed using the spreadsheet software Microsoft Excel 2016, calculating mean, median, minimum and maximum for the measured areas. Mean ($\bar{x}$), median, and minimum values were based on the time averaging function of spot measurements; maximum value was based on the maximum reading registered during the spot measurement. Differences in field level across different areas was compared in a table and illustrated in a box plot and the factors determining the attenuation/elevation of the field pointed out.

Results

The field spatial distribution measurements conducted at the apartments in Stockholm show great variation in the RF field levels.

High exposure apartment. As illustrated in Figs. 4-6, the propagation of the field from the nearby mobile phone base stations' several antennas in the high exposure apartment. Based on the RF broadband analyzer spot measurements, the maximum indoor E-field topped at 3 V m^{-1} at the bedroom on the 7th floor. The maximum outdoor exposure level of 6 V m^{-1} was encountered on the 8th floor balcony, located at the same elevation and only 6.16 m away from the base station antennas. Outdoor areas i.e. balconies have notably higher exposure, indicated by the darker color.

High exposure levels were encountered also on the 6th floor balcony with a direct line of sight to the mobile phone base station antenna at 11.87 m distance. Since the base station antenna was not aimed at the aforementioned area, hence even higher exposure conditions are avoided. The lowest exposure area is in the middle of the apartment (0.30 V m^{-1}), which is still twice as high as the mean exposure level of the low exposure apartment (0.16 V m^{-1}).

Low exposure apartment. RF field in the low exposure apartment is illustrated in Fig. 7. The field distribution in low

exposure apartment shows much less variation in amplitude, as the field is several times lower when compared to the high exposure apartment. The maximum indoor field (0.52 V m^{-1}) was measured at the corner window, with direct line of sight to the neighboring house with mobile phone base station antennas. Maximum outdoor field of 0.75 V m^{-1} was measured at the balcony facing the same next-door building with mobile phone base station antennas. The minimum field of 0.10 V m^{-1} was registered on the apartment area closest to the center of the building, hence demonstrating the shielding effects of the indoor walls.

Spot measurements resulted both in time averaged and maximum RF field levels. Pearson's product-moment correlation coefficient shows high correlation between the two sets of values: r=0.95 in the high exposure apartment, and r=0.97 in the low exposure apartment. In average, maximum values were 58% higher than time averaged values in the high exposure apartment, and 87% higher in the low exposure apartment.

In Fig. 8 a boxplot is presented comparing the high exposure apartment to the low exposure apartment (indoor areas) based on 1-min spot measurements maximum reading.

Field increase from indoor to outdoor. Comparison was also made in both apartments between the outdoor area (staying at the balcony) and the corresponding adjacent room area, which had access to the balcony. There was about a five-fold difference in mean indoor exposure levels and about a six-fold difference in mean outdoor exposure levels between the apartments. Considering maximum readings, the outdoor exposure difference was eight-fold.

Tables II and III presents the main statistics for the low exposure and high exposure apartment, expressed in V m^{-1} (Table II) and $\mu W/m^2$ (Table III). Tables II and III statistics are based on 1-min averaged spot measurements. The maximum indoor RF field was 0.52 V m^{-1} and 3.00 V m^{-1} respectively. Maximum reading at the balcony outside the low exposure apartment was 0.75 V m^{-1} compared with 6.00 V m^{-1} outside the high exposure apartment.

Discussion

There are a limited number of studies of RF exposure levels in Sweden. A car mounted measurement system was used to map spatially some of rural, urban and city areas published in 2014 (12). Mean power density levels showed highest exposure levels at Stockholm city (6,700 $\mu W/m^2$), followed by city of Solna (3,278 $\mu W/m^2$) and then urban areas as represented by Göteborg, Helsingborg, Jönköping and Ljungby (1,500 $\mu W/m^2$) and rural areas represented by Ryssby and Ekerö (230 $\mu W/m^2$). Their study clearly indicated that higher population density results in higher RF exposure (12). They also noted that power density can vary by >50 dB (100,000 times) over a driving distance of 10 km, which supports the finding in our study-high RF exposure is not required to have a good mobile telephony service reception. Note that these measurements do not represent current RF radiation due to the rapid increase of deployment of the wireless communication (8).

A RF survey in Greece, found median urban electric field (median 1.1 V m^{-1}) to be significantly higher than rural levels (median 0.3 V m^{-1}). As the study utilized temporal measurements with 6-min averaging from 90 installed measurements stations, the data showed large diurnal variation for stations positioned close to mobile phone base stations, with median diurnal variation of 33.8% (13). These measurements are also old.

Baltrėnas *et al* (4) investigated a 10-story building neighboring a mobile phone base station antenna, where the height of the building was 30 m distanced 35 m from the base station. These conditions are similar to our study. The base station antenna was approximately on the same height as floor 6. Consequently, the highest exposed floors were 5-7, with floors where the power density at the balcony was about three times higher at 6th floor as compared to the 3rd floor. The difference was about 15-times when comparing the RF power density at the 1st floor to the 6th floor (4).

The present measurements with means of RF radiation up to 1.3 V/m (4,485 $\mu W/m^2$) at the windows in the bedrooms in the high exposure apartment imply that this exposure may almost be compared to the exposure from a mobile phone in calling mode for many hours per day. A cohort study on Swiss adolescents showed that there was an association between whole body cumulative RF radiation dose from mobile phone talk, internet use and sent SMS and symptoms like headache and exhaustibility and also a decrease in figural memory (14,15).

Many research studies have shown effects from RF radiation exposure on animals below current safety levels with opened blood brain barrier and neuronal damage (16,17), oxidative stress with increased production of reactive oxygen species (18,19),

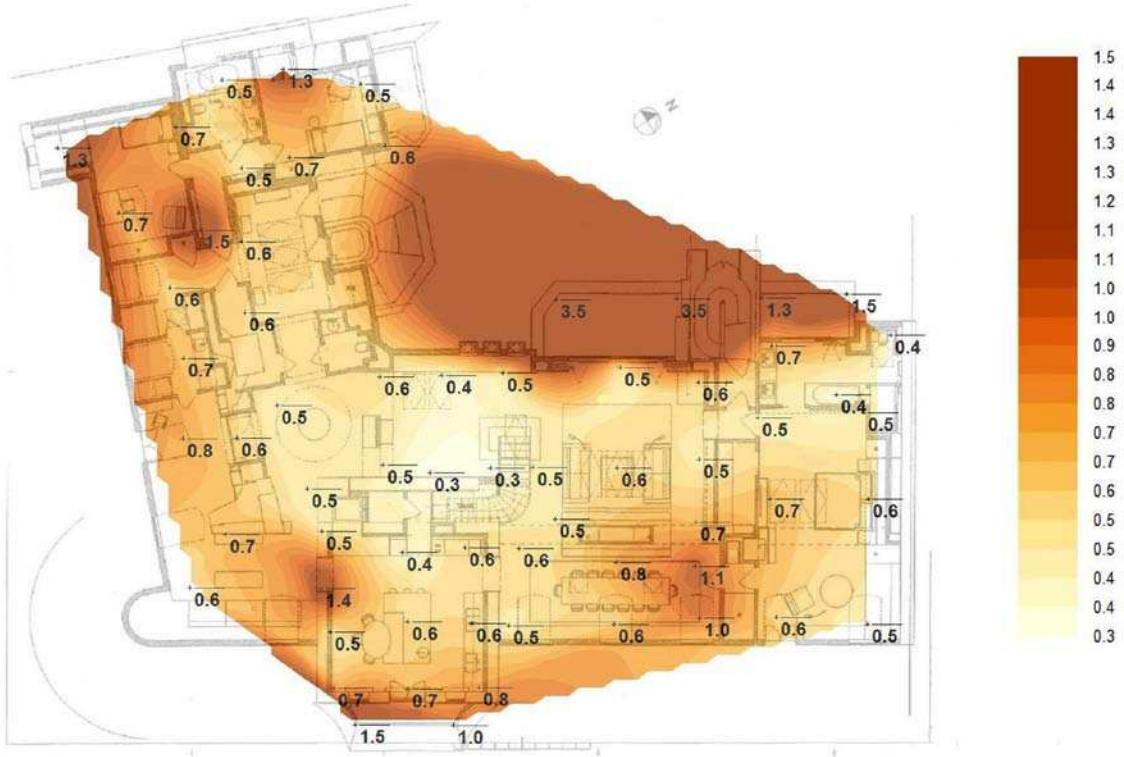

Figure 4. Spatial field distribution map of the high exposure apartment on the 6th floor; time-averaged RF electric field (V m^{-1}). RF, radiofrequency.

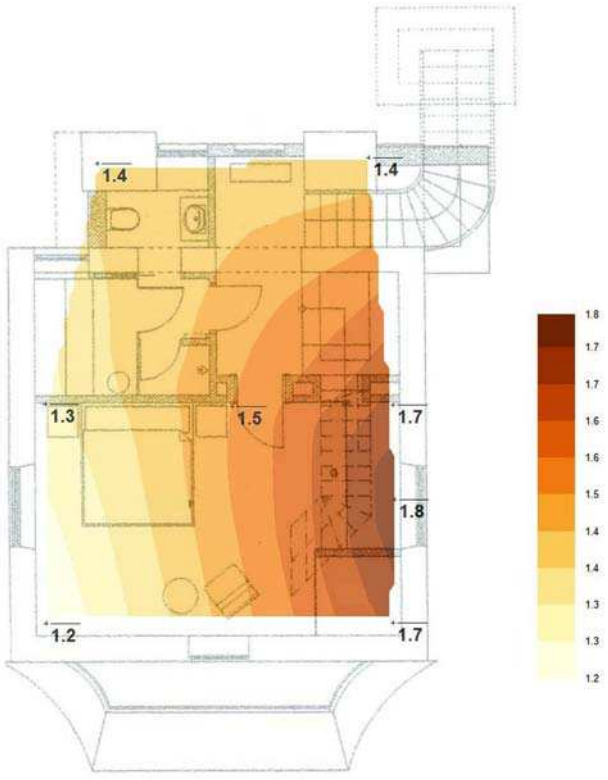

Figure 5. Spatial field distribution map of the high exposure apartment, a bedroom on the 7th floor; time-averaged RF electric field (V m^{-1}). RF, radio-frequency.

DNA-damage especially in the memory center hippocampus in the brain and increase in pro-inflammatory cytokines (20).

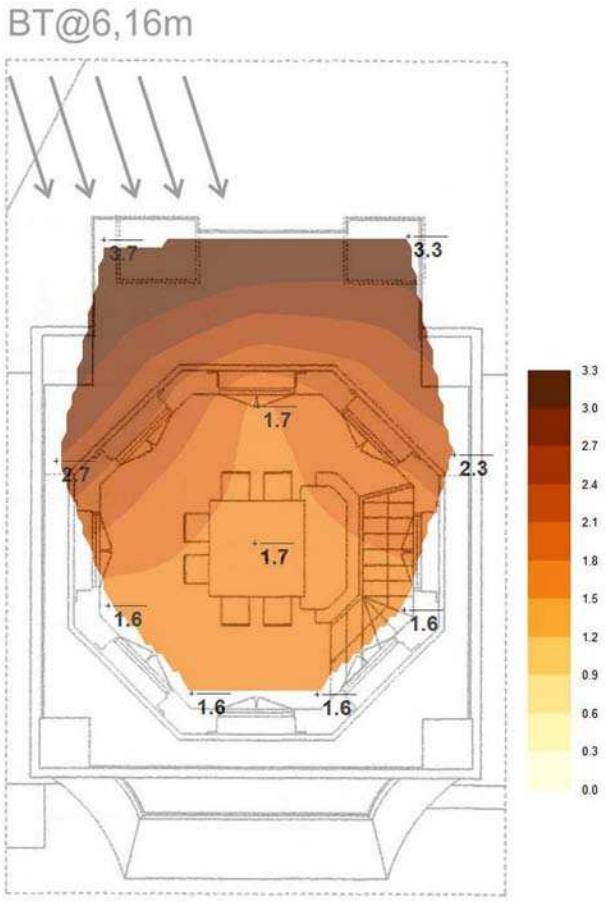

Figure 6. Spatial field distribution map of the high exposure apartment, a room on the 8th floor and on the same elevation with mobile phone base station antennas; RF radiation from base station antennas indicated with arrows; time-averaged RF electric field (V m^{-1}). RF, radiofrequency.

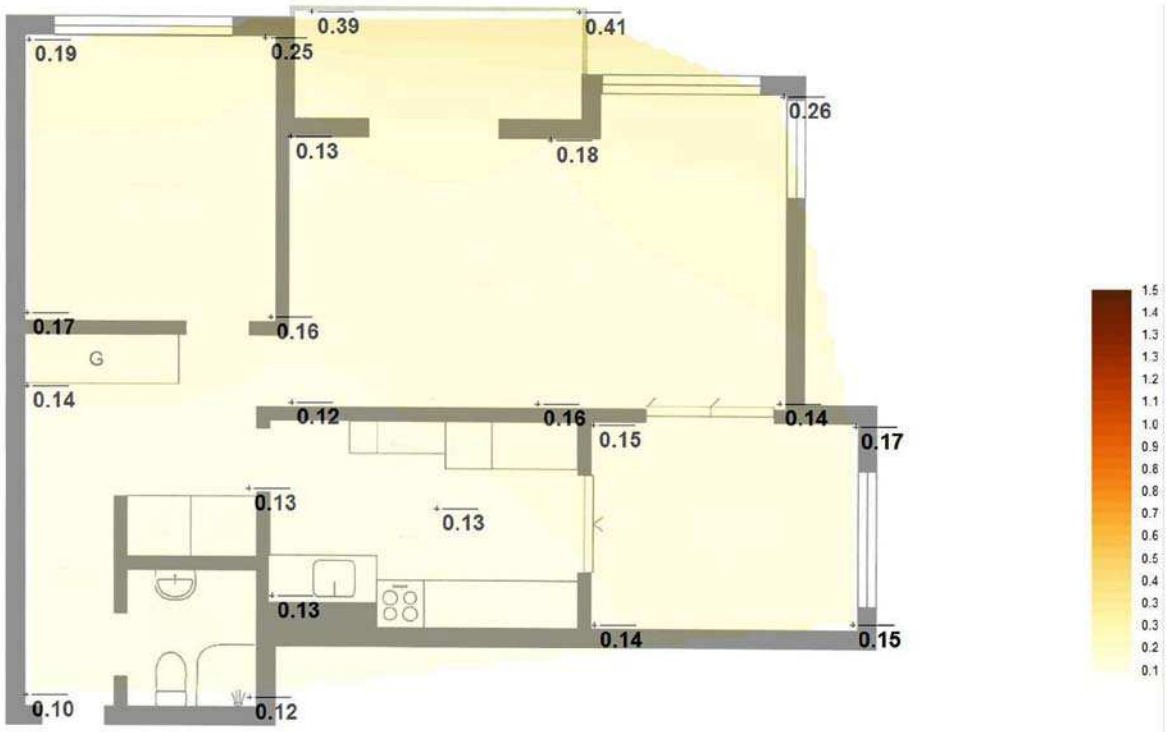

Figure 7. Spatial field distribution map of the low exposure apartment; time-averaged RF electric field (V m^{-1}). RF, radiofrequency.

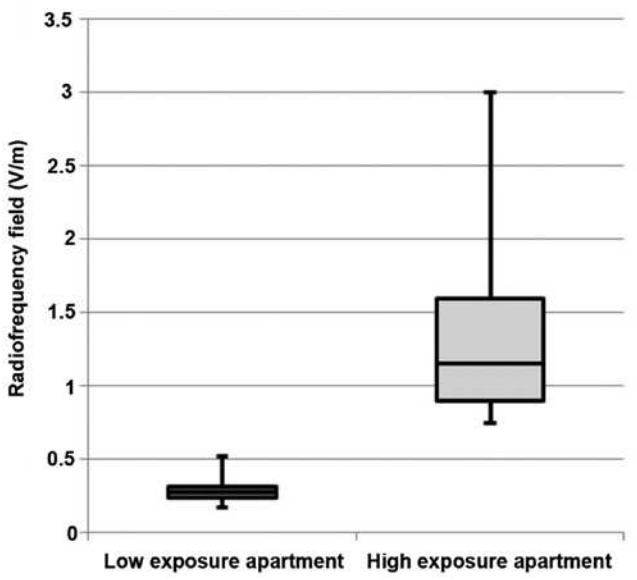

Figure 8. Box plot comparing indoor areas of the low exposure apartment to the high exposure apartment (V m^{-1}). For median RF electric field the difference is more than four times; based on spot measurements maximum readings over 1-min period. Whiskers plot depicts (from bottom up) minimum, first quartile, median, third quartile and maximum of the sample containing all the spot measurement values in the area. RF, radiofrequency.

Apart from animal studies research studies on people living near mobile phone base station show augmented indications on health risks. Adverse effects have been seen on neurotransmitters in the brain (21), on hormones like cortisol, ACTH and from the thyroid, decreased levels of testosterone in men and prolactin in young women and also increase in salivary cortisol (22,23). Other studies have shown lowered antioxidant levels and induced DNA damage in blood lymphocytes (10,24) as well as health complaints. Symptoms like sleep disturbances, headache, fatigue, dizziness, cardiovascular symptoms depression and difficulties with memory and concentration have been reported from people living near mobile phone base stations (25,26).

Human exposure has increased rapidly in recent years and will increase substantially with the introduction of the fifth generation (5G) for wireless communication (www.5gappeal.eu) (27,28) and should now be regarded as an environmental pollutant. Of special concern is that RF radiation in the frequency range 30 kHz to 300 GHz was in 2011 classified as a 'possible human carcinogen' Group 2B by the International Agency for Research on Cancer (IARC) (29,30). The carcinogenic evidence has by now strengthened and RF radiation should be reclassified as a known human carcinogen, Group 1 (27,28). Environmental RF radiation is often involuntary with little possibilities to avoid, especially since mostly nothing has been done to inform and protect people from RF radiation (31,32).

Especially the two bedrooms for the children in this apartment were exposed to high RF radiation, (mean 2,531 and 1,471 $\mu W/m^2$) (9). Children will probably be exposed for a whole lifetime in contrast to the present generation. They also seem to be more sensitive for RF radiation with more immature cells in their growing bodies (33,34).

A study from Taiwan calculated annual power density in watt-year/km^2 to each township from all 71,185 mobile phone base stations in service between 1998-2007. They found a statistically significantly increased risk for all neoplasms in children with higher-than-median exposure of RF radiation from base stations during five years prior to their neoplams (35). The Interphone study group calculated the estimated RF dose from mobile phones in five of the participating countries. The

RF radiation dose was estimated as total cumulative specific energy (TCSE) in J/kg absorbed at the tumor's estimated centre. The risk for a glioma increased with increasing TSCE 7+ years before diagnoses (36). Several studies have shown increasing risks for brain tumors, especially glioblastoma multiforme, with increasing years of mobile phone use, amount of calls and calling time (29,30,37,38).

In comparing two Stockholm apartments, several factors and exposure determinant could be pointed out. Both apartments were located in the vicinity of the mobile phone base station antenna, which allowed good mobile services reception indoor. Measured RF field levels in the low exposure apartment demonstrate that high exposure is not needed to provide good mobile phone reception.

Two mobile phone base stations placed very near, less than 20 m to an apartment may imply health risks for the inhabitants.

The low exposure apartment exposure levels were lower since the mobile phone base station was installed on top of the neighboring building, whereas on the high exposure apartment the base station was on top of the same building.

The high exposure apartment was on the top floor, with the mobile phone base station antennas situated on the roof above. The low exposure apartment was positioned seven floors lower from the roof where the base station antennas were located.

The low exposure apartment was located on the opposite side of the building from the mobile phone base station, hence the building itself provided cover (Fig. 9). Building materials, such as concrete and metal structures provide partial shielding effect against inbound radio waves.

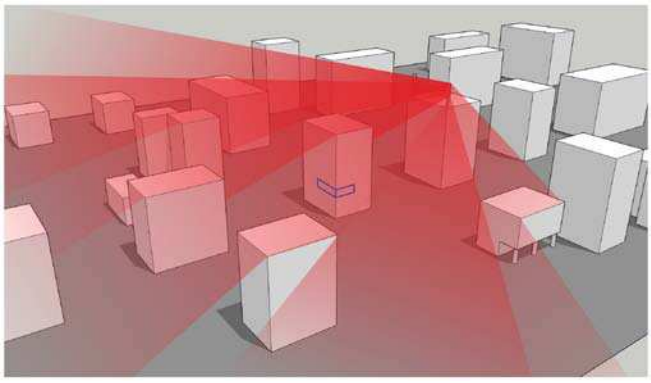

Figure 9. Mobile phone base station antenna neighboring the low exposure apartment; the buildings hinder the propagation of the RF field, especially shielding the sides facing away from the radiofrequency source; mobile phone base station antennas are sector antennas and radiate the microwaves into a direction (sector) these are aimed at. Rectangles, low exposure apartment.

In both apartments, indoor RF levels were several folds lower than outdoor levels of the corresponding room. Lower levels were detected also in the vicinity of the windows. This indicates a notable screening effect by the contemporary heat-reflecting windows.

In both apartments the lowest exposure levels were registered within the center of the building, far away from the windows, shielded by the concrete or brick walls.

Although the tin roof of the high exposure apartment shields it from the majority of the inbound radio waves, countless reflections and diffraction from the structures on the roof and balconies provide the pathway to indoor. The RF field penetrated the building's constructions, including the windows and resulted in notably high exposure levels indoor.

Advisory Group recommendations on priorities for the IARC Monographs

An Advisory Group of 29 scientists from 18 countries met in March, 2019, to recommend priorities for the International Agency for Research on Cancer (IARC) Monographs programme during 2020–24. IARC periodically convenes such advisory groups to ensure that the Monographs evaluations reflect the current state of scientific evidence relevant to carcinogenicity.[1] A detailed report of the Advisory Group will be published subsequently.[2]

The Advisory Group assessed the response to a public call for nominations and considered more than 170 unique candidate agents, including the recommended priorities remaining from a similar Advisory Group meeting convened in 2014.[3] The expertise of the Advisory Group covered multiple disciplines, and the members appraised, on an individual nomination basis, the evidence according to human exposure (including any evidence of exposure in low-income and medium-income countries), cancer epidemiology, cancer bioassays in experimental animals, and carcinogen mechanisms, in line with the evaluation methodology recently refined in the Preamble to the IARC Monographs.[1] A complementary approach assessed all nominations using a chemoinformatics, text mining, and chemical similarity analysis workflow;[4] this approach helped to reveal coverage and gaps in the extent of evidence across data streams, supporting decisions on individual agents and groups of chemically related nominations. The Advisory Group deliberated on all nominated agents both by evidence stream (ie, exposure, human cancer, cancer bioassay, and carcinogen mechanisms) and by type of agent (eg, metals, fibres, chemicals, biological agents, and complex mixtures) to inform development of priority recommendations.

The Advisory Group recommended a broad range of agents with high (table 1), medium, or low (table 2) priority for evaluation. Priority was assigned on the basis of evidence

	Rationale
Agents not previously evaluated by IARC Monographs	
Haloacetic acids (and other disinfection byproducts)	Relevant human cancer, bioassay, and mechanistic evidence
Metalworking fluids	Relevant human cancer and bioassay evidence
Cannabis smoking, fertility treatment, glucocorticoids, *Salmonella typhi*, sedentary behaviour*, tetracyclines and other photosensitising drugs	Relevant human cancer and mechanistic evidence
Cupferron, gasoline oxygenated additives, gentian violet, glycidamide, malachite green and leucomalachite green, oxymetholone, pentabromodiphenyl ethers, vinclozolin	Relevant bioassay and mechanistic evidence
Breast implants, dietary salt intake*, neonatal phototherapy*, poor oral hygiene*	Relevant human cancer evidence
Aspartame	Relevant bioassay evidence
Arecoline, carbon disulphide, electronic nicotine delivery systems and nicotine*, human cytomegalovirus, parabens	Relevant mechanistic evidence
Agents previously evaluated by IARC Monographs†	
Automotive gasoline (leaded and unleaded), carbaryl, malaria	New human cancer, bioassay, and mechanistic evidence to warrant re-evaluation of the classification
Acrylamide*, acrylonitrile, some anthracyclines, coal dust, combustion of biomass, domestic talc products, firefighting exposure, metallic nickel, some pyrethroids (ie, permethrin, cypermethrin, deltamethrin)	New human cancer and mechanistic evidence to warrant re-evaluation of the classification
Aniline, acrolein, methyl eugenol and isoeugenol*, multi-walled carbon nanotubes*, non-ionising radiation (radiofrequency)*, some perfluorinated compounds (eg, perfluorooctanoic acid)	New bioassay and mechanistic evidence to warrant re-evaluation of the classification
Ostrogen:oestradiol and oestrogen-progestogens‡, hydrochlorothiazide, Merkel cell polyomavirus, perchloroethylene, very hot foods and beverages	New human cancer evidence to warrant re-evaluation of the classification
1,1,1-trichloroethane, weapons-grade alloy (tungsten, nickel, and cobalt)	New bioassay evidence to warrant re-evaluation of the classification
Acetaldehyde, bisphenol A*, cobalt and cobalt compounds, crotonaldehyde, cyclopeptide cyanotoxins, fumonisin B_1, inorganic lead compounds, isoprene, o-anisidine	New mechanistic evidence to warrant re-evaluation of the classification

Evidence of human exposure was identified for all agents. *Advised to conduct in latter half of 5-year period. †See current International Agency for Research on Cancer (IARC) list of classifications, volumes 1–123. ‡Group 1 carcinogen; new evidence of cancer in humans indicates possible causal associations for additional tumour sites (see Section 3 of Preamble to the IARC Monographs[1]).

	Previous evaluation status
Medium priority agents	
2,3-butanedione (diacetyl), alachlor, biphenyl, chlorinated paraffins, chlorpyrifos, c.i. direct blue 218, diphenylamine, hydrazobenzene, indole-3-carbinol, mancozeb, nanomaterials (eg, titanium dioxide or nanosilica), nitrogen dioxide, *o*-benzyl-p-chlorophenol, ozone, pendimethalin, sleep, styrene-acrylonitrile trimer, terbufos, tris(chloropropyl)phosphate	Agents not previously evaluated by the IARC Monographs
Aflatoxins†, anthracene, antimony trioxide, atrazine, bromate compounds, dimethyl hydrogen phosphite, furan, *N*-methylolacrylamide, *p*-nitrotoluene, *Schistosoma mansoni*, tris(2-chloroethyl) phosphate, tobacco smoking (including second hand)†	Agents previously evaluated by the IARC Monographs*
Low priority agents	
2-hydroxy-4-methoxybenzophenone, aluminium, androstenedione, butyl methacrylate, cinidon ethyl, dysbiotic microbiota, fonofos, furmecyclox, isoflavones, isophorone, laboratory work and occupation as a chemist, methanol, S-ethyl-*N*,*N*,-dipropylthiocarbamate, semiconductor manufacturing, Sucralose	Agents not previously evaluated by the IARC Monographs
1,1-dimethylhydrazine, benzophenone-1, carbon black, catechol, chlordecone, cumene, dichloromethane, hepatitis D virus, human papillomavirus (beta [cutaneous] and some alpha [mucosal] types), *Opisthorchis felineus*, outdoor air pollution†, pyrrolizidine alkaloids, selenium and selenium compounds	Agents previously evaluated by the IARC Monographs*

Evidence of human exposure was identified for all agents. *See current International Agency for Research on Cancer (IARC) list of classifications, volumes 1–123. †Group 1 carcinogen; new evidence of cancer in humans indicates possible causal associations for additional tumour sites (see Section 3 of Preamble to the IARC Monographs[1]).

Table 2: **Agents recommended for evaluation by the IARC Monographs with medium and low priority**

of human exposure and the extent of available evidence for evaluating carcinogenicity (ie, the availability of relevant human cancer, experimental animal bioassay, or mechanistic evidence to support a new or updated evaluation according to the Preamble to the IARC Monographs[1]). Any of the three evidence streams could alone support prioritisation of agents with no previous evaluation. For previously evaluated agents, the Advisory Group considered the basis of the previous classification, as well as the potential impact of the newly available evidence during integration across streams (see table 4 in Preamble to the IARC Monographs[1]). Agents without evidence of human exposure or evidence for evaluating carcinogenicity were not recommended for further consideration. The Advisory Group recognised that agents related to the identified priorities might also warrant evaluation. Furthermore, additional agents might merit consideration if new relevant evidence indicating an emerging carcinogenic hazard (eg, from cancer epidemiology studies, cancer bioassays, or studies on key characteristics of carcinogens) becomes available in the next 5 years. In line with the interim standard operating procedure adopted by the IARC Governing Council,[5] IARC will consider this advice when selecting agents for future Monograph evaluations according to the Preamble to the IARC Monographs.[1]

The views expressed are those of the authors and do not necessarily represent the decisions, policy, or views of their respective institutions.

Swiss Re SONAR

New emerging risk insights

May 2019

What shapes the insurance industry?

Past experience and, importantly, new, changing and not-yet envisioned risks.

We created this SONAR report to inform and inspire conversations about emerging risks, so we can continue to build resilience together, in these uncertain times.

Contents

Overview

Emerging risk themes by potential impact and timeframe

0–3 years

- Teaching an old dog new tricks – digital tech meets legacy hardware
- Don't ask, don't tell – genetic testing and adverse selection
- Getting the balance right – technology regulation affecting the insurance industry
- Vaccination – a shot worth more than politics and profitability
- Beggar thy neighbour? – Global trade reordered
- Resilience at stake – forests' vital functions under threat
- Wiggle room – Artificial Intelligence and healthcare
- Pervasive and toxic – chemicals in our bodies and environment
- Conflicting interests – the widening urban-rural divide

> 3 years

- Off the leash – 5G mobile networks
- Limits to tinkering – the fiscal and monetary policy balance at risk
- It's existential – climate change and life & health **(Special feature)**
- Risky bets? Insurance demand in an age of shifting markets
- Retirement skills gap – accidents waiting to happen
- Concussion injuries in sport – head on to more widespread claims
- A celebrity body –the hazards of aesthetic surgery tourism

Most affected business areas

for **Property** for **Life & Health** for **Operations**

for **Casualty** for **Financial markets**

Potential impact

High Medium Low

Foreword

In our annual SONAR report for 2019, we highlight the emerging risks we have identified and assessed through the course of the last year. The clash of new and legacy technologies, the fiscal and monetary imbalance, and the retirement skills gap are just some of the risks we feature in this study.

Many of these risks are entirely new, because they emerge from innovations not seen before, or new developments in society and/or in insurance framework conditions. The expected timeframe for the maturation of the risks into real-life events with significant loss-making potential is often short. However, we also cover "slow-burner" emerging risks, where evolution of the exposure to the point of potential for notable impact on the insurance industry will be long-running.

A classic example is climate change. Swiss Re and the insurance industry at large first flagged climate change as an emerging risk many decades ago. The risk has now "emerged" but associated (and challenging) uncertainties still remain. Such as, for example, the implications of climate change on Life & Health insurance. We devote a special feature chapter to this important topic in this report.

We hope this year's SONAR report provokes new insights for you. We look forward to engaging with you to discuss your thoughts and the spectrum of emerging risks overall.

Patrick Raaflaub
Group Chief Risk Officer

Failure of key infrastructure like power distribution can significantly impact the insurance industry.

Introduction

We define emerging risks as newly developing or changing risks which are difficult to quantify. The loss potential of these risks is currently difficult to estimate, but they may have a major business impact on the insurance industry. Against the backdrop of macro trends identified by Swiss Re, which are synthesized in overarching perspectives (see macro trends environments and overarching topics, page 7), this year's SONAR report features 15 new emerging risk themes and five emerging trend spotlights. It also includes a special feature on the implication of climate change on Life & Health insurance.

To assess and underwrite risks, the insurance industry relies on experience (ie, historical data for identified and insurable risks). However, historical data alone cannot build understanding of the future risk landscape, which is forever changing and presents new and previously unforeseen risks. Here, the insurance industry needs to demonstrate foresight and make use of sound future intelligence. Knowledge sharing through different forms of risk dialogue with all stakeholders can help insurers manage emerging risks more effectively, for industry sustainability and to improve societal resilience. Swiss Re's SONAR report, which has been published annually since 2013, provides a forward-looking perspective, to further promote and engage with such risk dialogue.

Swiss Re identifies emerging risks, first and foremost, through its proprietary SONAR tool, an internal crowdsourcing platform that collects input and feedback from underwriters, client managers, risk experts and others across Swiss Re. The emerging risk themes outlined in this report are based on early signals collected throughout the year. They neither reflect the entire emerging risk landscape of the insurance industry nor that of Swiss Re. They have been categorised according to their estimated impact and potential timeframe to materialise, and with respect to the line of business (see figure page 2) where we expect the biggest exposure will rest.

Per lines of business, the top emerging risk themes identified in this year's edition are:

for **Property:**	Retirement skills gap – accidents waiting to happen
for **Casualty:**	Teaching an old dog new tricks – digital tech meets legacy hardware
for **Life & Health:**	Don't ask, don't tell – genetic testing and adverse selection
for **Financial Markets:**	Limits to tinkering – the fiscal and monetary policy balance at risk
for **Operations:**	Getting the balance right – technology regulation affecting the insurance industry

Some of the emerging risk themes and trends presented in this and previous SONAR reports may never materialise as exposures with loss-making potential. Others likely will. The earlier the re/insurance industry starts adapting to new risks, the better prepared it will be to successfully protect its bottom line, develop new products and write profitable business.

In an appendix, emerging risks with highest impact are listed from past reports dating back to 2015, with additional information about cross-cutting themes (see Appendix A: Key emerging risks from SONAR reports 2015–2019).

The low carbon economy calls for new solutions such as high speed trains or renewable energy installations.

Macro trends

Screening of interdependent macro trends

For today's and tomorrow's risk landscape, Swiss Re has identified and assessed 23 macro trends. This is central to understanding the risk landscape of the future, to make informed decisions and to create solutions for emerging risk pools. Swiss Re assesses these trends and their interdependencies through discussions with experts, in-depth reviews and by undertaking annual surveys.

The list of 23 macro trends for 2019 remains unchanged from the previous year, when "Data as an asset" was added. We deem these trends as having the potential to be decisive elements for the re/insurance industry within the next five to ten years. The trends fall into four, interlinked "environment" categories, namely (1) societal; (2) political; (3) competitive and business, and (4) technological and natural environments.

In this section, we provide insights into the four environments and the respective macro trends. We also highlight three overarching topics that feature strong interdependencies between certain macro trends, are reflected in today's reality, and are expected to shape the future of our industry.

Societal environment

- Growing middle class in HGM
- Longevity & radical medical innovation
- Connected & collaborative society
- Mass migration & urbanisation
- The future of work & talent gaps
- Rising social inequality & unrest

Political environment

- Public sector moving risk to private sector
- Protectionism & fragmented regulation
- Increasing nationalism
- Instability of geopolitical & economic systems
- Low yield environment & risk of inflation

Technological and natural environment

- Climate change & resource scarcity
- Structural change of energy production, distribution & consumption
- Massive expansion of digital & cyber risk
- Data as an asset
- Technology application as efficiency play
- Disruptive digital technologies
- Autonomous transportation & robotics

Competitive and business environment

- Re/insurance value chain disaggregation
- Rise of collateralised reinsurance
- Strategic partnerships with non-insurance companies & institutions
- Regional champions going global
- Increasing digital customer interaction

Societal environment

The economic relevance of the middle class remains all pervasive but increasingly, the onus is shifting to the emerging economies, most notably Asia Pacific. A large number of households in emerging markets have escaped poverty over the past years, and growing household wealth has led to more consumption. Shift and overall growth of insurance markets are to be expected, but they cannot be taken for granted (see page 38 "Risky bets?").

Escape from poverty has seen mass migration from rural areas to cities. The UN Department of Economic and Social Affairs estimates that by 2030, the number of people living in urban settings across the world will reach 5 billion, up from around 2.5 billion today. Over 90% of the increase will occur in high growth markets (HGM), and most in China and India. Migration and urbanisation concentrate risk. For one, large cities are more prone to health hazards, an important consideration for Life and Health (L&H) insurers. And also, with an associated accumulation of economic assets in urban areas, there is more potential for large financial losses in the event of a major natural disaster, an opportunity for property lines of business. Serving as powerhouses to national economies, cities also invite resentment from the rural periphy. A number of recent democratic elections and votes, e.g. Brexit, have shown signs for a growing divide between the populations of metropolitan centres and of rural peripheries (see page 24 "Conflicting interests").

In the mature economies, the post-World War II baby-boomers have mostly reached retirement years (with regard to the skills gap opening and subsequent risk, see page 17 "Retirement skills gap") with sufficient savings and asset gains accumulated from the prosperity of the 20th century. The next generation is still strong in numbers, but is accumulating less wealth and experiencing more pressure from globalisation and automation. The pension systems in many mature markets is becoming increasingly unsustainable for future retirees. This, and a shrinking middle class in some part of the developed world, may deepen social inequality. As more people feel left behind, a pool of dissatisfaction will likely build. In times of social media connectivity and of traditional political parties disrupted by political entrepreneurship, channeled resentment has become more decisive, and social unrest is on the rise. The "gilets jaunes" (yellow vests) movement in France is a case in point.

Currently, this is mostly a mature markets' problem, but it may also provide signals for the fast changing demography of developing countries. For instance, China's is grappling with unintended effects of its population policies. Small family units after decades of one-child policies will struggle to finance the retirement years of the country's already rapidly aging population. Restrictions on mobility are further exacerbating inequality.

Political environment

Globalisation momentum has slowed over the past decade. Relative to world GDP, cross-border investment, trade, bank loans and supply chains have all been shrinking or stagnating. This started well before US Donald Trump's Presidency. His anti-globalisation campaign, which has been a political success for his administration, has since been copied around the world. Multilateralism is on the back foot and global governance of commerce embodied by the World Trade Organization (WTO) is at risk of collapse (see page 12 "Globalisation fragmented" and page 23 "Beggar thy neighbor").

Rules on privacy, data and espionage are splintering. Even accounting and anti-trust regulations are fragmenting. Tax systems are being bent to patriotic ends, including a strong trend of taxing corporates locally based on local revenues. In this regard, the US is pressuring firms to repatriate capital, while Europe is targeting Silicon Valley. Moreover, the US makes frequent use of the power it derives from running the world's dollar-payments system to curb the activities of foreign companies. The old powers cling to what they still command, while broader economic, political and cultural power continues to shift to Asia.

While the low yield environment persists, room for manoeuvre by central banks has become increasingly limited. Long-term accommodative monetary policy combined with weaker global coordination has led to growing inflation risk. Central banks may lack the tools and independence to address inflation, resulting in a new super-cycle dominated by fiscal policy (see page 22 "Limits to tinkering").

Aging populations in richer countries put public finances, including pension and health systems, under strain. As a consequence, public services and assets are being outsourced to the private sector. One example is Haven, a joint venture by Amazon, Berkshire and JP Morgan to improve access to primary care in the US, simplify insurance and make transcription drugs more affordable for employees.[1]

[1] *Amazon, Berkshire, JPMorgan healthcare company to be called Haven,* Reuters, 6 March 2019,

Technological and natural environment

The world is undergoing a shift in terms of who owns data, especially in regards to individuals (see page 27 "The surveillance economy"). As social media and other companies which have "control" over data begin shifting their approach – either pre-actively or in response to regulatory pressure – data may increasingly come back into the hands of the individual. Data has been and will continue to be a key differentiator in business, including for re/insurers (see page 41 "Getting the balance right").

Technologies like Big Data and cloud computing can greatly increase the efficiency of capturing, storing and computing data. The Fourth Industrial Revolution is progressing full steam ahead including, among others, process automation, Internet of Things (IoT) devices and digital analytics capable of rapid analysis of massive amounts of un-/structured data (regarding speed of data transmission through 5G also see page 29 "Off the leash"). The combination of more data and better analytics can lead to better insurability of previously difficult-to-price products, and also to new capabilities in fraud detection. All this, however, raises privacy issues and trust concerns, and thus regulatory involvement. For insurers, specifically, these developments also raise the spectre of adverse selection.

The rise of Artificial Intelligence (AI) will have a major impact on knowledge and human capital-intensive businesses (for the realm of healthcare see page 31 "Wiggle room"), transforming existing employees into an "augmented" workforce. This could lead to an increase in unemployment, initially among lesser-skilled professions, and trigger social unrest.

The frequency and severity of risks resulting from cyber-attacks are expected to grow significantly over the next years. Recent examples have revealed how unprepared companies and government agencies are for such attacks. The need for cyber resilience has become a main focus of attention among corporate clients and insurance companies, triggering insurance demand. Cyber risk presents one of the largest opportunities for the re/insurance industry, while simultaneously also posing one of the biggest challenges. Keeping up with the changes in the cyber and technology space, and developing solutions to cover the resulting and ever-evolving risks is no mean feat.

Competitive and business environment

Primary insurers continue in their struggle to reshape their traditional systems and processes to serve the consumer base with next-generation insurance solutions (also see page 40 “Financial services and the digital revolution”). Reinsurers and intermediaries seek access to distribution channels and risks outside the traditional value chain. As international re/insurers face more restrictions with respect to data privacy and operational issues with legacy systems, innovative business models and digital eco-systems are likely to emerge, starting off in HGMs. These will significantly impact the global re/insurance value chain.

Digital ecosystems present a great opportunity for insurers to interact with potential customers. China is one of the fiercest Insurtech marketplaces in the world, and e-commerce is transforming the way the population interacts with industry. With the emergence of disruptive technology finding application in many industries, strategic partnerships seem to be a key component of the development of innovative insurance solutions. Investments in digital platforms by tech giants and Insurtech start-ups have been on a continual upward path since 2014.

With respect to the growing involvement of the emerging economies in global development, on the re/insurance side, many of the emerging markets remain dominated by national players. Some of these firms, for example from China and Korea, are developing global ambitions, and this will impact the dynamics of international re/insurance business in the years to come.

Low-carbon economy

The low-carbon economy model is rapidly gaining traction, as societies and enterprises explore and develop new solutions. The last decade has seen exponential growth of solar and wind power installations. This was mainly driven by large falls in production costs, initially due to innovation and then economies of scale. Similarly, there has been significant progress in battery storage technology, critical for the anticipated future dominance of the electric mobility. The official policy stance has become more supportive of the low-carbon ideal. For instance in motor, advanced countries' regulatory measures on combustion engine are becoming ever more demanding. And in China, the leadership has decided to clean up its cities. In 2018, the Ministry of Ecology and Environment was established with a mandate to invigorate enforcement and conduct local inspections. Policy innovation in transport means that today, China operates 99% of the world's electric buses.[2] The current policy priority is autonomous electric cars.

From an insurance perspective, the low-carbon economy is characterised by a range of often competing technologies and business models. The lack of performance history on these raises many uncertainties. A number of hypes in recent times turned out to be dead-ends: biofuels for cars and carbon capture for coal-fired power generation, to name a couple of examples. That's not say insurers should not remain alert of new developments. While low-carbon energy generation models contains inherently less property and casualty risk than high temperature/pressure generation, they also entail new risk factors and insurability potential, such as performance risk due to weather dependency. Insurers have already begun to address exposures like this with innovative parametric-based products.

Less optimistic, technological progress and shifts in regulation and in social norms are giving rise to the risk of stranded assets. These are unanticipated asset write-downs, devaluations or conversion to liabilities in high-carbon sectors such as oil and gas (including tar sands), utilities and basic materials. Nevertheless, despite such challenges, opportunities abound. The low-carbon economy is growing broadly and tangibly. Re/insurance can facilitate the introduction of low-carbon technologies by assessing and underwriting new risks as they emerge and by partnering with innovators across different industries, design new risk transfer solutions for the exposures of the future.

Globalisation, fragmented

After eight decades of expansion, trade globalisation is facing a major test. After World War II, the Western powers established an open and stable system of multinational trade – centred on the General Agreement on Tariffs and Trade (GATT), and the Soviets created an alternative trade network. After the end of the Cold War, the Western system prevailed, leading to a "golden age" of globalisation (1990–2007) powered by trade expansion, the rise of emerging markets and differentiation of value chains according to comparative advantage. This was facilitated by a period of (relative) US-led international political stability and embedded in global formats such as the G7, G20, and WTO.

The global financial crisis of 2008–09 brought globalisation momentum to a halt. In the decade before the financial crisis, world goods and services trade volumes doubled. In the decade after, volumes have grown by less than half the pre-crisis rate.[3] Cross-border investment, trade, bank loans and supply chains have all been shrinking or stagnating relative to world GDP. The Trump administration enthusiastically engages in trade wars. Geopolitical rivalry is gripping the tech

[2] *Electric Buses in Cities,* Bloomberg New Energy Finance, March 2018
[3] The International Monetary Fund's (IMF) *World Economic Outlook Database*

industry, which accounts for about 20% of world stock markets. Rules on privacy, data and espionage are splintering. Tax systems are being bent to patriotic ends. The US and EU have new regimes for vetting foreign investment, while China has only started to live up to its commitment to giving foreign firms a level-playing field.

All the while, the globalisation of world commerce continues, but patterns and governance have changed markedly.[4] Global institutions have lost influence relative to assertive nation states, which in turn are catering to the louder and more idiosyncratic demands of their citizens. For multinationals, re/insurers included, this represents a more demanding landscape with less predictable stakeholders.

Demography and health

The world's population is growing. Average life expectancy at birth is expected to rise from 71 years in 2010–2015 to 77 years in 2045–2050.[5] Demographic cohorts differ in age structures, wealth and health. While longer lives are a positive social outcome, they also pose a number of challenges.

First, the aging of societies, which we see in mature markets but also in emerging economies. China, which is now the world's second largest economy, is aging rapidly due to the one-child policy in place from 1979 to 2015. The average age of the Chinese population is increasing much faster than in other markets, the effects being not only a shrinking productive workforce, but also significant shifts in the old age dependency ratio. A resource gap widens quickly for the growing prevalence of age-correlated health issues, chronic diseases, dementia and other problems that require medical attention, caretakers and financial means. The accumulation of resource strain on health systems are common to many economies, but are dealt with quite differently. Immigration can be an important mitigating factor for healthcare labour shortages, but only in societies that are open to foreigners.

Another way to tackle increasing health costs is through technological innovation – from care robots to wearables monitoring health conditions. Face-to-face patient/physician interaction is being increasingly supported (or replaced) by telecommunications and digital means. Consequently, L&H insurance products are increasingly digitalised, from consulting through to claims handling. The number of digitally sold policies is growing exponentially, and the trend to more digital interaction reflects both customer demand and efficiency gains. Advances in diagnosis and testing hold equal promise and risks, including over-diagnosis and subsequent unwarranted treatments, as well as adverse selection risk from genetic tests cheaply available to consumers.

While medical innovation and the increasing awareness around lifestyle impacts has increased longevity and life quality for many, we see significant counter trends. In many emerging markets, with modernisation and changes in diets and physical activity levels, there is increased obesity and diabetes. But even mature markets show unexpected declines in mortality improvement. The longer trends and underlying reasons warrant deeper analysis.[6] In the US opioid crisis, excessive subscriptions for addictive painkillers has fuelled a fire of pre-existing social, demographic and health problems that a struggling health system has failed to cope with. Interconnections between demographics and health will remain an important field to follow.

Vaccination – a shot worth more than politics and profitability

One of the blessings of modern medicine is vaccination. Immunisation is a cost-effective way to keep many transmissible viral and bacterial diseases in check and, according to estimates of the World Health Organization (WHO), prevents 2–3 million deaths every year. But this achievement is under threat, due to questions around the economic viability of vaccine production and distribution and also what we see as weaponisation of vaccination in areas of conflict and with growing impacts of anti-vaccination campaigns. Vaccine shortages and refusal increase the likelihood of infection spread, which can potentially balloon to pandemic proportions, most notably for highly infectious diseases where herd immunity counts. The implications of a pandemic are most severe for life and health insurers. There are indirect implications for broader financial markets also.

For profitability reasons, the large pharmaceutical companies in the West are content to leave vaccine production to companies in new markets such as China. Globally, more vaccines are needed to fight diseases like hepatitis B or influenza and the supply chain has become increasingly based in the East. This results in new dependencies and the possibility of vaccine shortages in some locations, especially during periods of heightened political tension and national economic rivalry. Another danger we see is a lag in the development of new vaccines where the profit potential does not make for an attractive business case for pharmaceutical companies.

The WHO lists "vaccine hesitancy" among the "Ten threats to global health in 2019."[7] This "reluctance or refusal to vaccinate despite the availability of vaccines" is attributable, among others, to complacency, inconvenience in accessing vaccines and lack of confidence, the report says. Whatever the reasons, such attitudes risk the resurgence of otherwise avoidable dangerous diseases. A very recent case in point, in the US, there were 465 confirmed cases of measles across 19 states in the first quarter of 2019, the second largest outbreak since 2000 when measles were said to have been eliminated.[8]

The anti-vaccination movement derives legitimacy from cultural and/or philosophical rejection of vaccines as a force for good. However, in our view the politicisation of the anti-vaccination movement as a means of expressing dissent against domestic authorities and international organisations only heightens the risk of pandemics.

Potential impacts:

- Vaccines shortages and refusals increases the likelihood that infections will spread, increasing morbidity and mortality.
- Life insurers are exposed to higher claims in the case of a severe pandemic.
- A large pandemic can have significant impact on the health system and also mortality, with potential for large scale reduction of regional populations.
- A drop in productivity, due to many factors (eg, closed schools). Trade, travel and tourism will be subdued and economic output will be reduced.[9] This affects financial markets and is therefore directly relevant for re/insurers' balance sheets on both the asset and liability side.

Retirement skills gap – accidents waiting to happen

Almost one in five workers in the oil and gas industry is a baby boomer. This generation will retire in the next few years, which may lead to an expected shortage of 10 000 petro-technical professionals globally by 2025.[10] Combined with current layoffs and fewer students enrolling in university courses as petro-technical professionals, this situation is threatening the safe operation of hazardous oil and gas installations. Such circumstances are troubling especially given that ageing facilities often run at peak capacity.

The same is true of healthcare. By 2030, there's likely to be a shortage of 15 million healthcare professionals globally.[11] This is worrying since the demand for healthcare services in developed markets will rise as the baby boomers retire. These two sector-specific scenarios can be extrapolated to developed economies as a whole. In all sectors, from manufacturing to engineering to financial services, many people will be retiring in the coming years, taking with them critical know-how and experience that technology can only in part replace.

Research shows that professional experience is a very important element for safety, and that an increase in workplace-related accidents in manufacturing industries can come as a result of outsourcing.[12] The safety of individuals at the workplace and general operational safety are closely related, and workplace safety records will be a sentinel for things to come.

What does this mean for insurance? An uptick in P&C, professional indemnity, medical malpractice as well as healthcare-related claims might be among the consequences.

Potential impacts:

- A growing skills gap might cause more frequent occurrence of major accidents in hazardous industries and incidents in production and construction industry.
- Service industries could be exposed to more professional indemnity claims.
- A shortage of healthcare professionals might increases the risk of the healthcare industry to medical malpractice claims.
- A skills shortage in the healthcare sector will likely lead to increase costs in the provision of healthcare services, something that advances in technology will only in part offset.

Concussion injuries in sport – head on to more widespread claims

Each year more than 42 million individuals are diagnosed with concussion, often resulting from sports or recreational activity.[13] Millions more suffer sub-concussive blows, where the intensity of impact is not sufficient to result in a clinical diagnosis of concussion. Repetitive head trauma has been linked to many conditions that have latency periods of years or even decades, such as Parkinson's disease, Amyotrophic Lateral Sclerosis (ALS), dementia and Chronic Traumatic Encephalopathy (CTE), a progressive neurodegenerative disease which currently can only be diagnosed post death. Researchers are getting closer to being able to identify CTE in the living and this is expected to significantly increase the number of diagnoses.[14] There is also increasing evidence that even a single concussion experience may result in an increased risk of Parkinson's disease and dementia, or have lasting impact on cognitive function.[15]

Head trauma is not only a concern for professional athletes. CTE has been discovered in individuals who only played youth or college sports, including athletes and (American) football, soccer, rugby, basketball and baseball players.

The discovery of the long-term risks of head trauma has sparked high-profile litigations in the US, filed by athletes against professional sports organisations such as the National Football League (NFL). That lawsuit was settled for an uncapped amount, estimated to be well over USD 1 billion. Hundreds of other suits remain pending, against collegiate sports governing bodies, helmet manufacturers, youth sports organisations, and dozens of individual colleges and universities.

The number of people potentially affected, the increased attention on head trauma, and the size of the NFL settlement are just a few of the factors that make this a true emerging risk.

Potential impacts:

- Broader awareness of the issue will increase concussion diagnoses, as more people seek medical attention. This will trigger liability insurance, but also impact on life and health books.
- Additional litigations are to be expected due to the size of the NFL settlement and rising awareness of long-term risks increases.
- Enactment of youth concussion laws and revised rules/guidelines by sports organisations may increase requirements on standards of care and potential liabilities.

A celebrity body – the hazards of aesthetic surgery tourism

More people are travelling abroad for medical procedures such as plastic surgery and dentistry. The reasons include lower costs, no coverage for the treatment under home country healthcare plans, lack of access to required treatment in the home country, better quality of treatment and reduced waiting time. Travelling abroad for plastic surgery beauty enhancement treatments not covered by healthcare insurance policies is especially popular.

Experts have put the dramatic growth of plastic surgery down to a rise in the number of celebrities promoting cosmetic procedures, cultivating a consumer-base conditioned to desire new norms in body shapes and looks. Researchers at the Boston Medical Center have found the kinds of facial surgery people are requesting now include nasal and facial symmetry, rhinoplasties, hair transplants and eyelid surgical procedures.[16]

Cosmetic surgery poses pressing problems. A report by the Nuffield Council on Bioethics outline the risks of this lucrative market in the UK.[17] The absence of a coherent regulatory framework means that often non-specialist or underqualified physicians perform aesthetic procedures without adequate infrastructure, sometimes with devastating consequences. When undertaking treatment abroad, the patient and physician may not speak the same language fluently. this increases the risk of misunderstandings, wrong treatments and undesired effects.

It's not always clear if health insurance in the home country covers the additional costs originating from planned procedures abroad. This relates to rules on medical malpractice and its insurance, for example, regarding whether insurers have to cover costs from unplanned procedures abroad and if these costs can be recovered. Moreover, given difference in regulatory practices by jurisdiction, it can be difficult to assign the weight of responsibility. Given the high growth of cosmetic plastic surgery both at home and abroad, it's likely that in the future answers to these questions will more often come out of the courtroom.

Potential impacts:

- An unclear situation about medical malpractice claims in this area could trigger defense costs and later even the claims themselves.
- Manufacturers of the products and equipment used in cosmetic procedures are competing in a lucrative market, with different approval and oversight processes in different jurisdictions. Product liability claims for related implants could become an issue.
- Medical standards – also for procedures and related care services – may be of poor quality in some countries. If medical travelers do not research their chosen medical centre, they may find themselves with unwanted and potentially dangerous results.
- Antibiotic resistance is a global problem. Resistant bacteria may be picked up in countries with a high prevalence of superbugs in hospitals.
- For operations abroad, flying after surgery can increase the risk of blood clotting.

Limits to tinkering – the fiscal and monetary policy balance at risk

Since the global financial crisis, the world's major central banks have engaged in extraordinary policy measures resulting in massive expansion of their balance sheets. With central banks running out of tools to stimulate the economy, the growing consensus is that another economic downturn will need a fiscal response. The key question is what form of fiscal activism we might see. One idea – similar to the case of Japan – is to combine increased fiscal spending with more ultra-accommodative monetary policy, such as quantitative easing (QE) or yield curve control.

There are still more radical proposals. One example is outright "helicopter money", where central banks use their balance sheets to absorb the increase in government borrowing. This would be different from QE in that central banks would pledge to keep government bonds on their balance sheets indefinitely. Another idea that has gained traction recently is Modern Monetary Theory (MMT), which some argue is neither modern, monetary nor a theory. Under MMT, fiscal rather than monetary policy acts as the main stabilisation tool for the economy, while low interest rates are used to keep public finances sustainable.

While officially central banks retain their independence, the closer coordination with government raises questions about how true that is. We think outright regime shift towards alternative monetary/fiscal frameworks such as MMT is unlikely in the near-term. That said, we do expect fiscal policy to play a significantly bigger role, this at a time when global leverage is already close to historic highs, both to stimulate economic growth and to reduce income and wealth inequality. The degree and design of fiscal dominance will be important to monitor as it could have significant consequences for the economy and financial markets, including the insurance sector.

In a fairly benign scenario of closer policy coordination amid low inflation, a prolonged period of low interest rates would be the most likely outcome. By contrast, an outright regime change in the fiscal and monetary policy framework, such as MMT, could notably increase uncertainty around the inflation outlook and financial market stability. In the long-run, this could result in much higher inflation and interest rates, with broad repercussions on financial markets.

Potential impacts:

- The economy and financial markets, including the re/insurance industry, could benefit if changes to fiscal and monetary policy stimulate growth and financial stability.
- On the flipside, a policy shift could lead to a notable rise in uncertainty, causing higher financial market volatility and significant declines in asset valuations.
- If central banks (are forced to) keep interest rates low to accommodate increased fiscal spending, the insurance industry would suffer, in particular life insurers.
- Meanwhile, an unexpected and sustained increase in inflation – also a potential consequence of a regime change – would be harmful for the re/insurance industry, in particular for inflation-sensitive liability lines of business. At the same time, however, life insurers would benefit from a potential increase in interest rates as their liabilities typically have a longer duration than their assets

Beggar thy neighbour? Global trade reordered

As with other multinational businesses, insurers have become used to basic global rules that made global commerce more predictable. But the rules-based trading system is now in crisis. The very existence of the World Trade Organization (WTO) – which governs a thriving global commerce – is being questioned, most notably by its architects. For international businesses, this fundamental challenge is aggravated by regulatory fragmentation and shifts to revenue-based local taxation.

The significance for re/insurers is that regulatory restrictions and capital requirements may threaten business models based on global risk diversification and efficient capital management[18]. The US – architect of the current global trade order – no longer regards trade as the "tide that lifts all boats", but rather as a zero-sum game. The Trump administration questions the WTO's dispute settlement system and favours new trade agreements, based on bilateral relationships. There is now real danger of open trade conflict between the world's major trading blocs: the US, the European Union and China. The named three are all shaping their own trade networks. Further US disengagement from global geopolitical affairs and multilateral institutions for example, as well as the pursuit of trade policy through aggressive use of tariffs, withdrawal from existing agreements, and bilateral renegotiations, will significantly reduce the odds of bilateral deals.[19]

The Chinese approach differs, evolving around sweeping investments of billions of dollars into infrastructure projects in 60 countries under the umbrella of the Belt and Road Initiative. The goal is to create a network of trade routes connecting east and west. It has attracted many cheerleaders but also drawn harsh criticism. The European Commission now considers China both a strategic partner and an economic competitor. It in turn is showing a tendency to join the state mercantilist bandwagon by backing national champions, restricting foreign direct investment in sensitive sectors, and seeking trade deals in its favour.

As a result, multilateral trade liberalisation – a significant driver of globalisation and prosperity during the past two decades – has come to a halt. Trade architecture is no longer dominated by a Western alliance, but by competing architects building their own systems and channels. These competing trading blocs negotiate and revise agreements, putting greater emphasis on immediate domestic priorities as well as special interests. Multinational re/insurers will discover new opportunities but must also navigate previously unseen risks.

Potential impacts:

- Multinationals, including re/insurers and banks, risk getting caught between competing spheres of power.
- Regulatory restrictions and capital requirements may reduce market access and threaten business models based on global risk diversification and efficient capital management.
- Local political events may have outsized consequences, including on financial markets, if amplified by geopolitical dynamics (eg, elections in the Maldives becoming a proxy contest between India and China)
- Higher infrastructure project risk resulting from lower standards and less scrutiny due to the absence of respected multilateral agencies
- (Over)-sized projects – partly driven by short-term political interests – increase the risks of unprofitable underwriting of white elephants, for instance railroads without passengers.
- Legal risk of any litigation in unchartered jurisdictions

Conflicting interests – the widening urban-rural divide

The world is urbanising rapidly. More than 50% of world population already resides in cities. While Europe has 35 cities of a million people or more, China will have an estimated 225 by 2025.[20] Cities host many of the world's top research institutions, and the presence of major international business makes them ideal locations to bring together university, government, and private R&D efforts. Capital, knowledge and creativity feed from one other and turn cities into engines of growth, wealth and opportunity.

The flipside is the relative status loss of semi-urban and rural regions. The widening gulf between empowered urban centres and disenfranchised rural peripheries translates into contrasting economic and social realities. In Latvia, for example, about half the country's population lives in the metropolitan area of its capital, Riga, which generates about 70% of the country's economic output. While Riga's standard of living reaches the EU average, in the poorest rural regions, the standard of living is just a third of that average.[21]

Such socio-economic contrast polarises cultural values and political interests. It nurtures resentment and it divides public discourse. The growing political opposition between urban centres and rural periphery is not confined to Latvia. It reflects a broader global development: people who are outward-looking, embrace globalisation and share "progressive" cultural norms tend to live in cities; those rooted in local communities and uphold traditional values tend to live in the rural periphery.

The electoral landscape offers some evidence that a growing cultural divide and segregation between "city" and "countryside" can translate into different political preferences and create unexpected outcomes. Examples include the US presidential election of 2016 and the UK's referendum to leave the EU. In both cases, the peripheral and rural areas outvoted the large cities and metropolitan areas. With persistent division and growing alienation between the poles, more "surprises" may well be forthcoming. For example in the EU, there is evidence that population density is a powerful driver of anti-system voting: regions and localities with lower density are more prone to support anti-European integration parties.[22]

Potential impacts:

- The rapid growth of cities increases economic value concentration. This offers opportunities for the insurance sector, but also accentuates risk accumulation.
- Rural-urban antagonisms could increase market uncertainties, curb investments and endanger functioning supply chains. The cumulative negative impact on financial markets would present challenges for insurers.
- A growing gap between urban centres and the rural periphery could endanger the internal cohesion of territorial states, fan separatist tendencies and make finding policy solutions acceptable to all national socio-economic groups more challenging.
- Economic development could slow if electoral choices and social protests from rural communities prevent policies that enable cities to thrive.
- The (perceived) alienation of geographies and specific regions or localities could create resentments that bring more extremist parties into power, making political and regulatory framework conditions more volatile and detrimental for insurance business.

Emerging trend spotlight

Shifting litigation regimes

Litigation funding and class actions, especially prevalent in the US, are becoming increasingly popular in other parts of the world.

Litigation funding is the upfront payment by a third party of fees associated with a litigation case – such as the plaintiff's own legal costs, or the Adverse Cost Order in case the plaintiff loses – in return for a slice of the compensation received as a result of the lawsuit filed. The ongoing low interest environment makes litigation funding more lucrative to investors and thus drives propensity to sue. In turn, this may lead to more successful – and expensive – insurance claims and ballooning defence costs for the insurer. Well-known in the US, recently the practice has become more prevalent in the APAC region, South Africa and the UK. A landmark decision by the UK court of appeal concerning Mastercard and its fees, greatly lowered the threshold for class actions to proceed. The court also explicitly welcomes third-party funding for litigation. While a further appeal is likely, it is an on-going case example that illustrates that companies in the UK will be needing to spend significant amounts of money to defend against an uptick of class actions. Some of the largest funders, in some cases publicly-traded companies, have significant activities outside the US.

For the insurance industry, the mechanism is a double-edged sword. On one hand, it boosts opportunities to provide products and services to clients facing growing need for liability and legal expenses covers. Stronger consumer protection laws also drive pressure on producers to manage their liability risks by way of product safety and adequate insurance cover. On the other hand, the increased use of third-party funding can result in claims proliferation, longer litigation, more exposure for insurers defending such claims and higher settlement costs. Another worrying trend is the potential of governments to sell its law enforcement authorities to private firms in exchange for a payout. An example is the recent recruitment of external legal counsels by the Office of Attorney General, D.C for climate change litigation. These external counsels will be paid through the contingency fee arrangements in the event of damages awarded by the court.

The other development – class actions – is focused in Europe. Influenced by scandals such as "Dieselgate", the European Commission has proposed a "New Deal for Consumers."[23] This would entail the introduction of a directive on representative actions for the protection of the collective interests of consumers. The core of the proposal is that a qualified entity would be able to bring a representative action before a Member State court or other administrative authority on behalf of classes of consumers. Where Member States do not already allow class actions, they would be required to introduce them. Nevertheless, while the above proposed directive provides progress, a deluge of litigation may not yet be in the inevitable trend due to adverse costs risks, as funders and insurers need to carry out significant due diligence on the cases they may invest in.

The European Commission considers only litigation-based class or representative actions, but these are not the only mechanisms for collective redress nor the most efficient. Conceivable alternatives include "regulatory redress" with regulatory authority intervention, which would be an agreement or order for redress to be paid. If coupled with an ombudsman scheme, such an alternative dispute resolution (ADR) could present a promising path.[24] The Commission's "New deal" proposal is subject to political negotiations between the European Parliament and the Council. The outcome will have important consequences for the insurance industry.

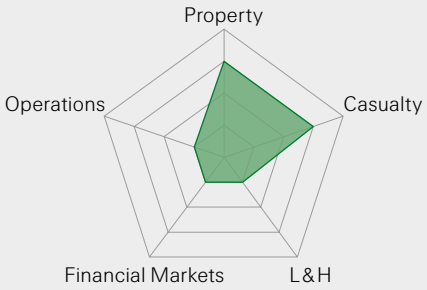
Technological and natural environment

Impact:	high
Most affected business areas	P&C
Time frame (years):	0–3



Teaching an old dog new tricks – digital tech meets legacy hardware

Digital solutions and old hardware don't always harmonise. A prime and real example happened on 13 July 2017 when thousands of commuters were stranded during peak rush hour as the metro network in Melbourne went into meltdown.[25] The reason was that a 40-year-old interface board being used to connect to the new digitised software was not able to handle the input to the system's tracks and signals, which themselves were also outdated.

This example illustrates the existing challenge. Standard procedure is to seek to improve the operational efficiency of old assets with software enhancements. Technological improvements on software are made on an ongoing basis to keep pace with increasing capacity and complexity of demands. Much hardware, though, is still of yesteryear.

We see an increasing dovetailing of old and new structures, often in areas of critical infrastructure, including smart electric power grids or pipelines, hospitals or cash points. New technology as part of industry 4.0 – a term used to describe technologies like artificial intelligence, quantum computing, 3D printing and IoT in eg production processes – applied to legacy solutions changes the existing risk landscape. While it reduces some old exposures, it also gives rise to new risks. To this end, insurers need to continuously re-evaluate their risks assessments and adapt their underwriting approach to technological innovation as applied in complex, multi-stage, multi-party and sometimes multinational nature construction projects, as well as in legacy infrastructure.[26]

Potential impacts:

- Large infrastructure breakdowns or accidents triggered by new software not working with old hardware can lead to property damage, bodily injury and business interruption claims. There are also new forms of cyber risks to date not priced for.
- Large failures of key infrastructure like power or communications can also impact operations of the insurance industry.
- As technology increases connectivity, insurers face higher risk accumulation and unexpected losses potential from the combination of new software with old hardware.
- While technological innovation can lead to reduced claims frequency in certain areas (eg, advanced driver-assistance systems for vehicles), it may also increase claims severity by introducing new exposures to an existing risk landscape.

Emerging trend spotlight

The surveillance economy

Many of this publication's readers probably have a social media account. Whether used for professional purposes, to stay in touch with old friends, or exchange views and perspectives, participants benefit from a network of connections which they otherwise would not have access to. And all this for free.

But … just as there's no such thing as a free lunch, there's no such thing as a free internet platform. So how do we pay for these services? We're told that they're funded by the ads that show next to the content we're consuming. We're not that interested in why and how the advertiser chooses to show us that particular commercial at that particular time of day or period in our lives. All the while, however, our online activity – our data – is being used to analyse patterns and predict behaviours, for sale on to the highest bidder. Monetising data is key for corporate profit. According to a recent study, a company is 2.6 times more likely to grow at more than 10% if it monetises data.[27]

The most mundane activities may lead to surprising conclusions. For example, the type of music we listen to online can be analysed for signs of depression, and this information can be then sold for advertising purposes to a medical company. Data on sleep patterns and activity from wearables can be used to confirm the signs of depression gathered from the kind of music we listen to. All this happens without our conscious knowledge and without recourse because our cars, phones, and homes have an increasing number of sensors that link our online and offline lives. Once this knowledge about us has been created, there's no easy way to change it.

For corporates as well as for consumers, today's surveillance economy can generate advantages. Individuals' willingness to "pay" with their data instead of money may translate into competitive advantage and cheaper services. It also helps link consumers with products and services best suited to their needs. On the darker side, however, the surveillance economy can be construed as intrusive and even Orwellian. The constant collection of our data means we are constantly being observed, analysed, compared and rated. And, by knowing what motivates us and understanding our belief systems, corporates can manipulate us, distort the market economy with their asymmetrical knowledge and even the democratic processes by manipulating information flows.

So what are the implications for insurance? According to a recent study on auto insurance, drivers participating in pay-as-you-drive programmes where their driving is monitored and their insurance premiums adjusted based on the data from the car, become 30% safer as a result.[28] This means that monitoring results in safer behaviour, improving the quality of life for the driver and lowering the claims for the insurance company. On the other hand, should an insurance company also receive data from music streaming services about our potential depression, it still may draw inadequate conclusions from correlations, end up reserving excessive amounts for our future medical treatment or face reputational risk and regulatory scrutiny.

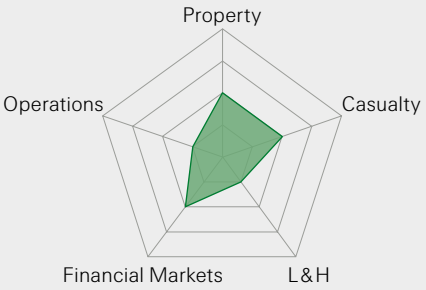
5G mobile networks will
enable wireless connectivity
in real time – a prerequisite for
broad use of autonomous cars.

Impact:	high
Most affected business areas	P&C
Time frame (years):	>3



Off the leash – 5G mobile networks

5G – short for fifth generation – is the latest standard for cellular mobile communications. Providing ultrafast broadband connection with higher capacity and lower latency, 5G is not only heaven for your smartphone. It will enable wireless connectivity in real time for any device of the Internet of things (IoT), whether that be autonomous cars or sensor-steered factory. In doing so, it will allow decentralised seamless interconnectivity between devices.

To allow for a functional network coverage and increased capacity overall, more antennas will be needed, including acceptance of higher levels of electromagnetic radiation. In some jurisdictions, the rise of threshold values will require legal adaptation. Existing concerns regarding potential negative health effects from electromagnetic fields (EMF) are only likely to increase. An uptick in liability claims could be a potential long-term consequence.

Other concerns are focused on cyber exposures, which increase with the wider scope of 5G wireless attack surfaces. Traditionally IoT devices have poor security features. Moreover, hackers can also exploit 5G speed and volume, meaning that more data can be stolen much quicker. A large-scale breakthrough of autonomous cars and other IoT applications will mean that security features need to be enhanced at the same pace. Without, interruption and subversion of the 5G platform could trigger catastrophic, cumulative damage. With a change to more automation facilitated by new technology like 5G, we might see a further shift from motor to more general and product liability insurance.

There are also worries about privacy issues (leading to increased litigation risks), security breaches and espionage. The focus is not only on hacking by third parties, but also potential breaches from built-in hard- or software "backdoors." In addition, the market for 5G infrastructure is currently focussed on a couple of firms, and that raises the spectre of concentration risk.

Potential impacts:

- Cyber exposures are significantly increased with 5G, as attacks become faster and higher in volume. This increases the challenge of defence.
- Growing concerns of the health implications of 5G may lead to political friction and delay of implementation, and to liability claims. The introductions of 3G and 4G faced similar challenges.
- Information security and national sovereignty concerns might delay implementation of 5G further, increasing uncertainty for planning authorities, investors, tech companies and insurers.
- Heated international dispute over 5G contractors and potential for espionage or sabotage could affect international cooperation, and impact financial markets negatively.
- As the biological effects of EMF in general and 5G in particular are still being debated, potential claims for health impairments may come with a long latency.

Emerging trend spotlight

Smart construction

The building industry is under construction. Projects are getting more complex, costs are rising and pressure to build quickly is increasing. Driving this trend is growing populations, a global shift towards data-driven solutions, and the increased costs of natural disasters. The last two years were the costliest annual back-to-back period ever in terms of insurance industry losses resulting from natural disasters. The natural catastrophe losses for 2017 and 2018 combined were USD 219 billion.[29]

The above factors are driving change in construction, with greater use of new technologies such as 3D printing, drones, wireless sensors, site automation and prefabricated components. In essence, smart construction is a drive to digitisation. From an insurance perspective, while more data can mean more accurate pricing, there are also challenges regarding data quality and security. Consequently, with increasing use of computer software and automation, associated risks may shift from human error to mechanical malfunction. Risks include cyber vulnerability, data corruption and loss, and inaccurate predictions due to defective modelling.

In 2016, the Dubai government launched its 3D Printing Strategy, with the aim of constructing 25% of buildings using 3D printing technology by 2030. In 2015, a Chinese construction company built the Mini Sky City, a 57-storey skyscraper in central China in 19 working days. The rapid build time was achieved by having 90% of the structure prefabricated in a factory. In Japan, machinery manufacturer Komatsu has been using smart construction technologies since 2015 in over 3 300 sites across the country. This entails using specialised drones to conduct survey work in under one hour, a process that could typically keep many workers busy for several days. An added benefit of such technology could be an increase in worker safety.

All told, traditionally the construction sector overall has been slow to innovate. One factor holding back adoption of new technologies is lack of sufficient data to substantiate the value of offsite manufactured assets across the construction lifecycle. A number of governments, including in the UK, Singapore and Finland, have been making steps towards a more data-driven approach to construction. For instance, they now mandate use of Building Information Modelling (BIM) for public projects to standardise the sharing and exchange of information concerning the construction and post-construction management of a building.[30] But BIM is far from being adopted by all players, especially smaller construction companies. Driving more universal shift to this technology remains a challenge.

As with many other trends in the digital age, to stay competitive insurers must develop new ways to locate, manage and analyse data. At the same time, of paramount importance is to strengthen industry oversight and not overestimate the impacts of innovation. In our view, this will be the only way to protect and advance the principles of sound construction methods.

Wiggle room – Artificial Intelligence and healthcare

Medical imaging and related diagnostics are being enhanced by Artificial Intelligence (AI). The US Food and Drug Administration has already approved AI software to support the detection of strokes and fractures based on MRI images.[31] More will follow soon, with many applications beyond imaging pending approval.

Investments in AI healthcare are surging globally. In places where healthcare provision is practically non-existent, affordable AI-driven systems can make treatments more accessible. And in developed countries, a shortage of healthcare workers and instant accessibility and cost efficiency will help build the value proposition and acceptance of AI-driven treatments.

A word of caution, however. Errors in healthcare can have big implications, and longer-term trust in AI-assisted treatments could suffer. Currently, the outcomes generated by AI lack a certain degree of transparency and, thus, accountability. While black-box AI may be fine for shopping, that's unlikely to be the case where AI leads to a wrong decision being made in a healthcare treatment scenario. Patients and insurers alike will need to understand how AI is involved in a doctor's action, and who can be held liable.[32]

Insurers of health-related products should continue to engage with healthcare providers, regulators and customers to ensure proper review of risks of AI in healthcare. Other aims of such dialogue should be to reduce short-term costs and possible liabilities, create standards for explainability and transparency, and shape public perception of AI as being innately beneficial to the provision of healthcare services.

Premature adoption before issues around accuracy, explainability and privacy issues are solved may do more damage than good. A careful, progressive approach, adopting technology that is commensurate with the risks and needs, and that complements human capabilities, is in the longer term interest of patients, healthcare providers and insurers.

Potential impacts:

- In many cases, diagnostics can become more accurate, especially regarding medical imaging. The reverse is true if errors occur leading to catastrophic personal outcomes. In most situations, human interpretation of AI-assisted insights will be a key feature.
- Data used for machine learning may enhance rather than reduce bias, so explainability for ethical and regulatory purposes will be essential, as will be scrutiny of the algorithms used and the decisions taken.
- On the upside. AI in healthcare may enable around-the-clock availability and low cost, thus increasing accessibility to more people.
- Used in conjunction with devices, AI could monitor health 24/7, allowing more rapid identification of problems and better outcomes.
- AI applied to big and combined databases could enhance understanding of health issues, and enhance diagnostics and treatment strategies. However, issues around privacy, compatibility and security need to be overcome first.

Emerging trend spotlight

The warehouse of the future

The warehouse is the backstage room in retail or department stores, where customers are handed the product they came to the store to buy. If it can't be found in the display, it may still sit in the warehouse. These repositories are the logistical link between increasingly globalised supply chains and consumers on the ground. Warehouses have been around for centuries, and now they are undergoing a revolution.

Being relatively closed and controllable systems, warehouses are hotbeds for automisation and robotics. In the warehouse of the future, robotic shelves will move around at high speed. They will feed batches that leave the warehouse, or feed from batches that restock it. Collaboration between humans and robots will continue to be important in the fully automated warehouse. But where humans are involved, they'll only interact from safe islands.

This system is already reality in retail, particularly in pharmacies. A pharmacist feeds the name of a certain drug into the registry system, which is then automatically retrieved from the repository without human involvement. The system also automatically re-orders products, and controls the warehouse according to demand and expiration dates. Informed by former sales, predictive analytics enables optimisation.

On-the-spot 3D printing will gain prominence for certain trades to accommodate demand for customisation and spare parts. Warehouse are set to become much more dynamic, with extended functionalities. Online trade has made front stores redundant: it's no wonder that companies like Amazon are at the forefront of warehouse innovation.

With respect to insurance, we see new risks and opportunities emerging from the more complex, automated and interdependent systems. First, the new warehouses represent a new fire hazard, with high-value concentration risk. If fire protection systems do not work, both the value of the content and the whole supply chain are at risk. With fewer humans and more technology, product liability and professional indemnity losses (for warehouse consultants and engineers), as well as property business interruption losses from flawed hardware and software will gain prominence, while single-loss events from human failure will become more rare. That said, the increasing interconnectivity could also mean a trend towards higher impact loss events, with just one (human or technology) failure having greater consequences.

Resilience at stake – forests' vital functions under threat

Almost a third of our planet's land surfaces is covered by forests. By storing carbon and water, and helping regulate our climate, forests are of enormous value to life.[33] Forests also provide important services like timber, drinking water, food, land slide and storm surge protection, pollinators for agriculture and with their biodiversity genetic resources for pharmacology.

Despite all this, survival of these natural resorts of resilience are coming under ever-increasing pressure. So much so that the destruction of the Amazon rainforest could reach a point where the ecosystem transforms irreversibly into a savannah-like state, with the loss of current benefits accumulating to USD 5 trillion.[34] The situation is just as bad in other parts of the world, such as the Philippines or Indonesia. Key drivers of the destruction of forests are land clearance for agriculture and illegal logging.

Another main concern is that deforestation is in itself a major contributor to climate change, accounting for nearly 20% of global greenhouse gas emissions, more than the whole global mobility sector.[35] This is a self-perpetuating disaster scenario, as under drier and warmer conditions, climate change has also led to increased frequency and intensity of forest fires in Canada, for example. Furthermore, monoculture tree plantations such as for paper are less resilient vis-à-vis natural perils like extreme weather conditions/storms that are occurring more frequently as climates change.[36]

Potential impacts:

- The agriculture sector and associated insurance lines are impacted by water scarcity in deforested areas and by loss of protection from floods, landslides and avalanches.
- Life and health insurance may be impacted via the spread of diseases from cleared forests into cities, driven by increased road access to forests where epidemics can spread from animals to people.[37]
- The biodiversity of forests is deteriorating, putting at risk the cheapest source of clean drinking water, and also undermining the role of forests in protecting us from landslides and storm surges.[38] The related economic activities provide an important basis for forestry and agricultural risk transfer to insurance companies.
- There is a vast potential for insurance as today's commercial forests remain largely uninsured, while an increasing number of commercial forest companies are looking for risk protection/transfer solutions.
- Combined with effective forest management, forestry insurance can strengthen the resilience of forests and reduce emissions from degradation and deforestation.[39]

Pervasive and toxic – chemicals in our bodies and environment

The chemicals behind Teflon and many other materials used in cookware, food packaging (food wrappers, pizza boxes etc), carpeting, upholstery, fire-fighting foam, apparel, floor wax, textiles and sealants belong to a family of substances known as PFAS (per- and polyfluoroalkyl substances).[40] They have achieved notoriety by showing up in the blood samples of 98% of all Americans, not surprising given their ubiquitous presence in the environment. It is equally not surprising that this finding has invited legal actions. The most notable case currently is a 2018 class action lawsuit brought against major producers on behalf of Americans who have been exposed to PFAS chemicals.[41]

PFAS are just one of a group of chemicals in widespread use and with resulting persistence in the environment where the time between application and first showing of potential negative side effects can be very long. Given the potential dangers that these chemicals pose, regulators across the globe are taking action. In 2007, the EU enacted the REACH legislation to improve the protection of human health and the environment from the risks posed by chemicals.[42] The law requires companies to demonstrate how the substance can be used safely.

China, meanwhile, has introduced a similar law, and the US has overhauled its chemical regulation TSCA.[43] There are differences between how the laws regulate chemicals, but they all require more transparency with respect to ensuring the safety of human life and the environment. Such transparency will help make the world a safer place, but will also generate potential for new lawsuits.

Potential impacts:

- Product liability and recall claims are to be expected in case of known or potentially negative side effects on human health from exposure to chemicals.
- Environmental release on a gradual or accidental basis could impact environmental liability policies, including clean-up costs.
- Employers' liability and workers compensation claims may be triggered where a connection between workplace-related diseases and certain chemicals is established.

40 As according to *United States Environmental Protection Agency*.
41 Sharon Lerner, *Nationwide Class Action Lawsuit Targets Dupont, Chemours, 3M, and Other Makers of PFAS Chemicals*, The Intercept, 6 October 2018
42 REACH stands for Registration, Evaluation, Authorisation and Restriction of Chemicals. See *Understanding REACH*, European Chemicals Agency
43 TSCA stands for Toxic Substances Control Act. See *TSCA Inventory*, US Environmental Protection Agency. Also *China REACH (MEP 7)*, www.chemsafetypro.com, 30 December 2015

An often long time lag between application and the first signs of potential negative side effects of chemicals make protection challenging.

Don't ask, don't tell – genetic testing and adverse selection

Since publication of our 2017 SONAR report on cancer screening and liquid biopsies, genetic testing has been widely adopted by public health systems and individuals. This has significant implications for life insurers, not least in respect to the regulatory constraints involved.[44]

The major challenge for life insurers is to obtain adequate and risk-relevant information during the underwriting process, since existing regulation was mostly enacted before the widespread distribution of direct-to-consumer (DTC) genetic tests. Generally, regulation disallows the use of genetic information in underwriting life insurance. This raises the prospect of more customers at higher risk of disease or mortality applying for life insurance, leading to adverse selection. Customers in the know may also fear being denied life cover due to some genetic conditions, leading the insured to withhold such information from the insurer.[45]

A new generation of predictive genetic tests based on polygenic risk scores (which attempt to quantify the cumulative effects of a number of genetic variants to display predisposition to a disease[46]) promoted by companies such as 23andMe and YouSurance, is only likely to widen the information gap between insurer and insured. Nevertheless, some insurance groups have been looking at the upside potential.[47]

Regulation that stimulates genetic information asymmetry will significantly impact insurers' ability to offer attractively priced coverage, and may challenge the way in which insurance risk is considered and managed. Insurers must be able to evaluate relevant consumer information when underwriting, and that includes risk-relevant data from genetic tests. Currently, there seem to be three broad regulatory approaches to access and use of genetic data for risk assessment: none/self-regulation, limitations by law, and outright legal ban. This lack of uniform approach shows the need for industry groups and regulators to work together to agree on reasonable self-regulation, one that balances the interests of consumers while maintaining the ability of insurers to underwrite sustainable products.[48]

Potential impacts:

- Loss developments can be worse than expected if those at increased risk buy disproportionate insurance cover, while those not exposed to genetically-triggered diseases stay away.
- As with any new innovation, there will be a challenging transition period in which insurers will need to develop the know-how of capturing and managing the data, design systems to incorporate the data and implement new underwriting approaches.
- As the results yielded by genetic tests become more accurate and their use becomes more widespread, the way insurers traditionally pool risk to differentiate individual risks may no longer be suitable.
- Allowing access to an insured's genetic information would enable more accurate risk assessment.
- In addition, access to genetic information could improve customer engagement and services. New value-added products to cover specific diagnostics, or services tailored to the insured's health goals, could create an active partnership between life insurer and insured, vastly improving customer retention.

Life insurance has not recovered since the financial crisis (life insurance in trillions USD)

Source: Swiss Re Institute, Life underinsurance in the US; bridging the USD 25 trillion mortality protection gap, September 2018

Risky bets? Insurance demand in an age of shifting markets

Globally, too many people are un- or underinsured and not protected when a catastrophe strikes. In 2018, the estimated worldwide protection gap for global catastrophe risks stood at around USD 80 billion.[49] The mortality protection gap is even larger. In the US alone, the mortality protection gap, a measure of life underinsurance, was close to USD 25 trillion in 2016.[50]

These numbers should be seen against the backdrop of shrinking middle classes in developed markets, the primary target group for many insurance products. The OECD defines middle class income as being between 70% and up to 200% of the median income. While almost 70% of baby boomers were part of middle-income households in their twenties, only 60% of millennials are today.[51] In all OECD countries – except Switzerland, Ireland and Spain – the income portion of the middle class is diminishing. According to McKinsey Global Institute, 98% of all households in 25 developed economies have seen their income rise between 1993 and 2005.[52] The picture is very different for the years 2005 to 2014 when 70% of households experienced flat or even falling income. Moody's paints a similar picture for the US, saying that rising prices and interest rates will erode disposable income. Shrinking disposable incomes may put willingness to pay for insurance coverage to the test. We already witnessed this in the US, after the global financial crisis of 2008–09. There was a significant widening of the mortality protection gap between 2007 and 2010 due to a large increase in joblessness and decrease in household asset values and increase in debt. When people were asked why they didn't buy life insurance even though they knew about the gap, 61% said they have other financial priorities.[53]

From an insurance industry standpoint, the hope – or wishful thinking – is that any shortfalls in the West can be offset by gains in the East, especially China. Indeed, China has already overtaken the US in respect to its global GDP contribution, and is projected to remain the growth engine of the world economy. But growth rates are slowing down. Although insurance potential continues to move East driven by demand from the thriving middle classes there, the risk of growing income inequality there is considerable, especially in the longer run.

Potential impacts:

- China has already overtaken the US in terms of contribution to global GDP and is projected to remain the growth engine of the world economy. Even so, its growth rates are slowing, and that could curb insurance demand.
- Insurance potential continues to move East. The thriving middle classes are to be found in Asia rather than in the West. However, there is risk in the longer run that the middle classes do not grow as expected, which could also lead to rising income inequality.
- Middle income households experiencing relative status loss and financial pressure tend to cut expenses deemed not essential, and insurance often falls into this basket.
- Whether real or just perceived – middle classes in the US and Europe are claiming status loss, which often translates into resentment towards "establishment" and "foreigners." The populist behaviours at the ballot box and social unrest on the street bring more uncertainty and volatility to these market environments.

are un- or underinsured.

Emerging trend spotlight

Financial services and the digital revolution

Digitisation is all the rage in financial services. This has been the case for a long time already and everybody agrees it's happening. Ironic, therefore, that there is little consensus about what it actually means, how it's changing the industry, or what actually needs to be done.

The expected bitcoin upheaval, which started a couple of years ago with calls to bring down the traditional banking system, failed to materialise. On the other hand, smart contracts and the underlying blockchain technology have been adopted by traditional players in banking and insurance, although some critics claim that blockchain itself still isn't living up to its promise.[54]

Nevertheless, nervousness among large financial institutions about innovative start-ups persists, both with regards to potential competition and investment opportunities. There are daily reports about digital disruption and how to survive. The consulting companies in particular are eager to promote digital disruption, offering guidance and a helping hand. Everyone wants to be a winner, but nobody exactly knows what direction to take. Which element of the digital revolution needs to be prioritised? How quickly do we need to adopt new behaviours, and what skills are required? And for re/insurers, what does this all mean?

The problem many institutions face is a clash of culture and hierarchy. Technologically affine youngsters come up against experienced and established caution, meaning their skills are not always deployed most effectively. On the other hand, experience and tradition is not necessarily a bad thing, not where it prevents companies from falling for the wrong technical innovation. Tension between old tradition and new ideas can be healthy. Smart digitisation strategies are not only about how to be ahead of everyone else, but also about the traps and risks to avoid. Too much haste may lead to costly mistakes, institutional memory loss, mispricing, increased cyber vulnerability and a generally bad risk culture. To consider trade-offs, to find the right balance, that's where the challenge lies. Finding a safe pathway through that digital challenge looks set to keep financial services firms busy for a while yet.

Getting the balance right – technology regulation affecting the insurance industry

As technological innovation advances, regulation follows on its heels. We are now seeing a first wave of non-insurance tech regulation spilling over into the insurance industry. Much of this is about access to and use of customer data, such as the General Data Protection Regulation (GDPR) and ePrivacy Regulation coming out of the European Union. These have created momentum for similarly broad data protection regulation in other locations, which are both expansive in how businesses collect, store and use customer data, and come with cross-border implications. Even the passive storage of cloud-based data in an overseas jurisdiction entails regulatory, political and business risks. Microsoft's jurisdictional battle with US law enforcement over customer data stored in its Ireland data centre is a case in point.

Excessive data protection requirements like limitations on cross-border data sharing can hinder the ability of insurers to utilise data in meaningful ways, including developing more personalised solutions and more frequent and meaningful interactions with clients. To ensure fair treatment of end users and avoid discrimination, re/insurers have to take a responsible approach. Increasingly in the spotlight are the potential risks arising from the operational aspects of tech innovation such as cloud services, outsourcing and cybersecurity. The consequent general lack of global harmonisation means there's a risk of conflicting laws.

In addition, global fragmentation of cybersecurity laws could increase operational costs and compliance risks. This could impact companies' future use of data-linked technologies. Outsourcing IT infrastructure to the cloud offers access to innovative services in many areas such as robotics, mobility and Big Data. New regulatory requirements that limit the use of cloud computing could hinder the development of a compelling digital service portfolio for a customer base, one that's increasingly asking for digital experience in service delivery.

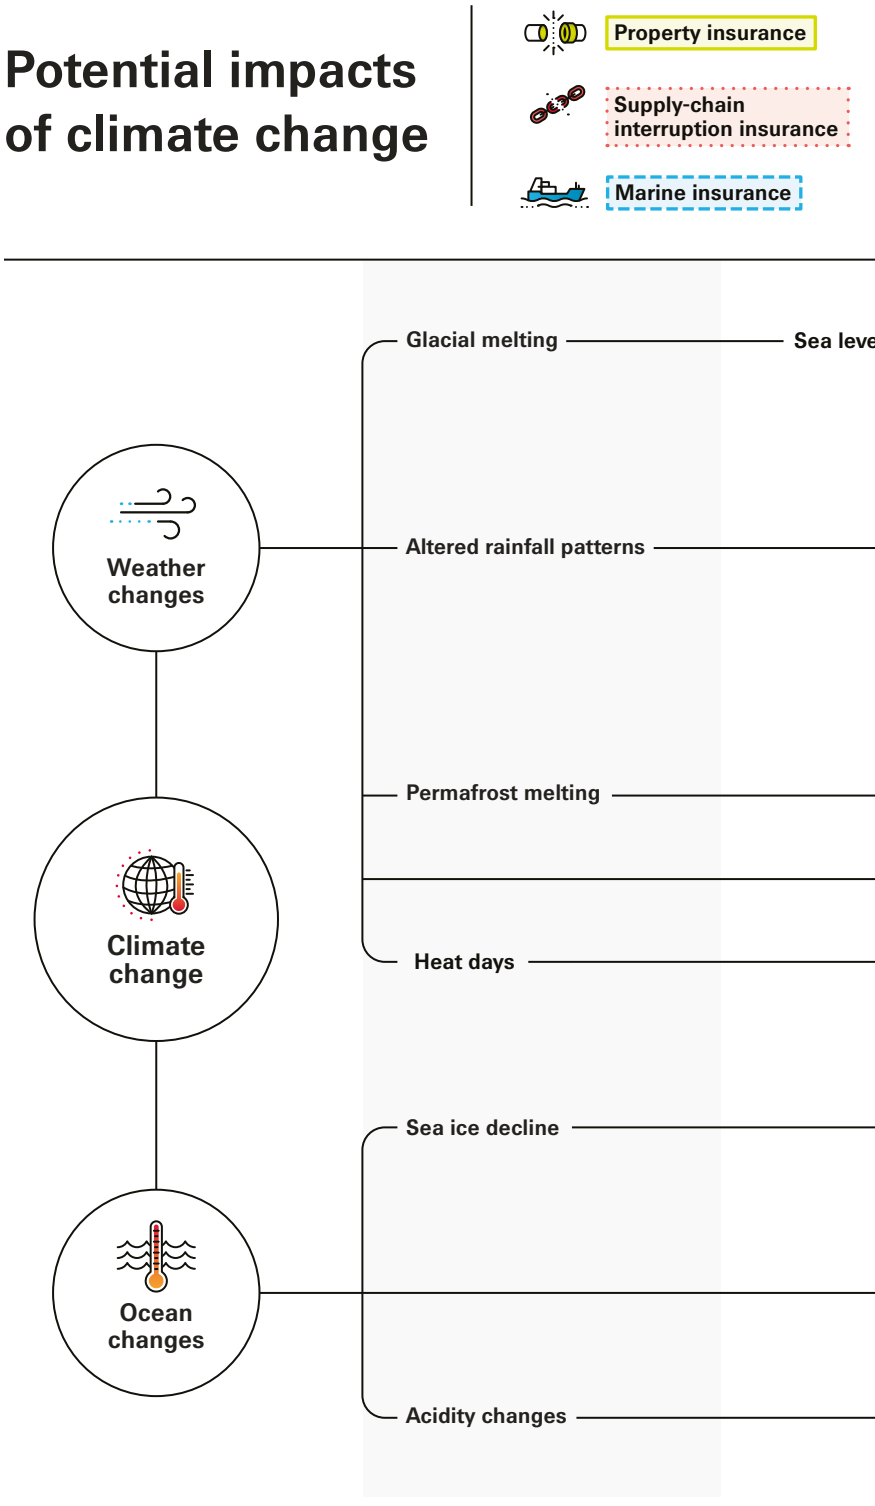
The lack of global harmonisation means risk of conflicting laws. For this reason, it is important that regulator efforts be well coordinated between jurisdictions. Technological development in an increasingly interconnected digital environment underscores the need for collaboration between regulators. Sound international standards are a prerequisite to optimise the insurance value chain from end-to-end.

Potential impacts:

- Laws and regulations relating to technological developments need to be well balanced and internationally coordinated. Otherwise, they could greatly increase a multinational insurers' legal, compliance and regulatory risks.
- Specific insurance regulation and general regulation eg data protection might not be aligned and cause friction.
- Legacy regulation and/or regulatory roadblocks limit timely utilisation of new technologies and hinder meaningful strategic partnerships.
- New data protection regulation might make the use of data for insurance purposes more difficult, thus obstructing fair risk assessment and forcing cross subsidisation.
- Digital transformation is necessary to stay competitive. Regulators should not restrict the use of cloud services but rather ensure that insurers have processes in place to identify, manage and mitigate the risks that cloud usage presents.

Climate change – from emerging risk to real-life danger

Climate change was on Swiss Re's emerging risk agenda in 1989 already, long before the term "emerging risk" was coined. Since then, climate change has fully emerged as a real and present-day problem. First impacts such as the greater frequency and severity of wildfire events are already showing. As the following infographic depicts, however, climate change risks extend to a wide-reaching scope of threats that society, and the insurance industry, are exposed to today. While many areas of climate change have been researched extensively, one risk area that has not, to date, been afforded the same degree of investigation is the impact of climate change on human life and health. We expect the impacts here to also be significant and therefore in the following section, bring the focus to exploring how societies and healthcare systems will need to adapt to a warmer world.



This graphic is intended to foster the risk dialogue and tries to explain complex interactions and interconnections in a simplified way. The graphic does not pretend to be comprehensive or complete. Please also take a look at the interactive version on swissre.com/SONAR2019

It's existential – climate change and life & health

While not all the threats of climate change are fully understood, it fully emerged as a present real life risk. The most pronounced risks from climate change affecting human health stem from heatwaves, floods, droughts, fires and vector-borne diseases. Millions of lives can be saved and the burden on healthcare services reduced if we pay more heed to changing climates. Without action, mortality rates and healthcare costs could soar,[55] and this would have significant consequences for the health, workers' compensation and life insurance lines of business.[56]

Changes in mortality will be driven by several changes occurring simultaneously. First, we expect that heatwaves will become more severe and extend to areas previously not impacted. This includes in the temperate zone, where a large proportion of the world's population lives. The 2003 heat wave in France was a first taste of things to come. It caused 70 000 deaths – mainly among the elderly.[57] With no mitigation, and with rapidly ageing populations in many countries, a future event will have an even bigger impact because the share of vulnerable older populations in the affected regions is rising fast.[58]

Increasing temperatures and high humidity due to climate change is another area of concern, in that this combination enables vector-borne diseases to conquer new ground. The West Nile and Zika epidemics were first warning signs.[59] Climate change will extend the transmission season and geographical range for many infectious diseases.[60] For example Lyme disease, avian influenza, meningitis, dengue fever and tropical bacterial and viral infections are projected to increase with climate warming, including potential shifts in their geographic range.[61] Severe drought conditions can lead to increased wildfires, which in turn lead to air pollution. This is even in areas far away from any conflagration, as the California wildfires of 2018 showed.[62]

Knock-on effects

The secondary impact of climate change will amplify the above. In focus here are migration, urbanisation, food security & nutrition, and water scarcity. Already today, more than 2 billion people live in areas of water stress,[63] areas where access to clean water for drinking, sanitation and personal hygiene – all pre-requisites for public health – is limited.[64] The number of regions affected by water stress will increase as temperatures rise. Public health could be further compromised by the expected increase of, for example, extreme heat, droughts and floods affecting agriculture. This will diminish or destroy the nutritional supply chains that help people withstand health threats.[65] Nor will fishery compensate because rising sea temperatures and ocean acidification will likely mean lower catches.[66]

Extreme weather events will not only impact agriculture. With continued sea level rise,[67] storm surges may reach further inland. With increased value concentration in mega-cities exposed to storm surges, economic and insured losses are likely to increase further. So too will the risk of epidemics. Migration to urban centres is concentrating an ever larger share of the world's population in a small areas. As has happened many times before, storms and floods that destroy infrastructure can trigger significant epidemics. And, once the flood water recedes, toxic mould may remain in buildings, posing yet another threat to public health.

In polar and other regions were permafrost has long been the environment norm, another possible consequence of warmer temperatures could be the release of older bacteria and viruses as ice thaws. Having not been exposed to these strains for thousands of years, the immunity of the world's population to such threats will be low. The building of new harbours to accommodate increasing marine traffic with the opening up of the arctic sea route, will make it more likely viruses or bacteria will be able to travel to far distant locations, triggering an epidemic or pandemic. Such outbreaks could be especially serious if the bacteria prove resistant to antibiotics (see section in the 2017 SONAR report on antibiotic resistance).

Becoming climate resilient in public health

The world community has acknowledged the imperative with the "Paris agreement on climate change" which aims to keep global warming well below 2 degrees Celsius in the long-term. In addition, it outlined in the WHO COP 24 special report on Health & Climate change what to do to save lives, reduce epidemics and make public health climate resilient.[68]

The immediate public health activities necessary to meet the challenge of climate change are to strengthen the prevention of climate-sensitive health risks and to build an adaptive skill set to absorb the changing, increasing risks presented by climate change described before. This also involves related sectors like food security and safety or sanitation. Additionally, however, there are other specific risks the health sector must address to achieve resilience in the face of climate change.

Health care facilities are the operational heart of service delivery, protecting health and treating patients, both during and after weather and climate-related events (such as heat stroke during heatwaves and injuries during cyclones) and in response to other environmental risks to health (such as asthma due to poor air quality). Health care facilities in poor and rich countries alike must be able to deliver in changing climate conditions, such as during extreme weather events. Cooling systems during heat days, flood security, emergency power and water supplies must become standard in health care facilities worldwide.

Many workers in the oil and gas industry will retire in the next few years: This will create a skills gap.

Appendix A: High impact emerging risk themes, 2015–2019

Every year Swiss Re publishes new emerging risks in its SONAR report. Occasionally, an emerging risk is reported again in a later report in case new aspects emerge or if the risk persists with increased urgency. Some overarching themes and common aspects are usually reflected in every report, often in the list of emerging risks ranked with highest impacts. For 2015–2019, here we list the top risks of each year and discuss how the overarching concerns regarding market dynamics, cyber risks and climate change have been profiled in specific high impact emerging risk themes over the years.

Market dynamics

As a key sector of the financial industry, the insurance industry is exposed to market dynamics. In 2015, the euro zone crises and expansive monetary policies were in the foreground, as were concerns over domestic populist movements fostering de-globalisation. While uncertainties from central bank quantitative easing continued in 2016, a potential slow-down of emerging market growth was added to the top emerging risks list. International regulatory fragmentation and protective trade barriers where each flagged as top risks in 2017, next to a return of inflation. Then, in 2018 national protectionism and regulatory fragmentation to hamper diversification for international re/insurers were synthesised into a top risk under the theme "A brave new world?" Heightened geopolitical tensions and trade conflicts are further confirming ongoing concern about the volatile global business environment for insurers.

Cyber risks

Cyber risk presents one of the largest opportunities for the re/insurance industry, while simultaneously presenting one of the largest challenges. The frequency and severity of risks resulting from cyber-attacks and their changing nature, are expected to grow significantly over the next years. The need for cyber resilience has become a main focus of attention among corporate clients and insurance companies, triggering insurance demand. The SONAR report has flagged the evolving aspects of technological change and uncertainty in a series of cyber risk themes over the past years. This includes a focus on vulnerabilities from the IoT (2015), the challenges from increased internet fragmentation (2016), accumulation risks from cloud solutions (2017) and lurking cyber risk from end-of-life software and hardware still in use (2018). In this year's report, we focus on exposures from 5G mobile and where software enhancements are applied to existing legacy hardware, particularly in the case of large infrastructure facilities.

Climate change

Swiss Re identified climate change as an emerging risk 30 years ago. Three decades on, we continue to flag the impact of climate change on specific risk factors and pools. For example, in 2015 we highlighted the associated theme of potential super natural catastrophes from "atmospheric rivers" affecting the US West Coast. We then raised a closer connection to climate change in the form of growing water stress and drought potential in our 2017 SONAR report, in our exposé on "The big drying". Today, climate change has become a fully-emerged risk, and in this year's report we have a dedicated section on its impact on life & health insurance.

Societal environment

Political environment

Technological and natural environment

Competitive and business environment

Listed above are our risk themes from the SONAR reports 2015–2019 with high impact potential. Risks with medium and low impact potentials are not listed. These high impact risks are colour-coded according to their respective macro trend environments. Together with the following descriptions per risk, the synopsis reflects a "high priority portfolio" of emerging risk, as it develops over time. It also allows "to keep track" of older emerging risks and reflect that some of the risks are reported once only, others reappear, and some overarching concerns (see page 47) are monitored throughout the years.

Summary of high impact emerging risk themes (2015–2019)

2015

De-globalisation: Political conflicts have been intensifying over the last few years in many regions including Eastern Europe, the Middle East and East Asia. Sanctions and other interventionist policy tools have led to economic distress, driving an upsurge in populist and nationalist sentiment. In Europe, this could trigger territorial separatism (eg, Scotland or Catalonia) and eventually undermine integration projects such as the European Union.

The great monetary experiment: The euro area debt crisis lingers on, with only modest growth, high unemployment and unsustainable debt levels in some countries. Traditional policy tools, including expansionary fiscal policy and monetary easing, are no longer feasible. Nevertheless, extremely accommodative monetary policies continue and even intensify. Short- to mid-term consequences include extremely low interest rates, distortions of risk-return profiles, potential asset price bubbles, and increasing economic inequality. Longer-term consequences include potential for higher inflation and reputational damage for central banks.

Super nat cats: The US Geological Service published a study on a winter storm scenario, looking at the impact of an "atmospheric river" event with a return period of 1 000 years. Findings indicate that flooding would overwhelm flood protections in many areas, resulting in the evacuation of more than a million residents, direct property damage of nearly USD 400 billion and business interruption costs of about USD 325 billion. The risk of volcanic eruptions might also be underestimated as no large eruption has occurred since 1815. However, eruptions can have a devastating impact if they occur close to population centres. They can also impact global travel, as illustrated by the eruption of Iceland's Eyjafjallajökull volcano in 2010.

Challenges of the Internet of Things: The IoT will revolutionise the digital world. Increased connectivity and reliance on digital processes raises questions about network and data security, resilience and long-term maintenance and software updates. Losses could occur from system malfunction and malicious attacks from hackers and criminals. There may also be legal and compliance risks due to the lack of consistent regulatory standards across countries.

2016

The great monetary experiment (cont.): Quantitative easing continues, resulting in a low to negative interest rate environment. Economic growth and inflation remains tepid in the euro area and Japan, triggering discussions about additional monetary policy stimulus. Negative interest rates will further undermine the conventional insurance business model, particularly for life insurers and pension funds.

Internet fragmentation: Cyber crime and espionage have grown strongly, making the internet less safe. Governments urge more effective protection of online assets and consider isolating critical IT infrastructure from global networks. Disconnected national/regional nets will become more common. Technology companies risk disruption to their business model and might face liability suits if no longer able to access data stored on cross-border servers.

Emerging market crises 2.0 – Amid rising US interest rates, economic growth in China has continued to slow, with knock-on impact on commodity prices leading to net capital outflows from emerging markets. Emerging market turmoil could hurt insurers' balance sheets and may trigger detrimental regulatory consequences.

2017

Bugs on the march – underestimated infectious diseases: The risk factors associated with infectious diseases, even known ones, are changing (eg, climate change, animal husbandry, land use, and poor health in areas connected with the world economy). These factors could facilitate outbreak and proliferation of infectious diseases.

Reduced market access – protecting your own backyard: Free trade, open markets and globalisation are coming under increasing pressure, with governments favouring local markets and national champions. Protectionism is no longer an emerging market phenomenon.

The perfect storm – cloud risk accumulation: Ever more widespread use of cloud and cloud-of-clouds solutions comes with a variety of risks: cyber attack, technical failure, prolonged outage and data inaccessibility. The data volumes involved and service interruption potential pose significant and catastrophic risk to system resilience.

The big drying – growing water stress: Farming, industrial use and household consumption are exacerbating water shortages in a growing number of regions (eg, California, US mid-West, southern Europe, the Mediterranean, South Africa). Severe water shortages also have an adverse impact on food production and can undercut oil and gas production.

The return of inflation – the effect on insurance business: Inflation is picking up in US and UK (not yet Europe and Japan). A sudden increase in inflation can adversely impact insurer profits. The long-term effect of accommodative monetary policy of recent years remain unclear.

Island solutions – regulatory fragmentation: International regulatory coordination activities among G20 are increasingly stalling, diminishing the chance for international standards and norms, and leaving an uneven playing field. Regulatory island solutions increase coordination and operational costs, and compliance burden to multinational insurers.

2018

Asbestos reloaded – USD 100 billion in losses and counting: Millions of metric tons of asbestos are still being processed in many countries. A UN report showed that over 300 million people in Europe and Central Asia are potentially exposed. Latin America and other regions are at risk also.

A brave new world? – emerging geopolitical risk: The global political and economic balance has become multi-polar. Global institutions lack mitigating power in circumstances of conflict. Aggressive propaganda, cyber-attacks and other means of "hybrid war" between nation states increase uncertainty.

Algorithms are only human too – opaque, biased, misled: Algorithms are susceptible to discriminatory bias. Black-boxed workings of algorithmic calculations can conceal and perpetuate mistakes. What's lacking is governance around development and application of algorithms.

Coming back to bite us – lurking cyber risks: Flaws and vulnerabilities in hardware (chips) and software may remain undetected for a long time (eg, "sleeper" cyber risk played out in recent WannaCry-attack). The risk is mispricing in cyber-covers, which may in turn impact operations.

A slow poison – the erosion of risk diversification: Re/insurance provides financial protection from risks by deploying capital across borders and lines of business. National protectionism and regulatory fragmentation are jeopardizing the benefits of international diversification.

2019

Limits to tinkering – the fiscal and monetary policy balance at risk: There is a growing consensus that another economic downturn will need a fiscal response. Potential responses include quantitative easing, "helicopter money" or modern monetary theory. The re/insurance industry could benefit if changes to policy bring growth and financial stability. The possible flipside is a rise in uncertainty, causing higher financial market volatility and declines in asset valuations.

Teaching an old dog new tricks – digital tech meets legacy hardware: Technological improvements are ongoing. Hardware in areas of critical infrastructure, including smart electric power grids or pipelines, hospitals or cash points, however, is often out dated. As a consequence, insurers face higher risk accumulation unexpected loss potential in the areas of property damage, bodily injury, business interruption and cyber risk.

Off the leash – 5G mobile networks: 5G will enable wireless connectivity in real time for any device of the IoT, such as autonomous cars or sensor-steered factory. Current concerns regarding potential negative health effects from electromagnetic fields are likely to increase. Hackers can also exploit 5G speed and volume to acquire (or steal) more data faster. Major concerns are possible privacy and security breaches, and espionage.

It's existential – climate change and life & health: The most pronounced risks from climate change affecting human health stem from heatwaves, floods, droughts, fires and vector-borne diseases. Millions of lives and healthcare services could be at risk. Without action, mortality rates and healthcare costs could soar, and this would have significant consequences for the health, workers' compensation and life insurance lines of business.

Don't ask, don't tell – genetic testing and adverse selection: Over the past years, the cost of genetic testing has declined significantly and, with direct-to-consumer (DTC) testing kits, genetic tests are now available and affordable for individual use. It has been widely adopted by public health systems and individuals. This has significant implications for life insurers, not least in respect to the regulatory constraints involved.

Appendix B: Terms and definitions

What is SONAR?

SONAR stands for Systematic Observation of Notions Associated with Risk. It is Swiss Re's tool for identifying, assessing and managing emerging risks. Experts across the company use a web-based platform to collect early signals of emerging risks. All signals are assessed and prioritised by an emerging risk management team which closely interacts with topic experts from Swiss Re's business areas. The team serves as a catalyst for risk identification and assessment to define and implement recommendations in collaboration with the business. The findings are regularly shared internally and summarised for external audiences here.

What are emerging risks?

We define emerging risks as newly developing or changing risks that are difficult to quantify and could have a major impact on society and industry.

What are emerging risk themes?

Emerging risk themes illustrate potential new or changing risk developments for the insurance industry. They are mainly derived from SONAR but also draw on other sources. All themes have been assessed and edited by Swiss Re's emerging risk management experts. This report only features new emerging risk themes (ie, topics covered in previous editions are not listed again). You can retrieve prior reports from our webpage: www.swissre.com/sonar

What is meant by overall impact?

The overall impact is an indicator of the potential financial, reputational and/or regulatory impact associated with an emerging risk topic. It is assessed on a scale from high to low:

HIGH	Potentially high financial, reputational and/or regulatory impact or significant stakeholder concern
MEDIUM	Potentially medium financial, reputational and/or regulatory impact or moderate stakeholder concern
LOW	Potentially low financial, reputational and/or regulatory impact, or low stakeholder concern

What is meant by time frame?

We divide themes into those likely to occur in less than 3 years and those likely to occur over a longer time horizon. This assessment should not be used as an indicator of when action is needed, as some themes likely to occur in the more distant future may, nonetheless, require immediate action to prepare.

What is meant by impact per business area?

Spider graph indicating the potential impact on major insurance business areas on a scale from 0 (= no impact) to 4 (=significant impact).

What are trend spotlights?

Boxes throughout the text provide selective spotlights on emerging trends which could become relevant for the re/insurance industry and its clients. The selection of topics is non-exhaustive, and descriptions are intended as food for thought and discussion starters rather than comprehensive reviews.

What are macro trends?

Swiss Re has identified a set of macro trends assumed to have a high impact on the re/insurance industry within the next 5 to ten years. The macro trends featured in this report have been selected independently through expert discussions and surveys. They provide context to the emerging risk insights from the SONAR process.

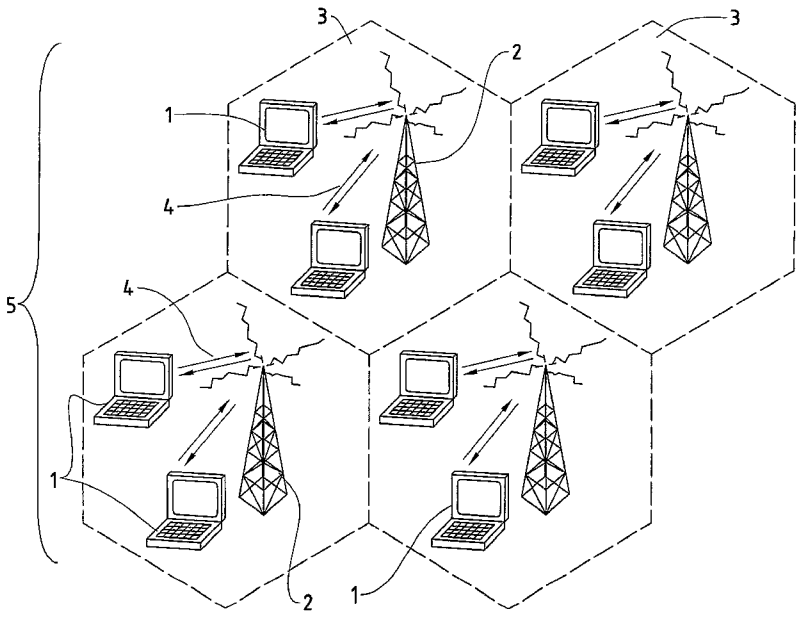
(54) Title: REDUCTION OF ELECTROSMOG IN WIRELESS LOCAL NETWORKS



(57) Abstract: A method and system for reduction of electrosmog in wireless local networks, one or more mobile network units (1) communicating with a base station (2) of a wireless local network (5). After a predefinable time interval without connecting signal, the base station (2) changes over from the normal transmitting-receiving mode into a sleep mode, in which sleep mode no beacon signals and/or other radio frequency signals are transmitted from the base station (2). If a mobile network unit (1) requires a network connection, it transmits an alert signal, and, upon receiving the alert signal of the mobile network unit (1), the base station transmits beacon signals to the mobile network unit (1) and changes over into the normal transmitting-receiving mode.

WO 2004/075583 A1

Reduction of Electrosmog in Wireless Local Networks

This invention relates to a method and system for reduction of electrosmog in wireless local area networks (WLAN), one or more mobile network units communicating with a base station by means of radio frequency signals in a wireless local area network, which base station amplifies the radio frequency signals of the mobile network unit and/or connects the wireless local area network to a wired fixed network by means of bridge functions. In particular, the invention relates to a method and system in which a WLAN comprises a plurality of access points with differing transmission cells.

The influence of electrosmog on the human body is a known problem. The health risk from mobile radio transmitters, handys and DECT telephones has been an explosive subject among the general public at least since the enormous breakthrough in mobile radio technology in the 1990s. To meet the concerns of science from the legislative side, the permissible limit values have thus been lowered several times, and technology has been increasingly focused on this problem. The risk of damage to health through electrosmog has also become better understood as a result of more recent and improved studies. When, for example, human blood cells are irradiated with electromagnetic fields, clear damage to hereditary material has been demonstrated and there have been indications of an increased cancer risk (Mashevich M., Folkman D., Kesar A., Barbul A., Korenstein R., Jerby E., Avivi L., Department of Human Genetics and Molecular Medicine, Tel-Aviv University, Tel-Aviv, Israel, "Exposure of human peripheral blood lymphocytes to electromagnetic fields associated with cellular phones leads to chromosomal instability," *Bioelectromagnetics,* 2003 Feb., 24(2): 82-90). In this study, for example, human peripheral lymphocytes were exposed to continuous electromagnetic fields of 830 MHz in order to examine whether this leads to losses or gains in chromosomes (aneuploidy). Bigger changes lead to instability of the genome (= the totality of all genes of a germinal cell) and thereby to cancer. The human peripheral blood lymphocytes (PBL) were irradiated at different average specific absorption rates (SAR) of 1.6 to 8.8 W/kg over a time period of 72 hours in an exposure system based on a parallel plate resonator in a temperature range of 34.5 to 37.5 °C. The average absorption rate (SAR) and

its distribution in the exposed tissue culture flask were determined by combining the measurement results with a numerical analysis based on a finite element simulation code. A linear increase in the chromosome No. 17 -- an aneuploidy (=numerical chromosome aberration) -- was observed as a function of the SAR, demonstrating that this radiation has a genotoxic effect. The SAR-dependent aneuploidy was accompanied by an abnormal mode of replication of the chromosome 17 region engaged in segregation (repetitive DNA arrays associated with the centromere), suggesting that epigenetic alterations are involved in the SAR dependent genetic toxicity. Control experiments (i.e. without any radio frequency radiation) carried out in the temperature range of 34.5 to 38.5 °C showed that elevated temperature is not associated with either the genetic or epigenetic alterations observed following RF radiation, these alterations being the increased levels of aneuploidy and the modification in replication of the centromeric DNA arrays. These findings indicate that the genotoxic effect of electromagnetic radiation is elicited via a non-thermal pathway. Moreover aneuploidy is to be considered as a known phenomenon in the increase of cancer risk.

Thus it has been possible to show that mobile radio radiation can cause damage to genetic material, in particular in human white blood cells, whereby both the DNA itself is damaged and the number of chromosomes changed. This mutation can consequently lead to increased cancer risk. In particular, it could also be shown that this destruction is not dependent upon temperature increases, i.e. is non-thermal. Based on the scientific studies in the field, and owing to increasing pressure from the public, especially in the industrialized countries, epidemiological studies have been systematized by the World Health Organization (WHO) in the last few years, such as e.g. the currently running WHO Interphone Project, in order to be able to assess more precisely the health risks from electrosmog and work out corresponding guidelines.

Local networks (LAN: Local Area Network) usually consist of so-called nodes which are connected via physical media, such as e.g. coaxial cable, twisted pair or optical fiber cable. These LANs are also referred to as wired LANs (wired fixed networks). In the last few years wireless LANs have

also become more and more popular (e.g. through developments such as the AirPort System of Apple Computer, Inc.). Wireless LANs -- also referred to as WLANs -- are especially suitable for integrating mobile units (nodes), such as e.g. laptops, notebooks, PDAs (Personal Digital Assistants) or mobile radio devices, in particular mobile radio telephones, with a corresponding interface, into a local computer network. The mobile nodes have an adaptor comprising a transceiver as well as a control card (such as e.g. infrared (IR) adaptor or a low frequency radio wave adaptor). The advantage of such mobile nodes is that they can be moved freely within the range of the wireless LANs. The mobile nodes communicate either directly with one another (peer-to-peer wireless LAN) or send their signal to a base station which amplifies the signal and/or passes it on. The base stations can likewise comprise bridge functions. Via such base stations with bridge functions, so-called access points (AP), the mobile nodes can access the wireless LAN on a wired LAN. Typical network functions of an access point comprise the transmission of messages of one mobile node to another, the sending of messages from the wired LAN to a mobile node and the transmission of messages of a mobile node to the wired LAN.

There exist many different access methods for WLAN in the state of the art which make it possible for a user of a mobile network device to access a wireless local network. One of these access methods, such as e.g. Carrier Sense Multiple Access/Collision Detection (CSMA/CD) or token passing have proved to be highly successful in their industrial application. Today the use of local or wide area networks usually does not have any clearly defined, predetermined characteristics anymore. With the growth of heterogeneous multimedia data exchange (e.g. video data streams, etc.) via WLANs, the Quality of Service (QoS) parameter for a particular type of data exchange (or application) has become more and more important. Such parameters comprise, for example, the highest possible bandwidth, lowest possible delay, etc. For such accesses, new access methods in the asynchronous or synchronous networks have been developed and can be found in the state of the art.

Together with the growth of the WLAN and the standardization of the access methods and the physical layer specifications for WLANS, such as e.g.

the 802.X physical layer protocols and non- 802.X protocols (e.g. ATM: Asynchronous Transfer Mode Protocol), the security needs of users and service providers of such networks have also become greater and greater. Unambiguous network recognition as well as user identification and/or authentication thereby complement one another. Within a WLAN, an AP transmits so-called Service Set IDentifier (SSID) when a mobile network unit tries to integrate itself in the wireless network. An SSID is an unambiguous identification, 32 characters long, which is assigned to the header of data messages sent over the network, and serves as a password for the mobile network units. The SSID differs from one WLAN to another. That means that all APs and mobile network units of a particular WLAN must use the same SSID. A network unit which cannot support the unambiguous SSID will not be granted any network access via a base station or respectively an AP. As mentioned, in the 802.X network technology, such as e.g. the 802.11 network technology, the network units normally communicate via an access point (AP). In the infrastructure mode, mobile network units can either communicate with one another or with network components of a wired network. An AP with bridge functions, which is connected to a wired network and one or more other access points, is referred to as the Basic Service Set (BSS). Designated as the Extended Service Set (ESS) are a plurality of BSS, which form in each case a sub-network. WLANs are usually operated in the infrastructure mode in order to provide access to other services, such as e.g. file server, printer services and/or the worldwide backbone network (Internet). In the 802.X technology, an SSID concerns in each case a Basic Service Set. Thus a mobile unit can only have network access to a BSS if it supports the corresponding SSID. SSIDs are sometimes referred to as network names since the SSIDs unambiguously designate or identify a network.

The physical range of an AP is called the Basic Service Area (BSA). If a mobile node is located within the BSA of an AP, it can communicate with this AP if the AP is likewise within the signal range (Dynamic Service Area (DSA)) of the mobile node. Mobile nodes typically have a signal strength of 100 mwatt to one watt. To connect the wireless LAN to the wired LAN, it is important for the AP to determine whether a particular message (information frame) on the network is intended for a node which lies within the wired LAN or within the

wireless LAN, and to pass on this information, if necessary, to the corresponding node. For this purpose APs have so-called bridge functions, e.g. corresponding to the standard IEEE Std 802.1D-1990 "Media Access Control Bridge" (31-74 ff). With such bridge functions, a new mobile node is registered in the wireless LAN, typically in a FDB (Filtering Database) of the AP in whose range the node is located. With each information frame on the LAN, the AP compares the destination address with the addresses (MAC addresses (Media Access Control Addresses)) which it has stored in the FDB, and sends, rejects or passes on the frame to the wired LAN or to the wireless LAN. The range of a wireless LAN is limited by factors such as e.g. wavelength of the signal, signal strength, impediments, etc. The radio frequency parameters cannot be selected freely, however. In most countries there are regulations, more or less strict, as mentioned further above, as concerns the low frequency transmission for wireless LANs (e.g. USA (FCC), Switzerland (BAKOM), etc.). This applies in particular to the USA, for example. In the USA the regulations are issued by the United States Federal Communications Commission (FCC) (D 15, Title 47, Code of Federal Regulations 1985). Three bandwidths are permitted: 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz. Many applications today use the 900 MHz band. The quantity of data which can be transmitted over the 900 MHz band is limited, however, by the narrow frequency bandwidth in this band. Therefore more and more applications are using the frequency band around 2400 MHz. Future applications will presumably also use the band around 5800 MHz in order to meet the growing demand for high data throughput.

Despite increasingly strict national guidelines with respect to legally specified limits, the impact of electrosmog in WLANs on the human body can be considerable. Moreover it is to be expected that this impact will continue to increase in the future for many people. Two factors in particular are playing a role in this: First, more and more applications require additional, usually higher-energy frequency bands in order to be able to meet the growing need with respect to transmission rate. Second, the need for WLAN expansion in the private sphere as well as in the public sphere, e.g. in airports, railway stations, trains, restaurants, exhibition halls, etc., has by far not yet reached its peak. With the state of the art as a basis, there has been a lot of effort put into providing evidence for the detrimental effects of electrosmog and setting

corresponding limits. Limits and guidelines alone will not suffice, however, to further contain the electrosmog in WLANs since the development in WLANs runs in exactly the opposite direction, as mentioned above. WLANs even represent zones in which people usually spend longer periods of time (place of work, Internet, network games, etc.) and are therefore to be considered as particularly problematic with respect to radiation impact. WLANs in the state of the art moreover send base stations, such as access points, so-called beacon signals periodically so that mobile units can recognize the network and authenticate themselves with an access point. These beacon signals comprise recognition signals, such as e.g. SSIDs and/or other radio frequency signals with control parameters. Even if no mobile units are located in the WLAN, the beacon signals continue to be transmitted periodically to the APs. This means that even when the WLAN is not being used at all, an underlying stress from electromagnetic radiation remains for persons in the Basic Service Area of an access point of the WLAN. For example, in the case of WLANs at places of employment, such as offices, etc., there exists therefore permanent stress from electrosmog from the WLAN on the employees of the company or organization. In the state of the art there exists only the possibility of further reducing the limits for electromagnetic radiation.

It is an object of this invention to propose a new method and system for reducing electrosmog in wireless local networks which do not have the drawbacks described above. In particular a solution should be proposed which can be managed without any disruptive software and/or hardware adaptations and is thus easily achievable for existing WLAN technologies.

These objects are achieved, according to the present invention, in particular through the elements of the independent claims. Further preferred embodiments follow moreover from the dependent claims and from the description.

In particular, these objects are achieved through the invention in that, for reducing electrosmog in wireless local area networks (WLANs), one or more mobile network units communicate with a base station in a wireless local network by means of radio frequency signals, which base station amplifies the

radio frequency signals of the mobile network unit and/or connects the wireless local area network to a wired fixed network by means of bridge functions, the base station changes over from the normal transmitting-receiving mode into a sleep mode after a predefinable time interval without connecting signal to a mobile network unit, in the sleep mode no recognition signals and/or other radio frequency signals being transmitted from the base station, the base station being ready to receive radio frequency signals, however, when needing a network connection, a mobile network unit transmits an alert signal to the base station, and upon receiving the alert signal of the mobile network unit, the base station transmits to the mobile network unit the recognition signals necessary for the connection and changes over into the normal transmitting and receiving mode. The invention as described above has the advantage that electrosmog in WLANs can be greatly reduced during times when there is no network activity. At the same time energy consumption is also reduced since in sleep mode no beacon signals or other radio frequency signals are transmitted from the base stations. The whole method and system is achievable in particular without any hardware changes of any kind in the mobile network unit being necessary on the user side, nor on the side of the base stations, and it is therefore simpler and less expensive to achieve compared with other solutions. This means that not only are the costs for new hardware saved, but also the costs for installing it. It must also be pointed out that in mobile network units weight and space considerations often play a role too. The present invention requires neither additional hardware space, nor does it result in increased weight of the mobile terminal (network unit). For company-internal WLANs, for example, it also further increases security, making it more difficult for the WLAN to be used by unauthorized persons e.g. outside of business hours since no periodic beacon signal is sent anymore by the base station or base stations if they are in sleep mode.

In an embodiment variant, when in need of a network connection, the mobile network unit transmits an alert signal only if it does not receive any recognition signal from a base station. This embodiment variant has the advantage, among other things, that no unnecessary alert signal has to be transmitted if the base station is already in normal transmitting-receiving mode.

This likewise results in a further reduction of electrosmog and at the same time energy saving in the mobile network units.

In another embodiment variant, only the base station in whose basic service area (BSA) the mobile network unit is located changes over into the normal transmitting and receiving mode, the other base stations of the wireless local network remaining in their previous operating mode. This embodiment variant has the advantage, among other things, that the electrosmog can be further reduced since for mobile units which are at times stationary, such as e.g. when working with a laptop at one's place of employment, only the needed base station goes back into the normal transmitting-receiving mode.

In still another embodiment variant, the base stations of the basic service areas (BSAs) bordering on the basic service area (BSA) of the base station in whose BSA the mobile network unit is located likewise change over automatically into the normal transmitting-receiving mode if they were previously in the sleep mode. This embodiment has, among other things, the same advantages as the preceding one, but during a shift of the mobile network unit from one BSA to the next, the base station of the bordering BSA is already in the normal transmitting and receiving mode.

In an embodiment variant, the base station of the wireless local network changes over from sleep mode into the normal transmitting-receiving mode only if a network-specific recognition signal of the alert signal corresponds to a stored recognition signal of the wireless local network. This embodiment has the advantage, among other things, that the user as well as the service provider of the WLAN is given additional security. Through the additional authentication by means of a network-specific recognition signal, an unauthorized person, such as someone outside the company in the case of company WLANs, cannot even activate the normal transmitting and receiving mode of the WLAN or respectively of the base station.

In an embodiment variant, at least parts of the network-specific recognition signal, such as e.g. supplementary information data, are definable for the wireless local network by a user of the mobile unit and/or by an operator.

This embodiment variant has, among other things, the same advantages as the preceding embodiment variant. The security can be further increased however through the addition of supplementary information data determinable by the user or operator. In an embodiment variant, these data can even be supplementary information data freely chosen by the user, whereby, as a borderline case, the supplementary information data could even be empty. As further embodiment variants, an unambiguous identification code of the user can be used as the supplementary information data. For example, this can be an IMSI (International Mobile Subscriber Identification) and/or a MSISDN (Mobile Subscriber ISDN) which is stored on a SIM (Subscriber Identification Module) card of the mobile network unit. This has the advantage, among other things, that a particular user can be identified by means of the MSISDN, and, if required, can be correspondingly authenticated, e.g. with a log-in password, etc., without the user having to be registered beforehand in the system, e.g. in a database. As an additional embodiment, it is even conceivable for the MSISDN of a mobile radio device of the user to be used as the MSISDN, for example, the mobile radio device being one from which an access request was previously sent to a central unit.

In a further embodiment variant, the alert signal is transmitted from the mobile unit in a network-independent way for each wireless local network. This embodiment variant has the advantage, among other things, that any mobile network unit can activate possibly available WLANs in a standard way, independently of a specific recognition signal, or at least can receive a beacon signal or similar signal of the network.

In another embodiment variant, the wireless local network is set up based on the 802.X network technology, the recognition signals containing the corresponding Service Set Identifiers (SSID). This embodiment variant has the advantage, among other things, that a standardized access method and standardized physical layer specifications with the 802.X layer protocols can be used for the WLANs. This allows a cost-effective implementation without it being necessary to depart from the standard methods. At the present time the standards of the Institute of Electrical and Electronics Engineers (IEEE) have taken hold worldwide in the WLAN area. Among the IEEE standards which

have gained acceptance are in particular the IEEE 802 standards for LAN (Local Area Network) technologies.

In another embodiment variant, the wireless local network is set up based on Bluetooth technology. Among other things, this embodiment variant has the same advantages as the preceding one. In particular, Bluetooth is supported by a wide range of well-known hardware and software producers, such as e.g. Ericsson, IBM, Intel, Nokia, Toshiba, etc., which are themselves members of the Bluetooth Special Interest Group, which defines the Bluetooth standard.

Embodiment variants of the present invention will be described in the following with reference to examples. The examples of the embodiments are illustrated by the following attached figures:

Figure 1 shows a block diagram illustrating schematically the architecture of an embodiment variant of a method and/or system according to the invention for reducing electrosmog in wireless local networks 5, one or more mobile network units 1 communicating by means of radio frequency signals 4 with a base station 2 of a wireless local network 5, which base station 2 amplifies the radio frequency signals 4 of the mobile network unit 1 and/or connects the wireless local network 5 to a wired fixed network by means of bridge functions.

Figure 2 shows a flow chart presenting schematically the architecture of a method and/or system in a wireless local network 5, whereby a beacon signal is constantly being transmitted from the base stations 2 in order to make a potential user aware of the availability of a WLAN 5.

Figure 3 shows a flow chart presenting schematically the architecture of a method and/or system according to the invention in a wireless local network 5, the WLAN 5 having two different operating modes, such as a normal transmitting - receiving mode and a sleep mode. The figure shows in particular the course of switchover from the sleep mode into the normal transmitting -

receiving mode when a mobile network unit 1 would like to use the wireless local network 5.

Figure 1 illustrates an architecture which can be used to achieve the invention. In this embodiment example, one or more mobile network units 1 communicate by means of radio frequency signals 4 with a base station 2, or respectively an access point, of a wireless local network 5. Wireless local networks 5 are also referred to as WLANs (Wireless Local Area Networks). A WLAN can be composed of one or more such base stations or respectively access points. The base station 2 amplifies the radio frequency signals 4 of the mobile network unit 1 and/or connects the wireless local network 5 by means of bridge functions to a wired fixed network. Base stations 5, or respectively access points, of a WLAN 5 can be connected e.g. via physical media such as, for instance, coaxial cable, twisted pair or fiber optic cable to assigned radius servers. The connection can comprise communication networks, such as, for example, mobile radio networks, such as a terrestrial mobile radio network, e.g. a GSM or UMTS network, or a satellite-based mobile radio network and/or one or more fixed networks, for instance the public switched telephone network (PSTN) and/or ISDN (Integrated Services Digital Network) or a suitable LAN (Local Area Network) or WAN (Wide Area Network). During log on of a mobile network unit 1 of a user in a WLAN 5, an identification code of the user is transmitted for authentication of the user together with supplementary information data, which can be determined by the user, via one of the APs 2 of the WLAN 5 to a central unit and/or radius server. The communication between the central unit and the access points 2 can take place e.g. via a TCP/IP interface and/or CORBA interface, an ATM module, a SMS and/or USSD gateway by means of special short messages, for example SMS (Short Message Services), USSD (Unstructured Supplementary Services Data) messages, or other techniques such as MExE (Mobile Execution Environment), via protocols such as GPRS (Generalized Packet Radio Service), WAP (Wireless Application Protocol) or another user information channel. The data transfer between the central unit and the access points 2 is initiated and carried out e.g. via transfer modules, implemented through software or hardware, of the central unit as well as of the access points. The mobile network units 1 or so-called mobile nodes can be e.g. laptops, notebooks, PDAs (Personal Digital

Assistants) or mobile radio devices, in particular mobile radio telephones. The mobile nodes are equipped through hardware and software with a corresponding interface in order to integrate them in a local wireless computer network (WLAN). They communicate by means of radio frequency signals with the access points 2 of the WLAN 5. The mobile nodes 1 can comprise e.g. an adaptor, which includes a transceiver as well as a control card (such as e.g. an infrared (IR) adaptor or a low frequency radio wave adaptor). The mobile nodes 1 are thereby able to move freely within the range of the wireless LAN 5. The access points 2 of the WLAN 5 can e.g. amplify the radio frequency signals of the mobile node 1 as well as comprise bridge functions which make it possible to access nodes 1 of a wired LAN from the wireless local network 5 and vice-versa. For transmission of the radio frequency signals, the access points 2 comprise at least one antenna. The antenna can be e.g. a dipole antenna, a loop radiator such as a folded dipole, a Marconi aerial or a ground plane antenna, a directional antenna such as e.g. a yagi aerial, a turnstile antenna or a parabolic aerial, an omnidirectional antenna or a fractal antenna system. The radio frequency signals lie typically in the frequency bands reserved for wireless LAN between 800 MHz and 6000 MHz, such as e.g. three frequency bands set by the United States Federal Communication Commission (FCC) in the USA: 902-928 MHz, 2400-2483.5 MHz and 5725-5850 MHz (D 15 of Title 47, Code of Federal Regulations). They can also be in the range of 400 MHz, for example, as is common e.g. with electronic, wireless garage openers, or at the WLL (Wireless Local Loop) frequencies auctioned a year ago in Germany and Switzerland, e.g. 26 GHz for wireless local loop methods. It is to be pointed out, however, that other frequencies are also possible, without affecting the scope of the invention. Thus, in principle, infrared signals can also be used for the invention such as e.g. IrDA, IR-LAN, etc. The bridge functions of the base station 2 can be achieved e.g. according to IEEE standard 802.1D-1990 "Media Access Control Bridges" pp. 31-47. In the WLAN network recognition and user identification and/or authentication complement one another. For network recognition, an AP periodically transmits so-called beacon signals within a WLAN, which signals comprise e.g. Service Set IDentifiers (SSID) and/or other control parameters for integrating a mobile network unit 1 into a wireless network. This applies in particular to the 802.X, such as e.g. the 802.11 network technologies, but also to Bluetooth and other network technologies. Beacon

signals are thus transmitted all the time to make potential users or respectively their mobile network units 1 aware of available WLANs 5. In the present invention, however, after a predefined time interval without a connection signal to a mobile network unit 1, the base station 2 switches over from normal transmitting and receiving mode to sleep mode. Understood by "normal transmitting and receiving mode" is the normal operating mode of the AP during which mobile network units 1 can access the APs or not.

In a flow chart, Figure 2 illustrates how a mobile network unit 1 recognizes the WLAN and connects thereto before the user can authenticate himself e.g. with the central unit and/or radius server. As mentioned, the base station in normal transmitting and receiving mode transmits beacon signals periodically 11. Even when no mobile network units are located in the WLAN, the beacon signals continue to be periodically transmitted from the APs. The SSID can be an unambiguous identification symbol, 32 characters long, which is assigned to the header of data messages sent over the network and which serves as a password for the mobile network units. The SSID differs from one WLAN to another. That means that all APs and mobile network units of a particular WLAN must use the same SSID. A network unit which cannot support an unambiguous SSID will normally not be granted any network access via a base station or respectively an AP. In the secure access mode (802.X) of the APs, the SSID from base station 2 and mobile network unit 1 must agree. In the non-secure access mode, a mobile network unit 1 can log on with the configured SSID, a blank SSID, or with the SSID set on "any." The beacon signals can be transmitted encrypted or unencrypted. The 802.11 network standard uses for encryption purposes WEP (Wired Equivalent Privacy), for example. WEP operates in three modes: no encryption, 40-bit encryption and 128-bit encryption. The 802.11 standard encrypts only the data packets, however, and not the management packets. The SSID is part of the beacon and probe management signal and is not encrypted when WEP is activated. A mobile network unit 1 receives the beacon signal 13, and recognizes the WLAN 5 from the beacon. Default SSIDs of WLANs are e.g. “tsunami” - Cisco, “101” – 3Com, “RoamAbout Default Network Name” - Lucent/Cabletron, “Default SSID", “Compaq” - Compaq, “WLAN” – Addtron (a popular AP), “intel” - Intel, “linksys” – Linksys, “Wireless”. Thus if a mobile network unit 1 receives a

beacon signal 13, it logs on with the corresponding AP, and carries out the authentication 14 of the user, if necessary, e.g. with the central unit, before it has access to the WLAN 5. If the mobile node 1 does not receive any beacon signal, but nevertheless needs a WLAN connection, it continues to scan for beacon signals 15 until it has found an available WLAN. This applies to the normal transmitting and receiving mode. In the normal transmitting and receiving mode the AP automatically transmits a further beacon signal after a predefined time interval 12. In the case that a base station 2 switches over into sleep mode, no recognition signals and/or other radio frequency signals are transmitted anymore from the base station 2, i.e. also no beacon signals, but the base station 2 nevertheless remains ready to receive radio frequency signals 4 also in sleep mode.

Figure 3 illustrates the method according to the invention on the side of the AP 2 when the base station 2 is in sleep mode. If a mobile network unit 1 needs a network connection, it transmits an alert signal which is received by the base station 2. If, in the normal transmitting and receiving mode, the base station does not receive any connection signal from a mobile network unit 1, the AP 2 waits for a predefinable period of time 24, if thereafter it still does not receive any connection signal 25, the base station 2 switches over into sleep mode 26, and waits 27 for a connection signal from a mobile node 1. Upon receiving an alert signal from a mobile network unit 1, the base station 2 transmits 22 the recognition signals necessary for the connection and/or beacon signals to the mobile network unit 1 (e.g. beacon signal), and, as described under Figure 2, carries out the authentication of the user of the mobile network unit 1. All base stations 2 of a WLAN 5 can always switch together from sleep mode into the normal transmitting and receiving mode, or only those base stations 2 in whose basic service areas 3 the mobile network unit 1 is located, the other base stations 2 of the wireless local network 5 remaining in their previous operating mode. It can make sense in addition for the base stations 2 of basic service areas 3 bordering on the basic service areas 3 of the base station 2 in whose BSA the mobile node 1 is located to automatically switch over into the normal transmitting and receiving mode if they were previously in sleep mode. In an embodiment variant, the mobile network unit 1, when needing a network connection, can transmit an alert signal

only when no recognition signal is received from a base station 2, or automatically every time it needs a WLAN, for example. It is furthermore possible for the base station 2 of the wireless local network 5 to switch over from sleep mode into the normal transmitting-receiving mode only when a network-specific recognition of the alert signal corresponds with a stored recognition signal of the wireless local network 5. This results in additional protection against unauthorized use of the WLAN. The security of the WLAN 5 can be further increased in that at least parts of the network-specific recognition signal are definable for the wireless local network 5 by the user of the mobile unit 1 and/or by an operator. As a special embodiment variant, the MSISDN and/or IMSI of a mobile radio device of the user of the mobile network unit 1 can be used as the supplementary information data. Moreover this can be stored on a SIM (Subscriber Identification Module) card of the mobile network unit. For other embodiments it can be important, however, that the alert signal is transmitted from the mobile network unit 1 in a network-independent way. This could be advantageous in particular for WLANs in public buildings, airports, etc. It is important to point out that the method or respectively system according to the invention can be achieved without modification of existing hardware on the side of the base stations 1 and on the side of the mobile network units 1, requiring only modification of the corresponding software components. Of course it is also possible to achieve the method and system according to the invention through addition of corresponding hardware modules.

Claims

1. A method for reducing electrosmog in wireless local networks, one or more mobile network units (1) communicating with a base station (2) of a wireless local network (5) by means of radio frequency signals (4), which base station (2) amplifies the radio frequency signals (4) of the mobile network unit (1) and/or connects the wireless local network (5) to a wired fixed network by means of bridge functions, wherein

the base station (2) changes over from the normal transmitting-receiving mode into a sleep mode after a predefinable time interval without connecting signal to a mobile network unit (1), in the sleep mode no recognition signals and/or other radio frequency signals being transmitted from the base station (2), the base station being ready to receive radio frequency signals (4), however,

when needing a network connection, a mobile network unit (1) transmits an alert signal to the base station,

upon receiving the alert signal of the mobile network unit (1), the base station (2) transmits to the mobile network unit (1) the recognition signals necessary for the connection and changes over into transmitting and receiving mode.

2. The method according to claim 1, wherein, when in need of a network connection, the mobile network unit (1) transmits an alert signal only if it does not receive any recognition signal from a base station (2).

3. The method according to one of the claims 1 or 2, wherein only the base station in whose basic service area the mobile network unit (1) is located changes over into the normal transmitting and receiving mode, the other base stations (2) of the wireless local network (5) remaining in their previous operating mode.

4. The method according to claim 3, wherein the base stations (2) of the basic service areas (3) bordering on the basic service area (3) of the base station (2) in whose basic service area the mobile network unit (1) is located likewise change over automatically into the normal transmitting-receiving mode if they were previously in the sleep mode.

5. The method according to one of the claims 1 to 4, wherein the base station (2) of the wireless local network (5) changes over from sleep mode into the normal transmitting-receiving mode only if a network-specific recognition signal of the alert signal corresponds to a stored recognition signal of the wireless local network (5).

6. The method according to claim 5, wherein at least parts of the network-specific recognition signal are definable for the wireless local network (5) by a user of the mobile unit (1) and/or by an operator.

7. The method according to one of the claims 1 to 6, wherein the alert signal from the mobile network unit (1) is transmitted in a network independent way for every wireless local network (5).

8. The method according to one of the claims 1 to 7, wherein the wireless local network (5) is set up based on the 802.X network technology, the recognition signals containing the respective Service Set Identifier (SSID).

9. The method according to one of the claims 1 to 7, wherein the wireless local network (5) is set up based on Bluetooth technology.

Toprådgiver i Holland advarer mod ukritisk 5G-udrulning

Author: Tabt Tråd

NYHED / UDLAND: Formanden for strålingskomitéen i Hollands nationale sundhedsråd, Hans Kromhout, advarer nu landets beslutningstagere mod ukritisk 5G-udrulning.

Den nederlandske professor mener, at alle herlighederne ved 5G skal holdes nøje op imod de risici for folkesundheden, som samfundet løber.

Det skriver det nederlandske dagblad, De Telegraaf.

Hans Kromhout mener ikke, at forsigtigheden med mobilstråling lever op til de standarder, man anvender til at beskytte befolkningen mod andre risici som kemikalier, pesticider og medicin, hvor kravene ifølge Hans Kromhout er strenge.

Hans Kromhout kritiserer især, at autoriteterne på strålingsområdet ignorerer klare forskningsresultater som det amerikanske NTP-projekt, der varede i 19 år og som sluttede med en klar konklusion af kræftfund i forsøgsrotter.

"Den amerikanske NTP-undersøgelse, som leverede klare beviser for sammenhæng mellem kræft og eksponering for EMR (red. elektromagnetisk stråling) – var godt udført og repræsenterede et stort gennembrud. Alligevel forsøger visse grupper at

bortforklare", siger han til avisen.

Mistillid til ICNIRP

Hans Kromhout kritiserer, at en lang række lande ret ukritisk adopterer deres grænseværdier fra det private forskerselskab ICNIRP og kalder det "ganske usædvanligt", at et selskab som ICNIRP kan opnå så stor en indflydelse.

"Det er lidt af en uigennemsigtig klub, hvor det er uklart, hvordan medlemmerne vælges. Kald det som selvbestaltet. I den forstand kan man ikke tillægge organisationen en uafhængig status", siger han til avisen.

To af verdens nøgleposter på området er besat af hollændere. I ICNIRP er nederlandske Eric van Rongen formand, indtil han træder et skridt tilbage og bliver næstformand i maj 2020.

Siden 2006 har nederlandske Emilie van Deventer været leder af WHO-kontoret The International EMF Project i Geneve, som siden oprettelsen i 1996 har arbejdet meget tæt med ICNIRP.

ICNIRP's hovedstifter og første formand, Michael Repacholi, forlod ICNIRP i 1996 for at blive leder i det nyoprettede WHO-kontor, som i betydelig grad har fungeret for teleindustriens sponsormidler.

REPUBBLICA ITALIANA

ROMEO ROBERTO, residente a Leinì (TO), Via Lamarmora

n. 11, rappresentato e difeso per procura in calce al ricorso introduttivo del giudizio di primo grado, congiuntamente e disgiuntamente, dagli Avv.ti Renato Ambrosio, Stefano Bertone e Chiara Ghibaudo, ed elettivamente domiciliato presso il loro studio in Torino, Via Bertola n. 2

APPELLATO

oggetto: malattia professionale

CONCLUSIONI

Per l'appellante:

come da ricorso depositato in data 31.8.2017

Per l'appellato:

come da memoria difensiva depositata in data 22.10.2018

FATTI DI CAUSA

Il sig. Roberto Romeo ha chiamato l'INAIL davanti al Tribunale di Ivrea, deducendo la natura professionale del neurinoma dell'acustico destro di cui è affetto, in quanto patologia contratta per l'uso abnorme di telefoni cellulari nel periodo 1995-2010, in cui ha lavorato alle dipendenze di Telecom s.p.a., e chiedendo quindi la condanna dell'Istituto convenuto a pagargli la prestazione dovuta per legge, commisurata alla percentuale di invalidità, indicata in misura pari ad almeno il 37%.

L'INAIL ha contestato la domanda attorea e ne ha chiesto il rigetto.

Istruita la causa mediante escussione di alcuni testimoni e con due c.t.u. medico-legali (una sul nesso causale e l'altra sulla quantificazione dei postumi permanenti), con sentenza n.

96/2017 pubblicata il 21.4.2017, il Tribunale, in accoglimento del ricorso, ha condannato l'INAIL a corrispondere al ricorrente la prestazione spettante con riferimento alla percentuale di invalidità del 23%, con condanna a rimborsare al ricorrente le spese di lite e a pagare le spese di c.t.u..

Propone appello l'INAIL; resiste l'appellato.

Disposta nuova c.t.u. medico-legale (affidata congiuntamente alla dott.ssa Carolina Marino e al dott. Angelo D'Errico, specialisti rispettivamente la prima in medicina-legale e il secondo in medicina del lavoro, dirigente medico del Servizio Sovrazonale di Edipemiologia ASL TO3), all'udienza del 3.12.2019, all'esito della discussione, la Corte ha deciso la causa come da separato dispositivo.

RAGIONI DELLA DECISIONE

Il Tribunale ha accolto il ricorso osservando che:

-il ricorrente, quale referente/coordinatore di altri dipendenti Telecom, ha utilizzato in maniera abnorme telefoni cellulari nel periodo 1995-2010, come dimostrato dall'istruttoria testimoniale (testi Musso, Nani, Bilucaglia);

-in base ad essa si deve infatti ritenere che il ricorrente, coordinando una quindicina di colleghi, nell'ipotesi più prudente utilizzasse con loro il telefono per almeno due ore e mezza al giorno (2 telefonate x 5 minuti x 15 colleghi), e che, nell'ipotesi maggiore, le ore al telefono diventassero oltre sette (3 telefonate x 10 minuti x 15 colleghi), a cui si aggiunge il tempo trascorso al telefono per riferire ai propri superiori e per coordinarsi con il

direttore dei lavori degli enti e con le imprese esterne che collaboravano nei lavori, nonché durante il fine settimana, come confermato dal teste Romeo, figlio del ricorrente;

-inoltre, all'epoca non esistevano strumenti per attenuare l'esposizione alle radiofrequenze e questa era aggravata dal tipo di tecnologia utilizzata per i primi telefoni cellulari (tecnologia ETACS), e dal fatto che spesso l'utilizzo avveniva all'interno dell'abitacolo di un'autovettura;

-la letteratura scientifica è divisa in merito alle conseguenze nocive dell'uso dei telefoni cellulari: da una parte l'Agenzia Internazionale per la Ricerca sul Cancro (IARC), facente parte dell'Organizzazione Mondiale della Sanità (ente imparziale ed autorevole a livello mondiale) il 31.5.2011 ha reso nota una valutazione dell'esposizione a campi elettromagnetici ad alta frequenza, definendoli come "cancerogeni possibili per l'uomo" (categoria 2B); dall'altra lo studio Interphone individua un rischio del 40% superiore per i glioma (famiglia di tumori cui appartiene anche quello che ha colpito il ricorrente) negli individui che abbiano usato il cellulare molto a lungo e per molto tempo; gli unici studiosi che con fermezza escludono qualsiasi nesso causale tra utilizzo di cellulari e tumori encefalici sono i proff. Ahlbom e Repacholi, ma detti autori si trovano in posizione di conflitto di interessi, essendo il primo consulente di gestori di telefonia cellulare ed il secondo di industrie elettriche;

-ai risultati a cui sono pervenuti gli studi finanziati dalle aziende produttrici di telefoni cellulari non può essere attribuita

particolare attendibilità in considerazione della posizione di conflitto di interessi degli autori, come ritenuto dalla S.C. nella sentenza n. 17438/2012 in un caso relativo ad altro tumore encefalico (neurinoma del ganglio di Gasser);

-la c.t.u. ha accertato la sussistenza del nesso causale;

-pertanto, e considerate le peculiarità del caso concreto (associazione tra tumore raro ed esposizione rara per durata ed intensità; periodo di latenza congruo con i valori relativi ai tumori non epiteliali; il fatto che la patologia sia insorta nella parte destra del capo del ricorrente, soggetto destrimane; mancanza di altra plausibile spiegazione della malattia), deve ritenersi provato un nesso causale, o quantomeno concausale, tra tecnopatia ed esposizione, sulla base della regola del "più probabile che non";

-i postumi permanenti debbono essere riconosciuti nella misura del 23%, come da conclusioni del c.t.u., non contestate da alcuna delle parti.

Con il primo motivo di gravame l'INAIL lamenta che il Tribunale abbia omesso di pronunciarsi sull'eccezione di inammissibilità del ricorso, ai sensi dell'art. 152 disp. att. c.p.c., per mancanza della dichiarazione di valore della prestazione richiesta.

Il motivo è infondato, avendo la Corte Costituzionale, con sentenza 20.11.2017 n. 241, dichiarato l'incostituzionalità di detta norma.

Con il secondo motivo, l'Istituto sostiene che il Tribunale abbia erroneamente ritenuto provato un uso abnorme per 15 anni del telefono cellulare per esigenze lavorative, essendo le testimonianze sul punto contraddittorie: in particolare, secondo la deposizione del teste Bilucaglia la durata delle telefonate (e quindi l'esposizione alle radiofrequenze) era di un'ora e quaranta minuti al giorno, mentre secondo quanto riferito dal teste Musso essa arrivava fino a 10 ore, durata inverosimile in quanto superiore alla stessa durata della giornata lavorativa. Inoltre, secondo quanto emerso dall'istruttoria testimoniale, le telefonate tra l'appellato e i colleghi avvenivano anche mediante telefono fisso, e, d'altra parte, il figlio dell'appellato non è stato in grado di quantificare le telefonate ricevute dal padre fuori dell'orario di lavoro quando egli era reperibile. Né in base alle deposizioni dei testimoni è possibile determinare la quantità e la durata delle telefonate all'interno dell'abitacolo dell'autovettura.

Pur non potendosi ritenere, diversamente da quanto sostenuto dall'appellato, che le circostanze storiche relative all'esposizione siano provate per non essere state contestate dall'INAIL ex artt. 115 e 416 comma 3 c.p.c., trattandosi di fatti non noti all'Istituto e che quindi esso non è in grado di contestare o meno, il motivo è comunque infondato.

L'istruttoria testimoniale ha infatti confermato la notevolissima esposizione del sig. Romeo alle radiofrequenze per l'uso del telefono cellulare nel periodo 1995-2010.

Infatti, il teste Musso, collega dell'appellato dal 1990 al 2010, ha riferito che l'appellato coordinava la sua attività e quella degli altri tecnici esterni (di cui l'appellato era superiore gerarchico), pari complessivamente a 15-20 persone; il teste ha dichiarato che si sentiva con l'appellato quotidianamente più volte al giorno, circa 2-3 volte al giorno o anche di più, con chiamate della durata di 5-10 minuti ciascuna.

Il teste Nani, collega dell'appellato dal 2000 al 2011, ha dichiarato di essersi sentito con lui molto spesso, anche un paio di volte all'ora, e che le telefonate duravano 5 minuti, ma anche di meno.

Il teste Bilucaglia, che ha lavorato con l'appellato dai primi anni '90 al 1996, ha dichiarato che quest'ultimo coordinava circa 10-12 colleghi; e di avere contattato l'appellato almeno 2-3 volte in un giorno, con telefonate di circa 5-10 minuti ciascuna.

Come rilevato dal Tribunale, le telefonate dell'appellato intercorrevano anche con il direttore dei lavori, con le imprese esterne e con i superiori (v. testi Musso e Bilucaglia).

Escludendo quindi i valori massimi (che si ottengono considerando il numero più elevato di telefonate effettuate dai tecnici all'appellato e la durata massima di esse, come indicati dai testi) e prendendo perciò in considerazione il numero minimo e il numero medio di telefonate di ciascun tecnico (rispettivamente 2 e 2,5) per il numero di essi (l5-20 secondo Musso, 10-12 secondo Bilucaglia), si ottiene un'esposizione, secondo le testimonianze di Musso e Nani, da un minimo di 3,30

ore al giorno (200 minuti) a un medio di 5 ore al giorno (300 minuti), e, secondo la testimonianza di Bilucaglia, da un minimo di 1 ore e 40 minuti (100 minuti) a un medio di 3 ore e 50 minuti (230 minuti).

Pertanto, pur con il grado di precisione compatibile con il fatto di riferirsi a circostanze che, anche a distanza notevole di tempo, si ripetono durante un periodo lungo, anche con un inevitabile grado di variabilità, il quadro istruttorio consente, a parere della Corte, di ritenere provata un'esposizione a radiofrequenze molto elevata, che, in via del tutto prudenziale, va quantificata in circa 4 ore al giorno per tutto il periodo dedotto nel ricorso.

All'epoca non esistevano strumenti che consentissero di evitare il contatto diretto del telefono cellulare con il viso, come cuffiette o auricolari (v. teste Musso, e v. teste Nani, secondo cui le cuffiette, peraltro acquistate personalmente dai tecnici Telecom, avevano iniziato ad essere utilizzate a partire dall'inizio del 2000, e, nello stesso senso, v. teste Bilucaglia).

E' vero, come osservato dall'INAIL, che l'appellato disponeva di un ufficio dotato di un telefono fisso (v. teste Musso), ma i testi hanno riferito che lo contattavano sul telefono cellulare in quanto era più facile reperirlo, considerato che sovente si spostava fuori dell'ufficio e che era meno agevole rintracciarlo sul telefono fisso, in quanto in tal caso occorreva passare per il centralino (v. testi Musso, Nani, Bilucaglia).

E' poi emerso che la tecnologia ETACS (che, come si dirà più oltre con riferimento alla c.t.u. svolta nel presente grado,

emetteva radiofrequenze molto più potenti di quelle utilizzate attualmente dai telefoni cellulari) è durata circa 7 anni (teste Musso, v. anche teste Nani, che ha dichiarato che a partire dal 2000 prevaleva la tecnologia GSM; nello stesso senso, v. teste Bilucaglia).

Queste circostanze hanno reso l'esposizione, già di per sé prolungata, particolarmente intensa.

Il figlio dell'appellato, sentito come teste, ha poi confermato che il padre è destrimane.

Con il terzo motivo di gravame, l'INAIL deduce l'erroneità della conclusione del Tribunale in ordine all'esistenza del nesso eziologico tra la patologia e l'esposizione lavorativa a radiofrequenze.

In particolare:

-osserva in primo luogo che il neurinoma del nervo acustico non è una malattia tabellata, sicché l'onere di provare la natura professionale della patologia incombe sul ricorrente;

-critica la c.t.u. disposta dal Tribunale, evidenziando gli errori materiali ivi contenuti e sostenendo che essa perviene a conclusioni errate, poiché non suffragate da una legge scientifica generale di copertura o quantomeno da una legge scientifica che abbia un preponderante consenso;

-deduce che la c.t.u., le cui conclusioni sono state recepite dal Tribunale, si è basata sulla classificazione IARC del 2013, senza dare adeguatamente conto di studi successivi, e non ha correttamente valutato il significato della classificazione delle

radiofrequenze in relazione all'evidenza cancerogena, ossia come categoria 2B ("possibilmente cancerogeno per l'uomo"), e quindi la più debole tra quelle utilizzate dall'Agenzia per classificare agenti che presentino evidenze positive di cancerogenicità (a fronte della categoria 2A, "probabilmente cancerogeno per l'uomo" e della categoria 1, "cancerogeno per l'uomo");

-sostiene che lo studio Interphone deve ritenersi attendibile, in quanto studio caso-controllo indipendente, pur a fronte di un solo parziale finanziamento da parte di industrie di telefoni cellulari e operatori di telefonia mobile, come pure devono ritenersi attendibili gli studi di Hardell; detti studi e gli ulteriori, pur con i limiti evidenziati dalla relazione del dott. Grandi (ricercatore del Dipartimento di Medicina, Epidemiologia, Igiene del Lavoro e Ambientale INAIL), prodotta nel presente grado, non supportano l'associazione tra utilizzo del telefono cellulare e l'insorgenza del tumore;

-deduce che, diversamente da quanto sostenuto dal c.t.u. (e condiviso dal Tribunale), non sono conosciuti i meccanismi di azione delle radiofrequenze;

-sostiene che non è provato che l'appellato (soggetto destrimane) usasse il telefono cellulare appoggiandolo sempre all'orecchio destro;

-deduce inoltre che non è corretto, come ha fatto il Tribunale, inferire dalla coesistenza di due fenomeni rari (nel caso di

specie, tumore raro ed esposizione rara a radiofrequenze) un nesso di causa-effetto tra di essi;

-sostiene infine che erroneamente è stato ritenuto un periodo di latenza del tumore (secondo la dottrina scientifica, almeno 10 anni) compatibile con l'esposizione a radiofrequenze sin dal 1995, considerato che il tumore (a lentissima crescita), si è manifestato già nel dicembre 2009, e, pertanto, non risulta applicabile il rischio individuale pari a 1,44, riportato invece dal c.t.u..

Alla luce della c.t.u. disposta nel presente grado anche questo motivo di gravame è infondato.

I Consulenti d'Ufficio si sono correttamente attenuti al quesito formulato dalla Corte con ordinanza del 16.1.2019, in cui era richiesto di svolgere gli accertamenti peritali basandosi su un'esposizione pari a 4 ore al giorno (come dimostrata dall'istruttoria testimoniale di cui si è già detto), seppure per mero errore, nel verbale di conferimento incarico del 19.3.2019, si sia fatto riferimento al quesito formulato nel primo grado, che non precisava la durata dell'esposizione. Pertanto, in conformità ai tempi di esposizione indicati nel quesito conferito, è stato stimato un tempo di utilizzo lavorativo del telefono cellulare pari a 840 ore/anno (4 ore x 210 giorni lavorativi), con un tempo stimato complessivo di utilizzo nell'intervallo di 15 anni intercorso tra il 1995 ed il 2010 pari a 12.600 ore (840 ore/anno x 15 anni) (v. pag. 51 c.t.u.).

I periti hanno inoltre considerato che, come emerso dall'istruttoria, i telefoni cellulari utilizzati dall'appellato sino alla fine del 1999 erano analogici (utilizzavano la tecnologia ETACS) e quindi, dal 2000, erano digitali (utilizzavano la tecnologia GSM), evidenziando che "*I telefoni analogici e quelli digitali basati su tecnologia GSM 2G erano caratterizzati da emissioni di radiofrequenze (RF) molto superiori rispetto a quelli digitali attuali 3G e 4G, con livelli di intensità di emissioni di RF di quasi due ordini di grandezza superiori (IARC, 2013), ovvero quasi 100 volte superiori"* (v. pagg. 51-52 c.t.u., affermazione tratta dalla Monografia IARC (2013) sulle radiofrequenze, come precisato dai Consulenti d'Ufficio a pag. 121 della relazione).

Premesso che il neurinoma acustico (o schwannoma vestibolare, indicato per brevità nella c.t.u. come "NA"), tumore cerebrale benigno, raro e a crescita lenta, è caratterizzato da un periodo di latenza dall'inizio dell'esposizione ad un fattore di rischio fino al momento della diagnosi di malattia pari a non meno di 10-15 anni (v. pag. 54 e segg.), i Consulenti d'Ufficio hanno citato i numerosi studi sulla materia, dando atto che la maggior parte di essi sono studi caso-controllo che sono stati condotti dal gruppo di lavoro Interphone e dal gruppo di ricerca dell'Università di Orebro, Svezia, guidato dal prof. Hardell, evidenziandone le caratteristiche e le metodologie, nonché i limiti e le critiche svolte su di essi dalla letteratura scientifica (v. pag. 58 e segg.).

Dopo lo studio Interphone pubblicato nel 2010 sulla relazione tra esposizione a TC (telefono cellulare) e gliomi e meningiomi (tra cui non era quindi incluso il NA), "*Nel 2011 il gruppo di studio INTERPHONE pubblicava, in un altro articolo, i risultati dello studio internazionale caso-controllo su uso di telefoni cellulari e rischio di sviluppare neurinomi dell'acustico, che comprendeva più di 1.000 casi e oltre 2.000 controlli arruolati tra il 2000 e il 2004 (**INTERPHONE, 2011**).*

Questo studio non ha riscontrato differenze nell'esposizione pregressa a TC in casi e controlli per "utilizzo regolare" definito sulla base di almeno una chiamata alla settimana.

*Al contrario, ha osservato un **eccesso di rischio statisticamente significativo di sviluppare NA** (di quasi 3 volte nei soggetti esposti, rispetto ai non esposti), **nei soggetti** classificati nella classe più alta di esposizione, corrispondente ad un **utilizzo complessivo di TC superiore a 1.640 ore** (traducibili in durate medie di esposizione di 1 ora al giorno per 4 anni, o di 2 ore al giorno per 2 anni, o di mezz'ora al giorno per 8 anni)*", evidenziando inoltre che i risultati dello studio mostravano nella classe con più alta esposizione cumulativa (utilizzo complessivo di telefono cellulare maggiore o uguale a 1640 ore) un'associazione statisticamente significativa del NA solo con l'uso ipsilaterale di telefono cellulare (OR, o *Odds Ratio* = 3.74), sicchè "*Dal momento che, come anche osservato da Cardis (**Cardis, 2008**), le radiofrequenze (RF)/emissioni elettromagnetiche emesse dai telefoni portatili vengono*

assorbite soprattutto dal lato del capo al quale viene accostato l'apparecchio telefonico durante l'utilizzo (c.d. ***utilizzo ipsilaterale****) e che con l'aumentare della distanza del telefono dal capo la dose di radiazioni elettromagnetiche assorbita dai tessuti diminuisce bruscamente, il riscontro di un'associazione statisticamente significativa del NA solo con l'uso ipsilaterale di TC supporta l'ipotesi che le RF emesse dai TC svolgano un ruolo causale nell'induzione/sviluppo di NA*".

Con riferimento ad una delle osservazioni dell'appellante sopra riportate, rileva la Corte che, non contestato e confermato dalla testimonianza del figlio dell'appellato che quest'ultimo è destrimane, il fatto che si tenda ad usare il telefono, esclusivamente o quasi, appoggiandolo all'orecchio del lato del corpo "dominante", rientra nel fatto notorio essendo usualmente riscontrabile nell'esperienza comune.

I Consulenti d'Ufficio hanno poi citato la classificazione dello IARC (Agenzia Internazionale per la Ricerca sul Cancro) del 2011, secondo cui le radiofrequenze sono "possibilmente cancerogene per l'uomo", valutazione confermata nella monografia del 2013 sulle radiazioni non ionizzanti, evidenziando che nell'aprile 2019 un Advisory Group della IARC, composto da 29 ricercatori provenienti da 19 paesi, ha inserito le radiofrequenze tra gli agenti per cui è ritenuta prioritaria una rivalutazione di cancerogenicità da parte della IARC nel periodo 2020-2024 (IARC Monographs Priorities

Group, 2019). Hanno quindi menzionato gli studi successivi (v. pagg. 68-69).

Nella tabella redatta dai Consulenti d'Ufficio alle pagg. 70 e 71 della perizia sono riportate le caratteristiche e i risultati degli studi epidemiologici pubblicati sull'associazione tra utilizzo di TC e NA, relativi al rischio di NA stimato per i soggetti con la più alta esposizione cumulativa in ciascuno studio, in termini di durata dell'esposizione, di durata cumulativa del tempo di esposizione o della durata dell'abbonamento telefonico, divisi anche per utilizzo ipsilaterale e controlaterale rispetto all'insorgenza del tumore.

Come rilevato dai Consulenti d'Ufficio, dall'esame della tabella emerge che la maggioranza degli studi mostra eccessi di rischio associati ad elevata durata di utilizzo o esposizione cumulativa a TC, che in vari studi sono statisticamente significativi, con più alti rischi associati all'utilizzo ipsilaterale di TC.

Nella perizia è evidenziato "*il fatto che negli studi in cui il rischio di NA è stimato sulla base del numero di ore cumulative di utilizzo, la categoria con la più alta esposizione cumulativa stimata (che trova il monte ore più alto di 1640 ore nello studio INTERPHONE 2011) ha un limite che è almeno circa 8 volte più basso del numero di ore (12.600 ore circa) di utilizzo di TC stimato nel caso del Sig. Romeo*" (v. pag. 69 c.t.u.).

I Consulenti d'Ufficio hanno poi esaminato le evidenze da studi sperimentali su animali, pubblicati successivamente alla monografia IARC del 2013, di cui uno condotto dall'Istituto

Ramazzini e l'altro dal National Toxicology Program (NTP) statunitense: il primo ha osservato un incremento statisticamente significativo di Schwannoma delle cellule cardiache di Schwann a carico dei ratti maschi, anche se stimato su un numero limitato di casi (3 casi nel gruppo a più alta esposizione vs. 0 casi nel gruppo non esposto), ed un incremento non statisticamente significativo di iperplasia delle cellule cardiache di Schwann, che costituisce una lesione pre-tumorale, in entrambi i sessi (Falcioni et al., 2018); e anche il secondo ha mostrato, per i ratti maschi, un incrementato numero di casi di Schwannoma cardiaco, rispetto ai ratti maschi non esposti, che era statisticamente significativo sia per esposizione a radiofrequenze CDMA (3 casi nel gruppo con esposizione intermedia, 6 casi nel gruppo con la più alta esposizione e 0 casi tra i non esposti) che per esposizione a quelle da GSM (5 casi nel gruppo più esposto e 0 casi tra i non esposti) (NTP, 2018).

I Consulenti d'Ufficio hanno precisato che "g*li Schwannomi cardiaci sono dello stesso tipo istologico dei neurinomi del nervo acustico (che, infatti, sono denominati anche Schwannomi vestibolari), cosa che supporta una relazione causale tra esposizione a radiofrequenze e incidenza di NA"* (v. c.t.u. pag. 76).

In base a tutti questi elementi, i Consulenti d'Ufficio hanno concluso che "*Nel caso concreto specifico in esame, il rischio derivante dall'utilizzo professionale di telefono cellulare risulta decisamente aggravato in relazione principalmente al lungo*

periodo di esposizione (15 anni) ed all'elevata intensità dell'esposizione stessa, quest'ultima dovuta sia alla tipologia di apparecchi telefonici cellulari utilizzati (ETACS e quindi GSM 2G, con livelli di emissione quasi 100 volte superiori rispetto ai più moderni telefoni cellulari), che all'elevato numero di ore di utilizzo dell'apparecchio telefonico stesso (con un'esposizione media di 840 ore/anno, con conseguente esposizione complessiva in 15 anni stimata nell'ordine di 12.600 ore).

Pertanto, anche alla luce delle risultanze dei più recenti studi sugli animali condotti da NTP e dall'Istituto Ramazzini (che mostrano eccessi di tumori dello stesso tipo istologico del NA, anche se in altra sede) e dalle recenti indicazioni dell'Advisory Group della IARC sulla necessità di una prioritaria rivalutazione da parte della IARC della cancerogenicità delle radiofrequenze, considerando le risultanze degli studi epidemiologici disponibili che, per quanto non del tutto concordanti, mostrano comunque frequentemente un eccesso di casi di NA in presenza di prolungata esposizione o di esposizioni intense, ***è dato ritenere che, nello specifico caso in esame, con criterio di elevata probabilità logica, si possa ammettere un nesso eziologico tra la prolungata e cospicua esposizione lavorativa a radiofrequenze emesse da telefono cellulare e la malattia denunciata dal periziato all'INAIL (neurinoma dell'ottavo nervo cranico destro)***" (v. conclusioni preliminari a pagg. 77-78, ribadite a pagg. 123-124 nelle conclusioni e risposte ai quesiti).

Le conclusioni sono fondate su un accurato ed aggiornatissimo esame delle fonti della letteratura scientifica, applicata alle peculiarità del caso concreto (per quantità e durata dell'esposizione), in assenza di fattori alternativi di rischio, secondo standard di certezza probabilistica ("più probabile che non").

Rispetto alle conclusioni del Consulenti d'Ufficio, i Consulenti INAIL hanno svolto articolate osservazioni (riportate a pagg. 79-84 della relazione), mentre i difensori dell'appellato hanno sottolineato la posizione di conflitto di interesse di alcuni autori di studi che hanno negato la cancerogenicità delle radiofrequenze (v. pagg. 84-97 c.t.u.), in particolare nell'ambito della letteratura citata dall'INAIL (v. pagg. 94-95).

Ritiene la Corte che i Consulenti d'Ufficio abbiano fornito esaustive risposte in merito alle osservazioni dei Consulenti di parte appellante.

In particolare:

1) i dati relativi all'esposizione su cui si sono basati i Consulenti d'Ufficio non sono, come sostenuto dai Consulenti INAIL, tratti "*sostanzialmente dalle informazioni anamnestiche riferite dall'assicurato"*, bensì, come già osservato, oggetto del quesito formulato dal Collegio avuto riguardo alle circostanze comprovate all'istruttoria testimoniale già sopra descritta;

2) con riferimento alle critiche sull'attendibilità degli studi secondo cui sussiste un nesso eziologico tra esposizione a

radiofrequenze e il neurinoma dell'acustico, i Consulenti d'Ufficio hanno svolto le seguenti articolate repliche:

a) quanto alle possibili distorsioni ("*bias*"), i Consulenti d'Ufficio hanno illustrato le differenze tra gli studi caso-controllo e gli studi di coorte, precisando che nella materia in esame la letteratura è quasi interamente costituita da studi caso-controllo. In questo tipo di studio (a differenza degli studi di coorte, da cui si ricava il rapporto tra l'incidenza della malattia nella popolazione esposta al fattore di rischio e l'incidenza della stessa malattia nella popolazione non esposta), il rischio relativo (RR) è approssimato da un altro indicatore di rischio, ovvero l'Odds Ratio (OR), che viene calcolato sulla base del rapporto tra la frequenza di esposizione al fattore di rischio tra i casi (malati) rispetto alla frequenza di esposizione al fattore di rischio tra i controlli (non malati).

Ciò rende possibili misclassificazioni non differenziali (che interessano sia i casi che i controlli nella stessa misura), le quali, come evidenziato dai Consulenti d'Ufficio, determinano sempre una sottostima del rischio rispetto al rischio reale, e misclassificazioni differenziali dell'esposizione (errori di classificazione che interessano in diversa entità i casi rispetto ai controlli), le quali possono condurre sia ad una sovrastima che ad una sottostima del reale rischio di malattia dovuto all'esposizione, e la più seria minaccia alla validità dei risultati è costituita da una forma di misclassificazione differenziale dell'esposizione denominata "*recall bias*", dovuta alla possibilità

che i soggetti che risultano affetti da malattia tumorale ricerchino nella propria memoria dei dati relativi alla propria pregressa esposizione a possibili fattori di rischio per la salute che possano avere determinato tale malattia.

Tuttavia i risultati degli studi disponibili (lo studio di Vrijheid et al., 2009, lo studio di Aydin et al., 2011, e lo studio di Petterson et al., 2015) indicano che è improbabile che gli studi su esposizione a TC e rischio di NA siano stati affetti da una misclassificazione differenziale dell'esposizione a RF da TC, tale da determinare una sovrastima dell'esposizione tra i casi rispetto ai controlli e, pertanto, una conseguente sovrastima del rischio di NA associato all'esposizione a RF da TC; al contrario, sia i risultati di detti studi, che quelli di altri studi che hanno valutato, in soggetti sani, la validità dell'esposizione a TC "autoriferita" (ovvero riferita dagli stessi soggetti inclusi nello studio e rilevata per mezzo di questionario o intervista ad essi somministrati), indicano la presenza di una forte misclassificazione non differenziale dell'esposizione (Samkange-Zeeb et al., 2004; Toledano et al., 2014; Vanden Abeele et al., 2013), con conseguente sottostima della forza dell'associazione tra esposizione a TC e rischio di NA, rispetto al rischio reale, sicché le stime di rischio (O.R.) ottenute nei diversi studi sarebbero fortemente sottostimate e il rischio reale di sviluppare NA sarebbe molto più alto di quello osservato negli studi stessi (v. pagg 99-103 c.t.u.);

b) anche quanto alla ipsilateralità dell'utilizzo del telefono cellulare rispetto al lato di comparsa del tumore gli studi disponibili (Shimizu e Yamaguchi, 2012) evidenziano la possibilità di una forte misclassificazione non differenziale, con conseguente sottostima (v. pag. 103 c.t.u.);

c) a differenza di quanto sostenuto dai Consulenti di parte INAIL, un effetto dose-risposta, cioè un significativo aumento del rischio di sviluppare la malattia tumorale (NA) all'aumentare della dose cumulativa di esposizione a RF da TC, è presente nei risultati della pooled analysis di Hardell et al. (2013), come da tabella riportata a pag. 104 della relazione, che mostra un rischio di NA associato all'uso di telefoni wireless progressivamente crescente all'aumentare della dose cumulativa di esposizione a TC (calcolata in base alle ore di utilizzo di TC): v. pagg. 103-105 c.t.u.;

d) un possibile motivo della mancanza di un effetto dose-risposta nello studio Interphone (2011) e in altri studi è che le categorie di esposizione cumulativa utilizzate fossero troppo basse: per esempio, nello studio Interphone il limite inferiore per la categoria di esposizione cumulativa più alta era posto a sole 1.640 ore di utilizzo di TC, corrispondenti a meno di mezz'ora al giorno per 10 anni. Come osservato nella relazione peritale, una dose di esposizione al di sotto di questo limite potrebbe essere non sufficiente a determinare lo sviluppo di NA (v. pag. 105 c.t.u.).

Si tratta peraltro di una dose di esposizione, come emerge dalla perizia, assolutamente non confrontabile con la massiccia e prolungata esposizione a radiofrequenze subita dall'appellato per ben 15 anni;

e) l'affermazione dei Consulenti INAIL secondo cui soggetti audiolesi protesizzati, che possiedono sussidi uditivi che utilizzano quotidianamente per l'intera giornata con annessa funzione bluetooth, non hanno mai fatto riscontrare casi di neurinomi dell'acustico, non è supportata da alcun riferimento bibliografico (v. pag. 107 c.t.u.);

f) diversamente da quanto sostenuto dai Consulenti INAIL, il trend della patologia per cui è causa (schwannoma dell'VIII nervo cranico) mostra un aumento, in coincidenza con la diffusione della telefonia cellulare, di detta malattia nel corso degli ultimi decenni. I Consulenti d'Ufficio hanno indicato, nelle pagg. 55-57 della relazione, i diversi studi sulla questione, rilevando che, secondo alcuni di essi, l'aumento di incidenza della malattia sarebbe attribuibile al miglioramento delle tecniche strumentali - basata sulla diffusione di nuove tecnologie, ad esempio TAC e RMN - utilizzate per pervenire alla diagnosi di tale tumore; ma osservando tuttavia che studi basati sui dati più recenti mostrano un ulteriore incremento di incidenza di NA, anche riferito a periodi in cui la diffusione dei migliori strumenti di diagnostica di questi tumori era già avvenuto (Kleijwegt et al., 2016: aumento nella regione di Leyden dell'incidenza di NA di oltre 3 volte in un arco

temporale di 11 anni intercorrente tra il 2001 al 2012; Marinelli et al., 2018: aumento dell'incidenza di NA in Minnesota, USA, di oltre 2 volte in un arco temporale di 11 anni intercorrente tra il 1995 al 2016; sempre negli USA, il Central Brain Tumor Registry, CBTRUS, ha pubblicato report annuali dal 2007 al 2016 con dati registrati dal 2004 al 2013 che evidenziano un raddoppio dell'incidenza annuale di NA: da 0,88 a 1,73 x 100.000); a pag. 108 della relazione hanno richiamato i dati del registro tumori danese che evidenziano un incremento nell'incidenza di tumori cerebrali, con un aumento del 40% tra gli uomini e del 29% tra le donne tra il 2001 e il 2010 (Sundhedsstyrelsen, 2010).

E' quindi condivisibile la conclusione dei Consulenti d'Ufficio secondo cui è improbabile che l'incremento di incidenza di NA sia attribuibile unicamente alla possibilità, derivante dell'affinamento delle metodiche diagnostiche di tale tumore o anche da una maggiore accessibilità della popolazione alle strutture sanitarie, di ottenere più diagnosi di NA.

3) Con riferimento agli studi di NTP e dell'Istituto Ramazzini, alle osservazioni critiche dei Consulenti INAIL sulla loro validità scientifica, anche mediante richiamo al recentissimo articolo pubblicato dall'International Commission on Non Ionizing Radiation Protection (ICNIRP) su Health Physics, i Consulenti d'Ufficio (v. pagg. 108-113 della relazione) hanno esaustivamente replicato che:

- si tratta dei più grandi studi sperimentali su animali condotti finora e sono caratterizzati da elevata standardizzazione dei protocolli di ricerca e da alta qualità dei metodi utilizzati;
- lo scopo principale degli studi sperimentali sui tumori condotti sugli animali è quello di valutare se l'esposizione ad un sospetto agente cancerogeno provochi o meno eccessi di tumori nei gruppi di animali esposti. Pertanto il fatto che, per gli animali oggetto di studio, possano essere previsti tempi e modalità di esposizione differenti rispetto a quelli degli esseri umani (per i roditori, a differenza che per l'uomo, "*total body"* e per l'intera vita), non rende i risultati degli studi meno validi.

Inoltre, con riferimento all'osservazione della difesa dell'INAIL, nel corso della discussione orale, circa l'inattendibilità di questi studi in quanto non effettuati sull'uomo, la Corte ritiene esaustiva e condivisibile la replica dei Consulenti d'Ufficio (anche mediante richiamo a fonti di letteratura scientifica sullo studio del NTP) secondo cui il criterio razionale per condurre studi di cancerogenicità in modelli animali *"si basa su dati sperimentali che mostrano che ogni agente noto come cancerogeno nell'uomo, quando adeguatamente testato, ha mostrato di essere cancerogeno negli animali (IARC, 2006) e che quasi un terzo dei cancerogeni umani sono stati identificati dopo che effetti cancerogeni sono stati trovati in studi ben condotti sugli animali (Huff, 1993). Non c'è ragione di credere che un agente fisico come le radiofrequenze possa danneggiare i tessuti animali, ma non i tessuti umani*" (Melnick, 2019, citato

alle pagg. 76-77 e 109 della relazione). Le sperimentazioni sulla cancerogenicità di agenti o sostanze vengono usualmente eseguite su animali, quali i roditori, che presentano elementi di similitudine con gli uomini, sicché non si può negare pregiudizialmente valore scientifico ai risultati di detti studi;

- il fatto che l'eccesso di tumore sia stato riscontrato soltanto nei ratti (e quasi esclusivamente di sesso maschile) non inficia la validità dello studio, considerato che lo schwannoma cardiaco insorge in diverse varietà di ceppi di ratti (e con maggior frequenza nei maschi), ma non è mai stato osservato nei topi;

- nonostante, nello studio dell'Istituto Ramazzini, l'esposizione dei ratti sia avvenuta alla dose massima testata, il tasso di assorbimento specifico conseguente all'esposizione era di poco superiore al limite massimo per irradiazione al corpo intero per l'uomo; mentre, quanto allo studio del NTP, pur essendo la dose di esposizione molto superiore al limite massimo di esposizione ammissibile per irradiazione al corpo intero per l'uomo, la dose assorbita a livello locale è solo una piccola parte della dose somministrata a tutto il corpo, e, in particolare, per il cervello, la dose assorbita è stata stimata in circa il 10% della dose totale somministrata a tutto il corpo;

- il numero di casi di tumore riscontrato negli animali è statisticamente significativo: nello studio di NTP, 6 casi nel gruppo a più alta esposizione a RF da CDMA e 5 casi in quello con più alta esposizione a RF da GSM, mentre nessun caso si è verificato nel gruppo non esposto; nello studio dell'Istituto

Ramazzini, 3 casi osservati nel gruppo a più alta esposizione e nessuno nel gruppo non esposto;

- in merito alla diversa localizzazione degli schwannomi riscontrati nei ratti esposti negli studi dell'NTP e dell'Istituto Ramazzini (localizzazione a livello cardiaco invece che a livello cerebrale), appare probabile che la modalità di irradiazione degli animali abbia influito nel determinare questo risultato, in quanto la somministrazione di RF è stata indirizzata a tutto il corpo e non concentrata solo sulla testa degli animali da esperimento, come invece avviene per l'esposizione a RF negli utilizzatori di TC;

- gli schwannomi cardiaci sono dello stesso tipo istologico dei neurinomi del nervo acustico (che, infatti, sono denominati anche schwannomi vestibolari), cosa che supporta una relazione causale tra esposizione a radiofrequenze e incidenza di NA. Pertanto, il fatto che i NA siano tumori benigni, al contrario degli schwannomi cardiaci maligni osservati nei ratti negli studi del NTP e dell'Istituto Ramazzini, appare irrilevante, considerato che questi studi dimostrano che l'esposizione a RF può determinare una trasformazione neoplastica delle cellule di Schwann, processo che sia i tumori benigni che i tumori maligni hanno in comune;

- lo studio del NTP ha concluso affermando che i risultati dimostrano una chiara evidenza di attività cancerogena delle RF (NTP, 2018);

- l'effettuazione di confronti multipli nelle analisi condotte nei due studi del NTP e dell'Istituto Ramazzini ha sicuramente aumentato il rischio che si verificassero associazioni spurie in questi due studi, ma la probabilità che tre analisi indipendenti abbiano trovato solo per caso un incremento significativo di sviluppare tumori dello stesso tipo istologico e nella stessa sede anatomica è bassissima, anche considerando i molti confronti effettuati in analisi, ciò che supporta in maniera inequivocabile l'effetto cancerogeno delle RF;
- la presenza di un effetto cancerogeno è supportata anche dall'osservazione di un significativo aumento del danno al DNA, valutato per mezzo della presenza di rotture del DNA con la metodica Comet assay, in vari organi, tra cui soprattutto il cervello, sia in ratti che in topi (Wyde, 2016);
- diversamente da quanto sostenuto dai Consulenti INAIL, le analisi sono state condotte "in cieco" (v. articolo di Melnick del 2019, in risposta alle critiche dell'INCIRP riguardo allo studio del NTP);
4) In merito alla motivazione per la quale l'Advisory Group della IARC ha inserito le radiofrequenze tra gli agenti per cui è ritenuta prioritaria una rivalutazione di cancerogenicità da parte della IARC nel periodo 2020-2024 (secondo i Consulenti INAIL non per motivi di particolare allarme, ma in quanto rivalutazione rientrante nelle normali procedure di aggiornamento periodico delle valutazioni di evidenza cancerogena promosse dall'Agenzia), nella relazione peritale è trascritta la tabella

riportata nell'articolo, dalla quale si ricava che le radiazioni non ionizzanti (radiofrequenze) sono tra gli agenti per i quali è raccomandata una rivalutazione urgente ("*high priority*") della cancerogenicità per l'uomo, indicazione, specificata nella tabella stessa, motivata dal fatto che le nuove evidenze derivanti da test biologici e meccanicistici "*richiedono una rivalutazione della classificazione*". Nell'articolo dell'Advisory Group è inoltre specificato che la priorità per la rivalutazione è stata assegnata sulla base di evidenze sull'esposizione umana e in base al grado di evidenza disponibile per valutare la cancerogenicità (v. pagg. 113-115 c.t.u.);

5) Quanto alle osservazioni dei Consulenti INAIL circa l'incompatibilità dell'evoluzione della patologia dell'appellato (essendo il tumore, già nel 2010, di dimensioni pari a 2,6 cm, a fronte di un ritmo di crescita di circa 1,5 mm all'anno) e i periodi di latenza della stessa (oltre 15-20 anni, non meno di 10-15 anni), i Consulenti d'Ufficio hanno osservato che, secondo l'autore citato dai Consulenti INAIL (Dott. P. Ferroli, Istituto Besta di Milano), il ritmo di crescita del tumore, di circa 1,5 mm all'anno, si riferisce a circa il 75% dei neurinomi dell'acustico, mentre un quarto di essi ha tendenza a crescere più rapidamente e in maniera più aggressiva (v. pag. 116 c.t.u.). Inoltre, i Consulenti d'Ufficio, alle pagg. 116-117 della relazione, hanno citato ampia letteratura scientifica da cui risultano tassi di crescita del neurinoma dell'acustico piuttosto variabili. In particolare, in caso di NA caratterizzati da fenomeni cistici ed

emorragici (come quello dell'appellato), sono stati osservati tassi di crescita di oltre 4 mm/anno (Paldor et al., 2016), e nella revisione di Paldor vengono citati anche alcuni case reports nei quali sono stati descritti casi di NA con tassi di crescita fino a 25 mm/anno (Fayad et al, 2014).

Appare dunque condivisibile la conclusione sul punto dei Consulenti d'Ufficio secondo cui "*I tassi di crescita del NA osservati nella letteratura scientifica, la presenza nel caso in esame di fenomeni cistico-necrotici (anche citati dai CTP INAIL) e il lungo periodo intercorso tra la prima esposizione e la diagnosi di NA (15 anni), rappresentano elementi certamente non idonei a giustificare una esclusione del nesso causale tra esposizione a RF da TC e insorgenza di NA, così come sostenuto dai CTP INAIL.*

Al contrario, tali dati rappresentano elementi assolutamente compatibili con la sussistenza, nel caso in esame, del riscontro di un NA delle dimensioni di 2.6 cm al momento della diagnosi, in soggetto esposto da 15 anni a RF da TC" (v. pag. 117).

6) Pertanto, considerato il periodo di esposizione dell'appellato alle radiofrequenze (dal 1995 al 2010, anno in cui gli è stato diagnosticato il NA), il tempo intercorso tra l'inizio dell'esposizione e la comparsa del tumore (pari a15 anni, e non a 4 anni come sostenuto dai Consulenti INAIL) è assolutamente compatibile con l'induzione e lo sviluppo del NA sulla base dei dati di letteratura, anche considerando 5 anni per l'iniziazione del tumore e 10 anni per il suo sviluppo.

Inoltre, diversamente da quanto sostenuto dalla difesa dell'appellante nel corso della discussione orale, non vi è contraddizione tra quanto argomentato dai Consulenti d'Ufficio alle pagg. 115-118 in merito alla latenza della malattia, al suo sviluppo e alle dimensioni del tumore al momento della diagnosi nel 2010 (2,6 cm), e quanto scritto alle pagg. 57-58 della relazione sul periodo di latenza riconosciuto nella letteratura scientifica (almeno 10-15 anni), avendo i Consulenti d'Ufficio motivato sulla compatibilità tra il periodo di latenza della malattia e le dimensioni del tumore, menzionando (a differenza dei Consulenti INAIL) copiosa letteratura scientifica sull'estrema variabilità della crescita media del tumore, che ha registrato anche casi di valori massimi pari a 17 mm/anno e addirittura fino a 25 mm/anno (v. pagg. 116-117 c.t.u.).

7) Non vi è contraddizione tra l'affermazione dei Consulenti d'Ufficio (v. nota 25 a pag. 70 della relazione) secondo cui «*Appare quindi improbabile che si possano vedere gli eventuali effetti dell'uso di TC sull'incidenza dei NA, almeno sui dati fino al 2010, data la diffusione relativamente recente dei TC e il lungo periodo di induzione di questi tumori*» e l'affermazione dell'esistenza del nesso eziologico nel caso di specie, poiché la frase di cui sopra è evidentemente riferita al fatto che appare improbabile che negli studi epidemiologici si potessero vedere eventuali effetti dell'uso di telefono cellulare, in quanto nelle popolazioni esaminate da tali studi l'inizio dell'esposizione, per la gran parte dei soggetti, era troppo recente, mentre, nel caso

concreto in esame, l'esposizione dell'appellato ha avuto inizio nel 1995, ovvero 15 anni prima della diagnosi del tumore (NA) ed in un periodo storico in cui i TC erano ancora poco diffusi nella maggior parte dei paesi europei (v. pagg. 118-119 c.t.u.).

I Consulenti d'Ufficio hanno pertanto ravvisato il nesso causale tenendo correttamente in considerazione la concreta esposizione dell'appellato alle radiofrequenze, che, per le sue peculiarità (durata ed intensità conseguente all'uso abnorme del telefono cellulare), presenta caratteristiche del tutto diverse da quelle medie riscontrate in generale dalla popolazione nel periodo per cui è causa;

8) con riferimento alle conclusioni dei Consulenti INAIL, che, al fine di escludere il nesso causale, richiamano il documento dell'ISS, rapporto ISTISAN 19/11, i Consulenti d'Ufficio hanno esaustivamente replicato che: "*il rapporto ISTISAN su RF e tumori è stato criticato dall'associazione Medici per l'Ambiente (ISDE, acronimo di International Society of Doctors for Environment) per varie ragioni (Di Ciaula, 2019), tra cui: la selezione degli studi inclusi nelle meta-analisi presentate; l'interpretazione delle associazioni osservate tra RF e tumori intracranici; l'uso inappropriato dei dati sull'andamento dell'incidenza dei tumori cerebrali per confutare l'associazione tra RF e tumori cerebrali; il non aver tenuto conto nella loro valutazione dei risultati di recenti studi sperimentali su animali, …, che hanno mostrato effetti cancerogeni su ratti (NTP, 2018; Falcioni et al., 2018) e, soprattutto, per non avere fatto*

conseguire alla dichiarata incertezza sugli effetti associati ad un uso intenso e prolungato di TC raccomandazioni più stringenti sui limiti di esposizione a RF, in particolare per i bambini e gli adolescenti, che potrebbero essere maggiormente suscettibili a tali effetti (Di Ciaula, 2019)" (v. pag. 119 c.t.u.).

I Consulenti d'Ufficio hanno poi menzionato il rapporto della ANSES (Agenzia Nazionale Francese per la Sicurezza Sanitaria per Alimentazione Ambiente e Lavoro) sugli effetti delle onde emesse dai telefoni mobili sulla salute, che conclude segnalando che gli studi scientifici pubblicati sino ad oggi non permettono di escludere la comparsa di effetti biologici per l'uomo oltre certe soglie di esposizione a RF da TC, evidenziando inoltre che il 76% dei telefoni cellulari esaminati emette radiofrequenze superiori al limite massimo raccomandato dall'ICNIRP per esposizione di testa e tronco (v. pagg. 119-121 c.t.u.).

I Consulenti d'Ufficio, a parere della Corte, hanno replicato punto per punto alle osservazioni dei Consulenti INAIL, menzionando copiosa letteratura scientifica a supporto delle proprie argomentazioni, e fornendo, in conclusione, solidi elementi per affermare un ruolo causale tra l'esposizione dell'appellato alle radiofrequenze da telefono cellulare e la patologia per cui è causa.

I dati epidemiologici, i risultati delle sperimentazioni sugli animali (non contraddetti, allo stato, da altre sperimentazioni dello stesso tipo), la durata e l'intensità dell'esposizione (assolutamente peculiari per la loro abnormità) che assumono

particolare rilievo considerata l'accertata – a livello scientifico – relazione dose-risposta tra esposizione a radiofrequenze da telefono cellulare e rischio di neurinoma dell'acustico, unitamente alla mancanza di un altro fattore che possa avere cagionato la patologia, complessivamente valutati, consentono di ritenere che, caso specifico, sussista una legge scientifica di copertura che supporta l'affermazione del nesso causale secondo criteri probabilistici ("più probabile che non").

In effetti, buona parte della letteratura scientifica che esclude la cancerogenicità dell'esposizione a radiofrequenze, o che quantomeno sostiene che le ricerche giunte ad opposte conclusioni non possano essere considerate conclusive, come evidenziato anche dai Consulenti d'Ufficio a commento delle osservazioni della difesa dell'appellato (riportate alle pagg. 84-97 della relazione), versa in posizione di conflitto di interessi, peraltro non sempre dichiarato: si veda in particolare, a pag. 94 della relazione, l'osservazione della difesa dell'appellato (in alcun modo contestata dalla controparte) secondo cui gli autori degli studi indicati dall'INAIL, nominativamente elencati, sono membri di ICNIRP e/o di SCENIHR, che hanno ricevuto, direttamente o indirettamente, finanziamenti dall'industria.

I Consulenti d'Ufficio hanno al riguardo osservato: "*Inoltre, anche alla luce dell'ampia documentazione sui conflitti di interesse di diversi ricercatori coinvolti nello studio INTERPHONE, pure prodotta dai consulenti dell'appellante, si ritiene che debba essere dato minor peso agli studi pubblicati da*

autori che non hanno dichiarato l'esistenza di conflitti di interesse invece sussistenti e che debba essere dato maggior peso ai risultati di studi condotti da ricercatori esenti da tali conflitti, come ad esempio gli studi effettuati da Hardell e collaboratori.

*Nel caso in esame, possono concretizzare situazioni di conflitto di interesse rispetto alla valutazione dell'effetto sulla salute delle RF, ad esempio, quei casi in cui l'autore dello studio ha effettuato consulenze per l'industria telefonica o ha ricevuto finanziamenti per la realizzazione di studi dall'industria telefonica oppure (come anche stabilito anche dal Karolinska Institutet di Stoccolma, in relazione all'esposto presentato contro il prof. Ahlbom, poi destituito dalla presidenza del gruppo di lavoro IARC sulle RF proprio a causa della sua appartenenza all'ICNIRP) nel caso in cui l'autore stesso sia membro dell'ICNIRP (International Commission on Non-Ionizing Radiation). Infatti l'**ICNIRP** è un'organizzazione privata, le cui linee guida sulle RF hanno una grande importanza economica e strategica per l'industria delle telecomunicazioni, con la quale peraltro diversi membri dell'ICNIRP hanno legami attraverso rapporti di consulenza ... A parte possibili legami con l'industria, appare evidente che i membri dell'ICNIRP dovrebbero astenersi dal valutare l'effetto sulla salute di livelli di RF che l'ICNIRP stesso ha già dichiarato sicuri e quindi non nocivi per la salute (**Hardell, 2017**)*" (v. pag. 107 relazione).

L'impostazione dei Consulenti d'Ufficio è del tutto condivisibile, essendo evidente che l'indagine, e le conclusioni, di autori indipendenti diano maggiori garanzie di attendibilità rispetto a quelle commissionate, gestite o finanziate almeno in parte, da soggetti interessati all'esito degli studi.

L'ampia letteratura scientifica citata ed applicata dai Consulenti d'Ufficio, del tutto indipendente, deve quindi ritenersi affidabile, così come le conclusioni, a livello epidemiologico, a cui essa è pervenuta.

Del resto, proprio in una controversia nei confronti dell'INAIL relativa a malattia professionale (tumore intracranico) per esposizione a radiofrequenze da telefono cellulare, la S.C. ha ritenuto che "*L'ulteriore rilievo circa la maggiore attendibilità proprio di tali studi, stante la loro posizione di indipendenza, ossia per non essere stati cofinanziati, a differenza di altri, anche dalle stesse ditte produttrici di cellulari, costituisce ulteriore e non illogico fondamento delle conclusioni accolte"* (v. Cass. 12.10.2012 n. 17438).

Trattandosi di malattia professionale non tabellata e ad eziologia multifattoriale, la prova della causa di lavoro, indubbiamente gravante sul lavoratore, per costante giurisprudenza di legittimità deve essere valutata in termini di ragionevole certezza, e quindi, esclusa la rilevanza della mera possibilità dell'origine professionale, essa può essere ravvisata in presenza di un rilevante grado di probabilità (cfr., tra le molte, Cass. 10.4.2018

n. 8773), grado che, per le ragioni illustrate, è emerso dalla c.t.u. disposta nel presente grado.

La percentuale di invalidità nella misura del 23%, già riconosciuta nella c.t.u. disposta dal Tribunale e ribadita dalla consulenza espletata nel presente grado, è stata espressamente accettata dall'appellato (v. pag. 3, punto a, memoria appellato).

In conclusione, l'appello dev'essere respinto.

Le spese del grado seguono la soccombenza e si liquidano in dispositivo in conformità ai parametri vigenti, tenuto conto del valore della causa e dell'attività difensiva svolta, con distrazione in favore dei difensori.

Le spese di c.t.u., viste le conclusioni a cui essa è pervenuta, vanno poste a carico definitivo dell'INAIL.

Al rigetto dell'appello consegue *ex lege* (art. 1, commi 17-18, l. 228/2012) la dichiarazione che sussistono i presupposti per l'ulteriore pagamento, a carico dell'appellante, di un importo pari a quello del contributo unificato dovuto per l'impugnazione.

P . Q . M .

Visto l'art. 437 c.p.c.,

respinge l'appello;

condanna l'Inail a rimborsare all'appellato le spese del grado, liquidate in euro 10.000,00, oltre rimborso forfettario, Iva e Cpa, con distrazione in favore dei difensori;

pone a carico dell'appellante gli oneri di CTU, liquidati come da separato decreto;

dichiara la sussistenza delle condizioni per l'ulteriore pagamento,

a carico dell'appellante, di un importo pari a quello del contributo unificato dovuto per l'impugnazione.

Così deciso all'udienza del 3.12.2019

IL CONSIGLIERE Est. **LA PRESIDENTE**

Securities registered pursuant to Section 12(g) of the Act: None

Indicate by check mark if the registrant is a well-known seasoned issuer, as defined in Rule 405 of the Securities Act. ☒ Yes ☐ No

Indicate by check mark if the registrant is not required to file reports pursuant to Section 13 or Section 15(d) of the Act. ☐ Yes ☒ No

Indicate by check mark whether the registrant (1) has filed all reports required to be filed by Section 13 or 15(d) of the Securities Exchange Act of 1934 during the preceding 12 months (or for such shorter period that the registrant was required to file such reports), and (2) has been subject to such filing requirements for the past 90 days. ☒ Yes ☐ No

Indicate by check mark whether the registrant has submitted electronically every Interactive Data File required to be submitted pursuant to Rule 405 of Regulation S-T (§232.405 of this chapter) during the preceding 12 months (or for such shorter period that the registrant was required to submit such files). ☒ Yes ☐ No

Indicate by check mark whether the registrant is a large accelerated filer, an accelerated filer, a non-accelerated filer, a smaller reporting company, or an emerging growth company. See the definitions of "large accelerated filer," "accelerated filer," "smaller reporting company," and "emerging growth company" in Rule 12b-2 of the Exchange Act. (Check one):

Large accelerated filer	☒	Accelerated filer	☐
Non-accelerated filer	☐	Smaller reporting company	☐
		Emerging growth company	☐

If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act. ☐

Indicate by check mark whether the registrant is a shell company (as defined in Rule 12b-2 of the Act). ☐ Yes ☒ No

At June 30, 2019, the aggregate market value of the registrant's voting stock held by non-affiliates was approximately $236,226,048,492.

At January 31, 2020, 4,135,863,778 shares of the registrant's common stock were outstanding, after deducting 155,569,868 shares held in treasury.

Documents Incorporated By Reference:

Portions of the registrant's Annual Report to Shareholders for the year ended December 31, 2019 (Parts I and II).

Portions of the registrant's definitive Proxy Statement to be delivered to shareholders in connection with the registrant's 2020 Annual Meeting of Shareholders (Part III).

TABLE OF CONTENTS

PART I

Item 1. Business

General

Verizon Communications Inc. (Verizon or the Company) is a holding company that, acting through its subsidiaries, is one of the world's leading providers of communications, information and entertainment products and services to consumers, businesses and government entities. With a presence around the world, we offer voice, data and video services and solutions on our networks that are designed to meet customers' demand for mobility, reliable network connectivity, security and control. Formerly known as Bell Atlantic Corporation (Bell Atlantic), we were incorporated in 1983 under the laws of the State of Delaware. We began doing business as Verizon on June 30, 2000 following our merger with GTE Corporation. We have a highly diverse workforce of approximately 135,000 employees as of December 31, 2019.

Our principal executive offices are located at 1095 Avenue of the Americas, New York, New York 10036 (telephone number 212-395-1000).

In November 2018, we announced a strategic reorganization of our business. Under the new structure, effective April 1, 2019, there are two reportable segments that we operate and manage as strategic business units - Verizon Consumer Group (Consumer) and Verizon Business Group (Business).

Verizon Consumer Group

Our Consumer segment provides consumer-focused wireless and wireline communications services and products. Our wireless services are provided across one of the most extensive wireless networks in the United States (U.S.) under the Verizon brand and through wholesale and other arrangements. Our wireline services are provided in nine states in the Mid-Atlantic and Northeastern U.S., as well as Washington D.C., over our 100% fiber-optic network under the Fios brand and over a traditional copper-based network to customers who are not served by Fios. In 2019, the Consumer segment's revenues were $91.1 billion, representing approximately 69% of Verizon's consolidated revenues. As of December 31, 2019, Consumer had approximately 95 million wireless retail connections, 6 million broadband connections and 4 million Fios video connections.

Verizon Business Group

Our Business segment provides wireless and wireline communications services and products, video and data services, corporate networking solutions, security and managed network services, local and long distance voice services and network access to deliver various Internet of Things (IoT) services and products. We provide these products and services to businesses, government customers and wireless and wireline carriers across the U.S. and select products and services to customers around the world. In 2019, the Business segment's revenues were $31.4 billion, representing approximately 24% of Verizon's consolidated revenues. As of December 31, 2019, Business had approximately 25 million wireless retail postpaid connections and approximately 489 thousand broadband connections.

Additional discussion of our reportable segments is included in the 2019 Verizon Annual Report to Shareholders under the headings "Management's Discussion and Analysis of Financial Condition and Results of Operations - Overview" and - "Segment Results of Operations" and in Note 13 to the consolidated financial statements of Verizon Communications Inc. and Subsidiaries, which are incorporated by reference into this report.

Service and Product Offerings

Our Consumer segment's wireless and wireline products and services are available to our retail customers, as well as resellers that purchase wireless network access from us on a wholesale basis. Our Business segment's wireless and wireline products and services are organized by the primary customer groups targeted by these offerings: Global Enterprise, Small and Medium Business, Public Sector and Other, and Wholesale.

Wireless

We offer wireless services and equipment to customers of both Consumer and Business.

Wireless Services

Our Consumer and Business segments provide a wide variety of wireless services accessible on a broad range of devices. Customers can obtain our wireless services on a postpaid or prepaid basis. Retail (non-wholesale) postpaid accounts primarily represent retail customers that are directly served and managed by Verizon and use Verizon branded services. A single account may include monthly wireless services for a variety of connected devices. A retail postpaid connection represents an individual line of service for a wireless device for which a customer is generally billed one month in advance for a monthly access charge in return for access to and usage of network services. Our prepaid service is offered only to Consumer customers and enables individuals to obtain wireless services without credit verification by paying for all services in advance. Approximately 96% of our Consumer retail connections were postpaid connections as of December 31, 2019.

We offer various postpaid and prepaid service plans tailored to the needs of our customers. Depending on those needs at a particular time, our plans may include features related to, among other things: unlimited or metered domestic and/or international voice, data, and texting; the ability to share data allowances and/or use data allowances in different periods; high definition voice and video features; the ability to use a device as a Wi-Fi hotspot; and varying data rates depending on the plan and usage on that plan. Our service offerings vary from time to time based on customer needs, technology changes and market conditions and may be provided as standard plans or as part of limited time promotional offers.

Access to the Internet is available on all smartphones and nearly all basic phones. In addition, our customers can access the Internet at broadband speeds on notebook computers and tablets that are either wireless-enabled or that are used in conjunction with separate dedicated devices that provide a mobile Wi-Fi connection.

As of January 2017, we no longer offer Consumer customers new fixed-term, subsidized service plans for phones; however, we continue to offer subsidized plans to our Business customers. We also continue to service existing plans for customers who have not yet purchased and activated devices under the Verizon device payment program.

Wireless Equipment

Consumer and Business offer several categories of wireless equipment to customers, including a variety of smartphones and other handsets, wireless-enabled Internet devices, such as tablets, laptop computers and netbooks, and other wireless-enabled connected devices, such as smart watches and other wearables. In certain cases, we permit customers to acquire equipment from us using device payment plans, which permit the customer to pay for the device in installments over time.

Verizon Consumer Group

In addition to the wireless services and equipment discussed above, Consumer sells residential fixed connectivity solutions, including Internet, video and voice services, and wireless network access to resellers on a wholesale basis.

Residential Fixed Services. We provide residential fixed connectivity solutions to customers over our 100% fiber-optic network under the Fios brand, and over a traditional copper-based network to customers who are not served by Fios. During 2018, we commercially launched fifth-generation (5G) wireless technology for the home (5G Home) on proprietary standards in four U.S. markets and on global standards in a fifth market in 2019.

We offer residential fixed services tailored to the needs of our customers. Depending on those needs at a particular time, our services may include features related to, among other things: Internet access at different speed tiers using fiber-optic, copper or wireless technology; video services that may feature a variety of channel options, video on demand products, cloud-based services and digital video recording capabilities; over-the-top video services; and voice services.

Network Access Services. We sell network access to mobile virtual network operators (MVNOs) on a wholesale basis, who in turn resell wireless service under their own brand(s) to consumers.

Verizon Business Group

In addition to the wireless services and equipment discussed above, our Business segment provides communications products and enhanced services, including video and data services, corporate networking solutions, security and managed network services, local and long distance voice services and network access to deliver various IoT products and services.

Global Enterprise

Global Enterprise offers services to large businesses, which are identified based on their size and volume of business with Verizon, as well as non-U.S. public sector customers. In 2019, Global Enterprise revenues were $10.8 billion, representing approximately 34% of Business's total revenues.

Global Enterprise offers a broad portfolio of connectivity, security and professional services designed to enable our customers to optimize their business operations, mitigate business risks and capitalize on data. These services include the following:

- *Network Services*. We offer a portfolio of network connectivity products to help our customers connect with their employees, partners, vendors, and customers. These products include private networking services, private cloud connectivity services, virtual and software defined networking services, and Internet access services.
- *Advanced Communications Services*. We offer a suite of services to our customers to help them communicate with their employees, partners, vendors, constituents and customers. These products include Internet Protocol (IP)-based voice services, unified communications and collaboration tools and customer contact center solutions.
- *Security services*. We offer a suite of management and data security services that help our customers protect, detect and respond to security threats to their networks, data, applications and infrastructure.
- *Core services*. We provide a portfolio of domestic and global voice and data solutions utilizing traditional telecommunications technology, including voice calling, messaging services, conferencing, contact center solutions and private line and data access networks. Core services also include the provision of customer premises equipment, and installation, maintenance and site services.

- *IoT services*. We provide the network access required to deliver various IoT products and services. We work with companies that purchase network access from us to connect their Open Development-certified devices, bundled together with their own solutions, which they sell to end users. We are building IoT capabilities by leveraging business models that monetize usage on our networks at the connectivity, platform and solution layers.

Small and Medium Business

Small and Medium Business offers wireless services and equipment, tailored voice and networking products, Fios services, IP networking, advanced voice solutions, security and managed information technology (IT) services to our U.S.-based customers that do not meet the requirements to be categorized as Global Enterprise. In 2019, Small and Medium Business revenues were $11.5 billion, representing approximately 36% of Business's total revenues.

In addition to the wireless services and equipment discussed above, Small and Medium Business provides fixed connectivity solutions comparable to the residential fixed services provided by Consumer, as well as business services and connectivity similar to the products and services offered by Global Enterprise, in each case with features and pricing designed to address the needs of small and medium businesses.

Public Sector and Other

Public Sector and Other offers wireless products and services as well as wireline connectivity and managed solutions to U.S. federal, state and local governments and educational institutions. These services include the business services and connectivity similar to the products and services offered by Global Enterprise, in each case, with features and pricing designed to address the needs of governments and educational institutions. In 2019, Public Sector and Other revenues were $5.9 billion, representing approximately 19% of Business's total revenues.

Public Sector and Other also includes solutions that support fleet tracking management, compliance management, field service management, asset tracking and other types of mobile resource management in the United States and around the world.

Wholesale

Wholesale offers wireline communications services including data, voice, local dial tone and broadband services primarily to local, long distance, and wireless carriers that use our facilities to provide services to their customers. In 2019, Wholesale revenues were $3.2 billion, representing approximately 10% of Business's total revenues. A portion of Wholesale revenues are generated by a few large telecommunications companies, most of which compete directly with us. Wholesale's services include:

- *Data services*. We offer a portfolio of data services with varying speeds and options to enhance our Wholesale customers' networks and provide connections to their end-users and subscribers.

- *Voice services*. We provide switched access services that allow carriers to complete their end-user calls that originate or terminate within our territory. In addition, we provide originating and terminating voice services throughout the U.S. and globally utilizing our TDM and VoIP networks.

- *Local services.* We offer an array of local dial tone and broadband services to competitive local exchange carriers, some of which are offered to comply with telecommunications regulations. In addition, we offer services such as colocation, resale and unbundled network elements in compliance with applicable regulations.

Distribution

We use a combination of direct, indirect and alternative distribution channels to market and distribute our products and services to Consumer customers.

Our direct channel, including our company-operated stores, is a core component of our distribution strategy. Our sales and service centers also represent a significant distribution channel for our services.

Our indirect/digital partners channel includes agents that sell our wireless and wireline products and services at retail locations throughout the U.S., as well as through the Internet. The majority of these sales are made under exclusive selling arrangements with us. We also have relationships with high-profile national retailers that sell our wireless and wireline products and services, as well as convenience store chains that sell our wireless prepaid products and services. In 2019, we grew our digital channel and expanded omni channel experiences for our customers to offer choice and convenience.

In addition to our direct channel, our Business segment has additional distribution channels that include business solution fulfillment provided by resellers, non-stocked device fulfillment performed by distributors and integrated mobility services provided by system integrators and resellers.

Competition and Related Trends

The telecommunications industry is highly competitive. We expect competition to remain intense as traditional and non-traditional participants seek increased market share.

With respect to our wireless connectivity products and services, we compete against other national wireless service providers, including AT&T Inc., Sprint Corporation and T-Mobile USA, Inc., as well as various regional wireless service providers. We also compete for retail activations with resellers that buy bulk wholesale service from wireless service providers, including Verizon, and resell it to their customers. Resellers may include cable companies. Competition remains intense as a result of high rates of smartphone penetration in the wireless market, increased network investment by our competitors, the development and deployment of new technologies, such as 5G, the introduction of new products and services, offerings that include additional premium content, new market entrants, the availability of additional licensed and unlicensed spectrum, and regulatory changes. In 2019, we began offering Apple Music and Disney+ to customers as part of their Unlimited plans. Competition may also increase as smaller, stand-alone wireless service providers merge or transfer licenses to larger, better capitalized wireless service providers and as MVNOs resell wireless communication services.

We also face competition from other communications and technology companies seeking to increase their brand recognition and capture customer revenue with respect to the provision of wireless products and services, in addition to non-traditional offerings in mobile data. For example, Microsoft Corporation, Alphabet Inc., Apple Inc. and others are offering alternative means for making wireless voice calls that, in certain cases, can be used in lieu of the wireless provider's voice service, as well as alternative means of accessing video content.

With respect to our wireline connectivity services, we compete against cable companies, wireless service providers, domestic and foreign telecommunications providers, satellite television companies, Internet service providers, over-the-top (OTT) providers and other companies that offer network services and managed enterprise solutions. Cable operators have increased the size and capacity of their networks in order to deliver digital products and services. We introduced offerings that provide customized Internet and video packages. Several major cable operators also offer bundles with wireless services through strategic relationships. Customers have more choices for obtaining video content from various online services. We expect the market will continue to shift from traditional linear video to OTT offerings. We expect customer migration from traditional voice services to wireless services to continue as a growing number of customers place greater value on mobility and wireless companies position their services as a landline alternative. We also face increasing competition from cable operators and other providers of VoIP services, as well as Internet portal providers.

We believe that the following are the most important competitive factors and trends in the telecommunications industry:

- *Network reliability, speed and coverage.* We consider networks that consistently provide high-quality, fast and reliable service to be a key differentiator in the market and driver of customer satisfaction. Lower prices, improved service quality and new service offerings, which in many cases include video content, have led to increased customer usage of connectivity services. We and other network-based providers must ensure that our networks can meet these increasing capacity usage requirements and offer highly reliable national coverage.

- *Pricing.* With respect to wireless services and equipment, pricing plays an important role in the wireless competitive landscape. As the demand for wireless services continues to grow, wireless service providers are offering a range of service plans at competitive prices. Many wireless service providers also bundle wireless service offerings with other products and offer promotional pricing and incentives, some of which may be targeted specifically to customers of Verizon. We and other wireless service providers, as well as equipment manufacturers, offer device payment options, which provide customers with the ability to pay for their device over a period of time, and some providers offer device leasing arrangements. In addition, aggressive device promotions have become more common in an effort to gain a greater share of subscribers interested in changing carriers. With respect to wireline services, pricing is used by competitors to capture market share from incumbents, and it is a significant factor as non-traditional modes of providing communication services emerge and new entrants compete for customers. For example, VoIP and portal-based voice and video calling is often free or nearly free to customers and is often supported by advertising revenues.

- *Customer service.* We believe that high-quality customer service is a key factor in retaining customers and attracting new customers, including those of other providers. Our customer service, retention and satisfaction programs are based on providing customers with convenient and easy-to-use products and services and focusing on their needs in order to promote long-term relationships and minimize churn. The Verizon Up program, for example, was launched to promote long-term relationships with our Consumer customers. The program offers a variety of rewards to customers in exchange for points in connection with their account-related transactions.

  Customer service is highly valued by our Business customers. We provide Global Enterprise and Public Sector and Other customers with ready access to their system and performance information, and we conduct proactive testing of our networks to identify issues before they affect our customers. We service our Small and Medium Business customers through service representatives and online support, as well as through store-based representatives for small business customers. For Wholesale customers, we pursue service improvement through continued system automation initiatives.

- *Product differentiation.* Customer and revenue growth are increasingly dependent on the development of new and enhanced products and services, as the delivery of new and innovative products and services has been accelerating. Customers are shifting their focus from access to applications and are seeking ways to leverage their broadband, video and wireless connections. To compete effectively, providers need to continuously review, improve and refine their product portfolio and develop and rapidly deploy new products and services tailored to the needs of customers. We continue to pursue the development and rapid deployment of new and innovative products and services, both independently and in collaboration with application providers, content providers and device manufacturers. Features such as wireless and wireline inter-operability are becoming increasingly important, driven by both customer demand and technological advancement.

- *Sales and distribution.* A key to achieving sales success in the consumer and small and medium business sectors of the wireless industry is the reach and quality of sales channels and distribution points. We seek to optimally vary distribution channels among our company-operated stores selling wireless products and services, outside sales teams and telemarketing, web-based sales and fulfillment capabilities, our extensive indirect distribution network of retail outlets and our sale of wireless service to resellers, which resell wireless services to their end-users.

In addition to these competitive factors and trends, companies with a global presence are increasingly competing with us in our Business segment. A relatively small number of telecommunications and integrated service providers with global operations serve customers in the global enterprise market and, to a lesser extent, the global wholesale market. We compete with these providers for large contracts to provide integrated solutions to global enterprises. Many of these companies have strong market presence, brand recognition and existing customer relationships, all of which contribute to intensifying competition that may affect our future revenue growth.

In the Global Enterprise and Public Sector and Other markets, competition remains high, primarily as a result of increased industry focus on technology convergence. We compete in this area with system integrators, carriers, and hardware and software providers. In addition, some of the largest information technology services companies are making strategic acquisitions, divesting non-strategic assets and forging new alliances to improve their cost structure. Many new alliances and acquisitions have focused on emerging fields, such as cloud computing, software defined network, communication applications and other computing tasks via networks, rather than by the use of in-house machines.

In the Small and Medium Business market, customer purchasing behaviors and preferences continue to evolve. Solution speed and simplicity with user interfaces that have a consumer-like "look and feel" are becoming key differentiators for customers who are seeking full life-cycle offers that simplify the process of starting, running and growing their businesses. Several major cable operators also offer bundles with wireless services through strategic relationships.

Our Wholesale business competes with traditional carriers for long-haul, voice and IP services. In addition, mobile video and data needs are driving a greater need for wireless backhaul. Network providers, cable companies and niche players are competitors for this business opportunity.

Verizon Media

Our media business, Verizon Media, includes diverse media and technology brands that serve both consumers and businesses. Verizon Media provides consumers with owned and operated and third-party search properties as well as mail, news, finance, sports and entertainment offerings, and provides other businesses and partners access to consumers through digital advertising, content delivery and video streaming platforms. In 2019, Verizon Media's revenues were $7.5 billion.

Verizon Media Products and Solutions

Ad Platform

Our Verizon Media Ad Platform provides advertisers and publishers with a simplified suite of intelligent advertising solutions across desktop, mobile and television devices. Verizon Media's business is comprised primarily of search advertising, display advertising, Ecommerce and subscriptions.

- *Search advertising*. Our search properties serve as a guide for users to discover information on the Internet. Verizon Media serves click-based search advertisements generated by proprietary algorithmic technology, as well as advertisements from partners. Verizon Media provides the underlying search products that facilitate user searches within Verizon Media and third-party partner properties.

- *Display advertising.* Display advertising is made up of both graphical and performance-based advertising and takes the form of impression-based contracts, time-based contracts and performance-based contracts. Verizon Media display ads leverage proprietary data signals to identify and engage users on Verizon Media properties and across the web. Through Verizon Media Ad Platform, we provide customers the ability to buy advertising inventory, measure campaigns across screens and advertising formats using self-serve technology or our managed services. We also provide publishers with the ability to monetize their ad inventory.

- *Ecommerce.* Our Ecommerce offering includes different types of business models, including facilitating transactions between businesses and consumers, enabling businesses that facilitate transactions for other businesses, and facilitating transactions between consumers.

- *Subscription memberships.* Our paid subscription offerings include premium content and services across our mail, news, finance, sports and entertainment properties, privacy and security solutions and computer protection.

Verizon Media Platform

As the digital platform reshapes the delivery of media and entertainment content, there is an increasing need for stable, high-quality video delivery platforms. Our Media Platform offers a scalable platform for delivering content, including live broadcasts, video on demand, games, software and websites to our customers on their devices at any time. This platform is targeted at media and entertainment companies and other businesses that deliver their digital products and services through the Internet.

Global Network and Technology

Our global network architecture is used by both Consumer and Business. Our network technology platforms include both wireless and wireline technologies.

Network Evolution

We are evolving the architecture of our networks to a next-generation multi-use platform, providing improved efficiency and virtualization, increased automation and opportunities for edge computing services that will support both our fiber-based and radio access network technologies. We call this the Intelligent Edge Network. We expect that this new architecture will simplify operations by eliminating legacy network elements, improve our fourth-generation (4G) Long-Term Evolution (LTE) wireless coverage, speed the deployment of 5G wireless technology and create new opportunities in the business market.

5G Deployment

Over the past several years, we have been leading the development of 5G wireless technology industry standards and the ecosystems for fixed and mobile 5G wireless services. We believe 5G technology will be able to provide users with eight capabilities, or currencies. The eight currencies are peak data rates, mobile data volumes, mobility, number of connected devices, energy efficiency of connected devices, service deployment, reduced latency and improved reliability. We expect that 5G technology will provide higher throughput and lower latency than the current 4G LTE technology and enable our networks to handle more traffic as the number of Internet-connected devices grows. During 2018, we commercially launched 5G Home on proprietary standards in four U.S. markets and on global standards in a fifth U.S. market in 2019. We also launched our 5G Ultra Wideband Network in 31 U.S. markets in 2019, as well as several 5G-compatible smartphones.

4G LTE

Our primary wireless network technology platform is 4G LTE, which provides higher data throughput performance for data services at a lower cost compared to that offered by 3G technology. As of December 31, 2019, our 4G LTE network is available in over 700 markets covering approximately 327 million people, including those in areas served by our LTE in Rural America partners. Under this program, we have collaborated with wireless carriers in rural areas to build and operate a 4G LTE network using each carrier's network assets and our core 4G LTE equipment and 700 Megahertz (MHz) C Block and Advanced Wireless Services (AWS) spectrum.

Wireless Network Reliability and Build-Out

We consider the reliability, coverage and speed of our wireless network as key factors for our continued success. We believe that steady and consistent network and platform investments provide the foundation for innovative products and services. As we design and deploy our network, we focus on the number of successful data sessions the network enables, delivering on our advertised throughput speeds, and the number of calls that are connected on the first attempt and completed without being dropped. We utilize three strategies to maintain the quality of our network: increasing the density of our network elements, deploying new technologies as they are developed and putting additional wireless spectrum into service. We choose among these strategies based on the circumstances present at different times in each of our service areas.

We have been densifying our network by utilizing small cell technology, in-building solutions and distributed antenna systems. Network densification enables us to add capacity to address increasing mobile video consumption and the growing demand for IoT products and services on our 4G LTE and 5G networks. We are also utilizing existing network capabilities to handle increased traffic without interrupting the quality of the customer experience. We continue to deploy advanced technologies to increase both network capacity and data rates.

In order to build and upgrade our existing 4G LTE network and deploy our 5G network, we must complete a variety of steps, which can include securing rights to a large number of sites as well as obtaining zoning and other governmental approvals and fiber facilities, for our macro and small cells, in-building systems and antennas and related radio equipment that comprise distributed antenna systems. We have relationships with a wide variety of vendors that supply various products and services that support our wireless network operations. We utilize tower site management firms as lessors or managers of a portion of our existing leased and owned tower sites.

Our networks include various elements of redundancy designed to enhance the reliability of the services provided to our customers. To mitigate the impact of power disruptions on our operations, we have battery backup at every switch and every macro cell. We also utilize backup generators at a majority of our macro cells and at every switch location. In addition, we have a fleet of portable backup generators that can be deployed, if needed. We further enhance reliability by using a fully redundant Multiprotocol Label Switching backbone network in critical locations.

In addition to our own network coverage, we have roaming agreements with a number of wireless service providers to enable our customers to receive wireless service in nearly all other areas in the U.S. where wireless service is available. We also offer a variety of international wireless voice and data services to our customers through roaming arrangements with wireless service providers outside the U.S.

Fios

Residential broadband service has seen significant growth in bandwidth demand over the past several years, and we believe that demand will continue to grow. We expect the continued emergence of new video services, new data applications and the proliferation of IP devices in the home will continue to drive new network requirements for increased data speeds and throughput. We believe that the Passive Optical Network (PON) technology underpinning Fios positions us well to meet these demands in a cost-effective and efficient manner.

While deployed initially as a consumer broadband network, our PON infrastructure is also experiencing more widespread application in the Business segment, especially as businesses increasingly migrate to Ethernet-based access services.

Global IP

Verizon owns and operates one of the largest global fiber-optic networks in the world, providing connectivity to Business customers in more than 150 countries. Our global IP network includes long-haul, metro and submarine assets that span over 1 million route miles and enable and support international operations.

Global business is rapidly evolving to an "everything-as-a-service" model in which Business customers seek cloud-based, converged enterprise solutions delivered securely via managed and professional services. We are continuing to deploy packet optical transport technology in order to create a global network platform to meet this demand.

Spectrum

The spectrum licenses we hold can be used for mobile wireless voice, video and data communications services. We are licensed by the Federal Communications Commission (FCC) to provide these wireless services on portions of the 800 MHz band, also known as cellular spectrum, the 1800-1900 MHz band, also known as Personal Communication Services (PCS) spectrum, portions of the 700 MHz upper C band and AWS 1 and 3 spectrum in the 1700 and 2100 MHz bands, in areas that, collectively, cover nearly all of the population of the U.S. This spectrum is collectively called low and mid-band spectrum. We are using our low and mid-band spectrum to provide both 3G and 4G LTE wireless services. However, we are increasingly reallocating spectrum previously used for 3G service to provide 4G LTE service. We are also repurposing low and mid-band spectrum to complement our spectrum licenses in the 28 and 39 Gigahertz (GHz) band, collectively called millimeter wave spectrum.

Millimeter wave spectrum is being used for our 5G technology deployment. We anticipate that we will need additional spectrum to meet future demand. This increasing demand is driven by growth in customer connections and the increased usage of wireless broadband services that use more bandwidth and require faster rates of speed, as well as the wider deployment of 5G mobile and fixed services. We can meet our future 4G and 5G spectrum needs by acquiring licenses or leasing spectrum from other licensees, or by acquiring new spectrum licenses from the FCC, if and when future FCC spectrum auctions occur.

From time to time we have exchanged spectrum licenses with other wireless service providers through secondary market swap transactions. We expect to continue to pursue similar opportunities to trade spectrum licenses in order to meet capacity and expansion needs in the future. In certain cases, we have entered into intra-market spectrum swaps designed to increase the amount of contiguous spectrum within frequency bands in a specific market. Contiguous spectrum improves network performance and efficiency. These swaps, as well as any spectrum purchases, require us to obtain governmental approvals.

Information regarding spectrum license transactions is included in the 2019 Verizon Annual Report to Shareholders in Note 3 to the consolidated financial statements of Verizon Communications Inc. and Subsidiaries, which is incorporated by reference into this report.

Strategic Transactions

During March 2015, we completed a transaction with American Tower Corporation (American Tower) pursuant to which American Tower acquired the exclusive rights to lease and operate approximately 11,300 of our wireless towers and corresponding ground leases for an upfront payment of $5.0 billion. We have subleased capacity on the towers from American Tower for a minimum of 10 years at current market rates, with options to renew. Under the terms of the lease agreements, American Tower has exclusive rights to lease and operate towers over an average term of approximately 28 years. As the leases expire, American Tower has fixed-price purchase options to acquire these towers based on their anticipated fair market values at the end of the lease terms. As part of this transaction, we also sold 162 towers for $71 million.

In June 2015, we completed our acquisition of AOL Inc. (AOL), a leader in digital content and advertising. The aggregate cash consideration paid by Verizon at the closing was approximately $3.8 billion.

In April 2016, we completed the sale (Access Line Sale) of our local exchange business and related landline activities in California, Florida and Texas, including Fios Internet and video customers, switched and special access lines and high-speed Internet service and long distance voice accounts in these three states to Frontier Communications Corporation (Frontier) for approximately $10.5 billion (approximately $7.3 billion net of income taxes), subject to certain adjustments and including the assumption of $612 million of indebtedness from Verizon by Frontier. The transaction included the acquisition by Frontier of the equity interests of Verizon's incumbent local exchange carriers (ILECs) in California, Florida and Texas.

The transaction resulted in Frontier acquiring approximately 3.3 million voice connections, 1.6 million Fios Internet subscribers, 1.2 million Fios video subscribers and the related ILEC businesses from Verizon. Approximately 9,300 Verizon employees who served customers in California, Florida and Texas continued employment with Frontier.

In July 2016, we acquired Telogis, Inc., a global, cloud-based mobile enterprise management software business, for $877 million of cash consideration.

In November 2016, we completed the acquisition of Fleetmatics Group PLC, a global provider of fleet and mobile workforce management solutions, for $60.00 per ordinary share in cash. The aggregate merger consideration was approximately $2.5 billion, including cash acquired of $112 million.

In December 2016, we entered into a definitive agreement, which was subsequently amended in March 2017, with Equinix, Inc. (Equinix) pursuant to which we agreed to sell 23 customer-facing data center sites in the U.S. and Latin America for approximately $3.6 billion, subject to certain adjustments (Data Center Sale). The transaction closed in May 2017.

In February 2016, we entered into a purchase agreement to acquire XO Holdings' wireline business (XO), which owned and operated one of the largest fiber-based IP and Ethernet networks in the U.S. Concurrently, we entered into a separate agreement to utilize certain wireless spectrum from a wholly-owned subsidiary of XO Holdings, NextLink, that held XO's millimeter-wave wireless spectrum. The agreement included an option, subject to certain conditions, to acquire NextLink. In February 2017, we completed our acquisition of XO for total cash consideration of approximately $1.5 billion, of which $100 million was paid in 2015.

In April 2017, we exercised our option to buy NextLink for approximately $493 million, subject to certain adjustments, of which $320 million was prepaid in the first quarter of 2017. The transaction closed in January 2018. The acquisition of NextLink was accounted for as an asset acquisition, as substantially all of the value related to the acquired spectrum. Upon closing, we recorded approximately $657 million of wireless licenses, $110 million of a deferred tax liability and $58 million of other liabilities.

In June 2017, we completed our acquisition of the operating business of Yahoo! Inc. (Yahoo), a leader in search, communications, digital content and advertising. Pursuant to the Purchase Agreement, upon the terms and subject to the conditions thereof, we agreed to acquire the stock of one or more subsidiaries of Yahoo holding all of Yahoo's operating business for approximately $4.83 billion in cash, subject to certain adjustments. In February 2017, Verizon and Yahoo entered into an amendment to the Purchase Agreement, pursuant to which the Transaction purchase price was reduced by $350 million to approximately $4.48 billion in cash, subject to certain adjustments.

In August 2017, we entered into a definitive agreement to purchase certain fiber-optic network assets in the Chicago market from WideOpenWest, Inc. (WOW!), a leading provider of communications services. The transaction closed in December 2017. In addition, the parties entered into a separate agreement pursuant to which WOW! was to complete the build-out of the network assets in 2019. This build-out was completed in 2019. The total cash consideration for the transactions was approximately $275 million, of which $226 million was paid in December 2017. During 2019 and 2018, the remaining cash consideration was paid.

In 2017, we entered into a transaction to acquire Straight Path Communications Inc., which held certain millimeter-wave spectrum licenses. The transaction closed in February 2018 for total consideration reflecting an enterprise value of approximately $3.1 billion. We are using the spectrum acquired for our 5G technology deployment.

Additional information regarding certain of these strategic transactions is included in the 2019 Verizon Annual Report to Shareholders in Note 3 to the consolidated financial statements of Verizon Communications Inc. and Subsidiaries, which is incorporated by reference into this report.

Patents, Trademarks and Licenses

We own or have licenses to various patents, copyrights, trademarks, domain names and other intellectual property rights necessary to conduct our business. We actively pursue the filing and registration of patents, copyrights, domain names, trademarks and service marks to protect our intellectual property rights within the United States and abroad. We also actively grant licenses, in exchange for appropriate fees or other consideration and subject to appropriate safeguards and restrictions, to other companies that enable them to utilize certain of our intellectual property rights and proprietary technology as part of their products and services. Such licenses enable the licensees to take advantage of the results of Verizon's research and development efforts. While these licenses result in valuable consideration for Verizon, we do not believe that the loss of such consideration, or the expiration of any of our intellectual property rights, would have a material effect on our results of operations.

We periodically receive offers from third parties to purchase or obtain licenses for patents and other intellectual property rights in exchange for royalties or other payments. We also periodically receive notices alleging that our products or services infringe on third-party patents or other intellectual property rights. These claims, whether against us directly or against third-party suppliers of products or services that we sell to our customers, if successful, could require us to pay damages or royalties, or cease offering the relevant products or services.

Acquisitions and Divestitures

Information about our acquisitions and divestitures is included in the 2019 Verizon Annual Report to Shareholders under the heading "Management's Discussion and Analysis of Financial Condition and Results of Operations - Acquisitions and Divestitures" and in Note 3 to the consolidated financial statements of Verizon Communications Inc. and subsidiaries, which is incorporated by reference into this report.

Regulatory and Competitive Trends

Regulatory and Competitive Landscape

Verizon operates in a regulated and highly competitive market. Current and potential competitors include other voice and data service providers, such as other wireless companies, traditional telephone companies, cable companies, Internet service providers, software and application providers and other non-traditional competitors. Many of these companies have strong market presence, brand recognition and existing customer relationships, all of which contribute to a highly competitive market that may affect our future revenue growth. Some of our competitors also are subject to fewer regulatory constraints than Verizon. For many services offered by Verizon, the FCC is our primary regulator. The FCC has jurisdiction over interstate telecommunications services and other matters under the Communications Act of 1934, as amended (Communications Act or Act). Other Verizon services are subject to state and local regulation.

Federal, State and Local Regulation

Wireless Services

The FCC regulates several aspects of our wireless operations. Generally, the FCC has jurisdiction over the construction, operation, acquisition and transfer of wireless communications systems. All wireless services require use of radio frequency spectrum, the assignment and distribution of which is subject to FCC oversight. Verizon anticipates that it will need additional spectrum to meet future demand. We can meet our needs for licensed spectrum by purchasing licenses or leasing spectrum from others, or by participating in a competitive bidding process to acquire new spectrum from the FCC. Those processes are subject to certain reviews, approvals and potential conditions.

Today, Verizon holds FCC spectrum licenses that allow it to provide a wide range of mobile and fixed communications services, including both voice and data services. FCC spectrum licenses typically have a term of 10 years, at which time they are subject to renewal. While the FCC has routinely renewed all of Verizon's wireless licenses, challenges could be raised in the future. If a wireless license was revoked or not renewed, Verizon would not be permitted to provide services on the spectrum covered by that license. Some of our licenses require us to comply with so-called "open access" FCC regulations, which generally require licensees of particular spectrum to allow customers to use devices and applications of their choice, subject to certain technical limitations. The FCC has also imposed certain specific mandates on wireless carriers, including construction and geographic coverage requirements, technical operating standards, provision of enhanced 911 services, roaming obligations and requirements for wireless tower and antenna facilities.

The Act generally preempts regulation by state and local governments of the entry of, or the rates charged by, wireless carriers. The Act does not prohibit states from regulating the other "terms and conditions" of wireless service. For example, some states attempt to regulate wireless customer billing matters and impose reporting requirements. Several states also have laws or regulations that address safety issues (e.g., use of wireless handsets while driving) and taxation matters. In addition, wireless tower and antenna facilities are often subject to state and local zoning and land use regulation, and securing approvals for new or modified facilities is often a lengthy and expensive process.

Broadband

Verizon offers many different broadband services. Traditionally, the FCC recognized broadband Internet access services as "information services" subject to a "light touch" regulatory approach rather than to the traditional, utilities-style regulations. In 2015, the FCC declared that broadband Internet access services are "telecommunications services" subject to common carriage regulation under Title II of the Communications Act. In December 2017, the FCC adopted an order reversing the 2015 Title II Order to return to "light touch" regulation of broadband Internet access services. The "light touch" portions of this order have been upheld by the U.S. Court of Appeals for the D.C. Circuit but further appeals are likely. The part of the FCC order automatically preempting state action on the subject was vacated, and a number of states are likely to join those that have taken steps to regulate broadband. Regardless of regulation, Verizon remains committed to the open Internet, which provides consumers with competitive choices and unblocked access to lawful websites and content, and our commitment to our customers can be found on our website at http://responsibility.verizon.com/broadband-commitment.

Wireline Voice

Verizon offers many different wireline voice services, including traditional telephone service and other services that rely on technologies such as VoIP. For regulatory purposes, legacy telephone services are generally considered to be "common carrier" services. Common carrier services are subject to heightened regulatory oversight with respect to rates, terms and conditions and other aspects of the services. The FCC has not decided the regulatory classification of VoIP but has said VoIP service providers must comply with certain rules, such as 911 capabilities and law enforcement assistance requirements.

State public utility commissions regulate Verizon's telephone operations with respect to certain telecommunications intrastate matters. Verizon operates as an "incumbent local exchange carrier" in nine states and the District of Columbia. These incumbent operations are subject to various levels of pricing flexibility and other state oversight and requirements. Verizon also has other wireline operations that are more lightly regulated.

Video

Verizon offers a multichannel video service that is regulated like traditional cable service. The FCC has a body of rules that apply to cable operators, and these rules also generally apply to Verizon. In areas where Verizon offers its facilities-based multichannel video services, Verizon has been required to obtain a cable franchise from local government entities, or in some cases a state-wide franchise, and comply with certain one-time and ongoing obligations as a result.

Privacy and Data Security

We are subject to federal, state and international laws and regulations relating to privacy and data security that impact all parts of our business, including wireline, wireless, broadband and the development and roll out of new products, such as those in the media and IoT space. At the federal level, our voice business is subject to the FCC's privacy requirements. Oversight of broadband Internet access privacy and data security is governed by the Federal Trade Commission (FTC). Generally, attention to privacy and data security requirements is increasing at both the state and federal level, and several privacy-related bills have been introduced or are under considerations at each level. Europe's General Data Protection Regulation, which went into effect in May 2018, includes significant penalties for non-compliance. In addition, a new privacy law took effect in California at the beginning of 2020, an additional privacy law is scheduled to take effect in Maine in 2020, and other states are considering additional regulations. These regulations could have a significant impact on our businesses.

Public Safety and Cybersecurity

The FCC plays a role in addressing public safety concerns by regulating emergency communications services and mandating widespread availability of both media (broadcast/cable) and wireless emergency alerting services. In response to cyber attacks that have occurred or could occur in the future, however, the FCC or other regulators may attempt to increase regulation of the cybersecurity practices of providers. The FCC is also addressing the use by American companies of equipment produced by companies imposing potential national security risks, but Verizon does not use such equipment in its network. In addition, due to recent natural disasters, federal and state agencies may attempt to impose regulations to ensure continuity of service during disasters.

Intercarrier Compensation and Network Access

The FCC regulates some of the rates that carriers pay each other for the exchange of voice traffic (particularly traditional wireline traffic) over different networks and other aspects of interconnection for some voice services. The FCC also regulates some of the rates and terms and conditions for certain wireline "business data services" and other services and network facilities. Verizon is both a seller and a buyer of these services, and both makes and receives interconnection payments. The FCC has focused in recent years on whether changes in the rates, terms and conditions for both the exchange of traffic and for business data services may be appropriate.

Information About Our Executive Officers

See Part III, Item 10. "Directors, Executive Officers and Corporate Governance" of this Annual Report on Form 10-K for information about our executive officers.

Employees

As of December 31, 2019, Verizon and its subsidiaries had approximately 135,000 employees. Labor unions represent approximately 23% of our employees.

Information on Our Internet Website

We make available, free of charge on our website, our annual reports on Form 10-K, quarterly reports on Form 10-Q, current reports on Form 8-K, and all amendments to those reports at http://www.verizon.com/about/investors as soon as reasonably practicable after such reports are electronically filed with the Securities and Exchange Commission (SEC). These reports and other information are also available on the SEC's website at www.sec.gov. We periodically provide other information for investors on this website, as well, including news and announcements regarding our financial performance, information on corporate governance and details related to our annual meeting of shareholders. We encourage investors, the media, our customers, business partners and other stakeholders to review the information we post on this channel. Website references in this report are provided as a convenience and do not constitute, and should not be viewed as, incorporation by reference of the information contained on, or available through, the websites. Therefore, such information should not be considered part of this report.

Cautionary Statement Concerning Forward-Looking Statements

In this report we have made forward-looking statements. These statements are based on our estimates and assumptions and are subject to risks and uncertainties. Forward-looking statements include the information concerning our possible or assumed future results of operations. Forward-looking statements also include those preceded or followed by the words "anticipates," "believes," "estimates," "expects," "hopes" or similar expressions. For those statements, we claim the protection of the safe harbor for forward-looking statements contained in the Private Securities Litigation Reform Act of 1995. We undertake no obligation to revise or publicly release the results of any revision to these forward-looking statements, except as required by law. Given these risks and uncertainties, readers are cautioned not to place undue reliance on such forward-looking statements.

The following important factors, along with those discussed elsewhere in this report and in other filings with the SEC, could affect future results and could cause those results to differ materially from those expressed in the forward-looking statements:

- cyber attacks impacting our networks or systems and any resulting financial or reputational impact;
- natural disasters, terrorist attacks or acts of war or significant litigation and any resulting financial or reputational impact;
- disruption of our key suppliers’ or vendors' provisioning of products or services;
- material adverse changes in labor matters and any resulting financial or operational impact;

- the effects of competition in the markets in which we operate;
- failure to take advantage of developments in technology and address changes in consumer demand;
- performance issues or delays in the deployment of our 5G network resulting in significant costs or a reduction in the anticipated benefits of the enhancement to our networks;
- the inability to implement our business strategy;
- adverse conditions in the U.S. and international economies;
- changes in the regulatory environment in which we operate, including any increase in restrictions on our ability to operate our networks;
- our high level of indebtedness;
- an adverse change in the ratings afforded our debt securities by nationally accredited ratings organizations or adverse conditions in the credit markets affecting the cost, including interest rates, and/or availability of further financing;
- significant increases in benefit plan costs or lower investment returns on plan assets;
- changes in tax laws or treaties, or in their interpretation; and
- changes in accounting assumptions that regulatory agencies, including the SEC, may require or that result from changes in the accounting rules or their application, which could result in an impact on earnings.

Item 1A. Risk Factors

The following discussion of "Risk Factors" identifies the most significant factors that may adversely affect our business, operations, financial condition or future performance. This information should be read in conjunction with "Management's Discussion and Analysis of Financial Condition and Result of Operations" and the consolidated financial statements and related notes. The following discussion of risks is not all-inclusive but is designed to highlight what we believe are important factors to consider when evaluating our business and expectations. These factors could cause our future results to differ materially from our historical results and from expectations reflected in forward-looking statements.

Operational Risks

Cyber attacks impacting our networks or systems could have an adverse effect on our business.

Cyber attacks, including through the use of malware, computer viruses, dedicated denial of services attacks, credential harvesting, social engineering and other means for obtaining unauthorized access to or disrupting the operation of our networks and systems and those of our suppliers, vendors and other service providers, could have an adverse effect on our business. Cyber attacks may cause equipment failures, loss of information, including sensitive personal information of customers or employees or valuable technical and marketing information, as well as disruptions to our or our customers' operations. Cyber attacks against companies, including Verizon, have increased in frequency, scope and potential harm in recent years. They may occur alone or in conjunction with physical attacks, especially where disruption of service is an objective of the attacker. The development and maintenance of systems to prevent such attacks is costly and requires ongoing monitoring and updating to address their increasing prevalence and sophistication. While, to date, we have not been subject to cyber attacks that, individually or in the aggregate, have been material to Verizon's operations or financial condition, the preventive actions we take to reduce the risks associated with cyber attacks, including protection of our systems and networks, may be insufficient to repel or mitigate the effects of a major cyber attack in the future.

The inability to operate or use our networks and systems or those of our suppliers, vendors and other service providers as a result of cyber attacks, even for a limited period of time, may result in significant expenses to Verizon and/or a loss of market share to other communications providers. The costs associated with a major cyber attack on Verizon could include expensive incentives offered to existing customers and business partners to retain their business, increased expenditures on cybersecurity measures and the use of alternate resources, lost revenues from business interruption and litigation. Further, certain of Verizon's businesses, such as those offering security solutions and infrastructure and cloud services to business customers, could be negatively affected if our ability to protect our own networks and systems is called into question as a result of a cyber attack. Our presence in the IoT industry, which includes offerings of telematics products and services, could also increase our exposure to potential costs and expenses and reputational harm in the event of cyber attacks impacting these products or services. In addition, a compromise of security or a theft or other compromise of valuable information, such as financial data and sensitive or private personal information, could result in lawsuits and government claims, investigations or proceedings. Any of these occurrences could damage our reputation, adversely impact customer and investor confidence and result in a material adverse effect on Verizon's results of operation or financial condition.

Natural disasters, terrorist acts or acts of war could cause damage to our infrastructure and result in significant disruptions to our operations.

Our business operations are subject to interruption by power outages, terrorist attacks, other hostile acts and natural disasters, including an increasing prevalence of wildfires and intensified storm activities. Such events could cause significant damage to our infrastructure upon which our business operations rely, resulting in degradation or disruption of service to our customers, as well as significant recovery time and expenditures to resume operations. Our system redundancy may be ineffective or inadequate to sustain our operations through all such events. We are implementing, and will continue to implement, measures to protect our infrastructure and operations from the impacts of these events in the future, but these measures and our overall disaster recovery planning may not be sufficient for all eventualities. These events could also damage the infrastructure of the suppliers that provide us with the equipment and services that we need to operate our business and provide products to our customers. These occurrences could result in lost revenues from business interruption, damage to our reputation and reduced profits.

We depend on key suppliers and vendors to provide equipment that we need to operate our business.

We depend on various key suppliers and vendors to provide us, directly or through other suppliers, with equipment and services, such as fiber, switch and network equipment, smartphones and other wireless devices that we need in order to operate our business and provide products to our customers. For example, our smartphone and other device suppliers often rely on one vendor for the manufacture and supply of critical components, such as chipsets, used in their devices, and there are a limited number of companies capable of supplying the network infrastructure equipment on which we depend. These suppliers or vendors could fail to provide equipment or service on a timely basis, or fail to meet our performance expectations, for a number of reasons, including, for example, disruption to the global supply chain as a result of the coronavirus. If such failures occur, we may be unable to provide products and services as and when requested by our customers, or we may be unable to continue to maintain or upgrade our networks. Because of the cost and time lag that can be associated with transitioning from one supplier to another, our business could be substantially disrupted if we were required to, or chose to, replace the products or services of one or more major suppliers with products or services from another source, especially if the replacement became necessary on short notice. Any such disruption could increase our costs, decrease our operating efficiencies and have a material adverse effect on our business, results of operations and financial condition.

The suppliers and vendors on which we rely may also be subject to litigation with respect to technology on which we depend, including litigation involving claims of patent infringement. Such claims are frequently made in the communications industry. We are unable to predict whether our

business will be affected by any such litigation. We expect our dependence on key suppliers to continue as we develop and introduce more advanced generations of technology.

A significant portion of our workforce is represented by labor unions, and we could incur additional costs or experience work stoppages as a result of the renegotiation of our labor contracts.

As of December 31, 2019, approximately 23% of our workforce was represented by labor unions. While we have labor contracts in place with these unions, with subsequent negotiations we could incur additional costs and/or experience work stoppages, which could adversely affect our business operations. In addition, while a small percentage of the workforce of our wireless and other businesses outside of wireline is represented by unions, we cannot predict what level of success unions may have in further organizing this workforce or the potentially negative impact it would have on our operations.

Economic and Strategic Risks

We face significant competition that may reduce our profits.

We face significant competition in our industries. The rapid development of new technologies, services and products have eliminated many of the traditional distinctions among wireless, cable, Internet and local and long distance communication services and brought new competitors to our markets, including other telephone companies, cable companies, wireless service providers, satellite providers and application and device providers. While these changes have enabled us to offer new types of products and services, they have also allowed other providers to broaden the scope of their own competitive offerings. If we are unable to compete effectively, we could experience lower than expected revenues and earnings. A projected sustained decline in any of our reporting units' revenues and earnings could have a significant impact on its fair value and has caused us in the past, and may cause us in the future, to record goodwill impairment charges. The amount of any impairment charge could be significant and could have a material adverse impact on our results of operations for the period in which the charge is taken. In addition, wireless service providers are significantly altering the financial relationships with their customers through commercial offers that vary service and device pricing, promotions, incentives and levels of service provided – in some cases specifically targeting our customers. Our ability to compete effectively will depend on, among other things, our network quality, capacity and coverage, the pricing of our products and services, the quality of our customer service, our development of new and enhanced products and services, the reach and quality of our sales and distribution channels and our capital resources. It will also depend on how successfully we anticipate and respond to various factors affecting our industries, including new technologies and business models, changes in consumer preferences and demand for existing services, demographic trends and economic conditions. If we are not able to respond successfully to these competitive challenges, we could experience reduced profits.

If we are not able to take advantage of developments in technology and address changing consumer demand on a timely basis, we may experience a decline in the demand for our services, be unable to implement our business strategy and experience reduced profits.

Our industries are rapidly changing as new technologies are developed that offer consumers an array of choices for their communications needs and allow new entrants into the markets we serve. In order to grow and remain competitive, we will need to adapt to future changes in technology, enhance our existing offerings and introduce new offerings to address our customers' changing demands. If we are unable to meet future challenges from competing technologies on a timely basis or at an acceptable cost, we could lose customers to our competitors. We may not be able to accurately predict technological trends or the success of new services in the market.

The deployment of our 5G network is subject to a variety of risks, including those related to equipment availability, unexpected costs, and regulatory permitting requirements that could cause deployment delays or network performance issues. These issues could result in significant costs or reduce the anticipated benefits of the enhancements to our networks. If our services fail to gain acceptance in the marketplace, or if costs associated with the implementation and introduction of these services materially increase, our ability to retain and attract customers could be adversely affected.

In addition to introducing new offerings and technologies, such as 5G technology, we must phase out outdated and unprofitable technologies and services. If we are unable to do so on a cost-effective basis, we could experience reduced profits. In addition, there could be legal or regulatory restraints on our ability to phase out current services.

Adverse conditions in the U.S. and international economies could impact our results of operations.

Unfavorable economic conditions, such as a recession or economic slowdown in the U.S. or elsewhere, could negatively affect the affordability of and demand for some of our products and services. In difficult economic conditions, consumers may seek to reduce discretionary spending by forgoing purchases of our products, electing to use fewer higher margin services, dropping down in price plans or obtaining lower-cost products and services offered by other companies. Similarly, under these conditions, the business customers that we serve may delay purchasing decisions, delay full implementation of service offerings or reduce their use of services. In addition, adverse economic conditions may lead to an increased number of our consumer and business customers that are unable to pay for services. If these events were to occur, it could have a material adverse effect on our results of operations.

Regulatory and Legal Risks

Changes in the regulatory framework under which we operate could adversely affect our business prospects or results of operations.

Our domestic operations are subject to regulation by the FCC and other federal, state and local agencies, and our international operations are regulated by various foreign governments and international bodies. These regulatory regimes frequently restrict or impose conditions on our ability to operate in designated areas and provide specified products or services. We are frequently required to maintain licenses for our operations and conduct our operations in accordance with prescribed standards. We are often involved in regulatory and other governmental proceedings or inquiries related to the application of these requirements. It is impossible to predict with any certainty the outcome of pending federal and state regulatory proceedings relating to our operations, or the reviews by federal or state courts of regulatory rulings. Without relief, existing laws and regulations may inhibit our ability to expand our business and introduce new products and services. Similarly, we cannot guarantee that we will be successful in obtaining the licenses needed to carry out our business plan or in maintaining our existing licenses. For example, the FCC grants wireless licenses for terms generally lasting 10 years, subject to renewal. The loss of, or a material limitation on, certain of our licenses could have a material adverse effect on our business, results of operations and financial condition.

New laws or regulations or changes to the existing regulatory framework at the federal, state and local, or international level, such as those described below, or new laws or regulations enacted to address the potential impacts of climate change, could restrict the ways in which we manage our wireline and wireless networks and operate our Media business, impose additional costs, impair revenue opportunities and potentially impede our ability to provide services in a manner that would be attractive to us and our customers.

- *Privacy and data protection* - we are subject to federal, state and international laws related to privacy and data protection. Europe's General Data Protection Regulation, which went into effect in May 2018, includes significant penalties for non-compliance. In addition, a new privacy law took effect in California at the beginning of 2020, an additional privacy law is scheduled to take effect in Maine in 2020, and other states are considering additional regulations. These regulations could have a significant impact on our businesses.

- *Regulation of broadband Internet access services* - In its 2015 Title II Order, the FCC nullified its longstanding "light touch" approach to regulating broadband Internet access services and "reclassified" these services as telecommunications services subject to utilities-style common carriage regulation. The FCC repealed the 2015 Title II Order in December 2017, and returned to its traditional light-touch approach for these services. The 2017 order has been affirmed in part by the D.C. Circuit, but further appeals and challenges are possible; the outcome and timing of these or any other challenge remains uncertain. Several states have also adopted or are considering adopting laws or executive orders that would impose net neutrality and other requirements on some of our services (in some cases different from the FCC's 2015 rules). The enforceability and effect of these state rules is uncertain.

- *"Open Access"* - we hold certain wireless licenses that require us to comply with so-called "open access" FCC regulations, which generally require licensees of particular spectrum to allow customers to use devices and applications of their choice. Moreover, certain services could be subject to conflicting regulation by the FCC and/or various state and local authorities, which could significantly increase the cost of implementing and introducing new services.

The further regulation of broadband, wireless and our other activities and any related court decisions could restrict our ability to compete in the marketplace and limit the return we can expect to achieve on past and future investments in our networks.

We are subject to a significant amount of litigation, which could require us to pay significant damages or settlements.

We are subject to a substantial amount of litigation, including, from time to time, shareholder derivative suits, patent infringement lawsuits, antitrust class actions, wage and hour class actions, personal injury claims, property claims, and lawsuits relating to our advertising, sales, billing and collection practices. In addition, our wireless business also faces personal injury and wrongful death lawsuits relating to alleged health effects of wireless phones or radio frequency transmitters. We may incur significant expenses in defending these lawsuits. In addition, we may be required to pay significant awards or settlements.

Financial Risks

Verizon has significant debt, which could increase further if Verizon incurs additional debt in the future and does not retire existing debt.

As of December 31, 2019, Verizon had approximately $99.1 billion of outstanding unsecured indebtedness, $9.4 billion of unused borrowing capacity under its existing revolving credit facility and $12.4 billion of outstanding secured indebtedness. Verizon's debt level and related debt service obligations could have negative consequences, including:

- requiring Verizon to dedicate significant cash flow from operations to the payment of principal, interest and other amounts payable on its debt, which would reduce the funds Verizon has available for other purposes, such as working capital, capital expenditures, dividend payments and acquisitions;

- making it more difficult or expensive for Verizon to obtain any necessary future financing for working capital, capital expenditures, debt service requirements, debt refinancing, acquisitions or other purposes;

- reducing Verizon's flexibility in planning for or reacting to changes in its industries and market conditions;

- making Verizon more vulnerable in the event of a downturn in its business; and

- exposing Verizon to increased interest rate risk to the extent that its debt obligations are at variable interest rates.

Adverse changes in the credit markets and other factors could increase our borrowing costs and the availability of financing.

We require a significant amount of capital to operate and grow our business. We fund our capital needs in part through borrowings in the public and private credit markets. Adverse changes in the credit markets, including increases in interest rates, could increase our cost of borrowing and/or make it more difficult for us to obtain financing for our operations or refinance existing indebtedness. In addition, our ability to obtain funding under asset-backed debt transactions is subject to our ability to continue to originate a sufficient amount of assets eligible to be securitized. Our borrowing costs also can be affected by short- and long-term debt ratings assigned by independent rating agencies, which are based, in significant part, on our performance as measured by customary credit metrics. A decrease in these ratings would likely increase our cost of borrowing and/or make it more difficult for us to obtain financing. A severe disruption in the global financial markets could impact some of the financial institutions with which we do business, and such instability could also affect our access to financing.

Increases in costs for pension benefits and active and retiree healthcare benefits may reduce our profitability and increase our funding commitments.

With approximately 135,000 employees and approximately 191,000 retirees as of December 31, 2019 eligible to participate in Verizon's benefit plans, the costs of pension benefits and active and retiree healthcare benefits have a significant impact on our profitability. Our costs of maintaining these plans, and the future funding requirements for these plans, are affected by several factors, including the legislative and regulatory uncertainty regarding the potential modification of the Patient Protection and Affordable Care Act, increases in healthcare costs, decreases in investment returns on funds held by our pension and other benefit plan trusts and changes in the discount rate and mortality assumptions used to calculate pension and other postretirement expenses. If we are unable to limit future increases in the costs of our benefit plans, those costs could reduce our profitability and increase our funding commitments.

Item 1B. Unresolved Staff Comments

None.

Item 2. Properties

Our principal properties do not lend themselves to simple description by character and location. Our total gross investment in property, plant and equipment was approximately $266 billion at December 31, 2019 and $253 billion at December 31, 2018, including the effect of retirements, but before deducting accumulated depreciation. Our gross investment in property, plant and equipment consisted of the following:

At December 31,	**2019**	2018
Network equipment	**77.3%**	78.0%
Land, buildings and building equipment	**12.0%**	12.4%
Furniture and other	**10.7%**	9.6%
	100.0%	100.0%

Network equipment consists primarily of cable (aerial, buried, underground or undersea) and the related support structures of poles and conduit, wireless plant, switching equipment, network software, transmission equipment and related facilities. Land, buildings and building equipment consists of land and land improvements, central office buildings or any other buildings that house network equipment, and buildings that are used for administrative and other purposes. Substantially all the switching centers are located on land and in buildings we own due to their critical role in the networks and high set-up and relocation costs. We also maintain facilities throughout the U.S. comprised of administrative and sales offices, customer care centers, retail sales locations, garage work centers, switching centers, cell sites and data centers. Furniture and other consists of telephone equipment, furniture, data processing equipment, office equipment, motor vehicles, plant under construction and leasehold improvements.

Item 3. Legal Proceedings

In October 2013, the California Attorney General's Office notified certain Verizon companies of potential violations of California state hazardous waste statutes primarily arising from the disposal of electronic components, batteries and aerosol cans at certain California facilities. We are cooperating with this investigation and continue to review our operations relating to the management of hazardous waste. While penalties relating to the alleged violations could exceed $100,000, we do not expect that any penalties ultimately incurred will be material.

Item 4. Mine Safety Disclosures

None.

PART II

Item 5. Market for Registrant's Common Equity, Related Stockholder Matters and Issuer Purchases of Equity Securities

The principal market for trading in the common stock of Verizon is the New York Stock Exchange under the symbol "VZ". As of December 31, 2019, there were 605,414 shareholders of record.

Stock Repurchases

In February 2020, the Verizon Board of Directors authorized a share buyback program to repurchase up to 100 million shares of the Company's common stock. The program will terminate when the aggregate number of shares purchased reaches 100 million, or a new share repurchase plan superseding the current plan is authorized, whichever is sooner. Under the program, shares may be repurchased in privately negotiated transactions, on the open market, or otherwise, including through plans complying with Rule 10b5-1 under the Exchange Act. The timing and number of shares purchased under the program, if any, will depend on market conditions and the Company's capital allocation priorities.

During the years ended December 31, 2019 and 2018, Verizon did not repurchase any shares of Verizon's common stock under our previously authorized share buyback program. At December 31, 2019, the maximum number of shares that could be purchased by or on behalf of Verizon under our share buyback program was 100 million.

Item 8. Financial Statements and Supplementary Data

Information required by this item is included in the consolidated financial statements and related notes of Verizon Communications Inc. and Subsidiaries in the 2019 Verizon Annual Report to Shareholders, which is incorporated herein by reference.

Item 9. Changes in and Disagreements with Accountants on Accounting and Financial Disclosure

None.

Item 9A. Controls and Procedures

Our Chief Executive Officer and Chief Financial Officer have evaluated the effectiveness of the registrant's disclosure controls and procedures (as defined in Rules 13a-15(e) and 15d-15(e) of the Securities Exchange Act of 1934), as of the end of the period covered by this Annual Report, that ensure that information relating to the registrant which is required to be disclosed in this report is recorded, processed, summarized and reported within required time periods using the criteria for effective internal control established in Internal Control–Integrated Framework issued by the Committee of Sponsoring Organizations of the Treadway Commission in 2013. Based on this evaluation, our Chief Executive Officer and Chief Financial Officer have concluded that the registrant's disclosure controls and procedures were effective as of December 31, 2019.

In the ordinary course of business, we routinely review our system of internal control over financial reporting and make changes to our systems and processes that are intended to ensure an effective internal control environment. There were no changes in the Company's internal control over financial reporting during the fourth quarter of 2019 that have materially affected, or are reasonably likely to materially affect, our internal control over financial reporting.

Management's report on internal control over financial reporting and the attestation report of Verizon's independent registered public accounting firm are included in the 2019 Verizon Annual Report to Shareholders and are incorporated herein by reference.

Item 9B. Other Information

None.

PART III

Item 10. Directors, Executive Officers and Corporate Governance

Set forth below is information with respect to our executive officers.

Name	Age	Office	Held Since
Hans Vestberg	54	Chairman and Chief Executive Officer	2019
Ronan Dunne	56	Executive Vice President and Group CEO - Verizon Consumer	2019
Matthew D. Ellis	48	Executive Vice President and Chief Financial Officer	2016
Tami A. Erwin	55	Executive Vice President and Group CEO - Verizon Business	2019
K. Guru Gowrappan	39	Executive Vice President and Group CEO - Verizon Media	2019
Kyle Malady	52	Executive Vice President and Chief Technology Officer	2019
Christine Pambianchi	51	Executive Vice President and Chief Human Resources Officer	2019
Rima Qureshi	55	Executive Vice President and Chief Strategy Officer	2017
Craig L. Silliman	52	Executive Vice President and Chief Administrative, Legal and Public Policy Officer	2019
Anthony T. Skiadas	51	Senior Vice President and Controller	2013

Prior to serving as an executive officer, each of the above officers has held high-level managerial positions with the Company or one of its subsidiaries for at least five years, with the exception of Hans Vestberg, who has been with the Company since 2017, Ronan Dunne, who has been with the Company since 2016, K. Guru Gowrappan, who has been with the Company since 2018, Christine Pambianchi, who has been with the Company since 2019 and Rima Qureshi, who has been with the Company since 2017. Officers are not elected for a fixed term of office and may be removed from office at any time at the discretion of the Board of Directors.

Hans Vestberg is the Chairman and Chief Executive Officer of Verizon. Mr. Vestberg joined the Company in April 2017 as Executive Vice President and President - Global Networks and Technology. He began serving in his current role of Chief Executive Officer in August 2018 and was elected Chairman in March 2019. Prior to joining Verizon, Mr. Vestberg served for six years as President and Chief Executive Officer of Ericsson, a multinational networking and telecommunications equipment and services company headquartered in Sweden.

Ronan Dunne is the Executive Vice President and Group CEO - Verizon Consumer. Mr. Dunne joined the Company in September 2016 as Executive Vice President and President of Verizon Wireless. Prior to joining Verizon, Mr. Dunne served for eight years as Chief Executive Officer of Telefónica UK Limited (O2), the second largest wireless operator in the United Kingdom.

K. Guru Gowrappan is the Executive Vice President and Group CEO - Verizon Media. Mr. Gowrappan joined the Company in April 2018 as the President and Chief Operating Officer of Oath. He began serving in his current role in October 2018. Prior to joining Verizon, Mr. Gowrappan served as the Global Managing Director of Alibaba Inc. from 2015 to 2018 and as the Chief Operating Officer for Quixey, a mobile search engine, from 2012 to 2015.

Christine Pambianchi is the Executive Vice President and Chief Human Resources Officer. Ms. Pambianchi joined the Company in July 2019. Prior to joining Verizon, Ms. Pambianchi led the Human Resources function at Corning Incorporated, a leading innovator in materials science, where she served as Executive Vice President, People and Digital, from 2018 to 2019 and as Senior Vice President, Human Resources, from 2010 to 2018.

Rima Qureshi is Executive Vice President and Chief Strategy Officer of Verizon. Ms. Qureshi joined the Company in November 2017. Prior to joining Verizon, Ms. Qureshi served as President and Chief Executive Officer of Ericsson North America from 2016 to 2017 and as Senior Vice President and Chief Strategy Officer and head of mergers and acquisitions of Ericsson from 2014 to 2016. Ms. Qureshi also served as Vice President of Ericsson's CDMA Mobile Systems Group, Senior Vice President of Strategic Projects, Chairman of Ericsson's Northern Europe, Russia and Central Asia Group and Chairman of Ericsson's Modem division before becoming Chief Strategy Officer.

For other information required by this item, see the sections entitled "Governance — Item 1: Election of Directors — Nominees for Election and — Election Process, — Our Approach to Governance — Where to Find More Information on Governance at Verizon, — Our Board Composition and Structure — Board Committees — Audit Committee and — Our Approach to Strategy and Risk Oversight — Other Risk-Related Matters — Business Conduct and Ethics" in our definitive Proxy Statement to be filed with the Securities and Exchange Commission and delivered to shareholders in connection with our 2020 Annual Meeting of Shareholders, which are incorporated herein by reference.

Item 11. Executive Compensation
